No. 698. Chota Valley, Ecuador. While traveling in the high Andes of Ecuador three years ago my fancy was taken by an attractive daisylike flower which I often saw along the trail. I was unable at that time to obtain many seeds, and what few I secured failed to grow when planted at Washington. On this second visit, however, I found an abundance of seeds available.

I have seen this plant at elevations between 5,000 and 10,000 feet. It grows in the rockiest, most forbidding places, usually where few other plants are able to obtain a foothold. Apparently it requires very little moisture. When fully developed it forms a low, spreading clump 1 or 2 feet in breadth, with grayish foliage, reaching not more than 6 inches above the ground. The flowers are borne on slender stems 4 to 8 inches above the foliage; they are an inch and a half in diameter and vary from pale lilac-pink to deep rose-pink. Some of the

62677 to 62691—Continued.

shades are extremely pretty, others a bit pallid. It should be easy through selection to develop a strain producing nothing but bright-pink flowers. The plant seems to be a perennial in this climate, but I suspect it will stand no frost.

62683 to 62687. *PERSA AMERICANA* Mill. (*P. gratissima* Gaertn. f.). Lauraceae. Avocado.

The avocados of the Chota Valley are an interesting group. The majority of them belong to the Mexican race, but quite a few are obviously of the lowland type which we call West Indian. Some of the trees seem almost intermediate in character between these two races, which leads to the belief that they may be of hybrid origin. The Mexican varieties of the Chota Valley are a superior lot, perhaps the finest which we have found during our explorations in tropical America.

The five varieties originally introduced in 1921, plus the five now obtained, give us a collection comprising some of the best forms grown in the Chota Valley.

62683. No. 688. Hacienda Carpuela. Avocado No. 1. This avocado is an oblong, light-green fruit, weighing about 12 ounces. It is probably not a Mexican; it may be a cross between this race and the West Indian; the characteristics of the fruit suggest this possibility. Since I was unable to see a mature specimen, I can not report upon the quality of the fruit, though I am assured by the owner of the tree that it is excellent. The seed cavity is large and the seed loose within. The foliage has no odor of anise when crushed.

62684. No. 689. Hacienda Carpuela. Avocado No. 2. This is a pear-shaped fruit with a distinct neck, pointed where it joins the stem. The weight is about 12 ounces; the color dull yellowish green. Since the leaves are distinctly anise scented, it seems probable that the variety belongs to the Mexican race. The seed is moderately large and tight in the cavity. I was unable to examine a mature specimen, hence I can not vouch for the quality of the flesh.

62685. No. 690. Hacienda Challhua. Avocado No. 3. This avocado is said by the owner of the hacienda to produce fruits of a large size and excellent quality, but I was unable to see mature specimens and am not able to vouch for this personally. The foliage is not anise scented, hence I suspect the variety to be of the West Indian race, though it may be a cross between this and the Mexican. The fruit is pyriform, rather slender, broadly necked; maroon-purple; the weight uncertain, perhaps 1 pound in well-developed specimens. The skin is rather thick, but not so much so as in many varieties of the West Indian race. The flesh is a rich yellow; the seed is large and tight in the cavity.

62686. No. 691. The Huerta de los Dolores. Avocado No. 4. This and the following variety come from an orchard which has an interesting history. Over a hundred years ago the owner of the grove died, leaving the property to the Virgin of Dolores. The Bishop of Ibarra was named administrator.

62677 to 62691—Continued.

Some of the trees on this property are extremely old; I suspect, in fact, that they may have been planted by the Spanish monks who originally owned the haciendas of the Chota Valley. It is not unlikely that certain of these trees date from the eighteenth century. The largest have trunks 8 to 10 feet thick.

The avocado represented by this number is undoubtedly of the Mexican race. The fruit is broadly pyriform; green skinned, and weighs about 8 ounces; the seed is of medium size and tight in the cavity. The flesh is rich yellow and of excellent quality.

62687. No. 692. The Huerta de los Dolores. Avocado No. 5. This avocado, having the same interesting history as No. 691 (S. P. I. No. 62686), is not a true Mexican, since the leaves are not strongly anise scented. Most probably it is a cross between this race and the West Indian. The fruit is oblong-ovoid, about 12 ounces in weight, and maroon-purple; the seed is rather large and loose in the cavity; the skin is thick for a Mexican, thin for a West Indian; the flesh is creamy yellow and is said to be of excellent flavor.

62688. *PRUNUS SEROTINA* Ehrh. Amygdalaceae. Capulin.

No. 706. Ambato, Ecuador. Seeds of a large-fruited capulin obtained in the market. For a description of the capulin, see S. P. I. No. 52597 and the Journal of Heredity for February, 1922.

62689 and 62690. *RUBUS GLAUCUS* Benth. Rosaceae. Andes raspberry.

62689. No. 699. Ibarra, Ecuador. Plants of a rare albino, or white-fruited, form of the Andes raspberry. It was discovered by José Félix Tamayo and brought by him to the Hacienda la Victoria in Ibarra, where it is now growing vigorously.

The typical form of the Andes raspberry has maroon-colored fruits. They will be found described in the inventories under S. P. I. Nos. 55788 and 62014, and in the Journal of Heredity, vol. 12, No. 9, November, 1921. According to Señor Tamayo, the albino form yields fruits of excellent quality, differing from those of the typical *Rubus glaucus* only in color.

62690. No. 708. Ambato, Ecuador. Seeds of the typical form of this excellent berry obtained from fruits purchased in the market.

For previous introduction, see S. P. I. No. 52717.

62691. *SOLANUM MEDIANIS* Bitter.

No. 681. Lima, Peru. Tubers presented by Prof. Julio Gaudron, Jardín Botánico de la Escuela Nacional de Agricultura. This is a potato-like species brought into the Botanic Garden of the School of Agriculture some years ago by Nicolas Esposto. It occurs wild on the coast of Peru, and Professor Gaudron believes it may prove of interest in connection with potato-breeding experiments, since it is exceedingly productive of tubers which are smaller than potatoes, being commonly 1 or 2 inches in length and not more than an inch in diameter. They have white, crisp flesh of very firm texture, but are not considered good to eat.

62692. DIOSPYROS LOTUS L. Diospyraceae. Persimmon.

From Taelingyeen, Chihli, China. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received January 24, 1925.

No. 837. November 28, 1924. *Hei Tsao* (black date). (*Dorsett.*)

Introduced for trial as stock for cultivated varieties of oriental persimmons.

62693 to 62699.

From South America. Collected by Wilson Popenoe, agricultural explorer, Bureau of Plant Industry. Received February 28, 1925. Notes by Doctor Popenoe.

62693 to 62696. SOLANUM TUBEROSUM L. Solanaceae. Potato.

62693 and 62694. Tubers purchased in the market at Lima, Peru, said to have been grown in the vicinity of Huancayo, high up in the Andes, east of Lima.

If the yellow-fleshed potatoes of the Andes can be successfully grown in the United States, I believe they will prove a distinct addition to our list of foodstuffs. The eyes are deep, however, and the tubers are not as large as those of standard varieties now grown in the United States. In quality they excel all other potatoes. This is not alone my opinion but that of numerous other Americans who have eaten them in the Andean countries.

62693. No. 679. These tubers are irregularly round, 2 to 3 inches in diameter; dull magenta-red externally, with very deep eyes. The flesh is rich yellow, mealy when cut, and of a rich nutty flavor quite unknown in North American potatoes.

62694. No. 680. The tubers of the variety are small, free from objectionably small eyes, and the flesh is even deeper yellow than that of No. 679 [S. P. I. No. 62693].

62695 and 62696. When in Ecuador in 1921 I secured and forwarded to the United States tubers of the Chaucha potato from the Province of Carchi in northern Ecuador. The potato specialists of the Bureau of Plant Industry, who are working with this crop, have found the Chaucha type distinct from other potatoes in that the tubers do not require to be stored before planting, but can be dug and replanted the same day. This characteristic gives the Chaucha type a certain importance in Ecuador, because it enables the farmer to maintain a constant succession of crops, and in the United States because plant breeders are desirous of having all possible new characters for use in breeding.

For previous introduction, see S. P. I. No. 53216.

62695. No. 694. The tubers listed under this number include several varieties. They were presented by J. F. Tamayo, of Ibarra, Ecuador.

62696. No. 695. These tubers are from the vicinity of Mira, Province of Carchi, Ecuador, and were presented by Jorge Benites. This

62693 to 62699—Continued.

variety differs from most other chauchas in having tubers which are long and slender, suggesting small sweet potatoes.

62697. SOLANUM sp.

No. 682. Tubers presented by Prof. Julio Gaudron, Jardín Botánico de la Escuela Nacional de Agricultura, Lima, Peru. Though this plant is grown at the Botanic Garden under the name *Solanum maglia*, Dr. W. E. Safford believes it is not this species. Its tubers, which are more or less round in form and 1 or 2 inches in diameter, are of no value as food. The plant, however, is of interest to breeders for hybridizing with the true potato.

62698. VALLEA STIPULARIS L. f. Elaeocarpaceae.

No. 709. Plants presented by Prof. Augusto Martinez, Ambato, Ecuador. This handsome Andean tree, native to high, cool regions in Ecuador and Colombia, seems worthy of cultivation in other regions. It grows to a height of 20 or 25 feet, forming a broad, compact crown of attractive foliage. The flowers, which are borne in clusters about 2 inches long, are half an inch in diameter and deep pink. I first saw this plant in Colombia three years ago and sent seeds of it from that country. I do not believe, however, that it has yet been established in the United States, and I therefore secured this lot of plants from the garden of Professor Martinez, where there is one old specimen, brought from the mountains many years ago. The tree produces abundant suckers, by which means it is easily propagated.

For previous introduction, see S. P. I. No. 51800.

62699. ZEPHYRANTHES sp. Amaryllidaceae.

No. 683. Bulbs presented by Julio Gaudron, Jardín Botánico de la Escuela Nacional de Agricultura, Lima, Peru. While walking through the test orchard of the School of Agriculture I noticed a number of bright-yellow flowers peeping up here and there through the grass. Professor Gaudron informed me that these belonged to two species, *Pyrolirion flavum* and *P. aureum*, and he offered to have some bulbs collected for trial in the United States. The lot represented by this number was supplied in consequence of this promise.

The flower strongly resembles in form and size the common *Zephyranthes* of the United States (*Z. atamasco*), but it varies in color from bright yellow to golden yellow.

62700 to 62744.

From Elstree, Herts, England. Plants presented by Vicary Gibbs, Aldenham House Gardens. Received March 3, 1925. Notes by Edwin Beckett, superintendent, Aldenham House Gardens.

62700. ASTER sp. Asteraceae.

Var. *Mrs. Pierpont Morgan*. A new aster which we raised last year.

62701. BERBERIS AQUIFOLIUM Pursh. Berberidaceae. Oregon hollygrape.

Var. *grandifolium*. A new introduction with strikingly handsome foliage. Raised at Aldenham.

62702. BUDDLEIA DAVIDII Franch. Loganiaceae. Butterfly bush.

62700 to 62744—Continued.

Var. *Nanhoensis*. A Chinese variety of spreading habit and free blooming, bearing bright rosy mauve flowers.

62703. *CARYOPTERIS TANGUTICA* Maxim.
Verbenaceae. Bluebeard.

Farrer No. 350. A deciduous semi-shrub from China, superior to *Caryopteris mastacanthus*, bearing profusely, bright violet-blue flowers.

62704. *CEANOTHUS HYBRIDUS* Hort. Rhamnaceae.

Var. *Marie Simon*. A lovely lilac-pink hybrid.

62705. *CLEMATIS MONTANA WILSONII* Sprague. Ranunculaceae.

A hardy climbing clematis, native to western China, which often attains a height of 20 feet or more. The very abundant, sweet-scented flowers, about an inch long, are white with occasionally yellowish or rosy tinges, and are produced in June and July with generally a second flowering in the autumn.

62706. *CHAMAECYPARIS LAWSONIANA* (Murray) Parl. Pinaceae.
Lawson cypress.

Var. *Fletcherii*. This is a very distinct and dainty variety with glaucous foliage.

62707. *DEUTZIA TAIWANENSIS* (Maxim.) C. Schneid. Hydrangeaceae.

A new species from the mountains of Formosa, with white or pinkish white flowers, belonging to the same group as *Deutzia scabra*.

62708. *DEUTZIA* sp. Hydrangeaceae.

Farrer No. 109. A striking and distinct medium-growing shrub with white, wavy-edged flowers; introduced from China by the late Reginald Farrer.

62709 to 62712. *DIERVILLA FLORIBUNDA* Sieb. and Zucc. Caprifoliaceae.
Crimson weigela.

62709. *Aldenham Glow*. A choice deep-scarlet flowered form resembling "Eva Rathke."

62710. *Avante Garde*. An early flowering, rich pink variety.

62711. *Emile Galle*. A very fine, dark-pink form.

62712. *Gloire de Bosquets*. The corolla without is carmine and purplish pink within; very effective.

62713. *DIERVILLA JAPONICA SINICA* Rehder. Caprifoliaceae. Weigela.

A Chinese variety with campanulate, pale-pink flowers. The shrub is 6 feet or less high, with slender-stemmed, oval leaves hairy beneath; the flowers are in small, terminal clusters.

62714. *ESCALLONIA* sp. Escalloniaceae.

C. F. Ball. A beautiful pink hybrid raised by the late Mr. Ball at the Botanic Gardens, Glasnevin.

62715. *ESCALLONIA* sp. Escalloniaceae.

Var. *rubra nana*. This is a charming dwarf form of the red-flowered species and is suitable for rockeries.

62716 to 62718. *EUONYMUS JAPONICUS* L. f. Celastraceae.

62716. *President Gauthier*. A strikingly variegated variety of the trailing evergreen, "spindle wood."

62700 to 62744—Continued.

62717. An evergreen with variegated foliage and dwarf compact habit, which is a real gem.

62718. A tiny-leaved, very distinct dwarf form.

62719 and 62720. *EUONYMUS RADICANS* Siebold. Celastraceae.

62719. *Little Gem*. A pretty, white-variegated form of dwarf habit.

62720. A distinct, rather stiff-habited variety.

62721. *EUONYMUS EUROPAEUS* L. Celastraceae. Spindle tree.

A most distinct form of *Euonymus europaeus*, with large foliage and handsome pink fruit.

62722. *EUONYMUS* sp. Celastraceae.

Vilmorin No. 5521. A handsome, free-flowering, tall, pyramidal form of the *Euonymus japonicus* group. A really excellent evergreen introduction from China.

62723. *ILEX FARGESII* Franch. Aquifoliaceae. Holly.

A Chinese holly which is described (Journal de Botanique, vol. 12, p. 255) as a shrub with black bark and dull-green, narrowly oblong leaves about 5 inches long, indistinctly toothed. The globose, red berries are in small axillary clusters.

62724. *LAVANDULA VERA* DC. Menthaceae. Lavender.

Munstead Blue. This form is of bushy habit and flowers early, carrying its bright-blue spikes most freely.

62725. *LAUROCERASUS OFFICINALIS* Roemer (*Prunus laurocerasus* L.). Amygdalaceae. Cherry laurel.

A form with curiously curled leaves.

62726. *LAUROCERASUS LUSITANICA* (L.) Roemer (*Prunus lusitanica* L.). Amygdalaceae. Portugal laurel.

An interesting variegated form of the Portugal laurel which first occurred at Aldenham.

62727. *LAUROCERASUS OFFICINALIS* Roemer (*Prunus laurocerasus* L.). Amygdalaceae. Cherry laurel.

This makes a very handsome low-spreading evergreen shrub with narrow, flat-growing foliage.

62728 and 62729. *LAVANDULA VERA* DC. Menthaceae. Lavender.

62728. *Twickel Purple*. A form having fine, bold foliage with good heads of deep-purple flowers.

62729. *Nana*; *Glasnevin* variety. A quite distinct form.

62730. *LONICERA PILEATA* Oliver. Caprifoliaceae. Privet honeysuckle.

Forma *gunnanensis*. According to Curtis's Botanical Magazine (pl. 8060) this form differs from the species only in the very small, thick, roundish leaves. *Lonicera pileata* is a much-branched, low, evergreen shrub from central and western China, about 1 foot high, with slender branches, oblong-lanceolate, dark-green leaves, half an inch to 1 inch long, and pale-yellow flowers in almost sessile pairs.

62700 to 62744—Continued.

62731 to 62733. *MALUS SYLVESTRIS* Mill.
(*Pyrus malus* L.). Malaceae. Apple.

62731. *Dartmouth Crab* (grafted). The flowers and large, deep reddish purple fruits make this a very attractive tree. The fruits are most suitable for making preserves.

62732. *Eleyi* (grafted). This is a new and very beautiful crab apple raised by Charles Eley and is a lovely flowering and fruiting form.

62733. *Gibbs' Golden Gage* (grafted). The tree bears many medium-sized waxy, almost translucent yellow fruits which give a very attractive appearance.

62734. *POPULUS RASUMOWSKIANA* Schroed.
Solanaceae. Poplar.

A supposed hybrid between *Populus nigra* and *P. suaveolens* which, according to the Gardeners' Chronicle (ser. 3, vol. 18, p. 108), is a large tree with cylindrical shoots and roundish leaves; the latter are smaller than those of *P. petrowskiana*, which this hybrid resembles very closely.

62735. *POPULUS SZECHUANICA* C. Schneid.
Salicaceae. Szechwan poplar.

This large poplar is said to be a common tree in the forests of Szechwan, China. In habit and general appearance it resembles *Populus suaveolens*, but the branches are more massive and the branchlets are stouter. It has proved hardy at the Arnold Arboretum, Jamaica Plain, Mass., and also at Rochester, N. Y. The foliage is colored red and bronze in early spring.

62736. *SKIMMIA FORTUNEI* RUBELLA
(Carr.) Rehder. Rutaceae.

This is similar to *Skimmia japonica*, but is more dwarfed in habit and, furthermore, native to China. The dark-green leaves are narrow and acuminate, the white flowers are in oblong panicles, and the fruits are dull crimson. The variety differs from the species in having reddish peduncles, pedicels, and buds.

62737. *SKIMMIA JAPONICA* VEITCHII
(Carr.) Rehder. Rutaceae.

A densely branched low shrub, native to Japan, with obovate yellowish green leaves crowded at the ends of the branchlets, yellowish white flowers, and bright-scarlet berries about a third of an inch in diameter. This is probably not hardy north of Washington, D. C.

62738. *STRANVAESIA DAVIDIANA* Decaisne.
Malaceae.

This may be trained as a small, standard tree, otherwise of bush form. The foliage is evergreen, and the terminal corymbs of white flowers are soon followed by the handsome bunches of scarlet fruits.

For previous introduction, see S. P. I. No. 56695.

62739. *VIBURNUM DAVIDI* Franch. Caprifoliaceae.

This Chinese viburnum is one of the most distinct and most remarkable of the genus. It is a low plant, entirely hardy, with large persistent, shining leaves resembling those of a rhododendron, the

62700 to 62744—Continued.

shoots of the year terminating in an umbel of white flowers, appearing in April. These flowers are succeeded by steel-blue fruits, ripening in autumn. It attains a height of from 25 to 50 centimeters and flourishes in shady peaty soil.

62740. *VIBURNUM FOETIDUM RECTANGULATUM* (Graebn.) Rehder. Caprifoliaceae.

This western Chinese variety is described by Alfred Rehder, of the Arnold Arboretum, as a spreading shrub ultimately about 12 feet high, with oblong or narrower leaves, white flowers in cymes 2 to 4 inches wide, and scarlet ovoid berries.

62741. *VIBURNUM FRAGRANS* Bunge. Caprifoliaceae.

A rare species introduced from China by Farrer. This will undoubtedly prove one of our very best early-flowering shrubs (flowering during March and April) of high merit like *Viburnum carlesii*. The flowers are deliciously fragrant and are white with a rose tint.

62742. *VIBURNUM HARRYANUM* Rehder. Caprifoliaceae.

An evergreen bearing quaint, small, round leaves and long, black fruits; very distinct. Native to China.

62743. *VIBURNUM HENRYI* Hemsl. Caprifoliaceae.

An evergreen, a most distinct species, with long, narrow leaves and white flowers in pyramidal panicles followed by beautiful fruits, first red and then turning black.

62744. *VIBURNUM PROPINQUUM* Hemsl. Caprifoliaceae.

A distinct evergreen shrub from China, bearing greenish white flowers in good-sized cymes which are followed by bluish black fruits.

62745. *HELIANTHUS TUBEROSUS* L. Asteraceae. Jerusalem artichoke.

From Toronto, Canada. Tubers purchased from George Keith & Sons. Received March 5, 1925.

Canadian-grown Jerusalem artichokes.

62746 to 62749. *HELIANTHUS TUBEROSUS* L. Asteraceae. Jerusalem artichoke.

From Paris, France. Tubers purchased from Vilmorin-Andrieux & Co. Received March 5, 1925. French-grown tubers.

62746. A spindle-shaped form.

62747. An ordinary, white form.

62748. A pink form.

62749. An improved, white form.

62750. *OLEA EUROPAEA* L. Oleaceae. Olive.

From Pistoia, Florence, Italy. Plants purchased from Giannino Giannini. Received March 7, 1925.

Grossa di Spagna. Very large olives, especially suited for preserving and drying. (1925 *Catalog of Giardino Allegra, Catania, Sicily*.)

Introduced for olive breeders.

62751 to 62753.

From Chihli, China. Scions collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received March 6, 1925. Notes by Mr. Dorsett.

January 15, 1925. From the Fa Hua Ssu temple, Silver Mountain, near Haitzu, at an altitude of 1,200 feet.

62751. *AMYGDALUS PERSICA* PLATYCARPA (Decaisne) Ricker. Amygdalaceae. Flat peach.

No. 1869. The fruit, which ripens in early August, is creamy white with a pink blush and is about 2 inches in diameter.

62752. *AMYGDALUS PERSICA* L. (*Prunus persica* Stokes). Amygdalaceae. Peach.

No. 1870. A large Chinese freestone peach, about 3 to 3½ inches in diameter, which ripens in August. The fruits are white with a pink blush.

62753. *PRUNUS* sp. Amygdalaceae. Plum.

No. 1868. The fruits ripen in July and are about 1 to 1½ inches in diameter. The skin and flesh are both yellow.

62754. *XANTHOSOMA CARACU* Koch and Bouche. Araceae. Yautia.

From San Juan, Porto Rico. Cormels presented by O. W. Barrett, agricultural adviser, Department of Agriculture and Labor. Received March 6, 1925.

Rollia. This is the best variety native to Porto Rico. It may be grown on a variety of soils. The yield is 2 to 4 pounds per hill. The tubers are of large size, white, mealy, and smooth. The rhizome is also eaten. It occurs in Belize, Trinidad, and Cuba. A very similar form produces larger (?) tubers in Venezuela. (*Barrett*.)

62755 to 62761.

From Orleans, France. Plants presented by Leon Chenault, through David Fairchild, agricultural explorer, Bureau of Plant Industry. Received March 9, 1925.

62755. *BERBERIS RUGIDICANS* Hort. Berberidaceae. Barberry.

A striking, new species having a peculiarly handsome red foliage. (*Fairchild*.)

62756. *× BERBERIS STENOPHYLLA* Lindl. Berberidaceae. Barberry.

Var. *Irwinii*. A plant of compact habit; excellent for the rock garden. (*Chenault*.)

A hybrid between *Berberis darwini* and *B. stenophylla*. (*Fairchild*.)

62757. *COTONEASTER SALICIFOLIA* FLOCCOSA Rehd. and Wils. Malaceae.

A graceful shrub, up to 13 feet high, which bears dense corymbs of white flowers and light-red, roundish fruits. Native to western China at altitudes of 7,500 to 9,800 feet.

For previous introduction, see S. P. I. No. 60649.

62758 to 62760. *PAEONIA* spp. Ranunculaceae.

62755 to 62761—Continued.

62758. *PAEONIA LUTEA* Delavay. Golden peony.

A shrubby Chinese peony, with a short, woody stem 1 or 2 feet high and deep-green, leathery, 3-parted leaves, white beneath, and about a foot in length. The golden yellow, single or slightly double flowers are 2½ inches across.

For previous introduction, see S. P. I. No. 59425.

62759 and 62760. *PAEONIA LUTEA* × ? Peony.

62759. *Madame Louis Henry*. A hybrid of *Paeonia lutea* bearing large, semidouble flowers which are a brilliant deep carmine, shaded with coppery yellow, sometimes bronzed buff yellow; the numerous stamens are a unique orange yellow. (*Chenault*.)

62760. *Souvenir du Professeur Maxime Cornu*, a hybrid of *Paeonia lutea*. The very large, fragrant full flowers of perfect form are bright yellow, the edges of the petals being carmine pink. (*Chenault*.)

62761. *PRUNUS CERASIFERA* Ehrh. Amygdalaceae.

Var. *Blirieana flore-pleno*. A variety bearing large, double, pink flowers, of a beautiful shape. (*Chenault*.)

62762. *PYRUS* sp. Malaceae. Pear.

From Chihli, China. Scions collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received March 31, 1925.

No. 2116. Chiuchou. February 13, 1925. *Ya Li* (duck pear). This pear is light yellow, about 3 inches in diameter, and ripens about the middle of September. (*Dorsett*.)

For previous introduction, see S. P. I. No. 62262.

62763. *VIBURNUM DAVIDI* Franch. Caprifoliaceae.

From Orleans, France. Seedlings presented by Leon Chenault, through David Fairchild, agricultural explorer, Bureau of Plant Industry. Received March 9, 1925.

This hardy Chinese viburnum, one of the most distinct of the genus, grows 10 to 30 inches high and flourishes in the shade on peaty soil. It has large, persistent, shining green leaves resembling those of a rhododendron. The current year's shoots terminate in umbels of white flowers, which appear in April. These flowers are succeeded by steel-blue fruits which ripen during the autumn.

62764. *CASTANEA* sp. Fagaceae. Chestnut.

From Chihli, China. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received March 10, 1925.

No. 1871. Fa Hua Ssu temple, Silver Mountain, near Haitzu. January 15, 1925. These chestnuts are said to ripen later than those sent in under Nos. 790 and 791 [S. P. I. Nos. 61834 and 61835.] (*Dorsett*.)

62765 to 62769.

From Kew, England. Plants presented by Dr. A. W. Hill, director, Royal Botanic Gardens. Received March 9, 1925.

62765. *AESCULUS CHINENSIS* Bunze. *Aesculaceae*.

A hardy Chinese horse-chestnut, sometimes 60 feet high, with finely toothed, short-stalked leaflets and elongated cylindric spikes of small, white flowers. It has proved hardy at the Arnold Arboretum, Jamaica Plain, Mass.

62766. *GLEDITSIA TRIACANTHOS* L. *Caesalpiniaceae*. Honey locust.

Var. *fastigiata*. A fastigate variety of the honey locust.

62767. *PRUNUS ZABELIANA* Hort. *Amygdalaceae*.62768. *ROBINIA PSEUDACACIA* L. *Fabaceae*. Common locust.

Var. *fastigiata*. A fastigate variety of the black locust.

62769. *TILIA INTONSA* Wilson. *Tiliaceae*. Linden.

An Asiatic linden, closely related to *Tilia chinensis* and described (Plantae Wilsonianae, vol. 2, p. 365) as a large tree, up to 75 feet in height, which grows commonly in the forests of western Szechwan, China. The bark is brownish gray, and the broadly oval, membranous leaves, about 5 inches long, are light yellowish green above, with ashy green lower surfaces.

62770 and 62771. *TRIFOLIUM PRATENSE* L. *Fabaceae*. Red clover.

From Danzig, Danzig Free State. Seeds purchased from John Hussey, Schwedisch-Danziger Saathandels Gesellschaft, "Sativa." Received March 2, 1925.

Locally grown Polish strains.

62770. A. 62771. B.

62772 to 62774. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). *Fabaceae*. Soy bean.

From Kaying, via Swatow, China. Seeds presented by Miss Louise Campbell. Received March 6, 1925.

62772. Big yellow bean.

62773. Small black bean.

62774. Small yellow bean.

62775 and 62776. *HELIANTHUS TUBEROSUS* L. *Asteraceae*.

Jerusalem artichoke.

From Reading, England. Tubers purchased from Sutton & Sons. Received March 12, 1925.

English-grown tubers.

62775. Purple. 62776. White.

62777 to 62780. *FICUS CARICA* L. *Moraceae*. Fig.

From Granada, Spain. Cuttings presented by Señor Juan Leyva, through Austin C. Brady, American consul, Malaga. Received March 13, 1925. Notes by Ira J. Condit, of the University of California.

62777. *Brebal*. A black fig very similar to our Mission.

62777 to 62780—Continued.

62778. *Castellana*. A black fig similar to *Brebal* but having a sweeter, inner pulp which is of better quality.

62779. *Isabelle*. This is a common fig at Granada. It is used there for fresh-fruit purposes and in the Turon district for drying. The trees are very productive, producing thin-skinned figs which are borne on stems of medium length.

62780. *Partridge Eye*. A common variety around Turon. The trees are vigorous, producing dark figs which turn to straw yellow; good for drying.

62781. *SORBUS HYBRIDA* L. (*Pyrus pinnatifida* Ehrh.). *Malaceae*.

From Edinburgh, Scotland. Seeds presented by William Wright Smith, regius keeper, Royal Botanic Garden. Received March 6, 1925.

It is generally believed that this tree, which is found wild in central and northern Europe, is a natural hybrid between *Sorbus aucuparia* and *S. intermedia*. It becomes 40 feet or more in height, with ascending branches and handsome, narrowly oval leaves. The white flowers, half an inch wide, are produced in May in corymbs 3 to 5 inches across, and the roundish, bright-red fruits are nearly half an inch in length.

62782 to 62788. *MUSA TEXTILIS* Nee. *Musaceae*. Abacá.

From Manila, Philippine Islands. Seeds presented by P. J. Wester, Bureau of Agriculture. Received March 13, 1925.

A collection of Philippine abacá varieties.

62782. *Bisaya*.62783. *Inusa*.62784. *Itom* C. A. 19392.62785. *Libuton* C. A. 199.62786. *Lono*.62787. *Lono sucker*.62788. *Sinanta Cruz*.

62789 and 62790.

From Oaxaca de Juarez, Oaxaca, Mexico. Seeds presented by Prof. C. Conzatti. Received February 21, 1925.

From the canyon of Tomellin, about 90 miles north of this city. (Conzatti.)

62789. *GOSSYPIUM* sp. *Malvaceae*. Cotton.62790. *SELERIA GOSSYPIOIDES* Ulbrich. *Malvaceae*.

A shrub, native to Oaxaca, with heart-shaped, 3-lobed leaves and purplish flowers.

62791. *SACCHARUM OFFICINARUM* L. *Poaceae*. Sugar cane.

From Mayaguez, P. R. Cuttings presented by the agricultural experiment station, through E. W. Brandes, Bureau of Plant Industry. Received March 14, 1925.

Java Unknown. This variety was located in a field of sugar cane near Mayaguez, P. R., in 1919. It was apparently distributed by the Federal experiment station there, but the label was lost, and it has since been known in literature by the above

name. It is a slender variety, very similar to Uba, and is immune to mosaic of sugar cane. It is rather slow in maturing, very high in fiber, and, on account of the clinging leaf sheaths, is difficult to harvest. Yields in the presence of mosaic disease are, however, very high. (*Brandes.*)

62792 and 62793. HELIANTHUS spp. Asteraceae.

From Milan, Italy. Tubers purchased from Fratelli Ingegnoli. Received March 14, 1925. Notes by Fratelli Ingegnoli.

Italian strains of native American sunflowers used as food in Italy.

62792. HELIANTHUS DECAPETALUS L. Thin-leaf sunflower.

Produces tender, sweet-flavored roots which are eaten fried, boiled, etc.

62793. HELIANTHUS SCABERRIMUS Ell. Prairie sunflower.

The small tubers, when fried, resemble the artichoke in flavor.

62794 to 62796.

From China. Collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received March 2, 1925. Notes by Mr. Dorsett.

62794. BRASSICA sp. Brassicaceae.

No. 1898. January 19, 1925. Seeds of a small, oil vegetable, purchased from Nau Yu Shing, of Naubsimeu. The plant after being chopped up is fried with meat.

62795. RAPHANUS SATIVUS L. Brassicaceae. Radish.

No. 1897. January 19, 1925. Seeds of a large radish, purchased from Nau Yu Shing, Naubsimeu. This radish, green outside and light green within, is used as a rule only for pickling.

62796. ZEPHYRANTHES CARINATA Herbert. Amaryllidaceae.

No. 1914. January 27, 1925. Bulbs secured from Mr. Li, of the village of Kechiatsu, near Feingtai, Chihli. The Chinese call these *tsang pu lien* (grass lily).

62797. ALLIUM CEPA L. Liliaceae. Onion.

From Peking, Chihli, China. Bulbs collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received March 6, 1925.

No. 1873. January 15, 1925. Secured in the Peking market, where they are known as "Small foreign onion." (*Dorsett.*)

62798. VIOLA ODORATA L. Violaceae. Violet.

From Killalow, County Clare, Ireland. Plants purchased from Mrs. Stanistreet. Received February 7, 1925.

Rosea Delicatissima. A new French violet which is delicate rose and white and very hardy. It flowers abundantly in the spring and is very pretty and uncommon. (*Stanistreet.*)

62799 and 62800.

From Cape Town, Union of South Africa. Seeds presented by W. S. Duke & Co. Received March 11, 1925.

62799 and 62800—Continued.

62799. ANTHOLYZA REVOLUTA Burm. f. Iridaceae.

A gladder-stemmed plant, closely allied to *gladiolus*. The bright-red flowers are produced in a few-flowered, very lax spike. Native to southwestern South Africa.

62800. ORNITHOGALUM THYRSOIDES Jacq. Liliaceae.

Flowers with a dark-brown central blotch. (*Duke.*)

In South Africa, where this bulbous ornamental is native, it is known as one of the "chinkeriches." The globose bulb is about 2 inches thick, and the five or six very narrow leaves are 6 to 12 inches in length. The flowers, sometimes an inch long under cultivation, are borne in rather dense racemes on a scape about a foot high. In a dried condition these make excellent "everlasting" flowers.

62801. PYRUS sp. Malaceae. Pear.

From Simla Hills, Punjab, India. Seeds presented by S. E. Stokes. Received March 11, 1925.

This Himalayan wild pear is called "shegal," or "kanth," by the natives. The fruit is bronze colored, perfectly round, and the size of a large cherry. The tree grows extensively in the mountains at altitudes of 4,000 to 8,000 feet. (*Stokes.*)

For previous introduction, see S. P. I. No. 58512.

62802. CYMBOPOGON MARTINI (Roxb.) Stapf. (*Andropogon murtini* Roxb.). Poaceae. Rusa-oil grass.

From Dehra Dun, United Provinces, India. Seeds presented by R. N. Parker, forest botanist. Received March 16, 1925.

A stout, perennial grass, native to northern India, which grows to a height of about 6 feet and has long, very smooth leaves of a rich green color and delicate texture. The perfume known commercially as Rusa oil is obtained from this plant, and this introduction has been made for specialists experimenting with perfume-yielding plants.

62803. JASMINUM sp. Oleaceae. Jasmine.

From Grasse, France. Plants presented by Bruno Court, through Warren E. Burns, New York City, N. Y. Received March 17, 1925.

To be tested as a source of perfume.

62804. HELIANTHUS TUBEROSUS L. Asteraceae. Jerusalem artichoke.

From Göteborg, Sweden. Tubers purchased from Göteborgs Trädgårdsförening. Received March 17, 1925.

Swedish grown Jerusalem artichokes.

62805. LILIUM TIGRINUM Ker. Liliaceae. Tiger lily.

From Tottori, Japan. Bulbs presented by Prof. Akio Kikuchi, Tottori Agricultural College. Received March 18, 1925.

Japanese-grown bulbs.

62806 and 62807. FICUS spp. Moraceae.

From Amaui, Tanganyika Territory, Africa. Seeds presented by A. H. Kirby, Director of Agriculture. Received March 6, 1925.

62806. FICUS BUSSEI Warb.

A large, handsome tropical tree, described (Engler, Botanische Jahrbücher, vol. 46, p. 213) as 50 feet in height with a broad, flat crown exceeding in diameter the height of the tree. The leathery leaves are oblong or oblong-oval. Native to the coast of Zanzibar.

62807. FICUS VOLKENSHI Warb.

According to Hutchinson (Flora of Tropical Africa, vol. 6, sect. 2) this is a shrub or small tree, with narrow, papery, dull-green leaves and axillary receptacles about half an inch long. It is reported to yield the best "bark cloth" known in Uganda, where this shrub is native.

62808 to 62814.

From Darjiling, India. Seeds presented by G. H. Cave, curator, Lloyd Botanic Garden. Received March 7, 1925.

62808. ACER OBLONGUM Wall. Aceraceae. Maple.

A subtropical maple described by Hiern (Hooker, Flora of British India, vol. 1) as a tree 40 to 50 feet tall, with a trunk 1 or 2 feet in diameter, and dark-green, oblong, entire leaves up to 7 inches long. The reddish wood is used for making agricultural implements.

62809. ACER THOMSONI Miquel. Aceraceae. Maple.

A large, handsome tree, with thin gray bark and very large shallow-lobed leaves up to 10 inches long. Native to Sikkim and Bhutan, India, at about 8,000 feet altitude.

62810. ILEX SIKKIMENSIS Kurz. Aquifoliaceae. Holly.

A Himalayan holly described by Kurz (Journal of the Asiatic Society of Bengal, vol. 44, pt. 2) as a moderately tall tree with stout branches; broadly oblong, leathery leaves 5 or 6 inches long and globular yellow berries.

62811. LAUROCERASUS ACUMINATA (Wall.) Roemer (Prunus acuminata Hook. f.). Amygdalaceae.

A slender-branched tree 30 to 40 feet in height, with narrow leaves up to 7 inches long and many-flowered racemes of yellowish white flowers. The fruit is a small, ovoid drupe. The tree is found in the central and eastern Himalayas at altitudes of 5,000 to 7,000 feet.

For previous introduction, see S. P. I. No. 55685.

62812. LITSEA ZEYLANICA Nees. Lauraceae.

An evergreen tree of moderate height, with leathery leaves about 6 inches long, dense clusters of yellowish white flowers, and subglobose berries a third of an inch in diameter. Native to southern India.

62813. MICHELIA CATHARTII Hook. f. and Thoms. Magnoliaceae.

A lofty tree with magnolia-like foliage and terminal white flowers about an inch in diameter. It is native in the temperate forests of the Sikkim Himalayas,

62808 to 62814—Continued.

where the moderately hard, dark-brown heartwood is used for planking and for making tea boxes.

For previous introduction, see S. P. I. No. 58908.

62814. MICHELIA LANUGINOSA Wall. Magnoliaceae.

This species is characterized by the white, woolly lower surfaces of its long, narrow, magnolia-like leaves. The white, solitary flowers are 3 to 4 inches across. Although this species is a spring-flowering tree in northern India, where it is native, in Sikkim it is said to form an autumn-flowering bush.

For previous introduction, see S. P. I. No. 58910.

62815 to 62846. SOJA MAX (L.) Piper (Glycine hispida Maxim.). Fabaceae. Soy bean.

From Nanking, China. Seeds presented by George E. Ritchey, University of Nanking, through John H. Reisner, University of Nanking. Received March 11, 1925. Notes by Mr. Ritchey.

62815. No. 400. Originally from Shantung. Plant about 80 centimeters high; leaves large, round, and yellowish green; flowers white or pink; growing season about 165 days.

62816. No. 401. Originally from Shantung. A bushy plant about 55 centimeters high; the leaves are large, deep green, and egg-shaped; the flowers are white; growing season about 150 days.

62817. No. 406. Originally from Kashing. This plant grows to a height of 110 centimeters. The leaves are large, deep green, and egg-shaped, and the flowers are purple. The growing season is about 170 days.

62818. No. 408. This bushy plant, about 60 centimeters in height, bears medium-sized, rather round green leaves and white flowers. The growing season is about 150 days.

62819. No. 435. A bushy plant, about 47 centimeters in height, with small, deep-green, egg-shaped leaves, and white flowers. The growing season is about 150 days.

62820. No. 443. Originally from Hupeh. This plant is bushy and about 50 centimeters in height; the leaves are small, round, and deep green; the flowers are white and purple. Growing season about 150 days.

62821. No. 445. Originally from Shantung. Bushy plant about 40 centimeters high, with medium-sized, egg-shaped, yellowish green leaves, and white or purple flowers. Growing season about 130 days.

62822. No. 446. Originally from Kashing. Bushy plant about 90 centimeters high; leaves large, egg-shaped, and deep green; flowers purple; growing season about 150 days.

62823. No. 485. Originally from Kaifeng, Honan. This plant is about 90 centimeters high and has few branches; the leaves are medium sized, round, and green; the flowers are white; growing season about 130 days.

62815 to 62846—Continued.

62824. No. 488. Originally from Kash-
ing. Plant about 90 centimeters high;
leaves medium sized, elongated, and
deep green; the flowers are purple;
growing season about 150 days.
62825. No. 493. Originally from Shan-
tung. This plant is about 97 centi-
meters in height; the leaves are me-
dium sized, roundish, and green; the
flowers are white or purple; growing
season about 130 days.
62826. No. 497. Originally from Kash-
ing. Plant about 87 centimeters high;
leaves large, egg-shaped, and green;
flowers purple; growing season about
130 days.
62827. No. 4024. Plant about 127 centi-
meters high; leaves large and elon-
gated, and yellowish green; flowers
white; growing season about 130 days.
Resistant to pod worms.
62828. No. 4102. Originally from Peking.
Plant about 47 centimeters high;
leaves small and elongated, and deep
green; flowers purple; growing season
about 90 days.
62829. No. 4103. Originally from Peking.
Plant bushy and about 50 centimeters
high; leaves roundish acuminate, deep
green; flowers purple or white; grow-
ing season about 90 days.
62830. No. 4104. Originally from Peking.
This bushy plant is about 48 centi-
meters high; the leaves are medium
sized, egg-shaped, and yellowish green;
the flowers are purple or white; grow-
ing season about 90 days.
62831. No. 4105. Yien Shan, Chihli.
62832. No. 4106. Yien Shan, Chihli.
62833. No. 4107. Patung, Hupeh.
62834. No. 4108. From the market, Nan-
king.
62835. No. 4109. Nanking. From the mar-
ket.
62836. No. 4110. From the market in Nan-
king.
62837. No. 4111. From Shantung.
62838. No. 4112. This plant is about 103
centimeters in height; the leaves are
large, roundish, and a yellow-green;
the flowers are white or purple; grow-
ing season about 130 days.
62839. No. 4113. This plant bears medium-
sized, elongated green leaves and white
flowers; growing season 130 days.
62840. No. 4114. This plant is about 84
centimeters high; the leaves are of
medium size, elongated and green; the
flowers are pink or white; growing sea-
son about 130 days.
- 62841 to 62846. These samples which have
been selected from the general fields
of the university have not been as-
signed identification numbers.
62841. A. 62844. D.
62842. B. 62845. E.
62843. C. 62846. F.
62847. *ZEA MAYS* L. Poaceae. Corn.
From Argentina. Seeds collected by H. L.
Westover, Bureau of Plant Industry. Re-
ceived March 13, 1925.

Collected near Choele Choele, Rio Negro.
(Westover.)

62848 to 62854.

From Paris, France. Purchased from Vil-
morin-Andrieux & Co., through David
Fairchild, agricultural explorer, Bureau
of Plant Industry. Received March 19,
1925. Notes by Doctor Fairchild.

62848. *AMPELOPSIS MEGALOPHYLLA* Diels
and Gilg. Vitaceae.

Plants of a Chinese vine with im-
mense leaves, which should make it par-
ticularly valuable for decorative purposes
in the covering of outbuildings.

62849. \times *JUGLANS INTERMEDIA* VILMORE-
ANA Carr. Juglandaceae.

Cuttings of a tree 80 feet high, a hy-
brid between the European and American
black walnut, with branches more up-
right than those of the European walnut,
grayish bark, and bronze-colored young
shoots. The slightly coriaceous, smooth,
dark-green, oval leaflets remain on the
branches until killed by frost. The fruit
is not produced every year and never in
large quantities; it is smooth, and the
nut is more deeply furrowed than that
of the European species.

For previous introduction, see S. P. I.
No. 52681.

62850 and 62851. (*PRUNUS CERASIFERA* \times
AMYGDALUS COMMUNIS) \times *AMYGDALUS*
PERSICA. Amygdalaceae.

A hybrid between *Prunus cerasifera* and
Amygdalus communis back crossed with
Amygdalus persica.

62850. Scions. 62851. Grafted plant.

62852. *PRUNUS CERASUS* L. Amygdala-
ceae. Sour cherry.

Var. *semperflorens*. Plants of the
Cerasier de la Toussaint, which is said to
be a pretty little shrub or tree, flowering
in the spring and again in the fall, and
bearing small, acid fruits.

62853. *VIBURNUM DAVIDI* Franch. Capri-
foliaceae.

Plants of one of the handsomest small
shrubs I have even seen. The leaves
have a grace of form, a texture, and
color which is remarkable, and the
bright-blue berries add a touch of style
to the plant. This shrub, an introduc-
tion from Szechwan, China, made in
1910, grows well in the shade and re-
quires plenty of moisture.

62854. *VIBURNUM THEIFERUM* Rehder.
Caprifoliaceae. Tea viburnum.

Plants of one of the more recent intro-
ductions from China, made by E. H.
Wilson, which is especially beautiful be-
cause of its brilliant-red fruits.

62855 and 62856.

From Algiers, Algeria. Collected by David
Fairchild, agricultural explorer, Bureau
of Plant Industry. Received March 21,
1925. Notes by Doctor Fairchild.

62855. *CITRUS LIMETTA* Risso. Ruta-
ceae. Sweet lime.

Cuttings of the "limoncello" lime of
Palermo, Italy, brought here by Doctor
Trabut. A large, juicy, seedless lime of
good quality and a good producer. It
may be harder than the lime now grown
in southern Florida.

62855 and 62856—Continued.

62856. *RUMEX TUBEROSUS* L. Polygonaceae.

Plants of a frost-resistant variety from Constantine, Algeria, presented by Professor Maire, of the University of Algiers. The broad, round leaves, used for making sorrel or "oseille" soup, should be studied by amateurs who are interested in the amelioration of potherbs. This variety has been bred with S. P. I. No. 63425 and produces vigorous seedlings intermediate in character between the two forms.

62857 to 62860. *GLADIOLUS* spp. Iridaceae.

From Cape Town, Union of South Africa. Corms presented by Dr. Rudolph Marloth. Received March 16, 1925.

Native South African gladioli introduced for gladiolus breeders.

62857. *GLADIOLUS HIRSUTUS* Jacq.

Grows in sandy stretches which are moist only during the winter.

About a foot in height, this species has bright-red flowers borne in a very lax, few-flowered, secund spike. The sword-shaped leaves are strongly ribbed.

62858. *GLADIOLUS PRIMULINUS* Baker.
Primrose gladiolus.

Var. *maculatus*. This species, flowering in May, grows on the hillsides.

A more tropical species than the preceding; the stem is a foot and a half high, and the basal leaves, three in number, are somewhat leathery, about a foot long. The reflexed segments of the primrose-yellow flowers are each marked with a maroon spot.

62859. *GLADIOLUS RECURVUS* L.

Grows in boggy sandy places; flowers during August.

A slender-stemmed species, up to 2 feet high, with two to six very fragrant flowers in a very lax spike. The flowers are flushed pink with minute blackish lilac spots.

62860. *GLADIOLUS TRISTIS* L.

Found in damp, sandy places; flowers in October.

The flowers of this species are yellowish white and fragrant, and are borne in a very lax spike. The slender stems are up to 2 feet high, and the subterete leaves are strongly three to five ribbed.

62861 to 62864. *LESPEDEZA* spp. Fabaceae.

From Fukuoka, Japan. Seeds presented by Mitsunaga Fujioka, Kyushu Imperial University. Received March 16, 1925.

62861. *LESPEDEZA BICOLOR* Turcz.

Var. *Japonica*. *Natus-hagi*.

62862. *LESPEDEZA BICOLOR INTERMEDIA* Maxim.

Yama-hagi.

62863. *LESPEDEZA CYRTOBOTRYA* Miquel.

Miyagino-hagi. A shrub about 6 feet high, resembling *L. bicolor* in habit, with oval-oblong leaflets and dense clusters of purple flowers. Native to Japan.

62864. *LESPEDEZA OLDHAMI* Miquel.

Chôsen-kihagi.

62865. *GELJERA PARVIFLORA* Lindl. Rutaceae.

From Sydney, New South Wales, Australia. Seeds presented by George Valder, under-secretary and director, Department of Agriculture. Received March 18, 1925.

The *wilga* is a tall shrub or tree, native to the interior of New South Wales, where it reaches a height of about 30 feet. It has slender pendulous branches, narrow leaves 3 to 6 inches long, and when well developed has a highly ornamental appearance with something of the aspect of a weeping willow. It has remarkable drought-enduring qualities, and the leaves are often fed to sheep, which are very fond of them.

62866. *DIOSCOREA* sp. Dioscoreaceae. Yam.

From St. Croix, Virgin Islands. Tubers presented by W. M. Perry, horticulturist, Agricultural Experiment Station. Received March 18, 1925.

Sealtop yam. A distinct advantage of this variety is that it does not burrow its way deeply into the ground, hence it is easy to dig. It may be necessary to throw some soil over the roots if they push themselves upwards out of the ground. We have harvested yams weighing 11 pounds each, but the average weight is about 5 pounds. It is considered a superior yam. I do not know the origin of the word "Sealtop," as it appears to be purely a local name. (Perry.)

62867 to 62870.

From Ariana, near Tunis, Tunisia, Africa. Seeds presented by the chief of the Botanical Service. Received March 9, 1925.

62867. *ACACIA PENDULA* A. Cunn. Mimosaceae.

A handsome evergreen tree, native to Australia, where the leaves and young branches are eagerly eaten by cattle and sheep. In times of drought the *myall*, as the tree is called in Australia, is frequently cut down and fed to stock, which seem to thrive on this fodder. Horses do not care for it.

62868. *PROSOPIS DULCIS* Kunth. Mimosaceae.

A thorny shrub or tree, 60 feet or less in height, native to tropical and subtropical Mexico, which bears sweetish pods, rich in protein and sometimes fed to cattle. The wood is strong and durable, and, when polished, resembles mahogany. The bark, leaves, and pods contain tannin.

62869. *PROSOPIS HORRIDA* Kunth. Mimosaceae.

A thorny shrub, native to tropical America, introduced for testing the fodder value of its sweetish pods. It is said to be very drought resistant.

62870. *TRIGONELLA ENSIFERA* Trautv. Fabaceae.

An annual leguminous plant, very closely allied to the fenugreek (*T. foenum-graecum*), from which it differs chiefly in having hairy pods. Its native country is unknown.

62871 and 62872. *COLOCASIA ESCULENTA* (L.) Schott. Araceae. Dasheen.

From Yokohama, Japan. Tubers purchased from the Yokohama Nursery Co. Received March 23, 1925. Notes by R. A. Young, Bureau of Plant Industry.

62871 and 62872—Continued.

62871. *Kinukatsugi*. A Japanese taro, of the dasheen type, producing a considerable number of small cormels, or tubers. It is considered by the Japanese to be one of their finest varieties. The cormels are similar in appearance to those of other Japanese taros tested in this country; but though small, they are of better quality.

For previous introduction, see S. P. I. No. 45481.

62872. *Yatsugashira*. One of the small-growing, short-season taros. Leaf stems blackish maroon except near the blade. In Japan, this is rated as one of the best varieties. The corm is small, multiple headed, and very irregular in shape, but the quality is good. The tubers are small, but snowy white and of very good quality; they are somewhat moist when cooked soon after harvesting, but become drier and mealier in storage. A desirable variety and an excellent keeper.

For previous introduction, see S. P. I. No. 40805.

62873 to 62896.

From Chihli, China. Scions and tubers collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received March 19, 1926. Notes by Mr. Dorsett.

Numbers 62873 to 62892 are from Tung-hoshankou, near Huailai. The fruit area in this region is at the edge of the northern foothills, at an altitude of about 1,800 feet.

62873. *AMYGDALUS PERSICA* L. (*Prunus persica* Stokes). Amygdalaceae. Peach.

No. 1983. February 3, 1925. *Ch'iu Tao* (autumn peach). The creamy white fruits, 2 to 3 inches in diameter, ripen in September.

62874 to 62882. *MALUS* spp. Malaceae. Apple.

62874. *MALUS* sp.

No. 1965. February 2, 1925. A variety called "sand crab apple" because of the resemblance of the flesh to grains of sand. The fruits are yellowish green, red, and $1\frac{1}{2}$ inches in diameter. They ripen at the end of August.

62875. *MALUS* sp.

No. 1968. February 2, 1925. *Hsiang Kuo* (fragrant apple). A Chinese apple, 3 or more inches in diameter, which is green with a pink or red blush. Ripens in August.

62876. *MALUS* sp.

No. 1981. February 3, 1925. *Hung Sha Kuo* (red crab apple). A variety 1 to $1\frac{1}{2}$ inches in diameter which ripens in August.

62877. *MALUS* sp.

No. 1992. February 3, 1925. *Pai Ping Kuo* (white apple). The fruits of this large Chinese apple ripen in September and are said to be 3 to 4 inches in diameter.

62878. *MALUS* sp.

No. 1994. February 3, 1925. *Pin Tze* (sour crab apple). A variety about 2 inches in diameter, which ripens during the middle of September.

62873 to 62896—Continued.

62879. *MALUS* sp.

No. 1995. February 3, 1925. *Pai Sha Kuo* (white crab apple). This apple ripens in August and is said to produce fruits 2 to 3 inches in diameter.

62880. *MALUS* sp.

No. 2011. February 4, 1925. A variety called *Pai Ping Kuo* (white apple). The fruits, reported to be 3 to 4 inches in diameter, ripen in September, becoming light green to nearly white.

62881. *MALUS* sp.

No. 2015. February 4, 1925. *Ch'iu Kuo* (autumn fruit). A crab apple producing red fruits 1 to $1\frac{1}{2}$ inches in diameter, which ripens in September.

62882. *MALUS* sp.

No. 2018. February 4, 1925. *Hsiao Hung Hai Tang Kuo* (small red crab apple). Fruits three-fourths to 1 inch in diameter, which ripen in September.

62883 to 62885. *PRUNUS ARMENIACA* L. Amygdalaceae. Apricot.

62883. No. 1989. February 3, 1925. *Ta Hung Hsing* (large red apricot). Yellow-fleshed fruits $1\frac{1}{2}$ to 2 inches in diameter which ripen the latter part of June and the first part of July.

62884. No. 1990. February 3, 1925. A variety known as *Mai Huang Hsing* (straw-yellow apricot). The fruits, yellow outside and white within, ripen in June and are about $1\frac{1}{2}$ to 2 inches in diameter.

62885. No. 3016. February 4, 1925. *Ta Pien Hsing* (large flat apricot). The yellow fruits are about 1 to $1\frac{1}{2}$ inches in diameter and ripen in July. The buds appear to be abnormally large; this may be characteristic.

62886 to 62889. *PRUNUS* spp. Amygdalaceae. Plum.

62886. *PRUNUS* sp.

No. 1967. February 2, 1925. *Hung Li Tze* (red plum). A variety 1 to $1\frac{1}{2}$ inches in diameter, which ripens in July.

62887. *PRUNUS* sp.

No. 1984. February 3, 1925. *Hung Li Tze* (red plum). Deep red when ripe and $1\frac{1}{2}$ to 2 inches in diameter. Ripens in July.

62888. *PRUNUS* sp.

No. 2009. February 4, 1925. *Ping Ting Hsiang Li Tze* (flat-topped fragrant plum). The red fruits are $1\frac{1}{2}$ to 2 inches in diameter and ripen in July.

62889. *PRUNUS* sp.

No. 2010. February 4, 1925. *Shui Ling Tang Li Tze* (water bell plum). The fruits are 1 to $1\frac{1}{2}$ inches in diameter and green and red when ripe, which is in July.

62890 to 62894. *PYRUS* spp. Malaceae. Pear.

62273 to 62896—Continued.

62890. *PYRUS* sp.

No. 1963. February 2, 1925. *Ch'iu Li* (autumn pear), a very good keeper. The pale-yellow fruits, 3 or more inches in diameter, ripen in September.

62891. *PYRUS* sp.

No. 1966. February 2, 1925. *Hsiang Shui Li* (fragrant water pear). The fruits become yellow when ripe, which is during August, and are 3 or more inches in diameter.

62892. *PYRUS* sp.

No. 1977. February 3, 1925. *Pau Chiu Su Li* (half-catty brittle pear). A yellow-fruited variety, $2\frac{1}{2}$ to 3 inches in diameter, which ripens during the middle of September. The fruits sometimes have a pink blush.

62893. *PYRUS* sp.

No. 1979. Tsanfengying, near Huailai. February 3, 1925. A variety called *Ch'iu Li* (autumn pear). The fruits are yellow with dark-colored spots and are 2 to 3 inches in diameter. Ripens in September.

62894. *PYRUS* sp.

No. 2017. Tung Hua Ssu temple, near Huailai. February 4, 1925. *Huai Lai Ya Kuang Li* (broad duck pear of Huailai). Yellow fruits which ripen in September.

62895 and 62896. *SOLANUM TUBEROSUM* L. Solanaceae. Potato.

62895. No. 1958. Huailai. February 3, 1925. *Pai P'i Tu Tou*. Tubers of a rather small potato grown in this vicinity. Planting is done early in April and harvesting in September.

62896. No. 1959. Huailai. February 3, 1925. *Tze P'i Tu Tou*. Tubers of a potato which is planted in April and harvested in September.

62897 to 62920.

From Eala, Belgian Congo, Africa. Seeds presented by V. Goossens, director, Botanic Garden. Received March 10, 1925.

62897. *ALBIZZIA ADIANTHIFOLIA* (Schum.) W. F. Wight (*A. fastigiata* E. Mey.). Mimosaceae.

A tropical African tree, of fastigate habit, with finely divided foliage. According to Holland (Useful Plants of Nigeria, pt. 2) this tree yields a gum somewhat similar to gum arabic. The seeds, after maceration, are eaten as a sauce by the natives of West Africa.

For previous introduction, see S. P. I. No. 61479.

62898. *ARTANEMA SESAMOIDES* Benth. Scrophulariaceae.

A tall, sparingly branched herbaceous plant, 2 to 3 feet high, with large, bluish lilac flowers. Native to the East Indies and distributed through tropical Africa.

62899. *BAREXYLUM AFRICANUM* (Sond.) Pierre (*Peltophorum africanum* Sond.). Caesalpiniaceae.

A handsome, yellow-flowered tree, with a habit like a Mimosa, native to tropical and subtropical Africa. It becomes 20 to 30 feet in height, and should be tested in southern Florida and also in southern California as an ornamental shade tree.

62897 to 62920—Continued.

62900. *BOSQUIEA ANGOLENSIS* Ficalho. Moraceae.

This is described (Flora of Tropical Africa, vol. 6, sec. 2) as a handsome tree 50 feet or less in height, with a loosely pyramidal head, and a trunk often free of branches to nearly half its height. The rigidly leathery leaves are elliptic and 2 to 6 inches long. Native to western tropical Africa.

62901. *CARICA PAPAYA* L. Papayaceae. Papaya.

Var. *elegantissima*.

62902. *CEPHALONEMA POLYANDRUM* Schum. Tiliaceae.

A tropical relative of our basswood, which is a shrub with broadly oval leaves and yellow flowers about an inch across. Native to the Belgian Congo and Cameroon.

62903. *CHAETOPHLOA SULCATA* (Aubl.) Hitchc. (*Setaria sulcata* Raddi). Poaceae.

A perennial, tropical grass with rather dense panicles.

62904. *CLITORIA LAURIFOLIA* Poir. (*C. janifolia* Benth.). Fabaceae.

A pink-flowered, erect, herbaceous plant, with hairy stems and leaves, indigenous to the West Indies and northern South America.

62905 to 62907. *CORCULUM LEPTOPUS* (Hook. and Arn.) Stuntz (*Antigonon leptopus* Hook. and Arn.). Polygonaceae.

The Rosa de montana is a handsome, summer-blooming climber, distributed from Mexico to Chile, where it grows in the cooler highland regions. The flowers with colored sepals are in many-flowered racemes.

62905. Variety *alba*. A white-flowered form.62906. Variety *rosea*. A pink-flowered form.62907. Variety *rubra*. A red-flowered form.62908. *CRACCA VILLOSA HIRTA* (Buch.-Ham.) Kuntze. Fabaceae.

A woody perennial, with reddish flowers, native to the East Indies.

62909. *CRACCA VILLOSA PURPUREA* (L.) Kuntze (*Tephrosia purpurea* Pers.). Fabaceae.

An herbaceous perennial, native to tropical Africa, with purple flowers.

62910. *HONCKENYA FICIFOLIA* Willd. Tiliaceae.

A very striking ornamental shrub, native to western tropical Africa. According to M. T. Masters (Flora of Tropical Africa, vol. 1) the branches are purplish and covered with yellowish hairs, and the hairy leaves are more or less deeply three to seven lobed. The large purple flowers, 2 to 4 inches wide, are in terminal racemes.

62911. *LIMONIA POGGEI LATIALATA* Wildem. Rutaceae.

A spiny shrub or small tree, native to Uganda, with pinnate leaves having winged stems and large white flowers borne in clusters of 4 to 10 in the axils of the leaves.

62897 to 62920—Continued.

62912. *MILLETTIA MANNII* Baker. Fabaceae.

A tropical African relative of the wisteria, which is described by Baker (Flora of Tropical Africa, vol. 1) as a shrub or small tree with compound leaves about 9 inches long with 15 or more pale-green leaflets. The reddish flowers appear in long-stalked, slightly compound panicles about as long as the leaves.

62913. *OUROUPARIA GAMBEIR* (Hunter) Baill. (*Uncaria gambir* Roxb.). Rubiaceae.

A climbing shrub or bush which is found wild or cultivated throughout the Malay Archipelago and the East Indies. From the leaves is obtained the extract known as gambir, which is highly valued for tanning purposes; it is said to impart a softness to leather not obtainable from other tanning agents.

62914. *PASPALUM SCROBICULATUM COMMERSONII* (Lam.) Stapf. Poaceae. Grass.

This is regarded as a fodder grass of some value in parts of tropical Africa, according to Stapf (Flora of Tropical Africa, vol. 9, pt. 3). It is perennial, 1 to 2 feet or more in height, and usually scantily tufted from a short rhizome. The simple or sparingly branched culms are erect or ascending.

62915. *PENNISETUM BENTHAMII* Steud. Poaceae. Grass.

A tropical African perennial grass, used as fodder in Rhodesia and Uganda, according to Holland (Useful Plants of Nigeria, p. 842).

62916. *PENTACLETHRA MACROPHYLLA* Benth. Mimosaceae.

A large, handsome tree, belonging to the Mimosa family, which appears of promise as a shade tree for the more tropical portions of the United States. According to Holland (Useful Plants of Nigeria, pt. 2), in tropical Africa, where the tree is native, the oily seeds are used as food by the natives, and the hard, durable wood is excellent for cabinet-work.

62917. *PIPTADENIA AFRICANA* Hook. f. Mimosaceae.

A wide-spreading tree, 15 to 20 feet high, with finely pinnate leaves 6 inches or more long, small spikes of whitish flowers which appear before the leaves, and straight, flat pods about a foot in length. Native to tropical Africa.

62918. *TETRAPLEURA TETRAPTERA* (Schum.) Taub. (*T. thonningii* Benth.). Mimosaceae.

A tall, unarmed tree, described by Oliver (Flora of Tropical Africa) as having alternate compound leaves with leathery leaflets and small leaves with spikelike clusters. According to Holland (Useful Plants of Nigeria, pt. 2), the pods are roasted and ground to make a "black soup," a common native dish in parts of tropical Africa. The soft pulp of these pods contains sugar, tannin, and a small quantity of saponin. The presence of saponin enables the natives to use the pods for washing purposes also.

62897 to 62920—Continued.

62919. *TRIUMFETTA SEMITRILOBA* Jacq. Tilliaceae.

Variety *tomentosa*. A bushy, herbaceous, hairy plant widely distributed in the Tropics, with bright-yellow flowers produced in long leafy racemes.

62920. *URENA LOBATA* L. Malvaceae.

Variety *reticulata*. An erect, shrubby, hairy, herbaceous plant, widely distributed throughout the Tropics, which is valued in India and also in parts of tropical Africa for the fiber obtained from the bark. This fiber is suitable for the manufacture of bags and twine and is regarded as a good substitute for jute, according to Holland (Useful Plants of Nigeria, pt. 1).

62921 and 62922.

From Paris, France. Seeds purchased from Vilmorin-Andrieux & Co., through David Fairchild, agricultural explorer, Bureau of Plant Industry. Received March 19, 1925. Notes by Doctor Fairchild.

62921. *AMPELOPSIS WATSONIANA* Wilson. Vitaceae.

A Chinese species, introduced in 1908, with large, 3-parted leaves, of an attractive green, and bunches of red fruits which become black. The flowers appear during July. This should be an attractive vine for walls.

62922. *DECAISNEA FARGESII* Franch. Lardizabalaceae.

One of the Vilmorin introductions from China, 1895, which is not very hardy here. This handsome shrub is distinguished by beautiful foliage in the summer and curious blue fruits, the size of one's finger, in the autumn.

62923 to 62934. *ORYZA SATIVA* L. Poaceae. Rice.

From Tottori, Japan. Seeds presented by Prof. Akio Kikuchi, Tottori Agricultural College. Received March 18, 1925.

Locally developed varieties.

62923. No. 1. *Wase Shinriki* No. 7.

62924. No. 2. *Wase Shinriki*.

62925. No. 3. *Oshiu*.

62926. No. 4. *Wase Kitabu*.

62927. No. 5. *Goriki* No. 7.

62928. No. 6. *Fukuyama* No. 7.

62929. No. 7. *Imogama* No. 2.

62930. No. 8. *Marygama* No. 1.

62931. No. 9. *Hayaoseki* No. 1.

62932. No. 10. *Hayaoseki* No. 3.

62933. No. 11. *Akagemochi*.

62934. No. 12. *Shimofruimochi*.

62935. *HELIANTHUS TUBEROSUS* L. Asteraceae. Jerusalem artichoke.

From London, England. Tubers purchased from James Carter & Co. Received March 27, 1925.

Red-skinned artichoke. An English variety.

62936 to 62939.

From Caracas, Venezuela. Seeds presented by Dr. Henry Pittier. Received March 6, 1925.

62936. DOLICHOS LABLAB L. Fabaceae.
Hyacinth bean.

No. 4. From Tachira.

62937. PHASEOLUS LUNATUS L. Fabaceae.
Lima bean.

No. 45. From Los Guayos, Carabobo.

62938 and 62939. PHASEOLUS VULGARIS L. Fabaceae.
Common bean.

62938. No. 44. A black variety from La Punta, Merida.

62939. No. 46. A black variety from Carache, Trujillo.

62940 to 62943. MUSA PARADISIACA SAPIENTUM (L.) Kuntze. Musaceae.
Banana.

From San Juan, P. R. Suckers presented by O. W. Barrett, agricultural adviser, Department of Agriculture and Labor. Received March, 1925.

Introduced for special experimental work.

62940 and 62941. Manzano. The fruits of this variety are very bright yellow, with a thin and delicate skin and flesh of fine texture and applelike flavor. The bunches of this variety are generally small, seldom reaching 100 fruits.

62940. No. 1.

62941. No. 2.

62942 and 62943. Datil. The fruit of this "date" banana is very small, not over an inch or so long, it is said, but of unusual sweetness, though inclined to be dry. This may be of use for breeding purposes. The plants are small and do not seem very vigorous. (David Fairchild.)

62942. No. 1.

62943. No. 2.

62944 to 62959.

From Caracas, Venezuela. Seeds presented by Dr. Henry Pittier. Received March 11, 1925.

62944. LATHYRUS SATIVUS L. Fabaceae.
Bitter vetch.

No. 33. From Lobatera, Tachira.

62945 to 62954. PHASEOLUS VULGARIS L. Fabaceae.
Common bean.

62945. No. 3 [7]. A cream-colored variety from Tachira.

62946. No. 5a. From San Miguel, Trujillo.

62947. No. 5b. From San Miguel, Trujillo.

62948. No. 18.

62949. No. 26. A pink variety.

62950. No. 30. A black variety from Tachira.

62951. No. 35. From Tachira.

62952. No. 37.

62953. No. 38a. From Valera, Trujillo.

62954. No. 39a. From Valera, Trujillo.

62955. PISUM SATIVUM L. Fabaceae. Pea.

No. 43. From Merida.

62944 to 62959—Continued.

62956. VICIA FABA L. Fabaceae.

Broad bean.

No. 32. From Tachira.

62957. VIGNA CYLINDRICA (Stickm.) Skeels. Fabaceae.
Catjang.

No. 42. A white variety from Mercado de Caracas.

62958 and 62959. VIGNA SINENSIS (Toner) Savi. Fabaceae.
Cowpea.

62958. No. 40. A chestnut-colored variety found in Miranda.

62959. No. 41. A pink variety from Cojedes.

62960 and 62961. ACACIA spp. Mimosaceae.

From Richmond, Victoria, Australia. Seeds presented by F. H. Baker. Received March 20, 1925.

62960. ACACIA DISCOLOR Willd.

A tall, unarmed shrub or small tree, native to southeastern Australia and Tasmania, which bears, in autumn, terminal and axillary clusters of yellow flowers.

62961. ACACIA PENNINERVIS Sieber.

The bark of this Australian acacia contains 18 per cent of tannic acid, according to Maiden (Useful Native Plants of Australia); furthermore, it is said to endure comparatively low temperatures. It is a tall shrub or tree, with narrow sickle-shaped phyllodia and short racemes of pale-yellow flowers.

62962 to 63148. ORYZA SATIVA L. Poaceae.
Rice.

From Kyoto, Japan. Seeds presented by Yoshinori Takesaki, assistant professor of plant breeding, Kyoto Imperial University. Received March 24, 1925.

62962 to 62968. Pure breed, originated by pure-line selection at the Kinai branch station. (Takesaki.)

62962. No. 1. *Oba Kinai.*

62963. No. 2. *Oba Kinai.*

62964. No. 1. *Aikoku Kinai.*

62965. No. 2. *Aikoku Kinai.*

62966. No. 3. *Aikoku Kinai.*

62967. No. 4. *Aikoku Kinai.*

62968. *Mubo Aikoku.*

62969 to 63042. Crossbreed originated at the Kinai branch station. (Takesaki.)

62969 to 63033. Kinai Early.

62969. No. 1. *Oba* × *Shinshukaneke.*

62970. No. 2. *Oba* × *Shinshukaneke.*

62971. No. 3. *Oba* × *Shinshukaneke.*

63149. MEDICAGO SATIVA L. Fabaceae.
Alfalfa.

From Kuelsheim, Baden, Germany. Seeds presented by Alois Grimm, through Charles J. Brand, United States Department of Agriculture. Received March 25, 1925.

Introduced for testing by alfalfa specialists.

Kuelsheim is the native place of Wendell Grimm, who, in 1857, brought the alfalfa seed into Minnesota, which after many years of natural selection became the hardy Grimm alfalfa of to-day. (*Brand*.)

63150. TRIFOLIUM PRATENSE L. Fabaceae.
Red clover.

From Reading, England. Seeds purchased from Sutton & Sons. Received March 27, 1925.

Giant hybrid red clover. An English variety.

63151 to 63153. PISUM SATIVUM L. Fabaceae.
Pea.

From Histon, Cambridge, England. Seeds purchased from W. J. Unwin, through D. N. Shoemaker, Bureau of Plant Industry. Received March 30, 1925.

Locally developed varieties.

63151. *Unwin's Advance Guard*.

63152. *Unwin's Cropper*.

63153. *Unwin's Little Wonder*.

63154. TRICHOSANTHES BRACTEATA
(Lam.) Voigt (*T. palmata* Roxb.).
Cucurbitaceae.

From Simla, India. Seeds presented by H. E. J. Peake, Khaltoo Fruit Orchards, Solan brewery. Received March 30, 1925.

This is called "Gohaker" by the Indians of this region; in Bengal it is called "Makhai." It is a very ornamental creeper resembling the tree-tomato. The flesh of the fruit is slate gray and very bitter; it is used by the Indians medicinally for ulcers and other similar disorders. (Peake.)

63155 to 63203.

From Peking, Chihli, China. Seeds collected by R. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received March 10, 1925. Notes by Mr. Dorsett.

January 13, 1925. Unless otherwise stated, the following seeds, Nos. 63155 to 63181, were purchased from Nau Yu Shing.

63155. ALLIUM FISTULOSUM L. Liliaceae.
Welsh onion.

No. 1844. A Chinese variety planted in the fall, allowed to stand over winter, then transplanted in the spring and harvested in the fall.

63156. ALLIUM sp. Liliaceae. Onion.

No. 1862. This variety is planted in the early spring and until the end of May. It is chopped fine and fried with meat.

63157 and 63158. APICIUM GRAVEOLENS L. Apiaceae. Celery.

63157. No. 1848. Planted in the spring or early summer, and when an inch or so high it is transplanted. It is chopped into pieces and used to cook with meat.

63158. No. 1849. *Yang Ch'iu Ts'ai* (foreign celery). Planted in early August and later transplanted; harvested in November.

63159. BETA VULGARIS L. Chenopodiaceae. Beet.

No. 1855. This variety is eaten boiled with meat and also with other vegetables.

63160. BRASSICA PEKINENSIS (Lour.) Gagn. Brassicaceae. Petai.

No. 1850. *Pai Ts'ai* (winter cabbage). Planted in August and transplanted when the plants are young. Matures in 60 to 70 days.

63161 to 63172. BRASSICA spp. Brassicaceae.

63161. BRASSICA sp.

No. 1822. *Piao er Ts'ai* (calabash vegetable). This variety, which is used like cabbage, is planted in the early spring and later transplanted.

63162. BRASSICA sp.

No. 1830. *Tze T'ai Ts'ai* (purple-stemmed vegetable). A variety planted during any season and which matures in about 50 days. Used chiefly by foreigners as greens.

63163. BRASSICA sp.

No. 1831. *Kai Ts'ai* (cover vegetable). Planted during any season and matures in about 50 days.

63155 to 63203—Continued.

63164. BRASSICA sp.

No. 1833. *T'ai Ku Ts'ai* (great ancient vegetable). Planted in early spring and later transplanted. Used like cabbage.

63165. BRASSICA sp.

No. 1834. *Kai Lan Ts'ai* (fragrant cover vegetable). This variety is planted in July, and when the plants are 2 or 3 inches high they are transplanted. Harvested about 50 days after transplanting.

63166. BRASSICA sp.

No. 1836. *Yu Ts'ai* (oil vegetable). Planted in July and harvested in 50 to 60 days. The leaf blades are chopped into small pieces, scalded, and fried with meat or dried shrimp.

63167. BRASSICA sp.

No. 1837. A vegetable resembling a Chinese turnip. Planted in July and harvested in about 60 days. Used only for pickling.

63168. BRASSICA sp.

No. 1847. *T'ai Ts'ai* (moss vegetable). A variety planted in spring and early summer, maturing for market in 60 days. The stems are chopped and used in soup.

63169. BRASSICA sp.

No. 1851. *Tin Hsin Pai Pai Ts'ai* (summer cabbage). Planted in early spring. When young plants are 2 to 4 inches high they are transplanted; harvested in 60 to 70 days. Used like any other cabbage.

63170. BRASSICA sp.

No. 1860. *Shih Liu Hung* (red pomegranate vegetable). The leaves are used for frying with meat and also for pickling.

63171. BRASSICA sp.

No. 1865. *Tze Ts'ai Hua* (purple vegetable flower). Planted during any season and matures in 60 to 70 days. Used with meat and bean curd.

63172. BRASSICA sp.

No. 1867. *Hsiao Pai Ts'ai* (small cabbage). This variety is planted during any season and matures for market in 40 to 50 days. It is cooked mostly with bean curd.

63173 to 63175. CAPSICUM ANNUM L. Solanaceae. Red pepper.

63173. No. 1852. *Yang Chi Chiao Chiu Chiao* (goat-horn pepper). Planted in early spring and later transplanted. Used for seasoning, with sesame oil, and to make pepper pickle.

63174. No. 1853. *Ta Hung Shih Tzu Chiao* (large red persimmon pepper). Planted in early spring and later transplanted to the field; harvested in the fall.

63175. No. 1854. *Hung Ch'ang Chiu Chiao* (red long pepper). Used as seasoning for meats and soups.

63155 to 63203—Continued.

63176. *CORIANDRUM SATIVUM* L. Apiaceae. Coriander.

No. 1835. Planted in any growing season and harvested in 20 to 30 days. It is chopped fine and used as a condiment and is also used for pickling.

63177 and 63178. *CUCUMIS SATIVUS* L. Cucurbitaceae. Cucumber.

63177. No. 1840. This variety is planted in early spring and harvested in 40 to 50 days.

63178. No. 1841. *Tung Tzu Huang Kua* (greenhouse cucumber). This looks different from our forcing type and is better flavored. It is grown in native greenhouses heated with flues.

63179. *CUCURBITA MOSCHATA* Duchesne. Cucurbitaceae. Cusshaw.

No. 1864. *Nan Kua* (southern pumpkin). This variety is planted in the early spring and later transplanted. It is boiled with meat.

63180. *CUCURBITA PEPO* L. Cucurbitaceae. Pumpkin.

No. 1863. *Hsi Hulu* (western gourd). Planted in early spring and later transplanted. When the plants have 10 leaves they begin to bear and continue through the season.

63181. *Daucus CAROTA* L. Apiaceae. Carrot.

No. 1843. *Yang Hung Luo Pu* (foreign carrot). This is a smooth, rather long carrot of a bright orange. It is boiled with meat and served with a thickened sauce.

63182. *ECHINOCHLOA CRUSGALLI* EDLIS Hitchc. Poaceae. Barnyard millet.

No. 1875. January 16, 1925. Presented by Dr. A. A. Howath, of the Peking Union Medical College. Doctor Howath collected this variety in Manchuria several years ago.

63183. *FOENICULUM VULGARE* Hill. Apiaceae. Fennel.

No. 1839. This variety is planted any time through the growing season and is harvested in 40 to 50 days. It is chopped into small pieces and used in meat pie.

63184. *GLEDITSIA SINENSIS* Lam. Caesalpiniaceae. Chinese honey locust.

No. 1878. January 16, 1925. Secured in the Western Hills by Doctor Howath. This is a larger fruited variety than the one under No. 1019 [S. P. I. No. 62176].

63185. *MEDICAGO SATIVA* L. Fabaceae. Alfalfa.

No. 1877. January 16, 1925. Collected in the Western Hills and presented by Doctor Howath.

63186 and 63187. *PHASEOLUS VULGARIS* L. Fabaceae. Common bean.

63186. No. 1856. *Hsun Pien Tou* (greenhouse bean). This variety is planted in October in greenhouse beds under cucumbers and matures in 80 to 90 days. It is used chiefly to boil with pork.

63187. No. 1857. January 13, 1925. *Mer Tou* (white bean). A pole bean cooked with meat.

63155 to 63203—Continued.

63188 and 63189. *PISUM SATIVUM* L. Fabaceae. Pea.

63188. No. 1845. *Hei Wau Tou Miao* (black pea sprouts). Planted in the early spring and summer. It is ground into flour and made into cakes and boiled and fried when green either with or without meat.

63189. No. 1846. *Pai Wau Tou Miao* (white pea sprouts). This variety is planted in early spring and summer, and when green it is boiled with sauce and meats.

63190 to 63197. *RAPHANUS SATIVUS* L. Brassicaceae. Radish.

63190. No. 1818. *Ta Hung P'ao Luo Pu* (big red-radish radish). The Chinese recommend planting this variety in July and August, and the crop is supposed to be ready for market in September and October. Used chiefly for boiling with meat and making into soup.

63191. No. 1819. This variety is planted in July and August and harvested in September and October. It is eaten as a fresh vegetable, cooked with meat, and used in soup.

63192. No. 1820. *Hsiang Ya Pai Luo Pu* (white elephant-tusk radish). Planted in May and June; matures in about 60 days. Used mostly for making soup.

63193. No. 1821. *Hsiao Hung Shiu Luo Pu* (small red water radish). It is usually peeled and eaten raw with pickles and is seldom cooked.

63194. No. 1823. *Hung Hsiu Ts'ui Luo Pu* (red-hearted fragile radish). Planted in July and August and harvested in September and October. It is stored before selling. Eaten raw.

63195. No. 1824. *Tze Tsui Luo Pu* (purple fragile radish). Planted in July and August and harvested in September.

63196. No. 1825. *Pien Luo Pu* (changing radish). Planted in July and August and harvested in September and October. Used only for soup, which is made with mutton, chopped coriander, and this radish.

63197. No. 1838. *Hung Ts'ui Luo Pu* (red fragile radish). Planted in July and August and harvested in September and October. It is eaten fresh.

63198. *SOJA MAX (L.) Piper (Glycine hispida Maxim.)*. Fabaceae. Soy bean.

No. 1875. January 16, 1925. Collected in Manchuria by Dr. A. A. Howath.

63199 and 63200. *SOLANUM MELONGENA* L. Solanaceae. Eggplant.

63199. No. 1859. A round variety planted in early spring and later transplanted, and which fruits throughout the season. It is boiled with meat, fried in oil with it, and also used to make pickles.

63200. No. 1861. *Pai Chang Chieh Tzu* (white long eggplant). Planted in the early spring and later transplanted. Used boiled and fried in sesame oil.

63155 to 63203—Continued.

63201. *SPINACIA OLERACEA* L. Chenopodiaceae. Spinach.

No. 1826. Used in the following ways—as greens, in soups, and chopped up and fried with pork.

63202 and 63203. *VIGNA SESQUIPEDALIS* (L.) Fruwirth. Fabaceae. Yard Long bean.

63202. No. 1858. *Huang Hua Ching Chiang Tou* (yellow-flowered cowpea). Planted in May, June, and July and harvested in 60 to 70 days. The bean pods are chopped up when green and cooked with meat, or they are boiled and eaten with a vinegar soy sauce.

63203. No. 1866. *Ssu Kua Ching Chiang Tou* (green-threaded gourd cowpea). Planted in May and June. The green pods are chopped into small pieces and cooked with meat.

63204 to 63291.

From Echo, Manchuria, China. Seeds presented by A. D. Woeikoff, director, experimental farm. Received March 23, 1925.

63204 to 63208. *PHASEOLUS ANGULARIS* (Willd.) W. F. Wight. Fabaceae. Adzuki bean.

63204 and 63205. *Li hsiao tou*, a dark variety.

63204. No. 306. 63205. No. 307.

63206. No. 309. *Pai hsiao tou*, a white variety.

63207 and 63208. *Hung hsiao tou*, a red variety.

63207. No. 310. 63208. No. 316.

63209 to 63211. *PHASEOLUS AUREUS* Roxb. Fabaceae. Mung bean.

63209 and 63210. *Lu tou*.

63209. No. 317. 63210. No. 326.

63211. No. 327. *Huang lu tou*.

63212 to 63291. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceae. Soy bean.

63212. No. 254. *Hsiao li er huang tou tsa*, a small, yellow variety.

63213 and 63214. *Hsiao li er fang tou tsa*.

63213. No. 255. 63214. No. 256.

63215. No. 257. *Hsiao huang tou tsa*, a small, yellow type.

63216 and 63217. *Hsiao ch'in huang tou tsa*, a golden variety.

63216. No. 258. 63217. No. 262.

63218. No. 264. *Ta li hua huang tou tsa*.

63219. No. 265. *Ta ch'in mi huang tou tsa*.

63220. No. 266. *Hua lia tou tsa*.

63221 to 63229. *Huang tou tsa*.

63221. No. 267. A yellow type.

63222. No. 272. This and the following variety [S. P. I. No. 63223] are yellow with black hilums.

63204 to 63291—Continued.

63223. No. 273.

63224. No. 275. A variety with a broad hilum.

63225. No. 276. A type with a black hilum.

63226. No. 278. This and the following type [S. P. I. No. 63227] have brown hilums.

63227. No. 279.

63228. No. 280. This and the following variety [S. P. I. No. 63229] have smooth hilums.

63229. No. 281.

63230 to 63232. *Hei tou*. The hilums of these three varieties are black.

63230. No. 282.

63231. No. 284.

63232. No. 286.

63233 to 63235. *Chong tou*. These three varieties have green hilums.

63233. No. 287.

63234. No. 288.

63235. No. 290.

63236. No. 291. *Jao li er huang tou tsa*.

63237. No. 294. *Ssu lui hwa*.

63238. No. 295. *Shao hei mi*.

63239. No. 296. *Feng tien pai mi*.

63240. No. 297. *Kunchuling pai mi*.

63241. No. 298. *Wan hsiaang hei mi*.

63242. No. 299. *Scui pink haipo hei hua*.

63243. No. 301. A brown variety.

63244. No. 303. This and the following variety [S. P. I. No. 63245] are yellow with brown hilums.

63245. No. 304.

63246. No. 1146. *Vanta*.

63247. No. 1150. This is a yellow type.

63248. No. 1151. Brown variety.

63249. No. 1152. A green variety.

63250. No. 1153. A light yellow variety.

63251. No. 1155. A green variety with a dark hilum.

63252. No. 1157. A green variety with a light hilum.

63253. No. 1158. A brown variety.

63254. No. 1160. A yellow variety.

63255. No. 1161. A green variety with a dark hilum.

63256. No. 1162. Shining black, round type.

63257. No. 1163. A light-green variety with a dark hilum.

63258. No. 1164. A black variety.

63259. No. 1169. A black variety.

63260. No. 1170. Green with darker side.

63261. No. 1171. A greenish brown variety.

63204 to 63291—Continued.

63262. No. 1172. A small black variety.
 63263. No. 1173. A black variety.
 63264. No. 1174. A small greenish brown variety.
 63265. No. 1175. Greenish brown variety.
 63266. No. 1177. Brownish yellow with a darker side.
 63267. No. 1180. Brown variety.
 63268. No. 1181. Lighter in color than No. 1180 [S. P. I. No. 63267].
 63269. No. 1183. Black variety.
 63270. No. 1185. Brown variety.
 63271. No. 1187. Greenish brown type.
 63272. No. 1189. Light-brown variety.
 63273. No. 1191. Brown variety.
 63274. No. 1193. Light-brown variety.
 63275. No. 1194. Brown variety.
 63276. No. 1195. Grayish black variety.
 63277. No. 1196. Brown variety.
 63278. No. 1200. Small, black variety.
 63279. No. 1203. Very small, brown variety.
 63280. No. 1205. Very small, greenish brown variety.
 63281. No. 1208. Brown variety.
 63282. No. 1209. Green variety with a black hilum.
 63283. No. 1213. Brown variety.
 63284. No. 1215. Black variety.
 63285. No. 1216. Black variety with a light hilum.
 63286. No. 1217. Black variety.
 63287. No. 1218. Brown variety.
 63288. No. 1221. Greenish yellow variety.
 63289. No. 1223. Yellow variety.
 63290. No. 1224. A green variety with a dark hilum.
 63291. No. 1228. A greenish yellow variety.

63292 to 63323.

From Chihli, China. Scions and cuttings collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received March 31, 1925. Notes by Mr. Dorsett.

63292 to 63294. *AMYGDALUS PERSICA* L. (*Prunus persica* Stokes). Amygdalaceae. Peach.

63292. No. 2105. Wanwu, near Chiuchou, which is a big deciduous fruit section, located in a large valley near Peking. February 13, 1925. *Hung Ying Tsui T'ao* (red eagle bill peach). The large fruits, 3 to 4 inches in diameter, ripen in June and are said to be of very good quality.

63293. No. 2106. Chiuchou. February 13, 1925. *Pai Ying Tsui T'ao* (white eagle bill peach). The fruits

63292 to 63323—Continued.

are about 3 to 4 inches in diameter and have white flesh. This variety ripens about 10 days later than No. 2105 [S. P. I. No. 63292].

63294. No. 2148. Wanwu, near Chiuchou. February 14, 1925. *K'uai Ta T'ao* (early large-leaved peach). A white peach, 3 to 4 inches in diameter, which ripens the middle of August.

63295. *AMYGDALUS PERSICA PLATYCARPA* (Decaisne) Ricker (*Prunus persica platycarpa* Bailey). Amygdalaceae. Flat peach.

No. 2107. Chiuchou. February 13, 1925. *Ho Shang Mao T'ao* (priest-hat peach). Ripens the end of July, becoming light green, and is 2 to 3 inches in diameter.

63296 to 63300. *MALUS* spp. Malaceae. Apple.

63296. *MALUS* sp.

No. 2112. Chiuchou. February 13, 1925. *Chu Sha Hung Sha Kuo* (cinnamon-red crab apple). The red fruits are 1 to 1½ inches in diameter and ripen the middle of July. The trees from which these scions came are said to be about 50 years old.

63297. *MALUS* sp.

No. 2113. Chiuchou. February 13, 1925. *Chang Pa Sha Kuo* (long handle crab apple). The light red fruits, 1 to 1½ inches in diameter, ripen late in July, and these scions are from a tree about 50 years old.

63298. *MALUS* sp.

No. 2119. Chiuchou. February 13, 1925. A variety called *Hung Ping Kuo* (red apple) by Mr. Fa. It is about 3 inches in diameter and is light green with a pink or red blush; ripens in September.

63299. *MALUS* sp.

No. 2134. Chiuchou. February 14, 1925. *Mo Pau Sha Kuo* (grindstone crab apple). A variety said to be 1½ to 2 inches in diameter and half red and half green when ripe, which is at the end of August.

63300. *MALUS* sp.

No. 2142. Chiuchou. February 14, 1925. *Hsiang Yo Pai Sha Kuo* (white elephant tusk crab apple). Fruits about 2 inches in diameter, white with a slight pink blush; ripens the early part of August. Secured from Chai Yu Chen's orchard.

63301. *MORUS ALBA* L. Moraceae. White mulberry.

No. 2111. Chiuchou. February 13, 1925. Cuttings of *K'uai Pai Sanggen* (early white mulberry), secured from Mr. Fa. The fruits are about an inch in diameter and ripen in June.

63302. *POPULUS* sp. Salicaceae. Poplar.

No. 2183. Wanchuang. A rather round-headed poplar quite common here. The bark is rough and dark gray on the trunk and main branches.

63303 to 63314. *PRUNUS* spp. Amygdalaceae.

63292 to 63323—Continued.

63303 to 63308. *PRUNUS ARMENIACA* L.
Apricot.

63303. No. 2114. Chiuchou. February 13, 1925. A variety which Mr. Fa says is *Ping Kuo Pai Sha Kuo* (apple white apricot). The fruits, half red and half white with white flesh, ripen in July and are $1\frac{1}{2}$ inches in diameter.

63304. No. 2130. Chiuchou. February 14, 1925. *Hsiao Pai Hsing* (small white apricot), $1\frac{1}{2}$ to 2 inches in diameter, which ripens in June, becoming white or light green.

63305. No. 2135. Chiuchou. February 14, 1925. *Mai Huang Hsing* (straw yellow apricot). The fruits are reported to be 1 to $1\frac{1}{2}$ inches in diameter and ripen in June, becoming white and yellow.

63306. No. 2138. Chiuchou. February 14, 1925. *Hung Lao Yieh Lien Hsing* (red god-faced apricot). The red fruits, 2 to 3 inches in diameter, ripen in July.

63307. No. 2140. Chiuchou. February 14, 1925. *Cha Hua Pa Ta Hsing* (flower rod apricot). The clingstone fruits, $1\frac{1}{2}$ inches in diameter, ripen in early July. They are white and blushed with pink.

63308. No. 2146. Chiuchou. February 14, 1925. *Mien Pa Ta Hsing* (soft rod apricot). The fruits, $1\frac{1}{2}$ inches in diameter, ripen in early August, becoming yellow.

63309 to 63311. *PRUNUS TOMENTOSA* Thunb.
Manchu cherry.

63309. No. 2104. Chiuchou. February 13, 1925. *Hung Shan Tou Ying T'ao* (red bush cherry) presented by Wang Chieh Ting. The fruits are of average size and ripen the middle of June.

63310. No. 2141. February 14, 1925. *Pai Shan Tou Ying T'ao* (white bush cherry) from Liukuanying village. The average-sized fruits ripen the end of May or early in June.

63311. No. 2147. Chiuchou. February 14, 1925. *Hung Shan Tou Ying T'ao* (red bush cherry), of average size, which ripens about the middle of June.

63312 to 63314. *PRUNUS* spp. Plum.63312. *PRUNUS* sp.

No. 2103. Chiuchou. February 13, 1925. *Hung Li Tze* (red plum), secured in Mr. Ting's orchard. The fruits are reported to be $1\frac{1}{2}$ inches in diameter, to ripen in June, and to be of good quality.

63313. *PRUNUS* sp.

No. 2108. Chiuchou. February 13, 1925. *Niu Hsin Hung Li Tze* (ox-heart red plum). This variety is $1\frac{1}{2}$ to 2 inches in diameter, ripens the end of August, and is a purple red.

63314. *PRUNUS* sp.

No. 2131. Chiuchou. February 14, 1925. *Chiu Ken Li Tze* (autumn plum). The red fruits are said to be 1 to $1\frac{1}{2}$ inches in diameter; ripen the end of August.

63292 to 63323—Continued.

63315 to 63319. *PYRUS* spp. Malaceae.
Pear.63315. *PYRUS* sp.

No. 2115. Chiuchou. February 13, 1925. *Ya Kuang Li* (broad duck pear), secured from Mr. Wang's orchard. A large, dark-yellow, irregular pear, 3 to 4 inches in diameter, which ripens in early October.

63316. *PYRUS* sp.

No. 2115-a. Chiuchou. February 13, 1925. *Ya Kuang Li* (broad duck pear), secured from Mr. Wang's orchard. A large, dark-yellow, irregular pear, 3 to 4 inches in diameter, which ripens in early October. The same pear as No. 2115 [S. P. I. No. 63315], but from a different tree.

63317. *PYRUS* sp.

No. 2117. Chiuchou. February 13, 1925. This variety is called *Suan Li* (sour pear) by Mr. Fa. It is yellow, about 2 inches in diameter, and ripens the end of August.

63318. *PYRUS* sp.

No. 2118. Chiuchou. February 13, 1925. *Chiu Feng Tze Li* (golden lantern pear). The fruits are yellow blushed with pink and are 2 to 3 inches in diameter; ripen the end of August.

63319. *PYRUS* sp.

No. 2150. En route from Chiuchou to the village of Liuyuan. February 15, 1925. *Tieh Li* (iron pear). The fruits are yellow, $1\frac{1}{2}$ to 2 inches in diameter, and ripen in September.

63320 and 63321. *SALIX* spp. Salicaceae.
Willow.63320. *SALIX* sp.

No. 2153. Tiuyuan. February 15, 1925. *Ch'a Tze Liu* (fork willow). From this tree the Chinese make their 3-tined pitchforks by selecting properly placed branches and then steaming the cut branches to bend to the desired shape.

63321. *SALIX* sp.

No. 2154. Wangming. February 15, 1925. *Ch'ing Pi Lui* (green-skinned basket willow).

63322 and 63323. *ZIZIPHUS JUJUBA* Mill.
(*Z. sativa* Gaertn.). Rhamnaceae.
Jujube.

63322. No. 2120. Chiuchou. February 13, 1925. *P'ao Tsao* (inflated jujube). The mahogany fruits, about three-fourths by 1 to sometimes $1\frac{1}{4}$ inches long, ripen the middle of September.

63323. No. 2151. Liuyuan. February 15, 1925. *Wu Ho Tsao* (seedless jujube). Secured from Liu Tai Ho. The tree has a spread of about 20 feet, and 2 feet above the ground it measured 29 inches in circumference. It is reported to be 60 years old. The fruits are mahogany brown and about three-fourths of an inch in diameter and 1 to $1\frac{1}{4}$ inches in length.

63324 to 63327. PISUM SATIVUM L.
Fabaceae. Pea.

From Horens, Denmark. Seeds purchased from Ostergaard Frowel. Received March 30, 1925.

Danish pea varieties.

63324. No. 1288. 63326. No. 1332.

63325. No. 1313. 63327. [No data.]

63328 to 63390.

From Nogent sur Vernisson, Loiret, France. Seeds presented by M. L. Pardé, directeur de l'Arboretum National des Barres, at the request of David Fairchild, agricultural explorer, Bureau of Plant Industry. Received March 11, 1925. Notes by Doctor Fairchild.

63328. ABIES KOREANA Wilson. Pinaceae.
Fir.

A newly discovered fir from Chosen which is described by E. H. Wilson (Journal of the Arnold Arboretum, vol. 1: 188) as a tree 30 to 50 feet high, with a trunk 4 to 10 feet in circumference, and characterized by its pyramidal habit and deeply fissured rough bark. It is an alpine species, growing abundantly above 3,000 feet in Chosen. It is densely branched, and the lustrous-green leaves with white undersurfaces make the tree very striking.

63329. ABIES NUMIDICA De Lannoy. Pinaceae.
Algerian fir.

Variety *glauca*. A small tree from Algeria which fruits abundantly at Nogent sur Vernisson in central France. Its wood is similar in all respects to that of the common European silver fir, and it may thrive in Arizona and California.

63330. ACANTHOPANAX TRIPOLIATUM (L.) C. Schneid. (A. *aculeatum* Seem.).
Araliaceae.

A hardy, spiny, climbing shrub, native to western China, with slender-stemmed, 3-parted, light-green leaves and compound terminal umbels of small, greenish flowers followed by small, black berries.

63331. ACER DIABOLICUM Blume. Aceraceae.
Maple.

A Japanese maple 10 meters in height. The yellow flowers appear in April before the leaves, which are pubescent beneath and five lobed.

63332. AMPELOPSIS BREVIPEDUNCULATA (Maxim.) Koehne. Vitaceae.

A handsome strong-growing vine, native to eastern Asia, which is particularly attractive in autumn with its clusters of deep-blue berries: it is well adapted for covering trellises and low walls.

63333. AMPELOPSIS MEGALOPHYLLA Diels and Gilg. Vitaceae.

A vigorous, hardy, very interesting vine, becoming 20 to 30 feet in length, with long-stemmed, deeply lobed leaves often more than 3 feet in diameter. The bluish black fruits are in loose cymes. This species is native to western Hupeh, China, where it grows at an altitude of about 4,000 feet.

For previous introduction, see S. P. I. No. 58647.

63328 to 63390—Continued.**63334. AMPELOPSIS ORIENTALIS (Lamr.) Planch.** Vitaceae.

The bright-green, finely cut foliage and dark-purple fruits of this Asiatic vine make it an attractive ornamental for the southern portions of the United States.

63335 to 63340. BERBERIS spp. Berberidaceae.
Barberry.**63335. BERBERIS GAGNEPAINI C. Schneid.**

An evergreen Chinese shrub 3 to 6 feet high, with leathery leaves, spiny on the margins, and delicate yellow flowers on red pedicels. The ellipsoid berries are dark purple.

For previous introduction, see S. P. I. No. 58138.

63336. BERBERIS JULIANAE C. Schneid.

A shrubby barberry, up to 7 feet high, native to western China. It has thick, 3-cleft spines about 1½ inches long, narrowly oval leathery leaves, and small, yellow flowers.

For previous introduction, see S. P. I. No. 58108.

63337. BERBERIS PRUNOSA Franch.

A robust evergreen shrub, probably 10 feet or more in height, native to southwestern China. Its leaves are of leathery texture, up to 2½ inches long, lustrous green above, often grayish beneath, not unlike in general appearance those of the Himalayan *Berberis aristata*. It gets its name from the rich pruinose (plum-colored) bloom which covers the fruits.

For previous introduction, see S. P. I. No. 48015.

63338. BERBERIS SARGENTIANA C. Schneid.

A black-berried barberry from western Hupeh, China, reaching a height of 7 feet. According to Dr. C. S. Sargent, it is the only evergreen barberry which has proved entirely hardy at the Arnold Arboretum, Jamaica Plain, Mass.

63339. BERBERIS TOLUACENSIS Hort.

A barberry of unknown origin, allied to *Berberis aquifolium*. The five to seven leaflets are bright shining green, very narrow, and spiny toothed.

63340. BERBERIS VERNAE C. Schneid.

A low shrub, native to Kansu, China, producing spatulate leaves in small fascicles and small yellow flowers which are followed by round, red berries one-fourth of an inch in diameter.

For previous introduction, see S. P. I. No. 58125.

63341. BERCHEMIA RACEMOSA Sieb. and Zucc. Rhamnaceae.

A tall Japanese shrub producing a great abundance of small berries which pass from green through red to black as they ripen. Mr. Mottet recommends it for trellises and old walls and to cover the stumps of old trees.

63328 to 63390—Continued.

63342. *BETULA MAXIMOWICZIANA* Regel
(*B. maximowiczii* Regel, not Rupr.).
Betulaceae. Birch.

Mr. Mottet remarks that this is without doubt the most beautiful of all the birches, characterized by the rapidity of its growth, the luxuriance of its foliage, and the yellow color of its bark. I saw a specimen at Kew and think it is one of the handsomest birches I have seen.

63343. *BUDDLEIA PANICULATA* Wall. Loganiaceae. Butterfly bush.

An Indian shrub, 6 to 15 feet high, with hairy branches and leaves and rather dense panicles of lilac-colored flowers. Probably best suited for the warmer parts of the United States.

63344. *CARAGANA BOISI* C. Schneid. Fabaceae.

A handsome bush 10 to 12 feet high, with long, arching branches, native to Szechwan and eastern Tibet, China. In May the light-green foliage and numerous yellow flowers make this an especially attractive ornamental.

For previous introduction, see S. P. I. No. 56808.

63345. *CARPINUS BETULUS* L. Betulaceae. European hornbeam.

Var. *carpinizza*. A wild, Hungarian variety of the common European hornbeam, differing from the type in having its leaves more heart-shaped.

63346. *CARPINUS TURCHANINOVII* OVALIFOLIA Winkler. Betulaceae. Hornbeam.

A shrubby tree, native to northern China, and said to resemble closely *Carpinus polynura*. The latter is a handsome, hardy tree of elegant habit, with dark-green, sharply toothed leaves and fruit clusters up to 2 inches in length.

63347. *CELASTRUS DEPENDENS* Wall. Celastraceae. Bittersweet.

A climbing shrub, native to the warmer portions of the Himalayas at altitudes of 1,000 to 4,000 feet. The membranous leaves are very variable in shape, and the yellowish green flowers are in terminal, pendulous panicles. An oil used in India for illuminative purposes is expressed from the seeds.

63348. *CELASTRUS FLAGELLARIS* Rupr. Celastraceae. Korean bittersweet.

A shrubby Chinese vine, quite hardy, with persistent spiny stipules, small oval leaves, and small axillary fruits with crimson arils.

63349. *CELASTRUS ROSTHORNIANA* Loesener. Celastraceae.

A Chinese plant described (Plantae Wilsonianae, vol. 2, pt. 2) as a climbing shrub 15 to 20 feet high, with thick, shining leaves, greenish white flowers, and orange-yellow fruits. It is fairly common in western Szechwan, China.

63350. *CELTIS TOURNEFORTII* Lam. Ulmaceae. Oriental hackberry.

A tree about 20 feet high, or sometimes only a shrub, with oval, sharp-pointed bluish green leaves 3 inches long or less and small, reddish yellow fruits. It is native to Asia Minor and is probably not hardy north of Washington, D. C.

63328 to 63390—Continued.

63351. \times *CLEMATIS GLOBULOSA* Hort. Ranunculaceae.

A hybrid of *Clematis douglasii* Scottii and *C. texensis*, with deep-purple, pitcher-shaped flowers. Both of the parents of this European hybrid are native to the western United States.

63352. *CLEMATIS INTEGRIFOLIA* L. Ranunculaceae.

Var. *hybrida* *velleda*. An erect, herbaceous clematis, becoming 3 feet high, with broad, entire, oval leaves and solitary nodding blue flowers.

63353. *CLEMATIS TANGUTICA* (Maxim.) Korsh. Ranunculaceae. Clematis.

The handsomest yellow-flowered Clematis in cultivation, the largest flowers being about 4 inches across. The species reaches a height of 8 to 10 feet and bears gray-green leaves and solitary rich-yellow flowers, with long, slender-pointed sepals, downy outside and at the edges. Native to northern and western China.

63354. *CORYLUS TIBETICA* Batal. Betulaceae. Hazelnut.

This remarkable species, with spiny involucre somewhat resembling the burs of a chestnut, was introduced into the Vilmorin Fruticetum from Kansu, China, in 1885. It is in flower and there are many catkins now (middle of January) on the shrub. It hybridizes freely with the other species here in the Fruticetum and may prove of distinct value for breeding purposes, but the nuts are too small to be of commercial importance.

63355. *EUONYMUS BUNGEANUS* SEMIPER-SISTENS (Rehder) C. Schneid. Celastraceae.

A large glabrous shrub or small tree, from 3 to 5 meters high, with bright-green, half-evergreen leaves of a bluish or grayish hue. The yellowish white flowers appear in loose, 3 to 7 flowered cymes, and the few fruits are bright pink. This variety differs from the typical species in having leaves which remain on the plant until midwinter.

63356. *EUONYMUS SANGUINEUS* Loes. Celastraceae.

The dull-green, serrate leaves and large, pink fruits of this hardy Chinese shrub or small tree make it an attractive ornamental for the northern United States.

63357. *EVODIA HUPEHENSIS* Dode. Rutaceae.

A very common tree in the woodlands of western Hupeh, China, according to E. H. Wilson (Plantae Wilsonianae, vol. 2, pt. 1), where it grows to a height of 20 to 40 feet. It has smooth, gray bark, spreading branches, and white flowers in large flat corymbs.

63358. *FRAXINUS MARIESII* Hook. f. Oleaceae. Ash.

A handsome, free-flowering shrubby Chinese ash which has narrowly oval leaflets with yellowish green lower surfaces. It blooms even when quite young; the upright panicles are about 5 inches long.

63328 to 63390—Continued.

63359. *GENISTA AETNENSIS* (Bivona) DC.
Fabaceae. Aetna broom.

An attractive shrub, 6 feet or less in height, with nearly leafless, slender branches, and fragrant, yellow flowers in loose terminal racemes. Native to Sicily and Sardinia.

63360. *KRAUNHIA JAPONICA* (Sieb. and Zucc.) Taub. (*Wisteria japonica* Sieb. and Zucc.). Fabaceae. Wisteria.

A comparatively little-known wisteria from Japan, which is hardy only in the Southern States. It is a deciduous climber with slender twining stems and bright, glossy green compound leaves. The white flowers are probably the smallest of all the wisterias, and are produced in very slender, many-flowered racemes up to a foot in length.

63361. *LONICERA SIMILIS DELAVAYI* (Franch.) Rehder. Caprifoliaceae.
Delavay honeysuckle.

A half-evergreen, shrubby climber, closely allied to *Lonicera japonica*, which was first found by the Abbé Delavay in the mountains of Yunnan, China. The oval leaves are gray felted beneath, and the sweet-scented, yellow flowers are in pairs in the axils of the leaves.

63362. *MAGNOLIA SALICIFOLIA* (Sieb. and Zucc.) Maxim. Magnoliaceae.
Anise magnolia.

A Japanese magnolia which is a slender tree about 20 feet in height, with narrowly oval, yellowish green leaves 3 to 6 inches long and short-stemmed white flowers 5 inches across. It is hardy at least as far north as southern Massachusetts.

63363. *PHILADELPHUS MAGDALENÆ* Koehne. Hydrangeaceae. Mock orange.

A bushy mock orange from Szechwan, China, which becomes about 6 feet high, with finely toothed, narrow leaves and white flowers an inch in diameter, borne in early June in few-flowered racemes.

63364. *PLATYCARYA STROBILACEA* Sieb. and Zucc. Juglandaceae.

M. V. 5852. A small, striking Chinese tree which at this time (January) is covered with pretty, brown conelike fruits somewhat resembling miniature fruits of the teasel. This is hardier than the other species, *P. strobilacea*.

63365. *PYRACANTHA GIBBSII* A. Jackson. Malaceae. Firethorn.

A fine ornamental evergreen bush, vigorous and hardy, native to Hupeh and Szechwan, China. It becomes 12 to 14 feet high, is nearly spineless, and in the autumn bears large clusters of scarlet berries which contrast admirably with the glossy dark-green foliage.

For previous introduction, see S. P. I. No. 56694.

63366. *RHAMNUS UTILIS* Decaisne. Rhamnaceae. Buckthorn.

A hardy, shrubby tree of ornamental appearance, with light-green, opposite leaves. Native to central and eastern China.

63367 to 63376. *ROSA* spp. Rosaceae.
Rose.

63328 to 63390—Continued.

63367 and 63368. *ROSA MACROPHYLLA* Lindl.

This Himalayan rose is described by Brandis (Forest Flora of India, p. 203) as an erect, often unarmed shrub, with large, red flowers 2 inches or less in width, and large, soft edible fruits an inch long. In its native home this rose is found at an altitude of 10,000 feet, and plants introduced into England have proved hardy in that country.

63367. Typical form.

63368. Var. *inermis*.

63369. *ROSA MOYESII* Hemsl.

A strikingly handsome, wild rose with flowers varying from dark blood-red to light pink. It is a shrub up to 10 feet high, native to western China, with scattered, short, straight prickles on the branches. The deep orange-red, narrowly ovoid fruits are 2 inches or more in length.

63370. *ROSA OMEIENSIS PTERACANTHA* (Franch.) Rehd. and Wils.

A robust, much-branched thorny bush, native to western China, where it grows at altitudes of 3,000 to 11,000 feet. Because of the fine single white flowers, the large, red prickles, and the bright-red fruits this is an exceedingly attractive rose.

63371. *ROSA PERSETOSA* Rolfe.

A pink-flowered rose from western China which is characterized by Dr. Alfred Rehder (Arnold Arboretum, Jamaica Plain, Mass.) as an upright shrub with densely bristly stems and flowers an inch across, produced in large panicles.

63372 to 63376. *ROSA SERICEA* Lindl.

An erect shrubby rose, up to 12 feet in height, with prickly branches and solitary white flowers, 2 inches wide, with usually only four petals. Native to the Himalayas, and perhaps hardy only in the Southern States.

63372. Typical form.

63373. M. V. 4001.

63374. M. V. 4620.

63375. M. V. 4710.

63376. Var. *xanthocarpa*.

63377. *SAMBUCUS JAVANICA* Reinw. Caprifoliaceae. Elder.

An East Indian elder, 6 feet or less in height, with long-pointed leaflets and flat clusters of ovoid, red berries.

63378. *SCHIZONOTUS AITCHISONI* (Hemsl.) Skeels. Rosaceae.

A shrub 2 to 3 meters high from Afghanistan, with straight, reddish branches which are strong and compact panicles of white flowers which bloom in September.

63379. *SKIMMIA FORTUNEI* Masters. Rutaceae.

A very pretty, spring-flowering shrub from China, with persistent foliage. The very fragrant, white flowers are borne in panicles; these are succeeded by deep-red, oval fruits which remain all winter here in France.

63328 to 63390—Continued.

63380. *SKIMMIA INTERMEDIA* Carr. Rutaceae.

A low, evergreen Japanese shrub, with entire, aromatic leaves, terminal panicles of rosy flowers, and attractive scarlet fruits.

63381. *SKIMMIA JAPONICA VEITCHII* (Carr.) Rehder. Rutaceae.

A Japanese shrub, 5 feet or more in height, with yellowish green leaves crowded at the ends of the branchlets and coral-red or bright-scarlet fruits about a third of an inch in diameter. It is said to be one of the best smoke-enduring evergreen shrubs, but is too tender to withstand the winters in the northern United States.

63382. *SOPHORA DAVIDII* (Franch.) Komarow (*S. viciifolia* Hance). Fabaceae.

A Chinese species 2 meters high of light and graceful habit, bearing clusters of white and blue flowers. This shrub appears to do well in limestone soil.

63383 and 63384. *STYRAX* spp. Styracaceae. Snowbell.

The styraxes are handsome shrubs of graceful, usually loose habit with numerous white, mostly fragrant, flowers. Several species are hardy as far north as southern Massachusetts.

63383. *STYRAX* sp.

M. V. 1901.

63384. *STYRAX* sp.

M. V. 5241.

63385. *SYRINGA VELUTINA* Komarow. Oleaceae. Lilac.

A charming shrub with pale-pink, deliciously fragrant flowers. In height it ranges from 4 to 8 feet. It is native to Chosen and is quite hardy.

63386 and 63387. *VIBURNUM* spp. Caprifoliaceae.

The viburnums are woody plants, many of which are valuable ornamentals because of their white or pinkish flowers and berrylike, red, blue, or black fruits.

63386. *VIBURNUM* sp.

M. V. 6870.

63387. *VIBURNUM* sp.

M. V. 7373.

63388. *VITIS COIGNETIAE* Pulliat. Vitaceae. Grape.

A Japanese species characterized by the very large leaves which turn purple-red in the autumn. This is a striking species for trellises.

63389. *VITIS FLEXUOSA* Thunb. Vitaceae. Grape.

A slender-stemmed, Chinese vine, with oval, heart-shaped leaves and very small fruits. Its chief value appears to lie in the dark-purple autumnal color of its foliage.

63390. *VITIS TITANEA* Hort. Vitaceae. Grape.

A vigorous Japanese climber with dark-green leaves and small, black fruits.

63391. *ANANAS SATIVUS* Schult. f. Bromeliaceae. Pineapple.

From Wusi, Kenya Colony, Africa. Slips collected by H. L. Shantz, Bureau of Plant Industry. Received May 7, 1924. Numbered January, 1925.

No. 98. February 20, 1924. An exceptionally good, small pineapple, grown in the Burra Hills. The climate of this portion of Africa is not especially hot, and this variety is regarded as the best for this region. (Shantz.)

63392 to 63400.

From Paris, France. Purchased from Vilmorin-Andrieux & Co., through David Fairchild, agricultural explorer, Bureau of Plant Industry. Received March 19, 1925. Notes by Doctor Fairchild.

63392. *CLEMATIS ARMANDI* Franch. Ranunculaceae. Armand clematis.

A species from Hupeh, China, bearing fragrant, white flowers, which has shown itself remarkably hardy here and which is characterized by the abundance and the persistence of its foliage.

63393. *CLEMATIS CIRRHOSA* L. Ranunculaceae.

A very attractive, climbing clematis from southwestern Asia, which bears, in spring, nodding, bell-shaped, white flowers over an inch across. It is tender to much frost and is therefore suited only for growing in the southern United States.

63394. *CLEMATIS SPOONERI* Rehd. and Wils. Ranunculaceae.

A most attractive species introduced in 1905 from China, bearing an abundance of large, white blossoms, some of which measure 9 centimeters in diameter.

63395. *COLUMNEA GLORIOSA* Sprague. Gesneriaceae.

Var. *superba*. A perennial epiphyte, indigenous to Costa Rica, with handsome scarlet and yellow flowers, produced singly in the axils of the leaves. It is tropical in its requirements.

63396. \times *COLUMNEA VEDRARIENSIS* Hort. Gesneriaceae.

A new hybrid between *Columnea magnifica* and *C. schiediana* recommended by Mr. Mottet. (Vilmorin.)

The parents of this hybrid are tropical American, herbaceous plants with scarlet and yellow flowers.

63397. \times *COLUMNEA VILMORINIANA* Hort. Gesneriaceae.

A new hybrid between *Columnea vedrariensis* and *C. gloriosa superba*, shown before the "Société Nationale d'Horticulture de France" on January 22, 1924, when it was awarded a certificate of merit.

It requires the same treatment as its parents and is very ornamental by reason of the intense red coloring of both flowers and leaves and its thickset, erect habit. (Vilmorin.)

63398. *DIOSCOREA* sp. Dioscoreaceae. Yam.

A variety of the Chinese yam. Through selection a tuber has been made to mature which does not penetrate so deeply into the soil as the original variety received from China. It is therefore worth testing as far north as Washington.

63392 to 63400—Continued.

63399. *HELIANTHUS TUBEROSUS* L. Asteraceae. Jerusalem artichoke.

This is said to be a most unusually vigorous strain of the common Jerusalem artichoke, producing long, fusiform tubers instead of the round, irregular ones.

63400. *HORDEUM VULGARE PALLIDUM* Seering. Poaceae. Six-rowed barley.

A new variety of 6-rowed barley with silky awns which should make it a distinct advantage in harvesting.

63401. *VIBURNUM SARGENTI* Koehne. Caprifoliaceae.

From Elstree, Herts, England. Seeds presented by Vicary Gibbs, Aldenham House Gardens. Received February 20, 1925.

Although similar to the Highbush cranberry (*Viburnum americanum*) of North America, this handsome, hardy shrub from northern China is more upright and denser in habit. The leaves are thick, pubescent beneath, and the sterile flowers are about $1\frac{1}{4}$ inches across. The round scarlet berries are usually in upright clusters.

63402 and 63403.

From Paris, France. Purchased from Vil-morin-Andrieux & Co., through David Fairchild, agricultural explorer, Bureau of Plant Industry. Received March 19, 1925. Notes by Doctor Fairchild.

63402. *SCHIZANDRA RUBRIFLORA* (Franch.) Rehd. and Wils. Magnoliaceae.

One of Wilson's Szechwan species which is hardy here. The red flowers appear when the shrub is quite young. Should be introduced as a climbing shrub for trellises, etc.

63403. *SCHIZOPHRAGMA INTEGRIFOLIA* Oliver. Hydrangeaceae.

A climbing shrub, closely related to the hydrangeas, native to rocky places in central China. It reaches about 15 feet in height, and has broadly oval, bright-green leaves about 5 inches long. The inflorescence consists of loose terminal clusters of small, white flowers, with large and showy sterile flowers at the margins of these clusters. This shrub is hardy as far north as southern Massachusetts.

For previous introduction, see S. P. I. No. 62280.

63404 to 63408.

From Algeria. Collected by David Fairchild, agricultural explorer, Bureau of Plant Industry. Received March 21, 1925. Notes by Doctor Fairchild.

63404. *ARUNDO PLINII* Turra. Poaceae.

Cuttings. It is this species of *Arundo*, and not *Arundo donax*, which is so much used for windbreaks and all sorts of shading mats by the vegetable growers of the Algerian coast. It is very different in habit from *A. donax*, having upright leaves instead of pendent ones, and, being smaller, is therefore useful for a wider variety of purposes.

63405. *BETA VULGARIS* L. Chenopodiaceae. Beet.

Cape Matifou. February 27, 1925. Var. *maritima*. Plants collected by Doctor Trabut and myself. A form occurring on the headlands of the African

63404 to 63408—Continued.

coast, with exceedingly thick, fleshy, brittle leaves. This should furnish the start for the production of a fleshy leaved variety of beet for use as a pot-herb.

63406. *CASIMIROA EDULIS* Llave. Rutaceae. White sapote.

Cuttings of an Algerian strain.

63407. *DIOSPYROS SINENSIS* Hemsl. Diospyraceae.

Cuttings of a species which I believe is the one Frank Meyer found south of Shanghai years ago and of which we lost the material. He found that it was being used there as a stock for *Diospyros kaki* and the trunk, below the graft, had white bark. Trees of this species are growing at Fondouk, Algeria; these originally came from the Jardin d'Essais du Hamma many years ago.

63408. *EUONYMUS* sp. Celastraceae.

Cuttings of an extremely dwarf species used as a border for flower beds in the same way as box is used, to separate the beds from the gravel walk.

63409. *VITIS VINIFERA* L. Vitaceae. European grape.

From Algiers, Algeria. Cuttings presented by Dr. L. Trabut. Received February 14, 1925.

An unnamed Algerian variety.

63410 to 63426.

From Paris, France. Purchased from Vil-morin-Andrieux & Co., through David Fairchild, agricultural explorer, Bureau of Plant Industry. Received March 19, 1925. Notes by Doctor Fairchild.

63410. *IRIS FOETIDISSIMA* L. Iridaceae.

Seeds of a rank-growing iris which I saw only in fruit. The deep-green leaves attracted my attention, and its red berries, Doctor Trabut says, constitute its chief attraction.

63411. *MORUS KAGAYAMAE* Koidzumi. Moraceae. Mulberry.

A handsome Japanese mulberry which thrives in Algeria. The leaves are readily eaten by silkworms.

63412. *ORCHIS ROBERTIANA* Loisel. Orchidaceae.

Plants from the Hamez Barrage near Algiers, where it occurs wild. A tall orchid with rather attractive greenish purple flowers, over half an inch across. According to Doctor Trabut this terrestrial orchid is easily grown in good garden soil and will persist for many years if once transplanted. When grown in good soil it will grow to a height of several feet.

63413. *OREOPANAX EPREMESNILIANUM* Andre. Araliaceae.

Cuttings from a tree in the Botanic Gardens of Mustapha which is an object of striking beauty. This is a shade tree of tropical American origin, having large, palmate leaves of a shining dark green.

63414. *PAPAVR ATLANTICUM* Ball. Papaveraceae. Poppy.

Seeds of a perennial poppy, 1 to 2 feet high, covered throughout with copious hairs. The orange-red or scarlet flowers are 2 to 3 inches wide.

63410 to 63426—Continued.

63415. *PAPAYER SETIGERUM* DC. Papaver-
aceae. **Poppy.**

Forma *atropurpurea*. Seeds of a violet-flowered, annual poppy, closely related to the opium poppy (*Papaver somniferum* L.). Native to the Mediterranean region.

63416. *PELARGONIUM LATERIPES* L'Herit. Geraniaceae.

A beautiful strain of a handsome running species of the so-called "Geranium." It is used in Algiers to cover the retaining walls of the roadways.

63417. *PELARGONIUM PELTATUM* (L.) Ait. Geraniaceae.

Cuttings of a variety used in the same way as S. P. I. No. 63416, but having larger leaves and more conspicuous brilliant pink flowers; probably a very good form for window-box use.

63418. *PHOENIX CANARIENSIS* × *RECLINATA*. Phoenixaceae. **Palm.**

Seeds of one of the finest specimens in Arthurs Garden, Algiers. This very graceful palm, which is much more attractive than the type *Phoenix canariensis*, should be substituted for it in California.

63419. *POPULUS EUPHRATICA* Oliver. Salicaceae. **Poplar.**

Var. *mauretanica*. Cuttings of what is probably a very ancient variety from the wet regions along the Euphrates in Mesopotamia. This form has interesting foliage, and, because of its ability to grow in the wet lands along irrigation ditches, where the soil is often saline from seepage, may be useful for similar regions in the United States.

63420. *POPULUS THEVESTINA* Dode. Salicaceae. **Poplar.**

Cuttings of one of the most brilliant, white-barked species of poplars I have ever seen. It grows to a fair size and resembles in its fastigate form the Italian poplar. Doctor Trabut remarks that it is less affected by a species of borer which attacks the Italian poplar and is altogether superior to that species as a tree for parks.

63421. *POPULUS TOMENTOSA* Carr. Salicaceae. **Chinese white poplar.**

Cuttings of a handsome species growing in the Jardin d'Essais at Maison Carree, Algiers. It is of upright growth, with widespreading branches, brilliant white bark, and large leaves.

63422. *PRUNUS MUME* Sieb. and Zucc. Amygdalaceae. **Japanese apricot.**

Scions of a very handsome Japanese flowering apricot, with semidouble deep-pink flowers, growing in a garden at Fonduk. I have never seen a more floriferous or prettier variety than this and surmise it may be quite new to our collection.

63423. *ROSA* sp. Rosaceae. **Rose.**

Madame Tellier. Seeds of a beautiful, very vigorous variety from the garden of Doctor Trabut at Mustapha Supérieure. The flowers are salmon pink, and the fruits are unusually large and fleshy.

63410 to 63426—Continued.

63424. *RUMEX SANGUINEUS* L. Polygonaceae.

Cuttings of a tall shrub which Doctor Trabut informs me is used in Sicily and the Canaries for hedge purposes. The leaves are sour like those of *Rumex acetosella*.

63425. *RUMEX TUBEROSUS* L. Polygonaceae.

Plants of a variety from Blida, Algeria, presented by Professor Maire, of the University of Algiers. This is a vigorous grower with elongated leaves which are used in the preparation of a sorrel soup, as are those of the true "oseille," *Rumex acetosa*. It is more resistant to frost than the ordinary oseille.

63426. *SCHINUS TEREBINTHIFOLIUS* Raddi. Anacardiaceae. **Brazilian pepper tree.**

Scions from a selected tree.

63427. *LECYTHIS ZABUCAJO* Aubl. Lecythidaceae. **Sapucaia nut.**

From Cartagena, Colombia. Seeds obtained through Lester L. Schnare, American consul. Received March 30, 1925.

Like the Brazil nut, the sapucaia is native to the Amazon Valley and adjacent regions, whence it is occasionally exported. Apparently it has never formed the basis of a considerable industry, as has the Brazil nut. By many people it is considered of even better flavor and quality than the latter.

The somewhat triangular nuts are over 2 inches long and about an inch wide. They are borne in large, woody, urn-shaped capsules, about 6 inches in diameter, with close-fitting lids at the top.

It seems unlikely that this tree will succeed in the United States, but it ought to do so in the Canal Zone, Porto Rico, Hawaii, and elsewhere in the Tropics. It seems never to have received much horticultural attention. Perhaps this is because of its slow growth and the long time required for trees to reach bearing age.

63428. *ALSTONIA CONSTRICTA* F. Muell. Apocynaceae.

From Sydney, New South Wales. Seeds presented by the director, Botanic Garden. Received March 30, 1925.

A tall shrub or tree, native to southeastern Australia, which is said to be of possible value as a source of rubber.

63429 and 63430. *JUGLANS REGIA* L. Juglandaceae. **Persian walnut.**

From Srinagar, Kashmir, India. Seeds presented by R. K. Koul, proprietor, Koul's Gardens. Received March 30, 1925.

Walnuts have been cultivated since remote times in the hilly portions of India, and in Kashmir especially the industry has been highly developed. These seeds are from superior varieties which grow at an altitude of about 5,500 feet, in a region where mild winters and warm, but not hot, summers prevail.

63429. *Burzil.* 63430. *Kaghzi.*

For previous introduction, see S. P. I. No. 58629.

63431 to 63476.

From China. Collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received March, 1925. Notes by Mr. Dorsett.

From the orchard area along the northern foothills near Huailai, about 1,800 feet above sea level.

63431 to 63433. *AMYGDALUS PERSICA* L. (*Prunus persica* Stokes). Amygdalaceae. Peach.

63431. No. 1986. Tunghoshankou, near Huailai. February 3, 1925. *Kang Tze Tao* (jar peach). Scions of a small, red peach, 1 to 2 inches in diameter. Ripens during August, becoming creamy white with a pink blush.

63432. No. 2027. Tsanfengying, near Huailai. February 5, 1925. Scions of the *Lo Yieh Pai Tao* (white-leaved peach). The fruits are 2 to 3 inches in diameter, becoming white when ripe, which is during August.

63433. No. 2028. Tsanfengying, near Huailai. February 5, 1925. Scions of the *Yiu Tao* (silver peach). The fruits are white with a pink blush, 3 to 4 inches in diameter, and ripen early in September.

63434. *AVENA NUDA* Hoefer. Poaceae. Naked oats.

No. 1949 Huailai. February 2, 1925. Known here as "oil wheat." Huailai is located in a broad valley, along the northern foothills, at an altitude of about 1,600 feet, which appears to be very well watered.

63435. *CANNABIS SATIVA* L. Moraceae. Hemp.

No. 1957. Huailai. February 2, 1925. Seeds.

63436. *FAGOPYRUM VULGARE* Hill (*F. esculentum* Moench.). Polygonaceae. Buckwheat.

No. 1955. Huailai. February 2, 1925. Seeds.

63437. *HOLCUS SORGHUM* L. (*Sorghum vulgare* Pers.). Poaceae. Sorghum.

No. 1953. Huailai. February 2, 1925. Seeds of a red sorghum.

63438 to 63448. *MALUS* spp. Malaceae. Apple.

63438. *MALUS* sp.

No. 1969. Shih tungtzu, near Huailai. February 3, 1925. Scions of an apple about 2 inches in diameter, which ripens in early September, becoming green and red.

63439. *MALUS* sp.

No. 1970. Shih tungtzu, near Huailai. February 3, 1925. Scions of a good-sized, red winter apple reported by the Chinese to be very good, but we found it soft and sweet and of only fair quality.

63440. *MALUS* sp.

No. 1971. Shih tungtzu, near Huailai. February 3, 1925. Scions of a winter apple, greenish with a red blush which sometimes extends over the fruit sufficiently to justify calling it red.

63431 to 63476—Continued.

63441. *MALUS* sp.

No. 1991. Tunghoshankou, near Huailai. February 3, 1925. Scions of an apple, 3 to 4 inches in diameter, which varies from pink to bright red and ripens in early September.

63442. *MALUS* sp.

No. 1993. Tunghoshankou, near Huailai. February 3, 1925. Scions of a fragrant apple, 2½ to 3 inches in diameter, which ripens during August, becoming green and red.

63443. *MALUS* sp.

No. 1996. Tunghoshankou, near Huailai. February 3, 1925. Scions of what the Chinese call *Sha Kuo Li* (crab-apple pear). The fruits, 1 to 2 inches in diameter, are similar to a pear when ripe, being light yellow with a pink blush. They ripen early in September.

63444. *MALUS* sp.

No. 1997. Tunghoshankou, near Huailai. February 3, 1925. Scions of an apple about 2 inches in diameter which ripens during September, being covered with large green and red spots. The flesh is acid in flavor.

63445. *MALUS* sp.

No. 1999. Tunghoshankou, near Huailai. February 3, 1925. Scions of a fragrant white apple, 2 to 3 inches in diameter, which ripens in August.

63446. *MALUS* sp.

No. 2008. Tung Hua Ssu temple, near Huailai. February 4, 1925. Scions of *Ping Kuo Tao* (peach apple). The fruits, 3 to 4 inches in diameter, have the shape of an apple but the flavor of a peach. They ripen in September.

63447. *MALUS* sp.

No. 2022. Tsanfengying, near Huailai. February 5, 1925. Scions of the *Pa Leng Hai Tang* (Polygon crab apple). The red fruits, 1 to 1½ inches in diameter, ripen in September.

63448. *MALUS* sp.

No. 2029. Tsanfengying, near Huailai. February 5, 1925. Scions of an apple, white with a pink blush, which ripens in September.

63449. *NICOTIANA TABACUM* L. Solanaceae. Tobacco.

No. 1975. February 3, 1925. Seeds of a large-leaved Chinese tobacco growing on the northern side of the White River, west of Huailai.

63450. *PHASEOLUS ANGULARIS* (Willd.) W. F. Wight. Fabaceae. Adzuki bean.

No. 1950. Huailai. February 2, 1925. Seeds of a small white bean.

63451. *PHASEOLUS AUREUS* Roxb. Fabaceae. Mung bean.

No. 1946. Huailai. February 2, 1925. Seeds of a green bean.

63452 and 63453. *PHASEOLUS VULGARIS* L. Fabaceae. Common bean.

63452. No. 1951. Huailai. February 2, 1925. Seeds of a yellow garden bean.

63431 to 63476—Continued.

63453. No. 1952. Huailai. February 2, 1925. Seeds of a white garden bean.

63454. *POPULUS* sp. Salicaceae. Poplar.

No. 2019. Tung Hua Ssu temple, near Huailai. February 4, 1925. Cuttings of a small-leaved poplar which was growing along waterways in the deciduous-fruit growing region of the foothills.

63455 to 63457. *PRUNUS ARMENIACA* L. Amygdalaceae. Apricot.

63455. No. 2013. Tunghoshankou, near Huailai. February 4, 1925. Scions of the *Shui Hsing* (winter apricot). The yellow freestone fruits, 1½ to 2 inches in diameter, ripen in June.

63456. No. 2026. Tsanfengyung, near Huailai. February 5, 1925. Scions of a fragrant freestone apricot, 2 inches in diameter, which ripens about the middle of June, becoming light cream colored with a pink blush.

63457. No. 2030. Tsanfengyung, near Huailai. February 5, 1925. Scions of the *Chin Kang Chuan Hsing* (Buddha's hand apricot). A yellow clingstone, about 2 inches in diameter, which ripens in July. The kernel is quite sweet.

63458 to 63461. *PRUNUS* spp. Amygdalaceae. Plum.

63458. *PRUNUS* sp.

No. 1976. Tunghoshankou, near Huailai. February 3, 1925. Scions of the *Huang Niu Hsiu Li Tze* (yellow ox-heart plum). The fruits are said to be 1 to 1½ inches in diameter and about 2 inches long.

63459. *PRUNUS* sp.

No. 1976a. These scions are from a different tree than No. 1976 [S. P. I. No. 63458].

63460. *PRUNUS* sp.

No. 1988. Tunghoshankou, near Huailai. February 3, 1925. Scions of the *Niu Hsin Hung Li Tze* (red ox-heart plum). The dark-red fruits are 1 to 2 inches in diameter with yellow flesh, ripening during June and July.

63461. *PRUNUS* sp.

No. 2012. Tunghoshankou, near Huailai. February 4, 1925. Scions of the *Ting Pi Hung Li Tze* (red-topped plum). The yellow-fleshed fruits ripen during August and are 1 to 1½ inches in diameter.

63462 to 63466. *PYRUS* spp. Malaceae. Pear.

63462. *PYRUS* sp.

No. 1978. Tsanfengyung, near Huailai. February 3, 1925. Scions of the *Hung Hsiao Li* (red sour pear). The yellow fruits, 2 to 2½ inches in diameter, ripen in September.

63463. *PYRUS* sp.

No. 1980. Tunghoshankou, near Huailai. February 3, 1925. Scions of the *Chin Pa Hsiang Li* (fragrant golden handle pear). Sometimes called "cold" pear. The yellow fruits, 3 or more inches in diameter, ripen in September.

63431 to 63476—Continued.

63464. *PYRUS* sp.

No. 1908a.

63465. *PYRUS* sp.

No. 2025. Tsanfengyung, near Huailai. February 5, 1925. Scions of the *Yuan Ping Li* (round pear). The fruits, yellow with a pink blush, are 2 to 3 inches in diameter, ripening during September.

63466. *PYRUS* sp.

No. 2033. Tsanfengyung, near Huailai. February 5, 1925. Scions of the *Tieh Li* (iron pear) or *Suan Li* (sour pear). The fruit is 1½ to 2 inches in diameter and is yellow when ripe, but has to be kept a considerable length of time before it is ready to eat.

63467. *ROSA* sp. Rosaceae. Rose.

No. 2037. Peking. February 10, 1925. Cuttings of a very attractive double, bright-red rose, about 2 inches in diameter, presented by Prof. W. E. Chamberlain, head of the Department of Agriculture of the Peking University. This rose appears to be quite hardy and does not bear many thorns. It is evidently a climber and blooms continuously from August until frost.

63468 and 63469. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceae. Soy bean.

63468. No. 1947. Huailai. February 2, 1925. Seeds of a yellow variety.

63469. No. 1948. Huailai. February 2, 1925. Seeds of a black variety.

63470. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceae. Common wheat.

No. 1945. Huailai. February 2, 1925. Seeds of Chinese spring wheat.

63471. *VICIA FABA* L. Fabaceae. Broad bean.

No. 1954. Huailai. February 2, 1925. *Tsan Tou* (silkworm bean). Seeds of an English broad bean.

63472. *VIGNA SESQUIPEDALIS* (L.) Frurth. Fabaceae. Yard Long bean.

No. 1960. Huailai. February 2, 1925. Seeds of a rather long and fairly broad bean which is yellow with longitudinal streaks.

63473 to 63475. *VIGNA SINENSIS* (Torner) Savi. Fabaceae. Cowpea.

63473. No. 1956. Huailai. February 2, 1925. Seeds of a pink or red cowpea.

63474. No. 1961. Huailai. February 2, 1925. Seeds of a cowpea mottled brown and cream colored.

63475. No. 1962. Huailai. February 2, 1925. Seeds of a yellow cowpea with a white or slightly brownish eye.

63476. *ZIZIPHUS JUJUBA* Mill. (*Z. sativa* Gaertn.). Rhamnaceae. Jujube.

No. 2023. Tsanfengyung, near Huailai. February 5, 1925. Scions of the *Chia Tsao* (home jujube). The fruits are said to be 1 to 1½ inches in diameter and 22 inches long.

63477. TRITICUM AESTIVUM L. (*T. vulgare* Vill.). Poaceae. **Common wheat.**

From Orleans, Loiret, France. Seeds presented by Edmond Versin. St. Jean le Blanc. Received March 27, 1925.

A new winter-wheat selection; not yet named nor in the trade. The heads are large and well filled; the yield is very large and the quality excellent. It is rust resistant and does not lodge; it is sown in October or November, maturing in July. (*Versin.*)

63478. TRIFOLIUM PRATENSE L. Faba-ceae. **Red clover.**

From Chalonnès sur Loire, France. Seeds presented by E. Jouffray. Received February 6, 1925.

Locally grown seeds.

63479 to 63483.

From Algeria. Collected by David Fairchild, agricultural explorer, Bureau of Plant Industry. Received March 30, 1925. Notes by Doctor Fairchild.

63479. IRIS ALATA Poir. Iridaceae. **Scorpion iris.**

Plants of a dwarf iris growing in the dry, stiff, clay soils west of Aumale, Algeria, at an altitude of 2,500 feet. The rhizomes are located several inches below the surface, and in the autumn the plant sends up beautiful blue flowers. The leaves look like grass and are spread out in a kind of rosette.

63480. NARCISSUS BULBOCODIUM MONOPHYLLUS (Dur.) Baker. Amaryllidaceae.

A delicate, white-flowered plant, closely related to the narcissus but more delicate than any narcissus I ever saw. It is fragrant but less so than some other narcissus. The slender scape rises above the rocky ground to a height of not over 8 inches. In the summer it must be exposed to the blazing subtropical sun and get thoroughly dried out, for it occurs on the mountain tops in the edge of the Sahara near the Oasis of Bou Saada.

63481. POPULUS THEVESTINA Dode. Salicaceae. **Poplar.**

Cuttings of a strictly fastigate, brilliantly white-barked desert poplar. As I saw this tree it seemed to me that I had never seen any poplar so delicate in outline or so ghostlike in its white coloring. As a landscape tree for the irrigated regions of California it should prove to be a great addition.

63482. ROMULEA BULBOCODIUM (L.) Sebast. and Mauri. Iridaceae.

Bulbs. As we drove from Aumale to the Oasis of Bou Saada we observed the Arab boys and women digging up the tiny corms of this plant and tying them into bundles. We found these corms good to eat and quite sweet. The baked clay soils of this region are peppered with the little rosettes made by the slender grasslike leaves.

63483. SCILLA PERUVIANA L. Liliaceae. **Squill.**

Bulbs. On the baked clay steppes of the region east of Aumale we found that

63479 to 63483—Continued.

the rosettes of this interesting species were common.

A blue-flowered, bulbous plant resembling the hyacinth in habit.

63484 to 63486.

From Srinagar, Kashmir, India. Seeds presented by R. K. Koul, proprietor, Koul's Gardens. Received March 30, 1925. Notes by Mr. Koul.

63484. BRASSICA OLERACEA CAULO-RAPA DC. Brassicaceae. **Kohl-rabi.**

The *Knol-khol* is indigenous to Kashmir and was cultivated there long before America was discovered. The appearance is somewhat rough and the skin hard, but it is a most delicious vegetable, and I consider it far superior to the American kind imported into the Old World. The Kashmir varieties known as *Munjées*, 2 to 8 pounds in weight, are rare, being cultivated at only a few places in the valley. Besides being eaten as an ordinary vegetable, they make splendid pickles.

63485. BRASSICA OLERACEA VIRIDIS L. Brassicaceae. **Kale.**

The Kashmir sag (*Karmi Hakh*) is between 12 and 18 inches long and is indigenous to Kashmir. When the leaves are from 4 to 5 inches long and five to six in number each leaf is picked and collected in bundles of 10 to 12 each. The pickings, which take place every now and then during the season, are from the side shoots and not from the stem, which is kept intact. There are two ways of preparing this vegetable: First, the leaves when well examined and washed are slightly fried in oil or butter and then a sufficient quantity of water, salt, and condiments added, and the leaves are boiled until soft; second, the leaves are first boiled and then fried and spiced. This vegetable is very delicious and is peculiar only to Kashmir.

63486. RAPHANUS SATIVUS L. Brassicaceae. **Radish.**

The Mirpur radishes are large, between 12 and 13 inches long and from 1 to 4 pounds in weight, and are famous throughout northern India. They are eaten raw after being cut into small slices, are very delicious, and are better than any other table radish. They may also be cooked as an ordinary vegetable or used for pickling.

63487 to 63489.

From Medellín, Colombia. Seeds presented by Camilo C. Restrepo. Received March 7, 1925. Notes by Señor Restrepo.

63487. CHLORIS sp. Poaceae. **Grass.**

Splendid for permanent pastures; originally from Australia.

63488. ECHINOCHLOA sp. Poaceae. **Grass.**

Janeiro grass. A good grass for arid land.

63489. JUGLANS sp. Juglandaceae. **Walnut.**

An unidentified species.

<i>Grain Futures Administration</i>	J. W. T. DUVEL, <i>Chief</i> .

This inventory is a contribution from

<i>Bureau of Plant Industry</i>	WILLIAM A. TAYLOR, <i>Chief</i> .
<i>Office of Foreign Plant Introduction</i>	DAVID FAIRCHILD, <i>Senior Agricultural Explorer in Charge</i> .

UNITED STATES DEPARTMENT OF AGRICULTURE

INVENTORY No. 83

Washington, D. C.

Issued September, 1927

SEEDS AND PLANTS IMPORTED BY THE OFFICE OF FOREIGN PLANT INTRODUCTION, BUREAU OF PLANT INDUSTRY, DURING THE PERIOD FROM APRIL 1 TO JUNE 30, 1925 (NOS. 63490 TO 64428)

CONTENTS

	Page
Introductory statement-----	1
Inventory-----	3
Index of common and scientific names-----	50

INTRODUCTORY STATEMENT

For the second quarter of 1925, the period represented by this inventory, the general situation in respect to foreign agricultural explorations agrees rather closely with the period represented by the preceding inventory, No. 82. Doctor Fairchild was in Algeria and Morocco, Mr. Dorsett spent most of the time in the Province of Chihli, northern China, and Mr. McClure continued his work in the Province of Kwangtung, southeastern China.

Among the plant material obtained by Doctor Fairchild in Algeria were scions of three varieties of loquats (*Eriobotrya japonica*, Nos. 63557 to 63559). These were grown at the governor general's garden at Mustapha and are said to be superior types. From Dr. L. Trabut, also at Mustapha, Doctor Fairchild obtained seeds of a hybrid eucalypt (*Eucalyptus trabuti*, No. 63581). This was discovered by Doctor Trabut in the botanic gardens in Mustapha and is said to be an unusually rapid grower.

Mr. Dorsett's collections include an interesting series of native Chinese melon varieties (*Cucumis melo*, Nos. 63702 to 63713), six native cabbagelike vegetables (*Brassica* spp., Nos. 63910 to 63915), and many local types of beans, peas, wheat, and barley, obtained largely from the native markets in the villages of Chihli Province.

In 1925, according to the Yearbook of the Department of Agriculture for that year, about 25,000 acres were devoted to the growing of green peas in the United States. In order to assist horticulturists in extending this area by breeding disease-resistant strains and strains adapted to a variety of conditions, locally developed varieties were introduced from Germany, France, Sweden, England, and New South Wales.

One of the best date varieties grown in Lower Egypt is said to be the Samany (*Phoenix dactylifera*, No. 63975), offshoots of which have been obtained from the Egyptian Ministry of Agriculture. Date culture in the southwestern portion of the United States is progressing steadily, and Old World varieties are being sought which will be best adapted for growing in the different sections.

An Australian tree from the semiarid interior of New South Wales should be of interest for growing in the drier regions of the Southwest. This is the wilga (*Geijera parviflora*, No. 64000), a low tree resembling the weeping willow. The leaves of this drought-resistant tree are fed to cattle in New South Wales.

A collection of *Crotalaria*s (Nos. 64058 to 64065) and one of *Crotalaria*s and *Sesbans* (Nos. 64066 to 64070), the former from South Africa and the latter from Egypt, will be tested in the Southern States as cover plants and as forage.

Through the courtesy of Em. Miége, Chief of the Service de l'Expérimentation Agricole of Morocco, seeds have been obtained of a noteworthy cotton variety (*Gossypium* spp., Nos. 64002 and 64003). This variety is called "Sarsar," from the name of the tribe which has grown it from time immemorial in the interior of Morocco. Because of its unusual precocity, resistance to drought, and length and strength of fiber, comparable to that of the Yuma variety, it should be of interest to cotton breeders in this country.

Bureau specialists testing rubber-producing plants will be interested in the several introductions of *Landolphas* from tropical Africa, *Funtumia elastica* (No. 63786) from the Gold Coast Colony, Africa, and Ceara rubber (*Manihot glaziovii*, No. 63798), one of the important Brazilian rubber-producing plants.

The botanical determinations of these introductions have been made and the nomenclature determined by H. C. Skeels, and the descriptive matter has been prepared under the direction of Paul Russell, who has had general supervision of this inventory.

ROLAND McKEE,

Acting Senior Agricultural Explorer in Charge.

OFFICE OF FOREIGN PLANT INTRODUCTION,

Washington, D. C., February 3, 1927.

INVENTORY¹

63490 to 63495. SOLANUM TUBEROSUM L. Solanaceae. Potato.

From Paris, France. Tubers purchased from Vilmorin-Andrieux & Co. Received May 6, 1925.

Locally developed varieties.

63490. *Chardon*.

63491. *Général Authaine*.

63492. *Institut de Beauvais*.

63493. *Maréchal Foch*.

63494. *Maréchal Joffre*.

63495. *Saucisse*.

63496. LILIUM CROCEUM Chaix. Liliaceae. Lily.

From Stuttgart, Germany. Bulbs purchased from Wilhelm Pitzer. Received May 21, 1925.

Horticulturists engaged in lily-breeding experiments in the United States are endeavoring to obtain material of *Lilium bulbiferum*. This is said to be offered in the trade in Europe as *L. croceum*, the orange lily, and material of the latter is now being introduced for comparison tests.

63497. THUNBERGIA GRANDIFLORA Roxb. Acanthaceae.

From Kingston, Jamaica. Cuttings presented by W. S. Goodman, superintendent. Hope Gardens. Received May 2, 1925.

Variety *alba*. The typical form of *Thunbergia grandiflora* is well known in tropical gardens, where it is highly esteemed for its large, sky-blue flowers and the ornamental effect of its foliage. The white form (variety *alba*) is less widely cultivated, though perhaps as meritorious as the type. It is a strong-growing climber, useful for covering pergolas and fences, and is sufficiently frost resistant for cultivation in the warmer parts of Florida and the most favored sections of southern California. (Note by Wilson Popenoe under S. P. I. No. 57216.)

¹ It should be understood that the names of varieties of fruits, vegetables, cereals, and other plants used in this inventory are those under which the material was received when introduced by the Office of Foreign Plant Introduction, and, further, that the printing of such names here does not constitute their official publication and adoption in this country. As the different varieties are studied, their entrance into the American trade forecast, and the use of varietal names for them in American literature becomes necessary, the foreign varietal designations appearing in this inventory will be subject to change with a view to bringing the forms of the names into harmony with recognized horticultural nomenclature.

It is a well-known fact that botanical descriptions, both technical and economic, seldom mention the seeds at all and rarely describe them in such a way as to make possible identification from the seeds alone. Many of the unusual plants listed in these inventories are appearing in this country for the first time, and there are no seed samples or herbarium specimens with ripe seeds with which the new arrivals may be compared. The only identification possible is to see that the sample received resembles seeds of other species of the same genus or of related genera. The responsibility for the identifications, therefore, must necessarily often rest with the person sending the material. If there is any question regarding the correctness of the identification of any plant received from this office, herbarium specimens of leaves and flowers should be sent in so that definite identification can be made.

63498 and 63499.

From Matania el Saff, Egypt. Seeds presented by Alfred Brucher, director, Middle Egypt Botanic Station. Received April 28, 1925.

63498. ONCOBA SPINOSA Forsk. Flacourtiaceae.

The discovery of chaulmoogric acid in the seeds of *Oncoba echinata* has prompted the testing of other species of the same genus for the presence of this acid, now used in the treatment of leprosy. *O. spinosa* is described (Flora of Tropical Africa, vol. 1, p. 115) as a spiny shrub with elliptic, membranous leaves and showy, fragrant, white flowers about 2 inches across. The round, hard-shelled fruit, 2 inches in diameter, is eaten by the natives of tropical Africa, where the shrub is indigenous. The shells are often used as ornaments.

63499. SCLEROCARYA BIRREA (A. Rich.) Hochst. Anacardiaceae.

A tropical African tree 25 to 50 feet tall, with leathery pinnate leaves and light-yellow round fruits about an inch in length. The sweet resinous flesh incloses a stony nut containing two to four seeds which have a flavor similar to that of walnuts and are a favorite food of the natives of Abyssinia.

63500 to 63521. DIOSPYROS KAKI L. f. Diospyraceae. Kaki.

From Nanking, China. Scions presented by M. Leslie Hancock, University of Nanking. Received April 1, 1925.

These scions are from our persimmon orchard here at the university; the material was received from many sources, and there are probably several duplications in the collection. (Hancock.)

63500. No. 6.	63505. No. 13.
63501. No. 7.	63506. No. 15.
63502. No. 10.	63507. No. 16.
63503. No. 11.	63508. No. 17.
63504. No. 12.	63509. No. 18.

63500 to 63521—Continued.

63510. No. 19.	63516. No. 28.
63511. No. 20.	63517. No. 29.
63512. No. 21.	63518. No. 31.
63513. No. 23.	63519. No. 32.
63514. No. 24.	63520. No. 33.
63515. No. 27.	63521. No. 34.

63522 to 63541. *HELIANTHUS TUBEROSUS* L. Asteraceae. Jerusalem artichoke.

From Paris, France. Tubers obtained from Vilmorin-Andrieux & Co., through D. N. Shoemaker, Bureau of Plant Industry. Received April 1, 1925.

Locally grown strains.

63522. No. 3/21.	63532. No. 21/23.
63523. No. 4/21.	63533. No. 26/23.
63524. No. 8/21.	63534. No. 27/23.
63525. No. 10/23.	63535. No. 29/23.
63526. No. 14/23.	63536. No. 30/23.
63527. No. 15/22.	63537. No. 33/23.
63528. No. 16/22.	63538. No. 35/23.
63529. No. 12/23.	63539. No. 38/23.
63530. No. 18/23.	63540. No. 43/23.
63531. No. 19/22.	63541. No. 45/23.

63542 to 63544. *SOLANUM TUBEROSUM* L. Solanaceae. Potato.

From Klein Wanzleben, Germany. Tubers presented by Dr. Phil. Oskar Rabbethge. Received April 2, 1925. Notes by Doctor Rabbethge.

European varieties, not in the American trade, introduced for potato-breeding experiments.

63542. Centifolia. A cross between Borcken and Flora, originated by the plant breeder Von Kameke. It is a red-skinned, white-fleshed table variety, and is very healthy. Season medium and yield large.

63543. Industry. A cross between Richter's Early and Simon, originated by the plant breeder Madow. It is grown on heavy soil. In western Germany it is the predominating yellow-fleshed table variety. It is a heavy yielder, matures late, but is susceptible to rot.

63544. Pepo. A cross between Deutsches Reich and Jubel, originated by the plant breeder Von Kameke. A light yellow-fleshed table variety, of very large yield. Resistant to rot and scarcely susceptible to fungous diseases; very resistant to wart disease. The lilac-colored flowers are inclined to vary.

63545. *TRIFOLIUM REPENS* L. Fabaceae. White clover.

From Edinburgh, Scotland. Plants presented by William Wright Smith, regius keeper, Edinburgh Botanic Garden. Received April 4, 1925.

Obtained from the Scottish Board of Agriculture. (Smith.)

Sent in response to a request for material of the brown-leaved strain of white clover; to be tested by clover specialists.

63546. *SACCHARUM OFFICINARUM* L. Poaceae. Sugar cane.

From Fortuna, Porto Rico. Cuttings presented by I. Mutz, through E. W. Brandes, Bureau of Plant Industry. Received April 1, 1925.

H 109.

A locally developed strain.

63547 and 63548. *PISUM SATIVUM* L. Fabaceae. Pea.

From Valence sur Rhone, France. Seeds obtained from Tézier Frères. Received April 2, 1925.

Locally grown strains.

63547. Mange-tout violet.

63548. Serpette française. An improved form with long pods.

63549. *ELEOCHARIS TUBEROSA* (Roxb.) Schult. Cyperaceae.

From Canton, China. Tubers collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received April 3, 1925.

No. 29. *Ma tai, Hon ma tai.* A variety of *ma tai* which differs in its cultural methods from the ordinary variety in that the irrigation water is withdrawn some time before the crop is ripe. The harvesting method is affected profoundly because with the variety commonly grown around Canton the crop is searched for blindly by women standing knee deep in mud and water, but with this variety the harvesting is done with a hoe, resulting in much less expenditure of labor. The culture of *ma tai* is rather complicated in that the corms are put through two preliminary "plantings" before they finally reach the field in which they produce. At the end of June or early in July the corms are set thickly in a bed and barely covered with soil. They are kept moist, and when their sprouts are 6 or 7 centimeters long they are transplanted to a wet culture plot and set about 1 foot apart each way. When the sprouts are about 30 centimeters high they are again transplanted to a wet culture field, usually one from which the first rice crop has just been harvested, and this time set about 3 feet apart in rows 3 feet apart, and alternated so that each plant is equally distant from all of its adjacent neighbors. Henceforth they are irrigated much the same as rice. When the plants become established each is given a small handful of powdered bean or peanut cake. The irrigation is discontinued in October. (McClure.)

63550. *CITRUS AURANTIUM* L. Rutaceae. Sour orange.

From Algeria. Seeds collected by David Fairchild, agricultural explorer, Bureau of Plant Industry. Received April 6, 1925.

From the Jardin d'Essais, Maison Carree. To be tested by citrus growers as a root-stock in comparison with strains of the same species already growing in the United States.

63551. *ALPINIA* sp. Zinziberaceae.

From Kwangtung Province, China. Rhizomes collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received April 3, 1925.

63551—Continued.

No. 28. January 17, 1925. Obtained from the village of Taichong. *Wong keung*. This is an important crop in this region, one village having harvested this year 1,000 mau [approximately 2 acres]. The yield is from 30 to 50 piculs [3,570 to 5,950 pounds] of the fresh rhizomes per mau [about one-sixth acre]. When dried, in preparation for the market, the rhizomes shrink from 25 to 30 per cent. The rhizomes are planted during April, sandy soil being preferred, about 10 inches apart in rows 14 inches apart, of which two occupy each raised bed. The number of rhizomes planted on each mau varies between 3,000 to 5,000, depending upon the richness of the soil. (*McClure*.)

63552. *NERIUM OLEANDER* L. Apocynaceae. Oleander.

From Algeria. Seeds collected by David Fairchild, agricultural explorer, Bureau of Plant Industry. Received April 6, 1925.

Seeds from wild plants growing in the Oasis of Bou Saada. To be tested for resistance to scale infestation.

63553. *GOSSYPIUM HIRSUTUM* L. Malvaceae. Cotton.

From Paris, France. Seeds presented by Vilmorin-Andrieux & Co., through Walter T. Swingle, Bureau of Plant Industry. Received April 6, 1925.

Coton Yerli.

To be tested by cotton specialists.

63554 to 63560.

From Algeria. Collected by David Fairchild, agricultural explorer, Bureau of Plant Industry. Received April 6, 1925. Notes by Doctor Fairchild.

63554. *BOUGAINVILLEA WARSZEWICZII* Hort. Nyctaginaceae.

Cuttings of a horticultural variety of this gorgeous flowering climber. Instead of flowering feebly all through the season, this form bursts into bloom in the spring with a perfect mass of magenta flowers which completely hide the plant, and then it does not flower until the following spring.

63555 and 63556. *DIOSPYROS SINENSIS* Hemsl. Diospyraceae.

Trees grown from seed of fruits produced by a single tree in Galland Park, Algiers. Doctor Trabut says the fruits are especially fine, and Mrs. M. J. Melia, the wife of the head gardener of Galland Park, declares that they are finer flavored than any of the kaki she has eaten. I think this is the white-barked persimmon which Frank Meyer saw used as a stock for the kaki in Nanchow, south of Shanghai.

63555. Plants. 63556. Scions.

63557 to 63559. *ERIOBOTRYA JAPONICA* (Thunb.) Lindl. Malaceae. Loquat.

These scions are from the governor general's garden in Mustapha.

63557. Since this variety did not have a name, I called it "Governor General." The head gardener said that it produced very delicious fruits much larger than the Tanaka, but that they were not good for shipping.

63554 to 63560—Continued.

63558. This variety, which Doctor Trabut calls the "Tanaka" and which he says came direct from Japan, has elongated fruits. According to Doctor Trabut it is the best of all the varieties for shipping.

63559. *Tanaka Type Improved*. According to M. J. Melia, head gardener, Galland Park, Algiers, this is a seedling from Tanaka and is larger fruited but not so good a shipper.

63560. *FICUS NITIDA* Blume. Moraceae.

Cuttings of the broad-leaved type which has been found far superior as a street tree here. It is called "Camellia" by Doctor Trabut and "Laevigata" by Mr. Melia.

63561 to 63568. *PISUM SATIVUM* L. Fabaceae. Pea.

From Trier, Germany. Seeds obtained from J. Lambert & Son, through D. N. Shoemaker, Bureau of Plant Industry. Received April 7, 1925.

Locally developed strains.

63561. *Rival*.

63562. *Schalerbsen*.

63563. *Schweizer Riesen*.

63564. *Staatsminister Eyschen*.

63565. *Trierer Bristallzlas*.

63566. *Verbesserte Flämische Riesen*.

63567. *Vorbote* (Eclipse).

63568. *Yuni Schwert*.

63569 and 63570. *PISUM SATIVUM* L. Fabaceae. Pea.

From Göteborg, Sweden. Seeds obtained from Göteborgs Tradgardsforening, through D. N. Shoemaker, Bureau of Plant Industry. Received April 7, 1925.

Locally developed strains.

63569. *Säbe Svenske*.

63570. *Sockerart smor*.

63571. *FRAGARIA* sp. Rosaceae. Strawberry.

From Orleans, France. Plants purchased from Barbier & Co. Received April 9, 1925.

Eugene Trancon. This dwarf variety, with very thick, short flower stems, bears bright red, superb fruits which are enormous, nearly as big as Mademoiselle Moutot, but of a more regular shape, resembling Docteur Morère. The firm, sweet, melting flesh is a rosy salmon and richly perfumed. This is a mid-early sort and especially noted for its early crop. (*Catalogue of Barbier & Co.*)

63572 to 63577. *PISUM SATIVUM* L. Fabaceae. Pea.

From Lyon, France. Seeds obtained from Leonard Lille, through D. N. Shoemaker, Bureau of Plant Industry. Received April 6, 1925.

Locally developed strains.

63572. *Du Chemin Long*, No. 10106.

63573. *Mangetout Beurra*, No. 10337.

63572 to 63577—Continued.

63574. *Nain de Gonthier ou de Paris*, No. 19988.

63575. *Nain Leveque*, No. 10150.

63576. *Petit Provençal*, No. 10091.

63577. *Serpette d'Auvergne à très longue cosse*, No. 9884.

63578 and 63579. *PISUM SATIVUM* L.
Fabaceae. Pea.

From Manchester, England. Seeds obtained from Dickson, Brown, & Tait, through D. N. Shoemaker, Bureau of Plant Industry. Received April 6, 1925.

Locally developed strains.

63578. *Centenary*.

63579. *St. Duthus*.

63580. *ARRACACIA XANTHOBBHIZA* Bancroft (*A. esculenta* DC.). Apiaceae.
Arracacha.

From Mayaguez, Porto Rico. Tubers presented by T. B. McClelland, horticulturist, Porto Rico Agricultural Experiment Station. Received April 9, 1925.

The arracacha is a perennial herbaceous plant, closely related to the carrot and indigenous to the higher altitudes of northern South America. It grows about 3 feet high, with carrotlike foliage and small umbels of purple flowers. The large fleshy roots are important food in parts of South America and Central America; they are eaten boiled like parsnips or sliced raw and fried, and are said to be very palatable either way. Propagation is affected by making cuttings of the crown with a small piece of the root attached.

63581. *EUCALYPTUS TRABUTI* Vilm. Myrtaceae.

From Mustapha, Algeria. Seeds collected by Dr. L. Trabut and presented through David Fairchild, agricultural explorer, Bureau of Plant Industry. Received April 7, 1925.

Collected in the botanic gardens of the university, February 23, 1925. A remarkable hybrid between *Eucalyptus botryoides* Sm. (pistillate) and *E. rostrata* Schlecht (staminate) discovered by Doctor Trabut. The characters of the leaves are intermediate; the capsules could not well be more nearly intermediate. The great value of this hybrid is in its unusually rapid growth. (Fairchild.)

For previous introduction see S. P. I. No. 45769.

63582 and 63583.

From Amani, Tanganyika Territory, Africa. Seeds presented by A. H. Kirby, Director of Agriculture. Received April, 1925.

63582. *ALBIZZIA CHINENSIS* (Osbeck) Merr. (*A. stipulata* Boiv.). Mimosaceae.
No. 20.

A large, rapidly growing tree, native to the subtropical regions of eastern India. It is said by Watt (Dictionary of the Economic Products of India) to have been found very satisfactory in Assam as a shade tree for tea. The

63582 and 63583—Continued.

roots do not penetrate the soil deeply, and the foliage does not make a dense shade.

For previous introduction see S. P. I. No. 61480.

63583. *CHRYSOPHYLLUM MONOPYRENUM* Swartz. Sapotaceae. **Satin leaf.**
No. 236.

An ornamental West Indian tree, up to 35 feet high, with broad green leaves, rusty white beneath, small white flowers, and oblong blackish berries about an inch and a half long.

For previous introduction see S. P. I. No. 45107.

63584. *SYRINGA SWEGINZOWII* Koehne and Ling. Oleaceae. **Lilac.**

From Paris, France. Plants purchased from Vilmorin-Andrieux & Co., through David Fairchild, agricultural explorer, Bureau of Plant Industry. Received April 16, 1925.

An attractive hardy lilac, about 10 feet high, from western China. The dark-green, oval leaves are 2 to 4 inches long, and the fragrant, rosy lilac flowers are borne during June in terminal panicles up to 10 inches in length.

63585. *TRIFOLIUM PRATENSE* L. Fabaceae. **Red clover.**

From Montlucon, Allier, France. Seeds obtained from G. & M. Peronnin, through A. J. Pieters, Bureau of Plant Industry. Received April 23, 1925.

A locally developed strain.

63586. *BOUEA OPPOSITIFOLIA* (Roxb.) Meissn. (*B. burmanica* Griffith). Anacardiaceae. **Maprang.**

From Bangkok, Siam. Seeds presented by Dr. Yai S. Sanitwongse. Received May 16, 1925.

One of the wild relatives of the mango (*Mangifera indica*) is the maprang, an evergreen tree of moderate height, native to Burma and the Andaman Islands. The narrowly elliptic, pale-green, leathery leaves are opposite, and the small yellow flowers are produced in slender, lax, few-flowered panicles. There is considerable variation in the size and quality of the edible, yellow fruits. According to Doctor Sanitwongse, the trees grown in Burma and Indo-China bear only very small fruits which are very sour. In Siam, however, where the tree is cultivated in alluvial soil, with river irrigation, the fruits are large, light yellow, and have a flavor resembling that of a yellow plum or apricot. The hard, gray wood is said to be very durable. The tree may possibly be sufficiently hardy for growing in southern Florida.

For previous introduction see S. P. I. No. 55046.

63587. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceae.

Soy bean.

From London, England. Seeds presented by Dr. J. L. North, curator, Royal Botanic Gardens. Received May 16, 1925.

Grown at Budapest, Hungary, from seed obtained in Siberia. (North.)

63588. JUGLANS sp. Juglandaceae.**Walnut.**

From Ibarra, Ecuador. Seeds presented by José Felix Tamayo. Received June 17, 1925.

The tocte is an Ecuadorian tree which closely resembles the black walnut, but the leaves are somewhat larger. The nuts are an inch and a half in diameter, with a very thick, bony shell and a kernel of mild, pleasant flavor. The wood is hard and fine grained. Although the nuts are very popular in parts of Ecuador, the tree is not cultivated, but grows wild around cultivated fields and dooryards.

63589 to 63599.

From Ayr, Scotland. Seeds purchased from McGill & Smith. Received April 7, 1925.

Locally grown seeds.

63589. ANTHYLLIS VULNERARIA L. Fabaceae. Kidney vetch.

63590 to 63595. TRIFOLIUM PRATENSE L. Fabaceae. Red clover.

63590. English broad leaved.

63591. English late flowering.

63592 and 63593. Harvested in Switzerland at an altitude of 3,000 feet. (McGill & Smith.)

63592. Mountain red clover No. 1.

63593. Mountain red clover No. 2.

63594. Welsh.

63595. Wild.

63596 to 63599. TRIFOLIUM REPENS L. Fabaceae. White clover.

63596. English giant.

63597. English.

63598. New Zealand.

63599. Wild.

63600. TRIFOLIUM REPENS L. Fabaceae.
White clover.

From Edinburgh, Scotland. Seeds presented by William Wright Smith, regius keeper, Edinburgh Botanic Garden. Received April 6, 1925.

Mixed natural seed harvested at the Edinburgh Plant-Breeding Station in 1923 from a large number of plants of wild white clover which were originally taken from Orkney, Shetland, Caithness, and the north of Scotland. (Smith.)

Sent in response to a request for material of the brown-leaved strain of white clover.

63601. PASSIFLORA EDULIS Sims. Passifloraceae.
Purple granadilla.

From Epping, New South Wales, Australia. Seeds presented by L. P. Rosén & Son. Received April 7, 1925.

Perfecta. An improved strain of the granadilla or passion fruit. (Rosén.)

63602 to 63604. COFFEA spp. Rubiaceae.
Coffee.

From Mayaguez, Porto Rico. Seeds presented by T. B. McClelland, horticulturist, Porto Rico Agricultural Experiment Station. Received April 1, 1925.

63602 to 63604—Continued.**63602. COFFEA EXCELSA Cheval.**

According to the Philippine Review, vol. 9, p. 121, this coffee thrives from sea level to 700 meters, succeeds well on rather stiff clayey soils, and is the most resistant to blight and drought of any coffee. It might be grown with an annual rainfall of 48 inches. It is of strong vigorous growth and produces 1 kilogram of dried coffee from 7 to 8 kilograms of fresh berries. *Coffea excelsa* makes an excellent stock for other coffees. The first crop is obtained at the age of 4 to 5 years and a full crop at the age of 7 to 8 years.

For previous introduction see S. P. I. No. 57271.

63603. COFFEA LAURENTII Wildem. (C. robusta Hort.).

A white-flowered shrub, native to Belgian Congo, with oval dark-green leaves up to a foot in length and shortly elliptic 2-seeded fruits. The roundish seeds are sometimes nearly half an inch long.

For previous introduction see S. P. I. No. 57272.

63604. COFFEA sp.

Received as *Coffea dybowski*, for which a place of publication has not been found.

63605. INDIGOFERA ENDECAPHYLLA Jacq. Fabaceae.

From Peradeniya, Ceylon. Seeds presented by H. A. Deutrom, acting manager of the experiment station, at the request of F. A. Stockdale, Director of Agriculture. Received April 4, 1925.

An annual or biennial leguminous plant which has become popular as a cover plant in Ceylon, according to the Tropical Agriculturist (vol. 63, October, 1924). The trailing stems are 1 to 2 feet long, and the violet-purple flowers are in dense racemes.

63606. HELIANTHUS TUBEROSUS L. Asteraceae.
Jerusalem artichoke.

From Montreal, Canada. Tubers obtained from the William Ewing Co. Received April 13, 1925.

Locally grown tubers.

63607 to 63609. PRUNUS ARMENIACA L. Amygdalaceae.
Apricot.

From Yugakujo, Manchuria. Scions presented by Dr. R. Watanabe, director, Southern Manchurian Agricultural Experiment Station. Received April 15, 1925.

Manchurian varieties.

63607. *Chin chou ta hsing.*

63608. *Erh hsing mei.*

63609. *Li tzu hsing.*

63610 to 63617. SACCHARUM OFFICINARUM L. Poaceae.
Sugar cane.

From Rio Piedras, Porto Rico. Cuttings presented by the Insular Experiment Station, through E. W. Brandes, Bureau of Plant Industry. Received April 15, 1925.

Locally developed strains.

63610 to 63617—Continued.

63610. *H. 109.* **63614. *P. R. 528.***
 63611. *B. 11569.* **63615. *P. R. 492.***

 63613. *P. R. 729.* **63617. *P. R. 558.***

63618 to 63621. *SACCHARUM OFFICINARUM* L. Poaceae. Sugar cane.

From Fajardo, Porto Rico. Cuttings presented by the Fajardo Sugar Co., through E. W. Brandes, Bureau of Plant Industry. Received April 15, 1925.

Locally developed strains.

63618. *F. C. 462.* **63620. *F. C. 306.***
 63619. *F. C. 86.* **63621. *F. C. 305.***

63622 to 63627.

From China. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received April 3, 1925. Notes by Mr. McClure.

63622. *CANARIUM PIMELA* Koen. Balsameaceae.

No. 53. Foh Tsun, Lohkongtang, Kwangtung. December 5, 1924. *U lam.* The fruits, black when ripe, exude a viscous, milky juice with a pungent flavor when the skin is broken. They are commonly eaten after having been scalded for a moment and flavored with soy sauce or sugar. In preparing them for the market the fruits are scalded, the seeds removed, and the flesh dried in the sun.

63623. *CELASTRUS HINDSII* Benth. Celastraceae.

No. 55. Honam Island. January 2, 1925. *Tsing kung t'ang.* A half-woody, slender vine, 2 to 4 meters long, growing wild on trees and shrubs in poor soil, chiefly granite clay. It is an attractive ornamental with bright reddish orange seeds which are exposed at maturity by the splitting of the pod into a three-pointed star.

63624. *DESMOS CHINENSIS* Lour. Annonaceae.

No. 57. Honam Island. January 2, 1925. *Ka ying chau.* A shrub, 1 to 2 meters high, growing wild in a shady place along the roadside in clay soil. The very fragrant, greenish yellow flowers are followed by curious clusters of attractive fruits which turn from yellow to red and are composed of many moniliform pods radiating from a short peduncle.

63625. *GLEDITSIA FERA* (Lour.) Merr. (*G. australis* Hemsl.). Caesalpiniaceae. Honey locust.

No. 59. *Tai ip ying.* A large tree growing wild on Honam Island, valuable as a lumber tree and as an ornamental.

63626. *ILEX ROTUNDA* Thunb. Aquifoliaceae.

No. 48. Honam Island. January 2, 1925. *Pak lan heung.* A small wild shrub, usually less than 1 meter high, with glossy foliage and attractive red fruits.

63627. *MUSSAENDA* sp. Rubiaceae.

No. 51. Honam Island. December, 1924. *Pak chi sin.* A wild ornamental vine with inconspicuous yellow flowers and conspicuous white bracts.

63628. *CALYCOPHYLLUM CANDIDISSIMUM* (Vahl) DC. Rubiaceae.

From Summit, Canal Zone. Seeds presented by Holger Johansen, Plant Introduction Garden. Received June 12, 1925.

A Central American timber tree known commercially as the degame is described by S. J. Record (Timbers of Tropical America, p. 547) as being 40 to 65 feet high, with a straight trunk free from limbs. The wood has the strength, toughness, and resilience of hickory and is used for making agricultural implements, tool handles, and similar articles.

63629 to 63650.

From China. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received April 3, 1925. Notes by Mr. McClure.

63629. *MYROXYLON SENTICOSUM* (Hance) Warb. (*Xylosma senticosum* Hance). Flacourtiaceae.

No. 50. Near Chukliu, Kwangtung. January 18, 1925. *Kai na lak.* A very ornamental and large shapely shrub or small tree, having dense glossy foliage and producing an abundance of small dark-red fruits which are borne in short-stemmed clusters along the branches.

63630. *PANDANUS* sp. Pandanaceae.

No. 43. Lamtau Island, Hong Kong Colony. December, 1924. *Lo tau lak. Lak poh loh.* This plant is widely used by the Chinese as a hedge. The long ribbonlike leaves are stripped of their marginal and midrib hooks, rolled into "spools," dried, and used to weave a coarse matting, and in a few instances they are used for hats.

63631. *PSYCHOTRIA ELLIPTICA* Ker. Rubiaceae.

No. 54. Honam Island, Kwangtung. January 2, 1925. An attractive ornamental 1 to 6 meters high, growing wild in a ferruginous sandy clay loam and having large leaves and rather inconspicuous white flowers. The clusters of fruits are at first yellow, turning red in the autumn.

63632. *RAPHIOLEPTIS INDICA* (L.) Lindl. Malaceae.

No. 49. Honam Island, Kwangtung. January 2, 1925. *Ch'un fa.* This very pretty little shrub, which was found wild, produces clusters of delicate pink flowers that are reminiscent of cherry blossoms, and berries which become red in the autumn.

63633. *SMILAX* sp. Smilacaceae. Smilax.

No. 56. From the wild near Fohsuen, Kwangtung. December 5, 1924. *Ma kap.* A sturdy glossy-leaved vine bearing in the autumn an abundance of brilliant red berries in dense umbels. This fine ornamental seems to thrive equally well on any soil and grows naturally under very difficult conditions on starved clay soil in burned or cut-over places.

63634 and 63635. *PHASEOLUS AUREUS* Roxb. Fabaceae. Mung bean.

63634. No. 30. Kochau, Kwangtung. Luk tau. Compared with the other varieties, luk tau is very small and cylindrical, and, as its name suggests, it is dark green. It is harvested twice a year, June and September, and is used in many forms, the chief of which are flour and sprouts.

63629 to 63650—Continued.

63635. No. 31. From the vicinity of Shiuhing, on the West River, Kwangtung. *Shiuhing luk tau*. This variety is harvested twice yearly, June and September, and is used in the same ways as No. 30 [S. P. I. No. 63634].

63636 to 63642. SOJA MAX (L.) Piper (Glycine hispida Maxim.). Fabaceae. Soy bean.

63636. No. 32. Kochau, Kwangtung. *Tsing tau*. A small light-green bean which is harvested and used in the same ways as No. 30 [S. P. I. No. 63634].

63637. No. 35. Pakmiu, Heungshan district, Kwangtung. *Hak tau*. This variety, harvested during July, produces black seeds which are flatter and more elliptical than the other varieties. These seeds are used mostly as "hung tau" in boiled dishes.

63638. No. 36. From the vicinity of Shiuhing, on the West River, Kwangtung. *Shiuhing hak tau*. Harvested during June or July, and used the same as No. 35 [S. P. I. No. 63637].

63639. No. 37. Kochau, Kwangtung. *Tai u tau*. Harvested during June or July and used the same as No. 35 [S. P. I. No. 63637].

63640. No. 39. Kochau, Kwangtung. *Wong tau*, *Pak tau*. These beans are nearly globular and yellow, and are harvested twice annually, during June or July and September or October. They are used in making bean curd and for the oil contained in them, though in this region they are rarely ever used for the latter.

63641. No. 40. The Canton Christian College Agricultural Department Gardens. *Pak tau*, *Wong tau*. This white or yellowish white bean is harvested in June or July, and the chief uses are the making of bean curd and of a soy sauce or "pak yau."

63642. No. 41. Koiu, Kwangtung. *Pak tau*. These beans are whiter than No. 39 [S. P. I. No. 63640] and have a suggestion of an "eye" around the hilum. Harvesting and use the same as No. 39.

63643. STIZOLOBIUM DEERINGIANUM Bort. Fabaceae.

No. 43. Canton Christian College Farm. January 20, 1925. *Kau tsau tau*. This vine grows from 2 to 3 meters in length and is harvested once a year. The Chinese farmers around Tsinguen and Linchow soak the vines and beans in water and use them as fertilizer, but the method used at the college is to plow them under as green manure. This variety makes a very heavy growth and is considered a valuable crop for the purpose of fertilizing.

63644 and 63645. TERMINALIA CHEBULA Retz. Combretaceae.

63644. No. 44. Kongtau village, Loh-kongtung, Kwangtung. December 5, 1924. *Ho tsai*. The flesh of the fruits is crushed and steeped in a small quantity of water, and the liquid that is drained off is used as a gray dye.

63629 to 63650—Continued.

63645. No. 45. Kongtau village, Loh-kongtung, Kwangtung. December 5, 1924. *Yuk hoh tsz*. Used in the same manner as No. 44 [S. P. I. No. 63644].

63646 to 63648. VIGNA CYLINDRICA (Stickm.) Skeels. Fabaceae. Catjang.

63646. No. 33. Pakmiu, Heungshan District, Kwangtung. *Hung tau*. This variety, which takes its name from the red color of the skin covering the seed, is harvested in June. The uses, which are not so varied as those of the others, are mostly in boiled dishes, alone with sugar, and for making soup.

63647. No. 34. Tsangshing, Kwangtung. *Hung kong tau*. Harvested in June and used in the same manner as No. 33 [S. P. I. No. 63646].

63648. No. 38. *Min tau*. This variety is characterized by a black "eye" around the hilum. Harvested during June or July and used in the same way as No. 33 [S. P. I. No. 63646]. It is considered by some to be useful in the treatment of rheumatism, and rice wine in which this bean has been boiled is used as a general tonic.

63649. VITEX NEGUNDO INCISA (Lam.) C. B. Clarke. Verbenaceae.

No. 47. Honam Island. December, 1924. *Hut kin shau*. This half-woody wild shrub is used by the Chinese as an astringent in the case of an open wound. The leaves are fragrant when crushed, and the pale-blue flowers are produced in terminal spikes.

63650. VITEX TRIFOLIA L. Verbenaceae.

No. 58. *Pak muk ying*. A shrub 2 to 3 meters high cultivated for drug purposes in a garden on Honam Island. The leaves have a dense white pubescence which gives the plant a grayish appearance; the flowers are light blue.

63651 to 63661. FRAGARIA spp. Rosa-ceae. Strawberry.

From Orleans, France. Plants purchased from Léon Chénault & Fils. Received April 16, 1925.

European varieties not known in the American trade.

63651. FRAGARIA sp.

Lucida Californica.

63652. FRAGARIA sp.

Chanteclair.

63653. FRAGARIA sp.

Gemma. Very vigorous, everbearing; fruits large and white, with little fiber. (Catalogue of Millet & Fils.)

63654. FRAGARIA sp.

Général de Castelnau. An everbearing very productive variety. Fruit larger than that of La Perle, dark red, very juicy, sweet, and firm. (Grandes Rose-raises du Val de la Loire Catalogue.)

For previous introduction see S. P. I. No. 59798.

63655. FRAGARIA sp.

63651 to 63661—Continued.

Madame Meslé. A very vigorous giant variety with enormous brilliant vermilion red fruits with pink flesh; a good commercial variety of large yield. Season medium. (*Catalogue of Millet & Fils.*)

For previous introduction see S. P. I. No. 56155.

63656. FRAGARIA sp.

Madame Moutot. A giant variety with enormous spherical red fruits; flesh light salmon. Quality excellent. (*Catalogue of Millet & Fils.*)

63657. FRAGARIA sp.

Marguerite Chabert. Fruit conical, very large, dark red; flesh pink. (*Catalogue of Rivoire Père & Fils.*)

63658. FRAGARIA sp.

Marguerite Lebreton. A very early variety with abundant elongated fruits. One of the best forcing varieties. (*Catalogue of Millet & Fils.*)

For previous introduction see S. P. I. No. 56157.

63659. FRAGARIA sp.

The Indispensable. An everbearing, very prolific variety, quite hardy; the plant does not disappear in winter. The fruits are larger than those of Docteur Morère, juicy, sweet, with firm red flesh of fine quality, and stands shipping well. It bears from June until frost. (*Edmond Versin, Orleans, France.*)

For previous introduction see S. P. I. No. 62521.

63660. FRAGARIA sp.

White Pineapple. Fruits white, very large. (*Catalogue of Millet & Fils.*)

63661. FRAGARIA sp.

Zoulon.

63662. SAXIFRAGA PURPURASCENS Hook. f. and Thoms. Saxifragaceae.

From Darjiling, India. Seeds presented by G. H. Cave, curator, Lloyd Botanic Garden. Received August 2, 1922. Numbered April, 1925.

This beautiful species comes from the temperate regions of the Sikkim Himalaya, where it was discovered growing in wet places at an altitude of from 10,000 to 14,000 feet. Though closely allied to the Himalayan *Saxifraga ligulata* and the Siberian *S. crassifolia*, it is quite different from, and far more beautiful than, either of those species. Nothing indeed can exceed the bright glossy green of the leaves, which are elegantly margined with red, or the deep, bright, vinous red-purple of its scape and inflorescence. (*Curtis's Botanical Magazine, pl. 5066.*)

For previous introduction see S. P. I. No. 39074.

63663 to 63667.

From Vineland Station, Ontario, Canada. Plants presented by F. E. Palmer, director, Horticultural Experiment Station. Received April 13, 1925. Notes from The Canadian Horticulturist, vol. 47, no. 4, unless otherwise stated.

63663 to 63667—Continued.

63663. FRAGARIA sp. Rosaceae.

Strawberry.

Valonia. A cross between Dunlap and Early Ozark. It is a vigorous grower, with perfect flowers, and is productive. In season it is two or three days earlier than Dunlap. The fruits are of medium size, bright red, moderately firm, and fair to good in quality.

63664. FRAGARIA sp. Rosaceae.

Strawberry.

Vanguard. A cross between Pocomoke and Early Ozark. The plants are vigorous, healthy, and productive, with perfect flowers. The ripening season is about a week before Dunlap. The fruits are of medium size, round-conic, regular in shape, bright red, firm, and of good quality, being sweeter than most early varieties.

63665. FRAGARIA sp. Rosaceae.

Strawberry.

Vantage. A cross between Williams and Early Ozark. Described (Report of the Vineland Station to the Ontario Department of Agriculture for 1919) as a vigorous grower, with early-maturing bright-pink fruits which retain their color in storage. Quality fair.

63666. RUBUS sp. Rosaceae. Raspberry.

Viking. A red raspberry (No. 14038), the result of a cross between Cuthbert and Marlboro. It is intermediate in character between the two parents. It is very vigorous, the canes being both stouter and taller than Cuthbert. There is very little tendency to droop over and hide the fruits, as does the Cuthbert, picking thus being an easier operation. The canes are almost entirely free of spines. In hardness, from present observation, it is about the same as Cuthbert, or a little better. The fruit is as large as or larger than Cuthbert, firm, and should be good for shipping. In color the fruit more or less resembles Marlboro, being lighter than Cuthbert.

63667. FRAGARIA sp. Rosaceae.

Strawberry.

No. 19322. This variety has not been sufficiently tested to decide definitely as to its value, but it looks promising as an early berry for local markets. It is vigorous, productive, and a good plant maker. The fruit is of good quality and appearance, though possibly lacking in firmness for distant shipping.

63668 and 63669.

From Algeria. Seeds collected by David Fairchild, agricultural explorer, Bureau of Plant Industry. Received April, 1925. Notes by Doctor Fairchild.

63668. CASUARINA sp. Casuarinaceae.

Near Maison Carree, March 13, 1925. Related to *Casuarina suberosa*, but distinct in having shorter cones. This attractive spreading tree was growing in the grounds of a famous French botanist who was the first president of the Société Botanique de France.

63669. TRIFOLIUM ALEXANDRINUM L. Fabaceae.

Berseem.

From Boufarik. Doctor Trabut has made a real success of the berseem even though it has been subjected to temperatures much below freezing. This seed

63668 and 63669—Continued.

was presented by J. Paulian, manager of the Domaine Ste. Marguerite, who is delighted with it as a green feed for cattle.

63670 to 63672.

From Algeria. Collected by David Fairchild, agricultural explorer, Bureau of Plant Industry. Received April 6, 1925. Notes by Doctor Fairchild.

63670. *COTULA CINEREA* Delile. *Asteraceae*.

In France and Algeria it is the custom to take various kinds of so-called "tisanes," herb teas made of infusions of aromatic herbs. Doctor Trabut has presented these seeds with the recommendation of his own experience.

63671. *CUCURBITA MOSCHATA* Duchesne. *Cucurbitaceae*. Cushaw.

Seeds of the *Courge Bedouin* or "Bedouin squash," purchased in a market in Algiers. The seeds of this variety are confined to one end of the elongated fruit, the other end being solid flesh. In shape it resembles a short club.

63672. *KOELERIA SETACEA* (Pers.) DC. *Poaceae*. Grass.

These roots are from the driest rocky clay soils of the mountains near Bou Saada, where this grass forms small patches of compact tufts, dark green in color. During the summer the plants must have been subjected to an intense heat and completely dried out.

63673 to 63675. *TRIFOLIUM* spp. *Fabaceae*.

From Ayr, Scotland. Seeds purchased from McGill & Smith. Received April 9, 1925.

Locally grown seeds.

63673 and 63674. *TRIFOLIUM PRATENSE* L. *Red clover*.

63673. *Montgomery*.

63674. *Vale of Clwyd*.

63675. *TRIFOLIUM REPENS* L. *White clover*.

Danish Morso.

63676 to 63688.

From Paris, France. Plants purchased from Vilmorin-Andrieux & Co., through David Fairchild, agricultural explorer, Bureau of Plant Industry. Received April 16, 1925.

63676. *ABIES KOREANA* Wilson. *Pinaceae*.

A newly discovered fir from Chosen, which is described by E. H. Wilson (Journal of the Arnold Arboretum, vol. 1, p. 188) as a tree 30 to 50 feet high, with a trunk 4 to 10 feet in circumference, and characterized by its pyramidal habit and deeply fissured rough bark. It is an alpine species, growing abundantly above 3,000 feet in Chosen. It is densely branched, and the lustrous-green leaves with white undersurfaces make the tree very striking.

For previous introduction see S. P. I. No. 63328.

63677. *BUDDLEIA ALTERNIFOLIA* Maxim. *Loganiaceae*.

According to Mottet (Arbres et Arbustes d'Ornement de Pleine Terre, p. 359), this was introduced from China

63676 to 63688—Continued.

in 1920. It is distinguished by its lilac flowers, which are very small and arranged in many-flowered sessile masses along the flowering branches. It flowers in June and July and has an elegant habit.

For previous introduction see S. P. I. No. 62283.

63678. *CALLICARPA GIRALDIANA* Hesse. *Verbenaceae*.

The dense clusters of round, berry-like violet fruits produced by this Chinese shrub in late autumn make it of great ornamental value. It has membranous light-green leaves and many-flowered cymes of pink flowers, and has proved hardy in southern Massachusetts, although little known elsewhere in the United States.

63679. *CARPINUS TURCZANINOVII* Hance. *Betulaceae*.

A hardy, shrubby Chinese hornbeam with oval sharp-pointed leaves 1 to 2 inches long. It is said to resemble *Carpinus polynœura*, also a Chinese species, and may have value as an ornamental plant.

For previous introduction see S. P. I. No. 63346.

63680. *CORYLUS CHINENSIS* Franch. *Betulaceae*.

The Chinese hazelnut is closely allied to the tree hazelnut (*Corylus colurna*), differing in leaf and stem characters. It becomes a tall tree, sometimes over 100 feet high, with heart-shaped leaves about 7 inches long. The nuts are borne in clusters of four to six. Native to western China.

63681. *HEMIPTLEA DAVIDII* (Hance) Planch. (*Zelkova davidii* Hemsl.). *Ulmaceae*.

A shrubby, spiny, elmlike tree, native to Chosen and northern China, which has merit as an ornamental tree because of its handsome dark-green foliage; the leaves are oval or oblong, deeply toothed, and about 2 inches long. Because of its spines, the tree may be useful for tall hedges.

63682. *LARIX DAHURICA PRINCIPIS-RUPPRECHTII* (Mayr) Rehd. and Wils. *Pinaceae*.

A hardy Chinese larch which makes a handsome tree, sometimes as much as 70 feet in height, with attractive bright-green foliage and shiny cones over an inch long.

63683. *LARIX EUROLEPIS* Henry. *Pinaceae*.

A hybrid between *Larix decidua* (*L. europaea*) and *L. leptolepis*; it is said to be a tree of vigorous growth.

63684. *PAEONIA MLOKOSIEWITSCHI* Lomakin. *Ranunculaceae*.

This is the most handsome of the yellow-flowered peonies, according to Curtis's Botanical Magazine (pl. 8173). It is a herbaceous perennial with stout stems, blue-green biternate leaves with red nerves and margins, and sulphur-yellow flowers. It appears to be as hardy as the other herbaceous peonies and as easily cultivated. It is native to the western part of the central Caucasus.

63676 to 63688—Continued.

63685. *ROSA FOLIOLOSA* × *RUGOSA* Rosaceae.

One of Vilmorin's hybrids.

63686. *VIBURNUM HENRYI* Hemsl. Caprifoliaceae.

An evergreen shrubby viburnum 10 feet or more in height, with dark shining green oblong leaves and stiff pyramidal panicles of white flowers. The oval fruits, a third of an inch long, are at first red, becoming black, and give the shrub a decidedly ornamental appearance in autumn. Native to central China, and hardy as far north as Massachusetts.

63687. *VIBURNUM HUPEHENSE* Rehder. Caprifoliaceae.

A fairly hardy, deciduous shrubby species, allied to *Viburnum wrightii*, with coarsely toothed, long-pointed, dark-green leaves and ovoid dark-red fruits. Native to central China.

For previous introduction see S. P. I. No. 59401.

63688. *VIBURNUM UTILE* Hemsl. Caprifoliaceae.

A handsome, hardy, evergreen shrub of rather open habit, with dark, glossy green, leathery leaves and pure white flowers produced in dense, terminal, rounded trusses in May. These are succeeded by oval blue-black berries. The shrub is native to western China, where it is said to grow on limestone soils.

63689. *PIROCYDONIA WINKLERI* Daniel. Malaceae.

From Paris, France. Plants purchased from Vilmorin-Andrieux & Co., through David Fairchild, agricultural explorer, Bureau of Plant Industry. Received April 20, 1925.

One of the pear grafts on the old quinces in the garden of St. Vincent College gave rise to a sucker of distinct character; this was called *Pirocydonia winkleri* by Lucien Daniel, Ile et Vilaine, France. The shoots and leaves are pubescent, unlike those of the pear. The leaves are short stemmed like the quince, but are lanceolate like the pear. A very peculiar thing about this hybrid is that it had its origin below the point of union of the graft and stock.

For previous introduction see S. P. I. No. 62016.

63690. *ANDROPOGON SERRATUS* Thunb. Poaceae. Grass.

From Mandalay, Burma, India. Seeds presented by the economic botanist, through C. V. Piper, Bureau of Plant Industry. Received April 16, 1925.

This grass is common throughout tropical Asia, including the Philippines. It has also been reported from Southern Rhodesia and is said to have some value as a forage grass. (*Piper*.)

63691 to 63699.

From Kwangtung Province, China. Rhizomes collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received April 20, 1925. Notes by Mr. McClure.

63691 to 63699—Continued.

63691. *ALPINIA* sp. Zinziberaceae.

No. 85. *Wong Keung*. Obtained at the village of Taichong.

For previous introduction and description see S. P. I. No. 63551.

63692. (Undetermined.)

No. 88. February 20, 1925. *Sha keung*. This plant is commonly cultivated in sandy regions in Kwangtung and is claimed by the Chinese to have drug value. It is used as a condiment (the fresh rhizomes being crushed with a little peanut oil and soy sauce and eaten with meat), as an ingredient in curry powder, and is also prepared for the market by drying.

63693. (Undetermined.)

No. 93. February 3, 1925. *P'o chuk*. This is a medium-sized bamboo whose stems attain a diameter of about 1½ to 2 centimeters and a height of about 3 meters. The shoots or sprouts are naturally slender, but are longer proportionally than the average variety. They are the first to appear on the market in the spring, coming usually before the end of February. This is a very popular variety with the Chinese. The rhizomes are flat as distinguished from those of No. 100 [S. P. I. No. 63699] which are round.

63694. (Undetermined.)

No. 94. February 3, 1925. *Lei chuk*. This is a very small bamboo with stems scarcely more than 1 centimeter in diameter and 1 meter in height and sprouts which are proportionally small. It is not a commercial variety, but is gathered by the Chinese from the wild. The season is slightly later than that of No. 93 [S. P. I. No. 63693], coming in March.

63695. (Undetermined.)

No. 95. Sheungtip. February 3, 1925. *Kan chuk*. This is another dwarf variety of the edible bamboo and is about the size of *Lei chuk* [S. P. I. No. 63694]. It is cultivated, or rather allowed to grow around the villages, and the sprouts come on the market in April.

63696. (Undetermined.)

No. 96. Tangwanfoh, near Takhing. February 4, 1925. *Tai Ngan chuk*. A large-noded, medium-sized bamboo whose shoots come to the market in April.

63697. (Undetermined.)

No. 97. Tangwanfoh, near Takhing. February 4, 1925. *Fa Hok chuk*. A straight, smooth-stemmed bamboo of medium size, although somewhat larger than *Tai Ngan chuk* [S. P. I. No. 63696]. The Chinese prefer the sprouts of this variety to those of the *Tai Ngan* variety.

63698. (Undetermined.)

No. 98. February 16, 1925. *Mau chuk*. Obtained in Kaakmukhaang, near Szchim. This is a very interesting bamboo and is much spoken of though not commonly seen, the culture appearing to be carried on mostly in very out-of-the-way mountain ravines. The plant is unusual among bamboos, being covered with a fine velvety pubescence. The leaves are unusually small in proportion to the large size of the plant. So far as I

63691 to 63699—Continued.

know, it is the only large bamboo here which spreads and propagates itself by means of underground stems. The sprouts are among the largest and are highly esteemed by the Chinese, being eaten fresh, dried, and pickled. The soil in which this bamboo was growing is reddish brown loam underlain with limestone, and no fertilizer is used.

63699. (Undetermined.)

No. 100. Shekkonghaang. February 3, 1925. *P'o chuk*. It differs from No. 93 [S. P. I. No. 63693] by having round rhizomes.

63700 to 63726.

From Chihli Province, China. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received April 9, 1925. Notes by Mr. Dorsett.

Numbers 63700 to 63715 were obtained at Loutai, February 15, 1925.

63700. *CHAEOTCHLOA ITALICA* (L.) Scribn. (*Setaria italica* Beauv.). Poaceae. Millet.

No. 2173. *Huang nien ku* (yellow sticky millet). A variety which ripens in August. It is ground into flour and used for cakes. The Chinese do not feed it to their stock.

63701. *CITRULLUS VULGARIS* Schrad. Cucurbitaceae. Watermelon.

No. 2164. *San pai hsi kua* (white watermelon). The true white watermelon, having white skin, flesh, and seeds. It has a diameter of 6 to 10 inches, a length of 18 inches, ripens in August, and is said to be of good quality.

63702 to 63713. *CUCUMIS MELO* L. Cucurbitaceae. Melon.

63702. No. 2156. *Hsiao hua pi tien kua* (small striped-skin sweet melon). A green and white striped, sweet-scented melon which ripens about the end of June. It is normally about 3 inches in diameter and 6 inches in length.

63703. No. 2157. *Ta hua pi tien kua* (large striped-skin sweet melon). This variety is green and white striped, sweet scented, and about 4 or 5 inches in diameter and 8 to 9 inches in length.

63704. No. 2158. *Pai tien kua* (white sweet melon). A sweet-scented melon, about 4 inches in diameter and 8 inches in length, which ripens in July. It is of very good quality.

63705. No. 2159. *Huang hsiang kua* (yellow fragrant melon). A small melon, almost round and about 2 to 3 inches in diameter, which ripens in July. It is used when ripe for scenting rooms, but is not edible.

63706. No. 2160. *Kuai pai pa tien kua* (early white-handled sweet melon). A melon about 3 inches in diameter and 6 inches in length, which ripens in June or July. It is said to be of very good quality.

63707. No. 2163. *Ching pi tien kua* (green-skinned sweet melon). This variety, which is 3 to 4 inches by 6 to 8 inches, ripens in July and is considered to be of very good quality.

63700 to 63726—Continued.

63708. No. 2165. *Hei ke ta tsui* (black-knotted fragile melon). A white-fleshed melon, about 3 inches in diameter and 8 or more inches long, which is considered to be of very good quality.

63709. No. 2167. *Hua pi tsui kua* (striped-skin fragile melon). A green and white striped melon, 4 by 8 inches, which ripens in July. It is said to be of good quality.

63710. No. 2169. *Hua pi tien kua* (flower-skinned sweet melon). A small melon, said to have light-green flesh, about 3 by 6 inches, which ripens in July. It is considered to be of good quality.

63711. No. 2170. *Hua pi tung kua* (flower-skinned eastern melon). This variety, about 8 by 10 inches, ripens in October and is said to be of very good quality.

63712. No. 2171. *Huang tung kua* (yellow eastern melon). A melon 6 by 8 or 10 inches, which ripens in October; it is of very good quality.

63713. No. 2172. *Huang chiu tsui* (golden-yellow fragile melon). A white-fleshed variety, 4 by 10 or more inches, which ripens in August.

63714. *CUCURBITA MOSCHATA* Duchesne. Cucurbitaceae. Cushaw.

No. 2168. *Huang bun wo kua* (yellow flat pumpkin). This variety, about 6 to 8 inches in diameter and 12 to 18 inches in length, is said to be harvested through the season. It is cut into small pieces and boiled.

63715 to 63717. *HOLCUS SORGHUM* L. (*Sorghum vulgare* Pers.). Poaceae. Sorghum.

63715. No. 2161. A variety, resembling kaoliang, which produces canes about 6 feet in height. It is not planted very extensively.

63716. No. 2186. Obtained at the Peking University, February 18, 1925, and originally collected at Liaoyang, Manchuria. *Huang ka nien kaoliang* (yellow-husked sticky kaoliang). It is sown in early spring and harvested in early September. The brush is about 19 inches long. This variety is used for grain and broom stock.

63717. No. 2187. This variety was also obtained at the Peking University, February 18, 1925, and was originally from Liaoyang. *Hung ka nien kaoliang* (red-husked sticky kaoliang). The brush is about 22 inches or more long. Used for grain and broom stock.

63718. *PHASEOLUS AUREUS* Roxb. Fabaceae. Mung bean.

No. 2175. Loutai. February 15, 1925. *Lu tou* (green mung bean).

63719 to 63721. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceae. Soy bean.

Loutai. February 15, 1925.

63719. No. 2155. *Huang tou* (yellow soy bean).

63700 to 63726—Continued.

63720. No. 2176. *Hei tou* (black soy bean).

63721. No. 2180. *Ching tou* (green soy bean).

63722. *TRIGONELLA FOENUM-GRÆCUM* L. Fabaceae. Fenugreek.

No. 2102. Peking. February 12, 1925. *Hsiang tsao* (fragrant grass). Obtained at the market and said to have originally come from one of the southern provinces. The Chinese use it in their rooms and sometimes put it in their pillows.

63723. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceae. Common wheat.

No. 2178. Loutai. February 15, 1925. *Chiu mai* (winter wheat).

63724 and 63725. *VIGNA SINENSIS* (Torrner) Savi. Fabaceae. Cowpea.

63724. No. 2174. Loutai. February 15, 1925. *Hung yeu pai chiang tou* (brown-eyed white cowpea).

63725. No. 2179. Loutai. February 15, 1925. *Tai li pang tsai tou* (fat-in-the-pod vegetable bean). These may be a pink-striped cowpea.

63726. *ZEA MAYS* L. Poaceae. Corn.

No. 2177. Loutai. February 15, 1925. *Pat yu mi* (white corn).

63727 to 63731.

From French West Africa. Seeds presented by Prof. R. H. Forbes. Received April 9, 1925. Notes by Professor Forbes.

63727 and 63728. *GOSSYPIUM OBTUSIFOLIUM AFRICANUM* Watt. Malvaceae. Cotton.

63727. From the vicinity of Bobodioulasso, in the Haute Volta. This is a perennial tree cotton considerably grown in the rainy regions south of the Niger. The fiber is strong and very short. The yield is low.

63728. From the Sudan, north of the Niger. This is probably the same as the above [S. P. I. No. 63727].

63729. *GOSSYPIUM PUNCTATUM* Schum. and Thonn. Malvaceae. Cotton.

From Segou, French Sudan. This is the species cultivated by the natives throughout the Sudan proper. It yields a strong but short fiber, 20 to 22 millimeters. It is mostly used by the natives, only small quantities being exported to France.

63730. *SYNTHESISMA* sp. Poaceae. Grass.

From Segou, French Sudan. This is the "fonio" of the natives, a "famine crop." Matures quickly during a scant rainfall, while all other crops fail.

63731. *VOANDZEIA SUBTERRANEA* (L.) Thouars. Fabaceae.

From Segou, French Sudan. There are two varieties, red and white, which mature quickly on scant rainfall. A "famine crop."

63732. *SACCHARUM OFFICINARUM* L. Poaceae. Sugar cane.

From Haiti. Cuttings presented through John A. Stevenson, Bureau of Plant Industry. Received April 20, 1925.

A locally developed strain.

63733. *SACCHARUM OFFICINARUM* L. Poaceae. Sugar cane.

From Santiago de las Vegas, Cuba. Cuttings presented by Gonzalo M. Fortun, director, Estación Experimental Agronomica, through E. W. Brandes, Bureau of Plant Industry. Received April 20, 1925.

H 109.

A locally developed strain.

63734 to 63736.

From Valley River, Manitoba, Canada. Plants presented by W. J. Boughen, Valley River Nurseries. Received April 21, 1925. Notes by Mr. Boughen.

63734. *VIBURNUM AMERICANUM* Mill. Caprifoliaceae.

Highbush cranberry from banks of the Skeena River, about 53° N. Lat.

63735. *PRUNUS PENNSYLVANICA* L. f. Amygdalaceae. Pin cherry.

Selected pin cherry, from 51.5° N. Lat.

63736. *RIBES* sp. Grossulariaceae. Gooseberry.

Thornless gooseberry from Fort La Corne, about 53° N. Lat.

63737 and 63738. *LANDOLPHIA* spp. Apocynaceae.

From Loanda, Angola, Africa. Seeds presented by John Gossweiler, Servicos de Agricultura. Received April 24, 1925.

Rubber-yielding shrubs.

63737. *LANDOLPHIA KLAIRII* Pierre.

A tropical African climbing shrub which is said (Flora of Tropical Africa, vol. 4, sec. 1) to be the principal rubber-producing plant in the Gabon district, French Equatorial Africa. The oblong leathery leaves are glossy green, and the hard globose fruits are 6 to 10 inches in diameter.

63738. *LANDOLPHIA PARVIFOLIA* Schum.

This is described by Otto Stapf (Thielsen-Dyer, Flora of Tropical Africa) as a much-branched, climbing shrub with small oblong leaves and pale-yellow or white flowers in small dense clusters. The greenish purple fruits, about 2 inches in diameter, have a smooth thick rind.

For previous introduction see S. P. I. No. 61015.

63739 and 63740. *HELIANTHUS TUBEROSUS* L. Asteraceae.

Jerusalem artichoke.

From Erfurt, Germany. Tubers purchased from Haage & Schmidt. Received April 22, 1925.

Locally grown tubers.

63739. *Erdbirne*.

63740. Received as *Helianthus doronicoides*, now referred to *H. tuberosus*.

63741 to 63750.

From Ottawa, Canada. Presented by W. T. Macoun, Dominion horticulturist, Central Experimental Farm. Received April 23, 1925.

63741 to 63750—Continued.

63741 to 63749. *MALUS SYLVESTRIS* Mill.
Malaceae. Apple.

A collection of seedlings of the McIntosh apple.

63741. *Joyce*. 63746. *Newtosh*.

63742. *Labo*. 63747. *Patricia*.

63743. *Lawfam*. 63748. *Pedro*.

63744. *Melba*. 63749. *Stonetosh*.

63745. *Miltosh*.

63750. *PRUNUS TOMENTOSA* Thunb.
Amygdalaceae. Manchu cherry.

Scions of a locally developed strain.

63751. *COFFEA EXCELSA* Cheval. Rubiaceae. Coffee.

From Lamao, Bataan, Philippine Islands. Seeds presented by S. Youngberg, acting Director of Agriculture, Bureau of Agriculture, Manila, at the request of P. J. Wester. Received April 9, 1925.

According to the Philippine Review (vol. 9, p. 121), this coffee thrives from sea level to 700 meters, succeeds well on rather stiff clayey soils, and is quite drought resistant. It might be grown with an annual rainfall of 48 inches. It is the most resistant to blight and drought of any coffee, is of strong vigorous growth, and produces 1 kilogram of dry coffee from 7 to 8 kilograms of fresh berries. *Coffea excelsa* makes an excellent stock for other coffees. The first crop is obtained at the age of 4 to 5 years and a full crop at the age of 7 to 8 years.

For previous introduction see S. P. I. No. 63602.

63752. *LACTUCA SATIVA* L. Cichoriaceae. Lettuce.

From Nanking, China. Seeds presented by M. Leslie Hancock, University of Nanking. Received April 14, 1925.

Grown by the Chinese for its stem, which is very fleshy. (Hancock.)

63753. *TRIFOLIUM PRATENSE* L. Fabaceae. Red clover.

From Scheemda, Netherlands. Seeds presented by the Hommo Ten Have's Seed Co. Received April 17, 1925.

Remontant. A European variety of red clover.

For previous introduction see S. P. I. No. 62309.

63754. *HELIANTHUS TUBEROSUS* L. Asteraceae. Jerusalem artichoke.

From Toronto, Canada. Tubers purchased from William Rennie Co. Received May 6, 1925.

Locally grown tubers.

63755 to 63757.

From Kwangtung Province, China. Collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received April 24, 1925. Notes by Mr. McClure.

63755 to 63757—Continued.

63755. *ALPINIA* sp. Zinziberaceae.

No. 104. March 6, 1925. *Yik tsz, Ye keung fa*. Rhizomes obtained at the Canton Christian College. This is a beautiful ornamental forming a dense growth of tough herbaceous stems which are set with fine dark-green foliage terminating in the summer in large racemes of fragrant white blossoms with red and golden lips. In addition to its value as an ornamental, the seeds, according to the Chinese, have a drug value. In fact, they are said to bring a wholesale price of \$50 to \$100 per 100 catties [133½ pounds].

63756. *POTHOS SEEMANNI* Schott. Araceae.

No. 106. Cuttings from a vine growing on a tree trunk on the Tengoo Mountain. A herbaceous climbing plant which adheres closely to the bark of trees by means of woolly adventitious roots. After attaining sufficient length to reach the lower branches of the tallest trees, it hangs in beautiful long festoons. It is a fine ornamental, chiefly on account of its splendid foliage; the flowers, in keeping with those of its kind, are rather inconspicuous.

63757. (Undetermined.) Poaceae. Bamboo.

No. 102. March 5, 1925. *Lak cha chuk*. Rhizomes of an edible bamboo, which is of considerable merit, collected on Honam Island, east of Tait'ong. It is of medium size, and when grown on fertile soil the culms reach a diameter of about 2.5 to 3 centimeters and a height of 3 to 4 meters. The nodes or joints are rather prominent, being larger in proportion to the stem than is usually the case. The sprouts, which are ready to harvest about the first of April, are very popular, bringing 50 to 60 cents a catty [1¼ pounds]. As grown here this bamboo is not fertilized and is allowed to shift for itself.

63758 to 63783.

From Amani, Tanganyika Territory, Africa. Seeds presented by A. H. Kirby, Director of Agriculture. Received April 9, 1925.

63758. *ADENANTHERA MICROSPERMA* Teijsm. and Binn. Mimosaceae.

No. 12. A handsome tropical tree, closely related to the mimosas, with attractive clean-cut foliage and twisted pods bearing bright-red beans. It is native to the East Indies and is considered a valuable timber tree because of its strong dark-brown wood, which is very hard, in spite of the rapid growth of the tree.

For previous introduction see S. P. I. No. 61478.

63759. *ALBIZZIA ADIANTHIFOLIA* (Schum.) W. F. Wight (*A. fastigiata* E. Mey.). Mimosaceae.

No. 16. A tropical African tree, of fastigate habit, with finely divided foliage. According to Holland (Useful Plants of Nigeria, pt. 2), this tree yields a gum somewhat similar to gum arabic. The seeds, after maceration, are eaten as a sauce by the natives of West Africa.

For previous introduction see S. P. I. No. 62897.

63758 to 63783—Continued.

63760. *BARYXYLUM DASYRACHIS* (Miquel) Pierre (*Peltophorum dasyrachis* Kurz.).
Caesalpiniaceae.

No. 237. A tall unarmed East Indian tree, described by Hooker (Flora of British India, vol. 2, p. 257) as having rigid pinnate leaves up to a foot in length and showy yellow flowers produced in terminal and axillary clusters 6 to 9 inches long.

63761. *BERRIA AMMONILLA* Roxb. Tiliaceae.

No. 47. "Trincomali wood" is the name under which the very hard, durable, dark-red wood of this Indian tree is exported, according to Watt (Dictionary of the Economic Products of India). The wood is used for making agricultural implements and for other purposes where toughness and hardness are desired. The tree is large, with long-stemmed, heart-shaped leaves and dense racemes of small white flowers. Its distribution includes the Malay Archipelago and the Philippines.

For previous introduction see S. P. I. No. 61482.

63762. *BERSAMA USAMBARICA* Guerin. Bersamaceae.

No. 48. A tropical African tree about 50 feet tall, with pinnate leaves 2 feet or more long and silky white flowers. It should be tried as a shade tree for extreme southern Florida.

63763. *BRIDELIA MICRANTHA* (Hochst.) Baill. Euphorbiaceae.

No. 52. According to J. H. Holland (Useful Plants of Nigeria, pt. 4), this is a thorny widespreading tree 20 to 40 feet high, which varies considerably in its height and degree of thorniness. The small black berries are edible, and the white timber is exceedingly durable and resistant to termites. Native to tropical Africa.

63764. *CANARIUM POLYPHYLLUM* Schum. Balsameaceae.

No. 63. The edible fruits of this Malaysian tree, according to Der Tropenpflanzer (vol. 17, p. 147) resemble walnuts and yield an oil which can be used in making margarine and similar products.

63765. *CASUARINA DISTYLA* Vent. Casuarinaceae.

No. 76. Unlike many of the better known casuarinas, this species is usually a small shrub 2 to 3 feet high. It is common in Tasmania and in parts of southern Australia.

For previous introduction see S. P. I. No. 61484.

63766. *COFFEA BUKOBENSIS* Zimmerm. Rubiaceae. Coffee.

No. 104. The coffee grown in the vicinity of Bukoba, Tanganyika Territory, was formerly supposed to be a variety of *Coffea arabica*, but Zimmermann (Der Pflanzer, vol. 4) maintains that it is a separate species and has named it *C. bukobensis*. The differences are in the venation of the leaves and flower structure. Culturally this species is very similar to *C. arabica*.

For previous introduction see S. P. I. No. 61485.

63758 to 63783—Continued.

63767. *COFFEA* sp. Rubiaceae. Coffee.

No. 108. Received as *Coffea quilloa*, for which a place of publication has not been found.

Introduced for cultural and comparison tests in tropical America.

For previous introduction see S. P. I. No. 61486.

63768. *DEGUELIA DALBERGIOIDES* (Baker) Taub. (*Derris dalbergioides* Baker). Fabaceae.

No. 132. A small spreading tree, described by Hooker (Flora of British India, vol. 2, p. 241) as being about 20 feet high, with rigid dark-green compound leaves and copious racemes of pink flowers. Native to eastern India and Java.

63769. *DIPTEROCARPUS TRINERVIS* Blume. Dipterocarpaceae.

No. 136. An East Indian tree described by Baker (Schoolflora voor Java, p. 108) as being 100 feet or more tall, with elliptical leaves about a foot long and clusters of large red flowers.

63770. *FICUS CHLAMYDODORA* Warb. Moraceae.

No. 171. A stately tree grown largely as a shade tree in parts of tropical Africa because of the handsome foliage and brick-red branches. According to Holland (Useful Plants of Nigeria), it bears twice a year abundant crops of peach-colored figs, which are fairly sweet and juicy.

For previous introduction see S. P. I. No. 61490.

63771. *FLACOURTIA RUKAM* Zoll. and Mor. Flacourtiaceae.

No. 176. A handsome unarmed Malayan tree with leathery leaves and edible berries, about the size of cherries, which are said to make excellent preserves.

63772. *INTSIA BIJUGA* (Colebr.) Kuntze (*Afzelia bijuga* Gray). Caesalpiniaceae.

No. 15. The ipil, as this is known in the Philippines, is described (W. H. Brown, Minor Products of Philippine Forests, vol. 2) as a tall tree, 100 feet or more in height, with fragrant white and reddish flowers borne in large conspicuous clusters. The wood is valued as building material.

63773. *LANDOLPHIA STOLZII* Busse. Apocynaceae.

No. 206. A number of Landolphas are being introduced from tropical Africa for testing by department rubber specialists. This one is described by Thiselton-Dyer (Flora of Tropical Africa) as a climbing shrub with small oval leaves, dense clusters of white sweet-scented flowers, and fruits resembling small oranges.

For previous introduction see S. P. I. No. 61493.

63774. *LANDOLPHIA* sp. Apocynaceae.

No. 207. The Landolphas are tropical African climbers, many of which yield rubber. This unidentified species will be tested in southern Florida for its rubber-yielding value.

63758 to 63783—Continued.

63775. *LILIUM REGALE* Wilson. Liliaceae.
Regal lily.

No. 210. Seeds of the Regal (Royal) lily as grown in Africa, introduced for department horticulturists.

For previous introduction see S. P. I. No. 61494.

- 63776 and 63777. *MANIHOT GLAZIOVIA* Muell. Arg. Euphorbiaceae.

Ceara rubber.

Ceara rubber, obtained from this tree, is one of the important rubbers of commerce.

For previous introduction see S. P. I. Nos. 61496 and 61497.

63776. No. 216. Received as *Manihot dictoma*, but the seeds do not agree with that species.

63777. No. 217.

63778. *MUSA TEXTILIS* Nee. Musaceae.

No. 227.

Abacá seeds to be grown for testing as fiber.

For previous introduction see S. P. I. No. 61500.

63779. *PACHIRA FASTUOSA* (DC.) Decaisne. Bombacaceae.

No. 51. A handsome tropical tree native to Mexico, according to the Gardeners' Chronicle, vol. 54, p. 325. The flowers in their size and color are both exceptional and attractive, as they measure about a foot in diameter; the strap-shaped petals are white, and the large brushlike clusters of stamens are crimson and yellow. The foliage is not unlike that of the horse-chestnut, but it is more leathery in texture.

63780. *PENTAS* sp. Rubiaceae.

No. 238. A shrubby tropical plant, native to West Africa, which may have value as a greenhouse ornamental.

63781. *PTYCHOCOCCUS PARADOXUS* (Scheff.) Beccari. Phoenicaceae.

Palm.

No. 262. A small palm, 9 to 12 feet high, native to New Guinea. The slender trunk is covered with white hairs, and the feathery leaves are borne at the summit of the trunk.

63782. *RANDIA* sp. Rubiaceae.

No. 263. The *Randia*s are tropical shrubs or trees, often with showy white or yellowish flowers. The round berries of some species are edible.

Received as *Randia sericantha*.

63783. *SCHEFFLERODENDRON USAMBARENSE* Harms. Fabaceae.

No. 274. A handsome tropical African leguminous tree, described by Harms (Engler's Botanische Jahrbücher, vol. 30, p. 88) as having dense compound foliage and axillary racemes of reddish brown flowers.

63784. *MUSA PARADISIACA SAPIENTUM* (L.) Kuntze. Musaceae. Banana.

From San Juan, Porto Rico. Suckers presented by O. W. Barrett, agricultural adviser, Department of Agriculture and Labor. Received April 9, 1925.

Colorado Blanco. A Porto Rican variety.

63785. *CHRYSOPHYLLUM MONOPYRENUM* Swartz (*C. oliviforme* Lam., not L.). Sapotaceae. Satin leaf.

From Manila, Philippine Islands. Seeds presented by P. J. Wester. Received April 13, 1925.

While the fruits of this tree are usually poor for eating purposes, I had brought to me recently a bag of fruits of remarkably good quality. These are distinctly superior to many native edible fruits. (Wester.)

A tropical American tree of attractive appearance; the oval or oblong leaves are silky golden beneath, the flowers are white, and the blue-black fruits are over an inch long.

63786. *FUNTUMIA ELASTICA* (Preuss) Stapf. Apocynaceae.

Lagos rubber tree.

From Accra, Gold Coast Colony, Africa. Seeds presented by W. S. D. Tudhope, Director, Department of Agriculture. Received April 16, 1925.

A large forest tree which is very widely distributed throughout central Africa and is the source of Lagos rubber which is of excellent quality.

For previous introduction see S. P. I. No. 61086.

63787 to 63797.

From Kwangtung Province, China. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received April 21, 1925. Notes by Mr. McClure.

- 63787 and 63788. *ADENANTHERA MICROSPERMA* Teijsm. and Binn. Mimosa-ceae.

63787. No. 89. February 5, 1925. *Sai sz kak*. From trees growing in the mission compound at Tukking. This is an excellent lumber tree with rich-brown wood which is very strong and hard in spite of its comparatively rapid growth. As an ornamental it is also desirable, with its splendid clean-cut leaves and cork-screw pods bearing bright-red beans. It reaches a considerable size, the largest specimen in the compound being 40 centimeters in diameter and 15 meters high.

63788. No. 90. February 10, 1925. *Seung sz kak*. From Tenguhausen, near Haulik, on the West River. Similar to No. 89 [S. P. I. No. 63787] except that the seeds seem slightly smaller and darker.

63789. *BISCHOFIA* sp. Euphorbiaceae.

No. 83. February 10, 1925. *Kat long, Chau jung*. Found near Haulik, West River. This tree, like *Bischofia javanica*, to which it seems closely related but from which it may be distinguished by its smaller leaves and berries, is valued as a source of lumber. It is a deciduous tree bearing profusely large dense pendulous panicles of small, brown, dry fruits.

63790. *BOEHMERIA NIVEA* (L.) Gaud. Urticaceae. Ramie.

No. 92. February 17, 1925. *Pak chue ma*. From plants cultivated near Lintan. Ramie, the material used to make the very useful summer fabric called grass cloth, is obtained from this plant.

63787 to 63797—Continued.

63791. *BRIDELIA MONOICA* (Lour.) Merr.
Euphorbiaceae.

No. 80. Sheungtip. February 3, 1925. *Pik pok tsai*. An attractive small, native tree whose slender drooping branches are slightly suggestive of the weeping willow, although the sessile leaves are elliptic ovate and obtuse. This plant, widely distributed throughout Kwangtung, is a fair ornamental, although neither its flowers nor its fruits are conspicuous.

63792. *FRAXINUS CHINENSIS* Roxb.* Oleaceae. Ash.

No. 84. February 10, 1925. *Shui lau, Chaak paan lau*. From two trees growing near a pond on the road to the Tengu Mountain, near Haulik. The lumber, not abundant here, is used by the Chinese to make implements, oars, etc.

63793. *ILEX* sp. Aquifoliaceae.

No. 79. *Chue t'in shue, Tsau peng shue, Pak lan heung*. From an isolated tree growing wild along the road near Samshui, on the flood plain of the West River. This is a beautiful spreading tree with smooth light-gray bark and glossy dark-green persistent foliage. The thick clusters of red berries are slightly flattened in shape and considerably smaller than a garden pea.

63794. *ILEX* sp. Aquifoliaceae.

No. 81. February 16, 1925. *Pak lan heung*. Along the road from Lintan to Szechin. This tree, leafless, but with every branch literally hidden in a profusion of brilliant red berries, was a most strikingly beautiful object. It stood out very conspicuously in quite a group of its species as being leafless but heavily loaded with fruits while the others still clung to half their foliage but bearing much less abundantly.

63795. *ORMOSIA CALAVENSIS* Azaola. Fabaceae.

No. 91. February 9, 1925. *Kai Ngaan shui*. A striking ornamental from a ravine on Tengu Mountain. This is a large tree with black bark, splendid foliage, and bearing bright-red seeds.

63796. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceae. Soy bean.

No. 78. February 16, 1925. A light-green variety from a shop in Lintan and said to have originally come from Tung-koon, on the East River.

63797. *VITEX QUINATA* (Lour.) F. N. Williams. Verbenaceae.

No. 99. Kochanghui, on the Little North River. January 18, 1925. *Po keng, F'oi shue*. This large tree, 10 meters high and 50 centimeters in diameter, bears small fragrant purple or lavender flowers in large upright panicles. It yields a hard wood useful in making furniture and boats.

63798. *MANIHOT GLAZIOVII* Muell. Arg. Euphorbiaceae. Ceara rubber.

From Paris, France. Seeds purchased from Vilmorin-Andrieux & Co. Received April 23, 1925.

An important rubber-producing plant, native to Brazil.

63799. *NEYRAUDIA MADAGASCARIENSIS* (Kunth) Hook. f. Poaceae. Grass.

From Darjiling, India. Seeds presented by G. H. Cave, curator, Lloyd Botanic Garden. Received April 20, 1925.

A large coarse grass, described by J. D. Hooker (*Flora of British India*, vol. 7) as having a solid stem 6 to 8 feet or more in height, with smooth soft leaves 1 or 2 feet long and panicles 1 to 3 feet long. Although native to Madagascar, this grass is distributed throughout tropical Asia. In its native home the leaves are used for making hats.

63800 to 63820.

From Leningrad, Russia. Seeds presented by Dr. Wl. Kousnetzoff, botanist in charge of forage and pasture plants, Bureau of Applied Botany and Plant Breeding. Received April 13, 1925. Notes by Doctor Kousnetzoff.

63800 and 63801. *AGROPYRON CRISTATUM* (L.) Gaertn. Poaceae. Grass.

A perennial, thickly caespitose grass, upright or ascending, native to southern Europe and Asia.

63800. No. 1338. Province of Omsk.

63801. No. 2113. Minusinsk. Province of Yeniseisk, District of Siberia.

63802. *AGROPYRON SIBIRICUM* (Willd.) Beauv. Poaceae. Grass.

No. 1340. Province of Omsk.

An upright caespitose perennial grass, up to 16 inches high, with linear leaves. Native to southern Russia and the Caucasus.

63803 to 63805. *BROMUS INERMIS* Leyss. Poaceae. Grass.

A perennial upright European grass, which forms a thick mat, with creeping rhizomes. The stems are 1 to 3 feet high.

63803. No. 1612. Djirgalantou. Mongolia. From the basin of a river.

63804. No. 1613. Adjin, Mongolia. From the basin of the Kossogol River.

63805. No. 1342. Province of Omsk.

63806. *ELYMUS DAHURICUS* Turcz. Poaceae. Grass.

No. 1346. Province of Omsk.

A tall perennial grass with stout erect stems, native to mountainous regions in central and eastern Asia.

63807 and 63808. *ELYMUS SIBIRICUS* L. Poaceae. Grass.

A tall perennial grass with heavy pendulous panicles; native to Siberia.

63807. No. 1347. Province of Omsk.

63808. No. 2273. Nikol'sko-Ussurijsk, Province of Primorskaya.

63809 and 63810. *HEDYSARUM GMELINI* Ledeb. Fabaceae.

In localities where this is native it is popular as a forage plant.

63809. No. 2285. District of Minusinsk, Province of Yeniseisk.

63810. No. 2286. District of Minusinsk, Province of Yeniseisk.

63800 to 63820—Continued.

63811. *LESPEDEZA STRIATA* (Thunb.)
Hook. and Arn. Fabaceae.

No. 2270. Nikoljsko-Ussurijsk, Province of Primorskaya.

63812 and 63813. *MEDICAGO FALCATA* L.
Fabaceae.

63812. No. 1327. Province of Omsk.

63813. No. 2111. District of Minusinsk, Province of Yeniseisk.

63814. *MEDICAGO PLATYCARPA* (L.) Trautv.
Fabaceae.

No. 1311. Province of Irkutsk, eastern Siberia.

A Siberian alfalfa of erect habit, with yellow flowers and large, flat, black pods.

63815 and 63816. *MEDICAGO SATIVA* L. Fa-
baceae. Alfalfa.

63815. No. 1783. District of Slavgorodsk, Province of Omsk.

63816. No. 1784. District of Tatarsk, Province of Omsk.

63817. *ONOPRICHIS VULGARIS* Hill (*O. viciaefolia* Scop.). Fabaceae.

No. 2110. District of Minusinsk, Province of Yeniseisk.

63818. *PHLEUM PHLEOIDES* (L.) Karst.
(*P. boehmeri* Wibel.). Poaceae. Grass.

No. 2115. District of Minusinsk, Province of Yeniseisk.

A perennial, thickly matted grass, native to Europe and western Asia, with stems 1 to 2 feet high and gray-green leaves up to 8 inches long.

63819. *TRIFOLIUM REPENS* L. Fabaceae.
White clover.

No. 1842. Harbin, Manchuria.

63820. *VICIA AMOENA* Fisch. Fabaceae.
Vetch.

No. 2109. District of Minusinsk, Province of Yeniseisk.

A perennial, hairy Siberian vetch, with erect stems up to 2 feet high and purplish flowers.

63821. *MUSA URANOSCOPOS* Lour. Musa-
ceae. Banana.

From China. Offshoots collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received April 27, 1925.

No. 107. March 10, 1925. *Shaan pa tsiu, Shui tsiu*. From plants growing on a trash pile near the Hengwan monastery on the Tengou Mountain, Kwangtung. The plants are 1½ to 2 meters high, with leaves one-half to 1 meter long, bright-red flowers blooming in the summer, and fruits said to be very seedy and not edible. The plants do not appear to be cultivated by the Chinese around Canton, nor used by them for any purpose. (McClure.)

63822. *BERBERIS REPLICATA* W. W. Smith. Berberidaceae. Barberry.

From Wisley, Ripley, Surrey, England. Seeds presented by Fred J. Chittenden, director, Royal Horticultural Society Gardens. Received April 24, 1925.

An evergreen barberry originally collected by George Forrest in thickets on the Shweli-

Salwin Divide, southwestern China, at an altitude of 11,000 feet. The rather small leaves have recurved margins and are gray beneath. It is an early and profusely flowering species, bearing its blossoms all along the branches in a very attractive fashion, and the deep-crimson berries make it handsome in the fruiting stage. It appears to be very hardy in England.

For previous introduction see S. P. I. No. 58463.

63823 to 63826.

From Kwangtung Province, China. Collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received April 24, 1925. Notes by Mr. McClure.

63823. *EURYALE FEROX* Salisb. Nympha-
ceae.

No. 103. Shihing, on the West River. *Chi sat*. Seeds of a hydrophytic plant said to resemble the lotus somewhat. It is covered with short spines, however, and has very large, floating leaves. The seeds must be kept moist from maturity (September) until planting time (April), or they will not grow. They are stored wet in large earthen jars. If used for food, however, they are immediately dried, the shell removed, and the starchy kernels placed on the market. The most notable use to which the seeds of this plant are put is the feeding of a famous variety of cultivated fish known as man hing long lei ue. These fish are said to be characterized by very soft bones, fins, and scales, the latter being eaten with the flesh. The Chinese attribute these peculiar qualities of this fish to the fact that they are fed on the seeds of *chi sat*. These seeds are also used for human consumption and are considered to be a particularly beneficial food.

63824. *STIZOLOBIUM PACHYLOBIUM* Piper and Tracy. Fabaceae.

No. 101. March 2, 1925. *Tai kau tsau tsu*. Seeds obtained at the Canton Christian College. This plant is a luxuriant vine and is used in parts of China as green manure. It makes a prodigious growth.

63825. *POTHOS* sp. Araceae.

No. 120. March 14, 1925. *Shek p'o t'ang*. Cuttings obtained from the wilds near the village of Heunglokauk. This is a pretty creeping plant which covers the granite rocks in moist, shady situations.

63826. (Undetermined.) Poaceae. Bamboo.

No. 105. March 6, 1925. *Wack chuk*. Cuttings obtained at the Canton Christian College. This is a very striking ornamental bamboo with golden-yellow culms, marked vertically with random narrow stripes of bright green. It reaches a diameter of 9 or 10 centimeters and a height of 10 meters when well established. This bamboo is not common, but is seen here and there as an ornamental in the Chinese gardens and monasteries.

63827 and 63828. *LILIUM* spp. Lilia-
ceae. Lily.

From Harbin, Manchuria. Seeds presented by P. Pavlov, president of the natural history section, Manchuria Research Society. Received April 28, 1925.

63827 and 63828—Continued.

63827. *LILIUM DAURICUM* Ker.

A plant about 3 feet in height, with a smooth or slightly furrowed stem which is green or tinged with brown or purple. The 20 to 50 horizontal leaves are 3 to 5 inches long, and the flowers, one to five in a cluster and 3 to 5 inches across, are orange-red, slightly spotted with purplish black, and tinged with yellow in the center. The anthers are red.

For previous introduction see S. P. I. No. 58553.

63828. *LILIUM MARTAGON* L.

The Martagon lily grows wild from central and southern Europe to southwestern Siberia. The stem is 3 to 6 feet high, often purple spotted, with horizontal deep-green leaves 3 to 6 inches long and dull claret-purple flowers, spotted purplish black, with red anthers. From 3 to 20 flowers are produced at one time, usually in late June and July.

63829. *COIX LACRYMA-JOBI* MA-YUEN (Rom.) Stapf. Poaceae. Adlay.

From Lamo, Bataan, Philippine Islands. Seeds presented by S. Youngberg, acting director, Bureau of Agriculture, Manila. Received June 11, 1925.

La Union.

The ma-yuen, or adlay, has attracted considerable attention as a cereal for tropical regions. According to P. J. Wester, it is better than upland rice for tropical agriculture in being more drought resistant, a heavier yielder, and much less expensive to cultivate. The seeds can be used largely in the same manner as corn.

63830 to 63836.

From Tibet, China. Seeds collected by Capt. F. Kingdon Ward and presented by Maj. Lionel de Rothschild, London, England. Received April 23, 1925. Notes by Captain Ward.

Collected in the Tsangpo Valley during April and May, 1924.

63830. *IRIS* sp. Iridaceae.

No. 5719. A purple-flowered plant, 9 inches in height, which grows in sandy soil in open alpine pastures at an altitude of 13,000 feet.

63831. *LILIUM* sp. Liliaceae.

No. 6428. A plant, 2 to 3 feet high, which grows on very steep, well-drained, grass-clad slopes in fine sandy soil, under pine trees, etc. It bears a single terminal flower.

63832. *LONICERA* sp. Caprifoliaceae.

No. 5688. A shrub, 6 feet high, which grows in thick spruce forests and which requires ample water and deep shade. The foliage and fruit are ornamental. The flowers were not seen.

63833. *LONICERA* sp. Caprifoliaceae.

No. 5753. A dwarf twiggy shrub, 1 to 1½ feet in height, growing in peaty soil on open slopes among dwarf rhododendrons. The flowers are small and yellow, and the berries large, scarlet, and translucent.

63830 to 63836—Continued.

63834. *LONICERA* sp. Caprifoliaceae.

No. 5776. A shrub, 6 to 8 feet high, requiring shade and ample water, found along streams in the forests. The leaves are dark green, the flowers yellow with large papery bracts, and the fruits are scarlet. It is very floriferous and particularly striking when in fruit.

63835. *LONICERA* sp. Caprifoliaceae.

No. 5872. A shrub, 2 to 3 feet high, bearing flowers of a purple-plum color and large blue-black berries. It grows on steep, sheltered, rocky slopes, in peaty soil with rhododendrons, etc.

63836. *LONICERA* sp. Caprifoliaceae.

No. 6106. A pale-yellow flowered bush or tree, 15 to 20 feet high, with orange-scarlet berries. The foliage is pale sea-green, almost glaucous. This species is found in fairly dry regions, in sandy soil, and in open meadows or thickets.

63837 to 63839.

From Kwangtung Province, China. Purchased by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received May 7, 1925. Notes by Mr. McClure.

63837. *COLOCASIA* sp. Araceae.

No. 113. Village of Heungloekuk. March 14, 1925. *Fa tau oo*. This variety, of moderate size and oblong in shape, is considered by the Chinese to be of excellent quality and flavor. Tubers.

63838. *DIOSCOREA ALATA* L. Dioscoreaceae. Yam.

No. 116. Village of Heungloekuk. March 13, 1925. *Tai hung shue*. A red-fleshed yam of good quality and flavor. Tubers.

63839. *ZINZIBER* sp. Zinziberaceae.

No. 114. Village of Heungloekuk. March 13, 1925. *Shaan keung*. Cultivated and used in the village of Heungloekuk as a condiment, as is the ginger commonly grown around Canton. Rhizomes.

63840. *RUBUS* sp. Rosaceae.

From Stavanger, Norway. Plants presented by Thoralf Bryne. Received May 7, 1925.

Paradise berry. A large red raspberry, almost as large as the largest variety known in cultivation, which is the English variety, the Royal. (Bryne.)

For previous introduction see S. P. I. No. 56145.

63841 to 63845. *GOSSYPIUM* spp. Malvaceae. Cotton.

From Nanking, China. Seeds presented by the University of Nanking, through T. H. Kearney, Bureau of Plant Industry. Received May 2, 1925.

63841 to 63843. *GOSSYPIUM* NANKING Meyen.

The "Chinese" cotton of commerce is, according to Watt (Wild and Cultivated Cottons of the World) an annual or perennial bush, with delicate, sparsely branched stems and imperfectly cordate leaves. The irregular-shaped seeds are densely coated with rufous velvet and

63841 to 63845—Continued.

bear a silky fiber, which in all the better varieties is white but often shows a tendency to become reddish or khaki. This cotton is cultivated throughout tropical Asia.

For previous introduction see S. P. I. No. 62595.

63841. Greenish yellow flowers.

63842. *Hsiao kan kuan*.

63843. Flowers small and white.

63844. *Gossypium* sp.

Million Dollar.

63845. *Gossypium* sp.

F 5.

63846 to 63849. *ORNITHOGALUM* spp.
Liliaceae.

From Bonnie Vale, Cape Province, South Africa. Seeds purchased from the Winton Nurseries. Received April 30, 1925.

In South Africa these liliaceous plants are known as "chinkeriches." They have become popular in that country as ornamentals. When dried the flowers retain their form and color admirably and for this reason can be used as "everlastings."

63846. *ORNITHOGALUM* sp.

Cream colored.

63847. *ORNITHOGALUM* sp.

Double white.

63848. *ORNITHOGALUM* sp.

Orange colored.

63849. *ORNITHOGALUM* sp.

White.

63850 to 63852. *AMYGDALUS PERSICA* L.
(*Prunus persica* Stokes). Amygdalaceae. Peach.

In 1913 seeds of the *Shatil* peach were introduced from the Kurram Valley, Northwest Provinces, India. The following seedlings, grown at the Plant Introduction Garden, Chico, Calif., appear worthy of propagation and are therefore assigned numbers, April, 1925, for convenience in distribution.

63850. Fruit round to oval, small, 2 inches in diameter; cavity of medium depth, rather broad; suture shallow; skin light yellow, thin, tender, heavily pubescent, separating easily from the flesh; flesh golden yellow, medium juicy, little fiber, slightly lacking in sugar, fair quality, not stained around the pit; pit $1\frac{1}{4}$ inches by 1 inch, brown, sharply pointed. A freestone. The tree is large and vigorous and has proved very satisfactory at Chico as stock. The fruits are good for drying and also for canning. Ripens at Chico, Calif., about the third week in August. (Row 18, tree 1, old test nursery.)

63851. Fruit nearly round or oval, $2\frac{1}{4}$ by 2 inches; cavity of medium depth, fairly abrupt, slightly elongated along suture; suture distinct, very shallow; apex with very small point; skin golden yellow, rather thick but tender, heavily pubescent, separating easily

63850 to 63852—Continued.

from the flesh; flesh golden yellow, tending soft, juicy, little fiber, slightly lacking in sugar, only slightly stained around pit; pit $1\frac{1}{2}$ inches by 1 inch, pinkish, very sharply pointed. A freestone. The tree is fast growing, vigorous, and prolific, and the fruits are excellent for table use and could also be used for canning and drying. Ripens at Chico, Calif., about the third week in August. (Row 18, tree 2, old test nursery.)

63852. Fruits medium sized, $2\frac{1}{2}$ by $2\frac{1}{4}$ inches, oval or nearly so, slightly oblique at base; cavity broad, fairly deep; suture medium apex with small point; skin golden yellow, thick, tough, adhering to flesh, pubescence very heavy; flesh golden yellow, tending juicy, firm, tough, rather flat, lacking in sugar, not stained near pit; pit 1 by $1\frac{1}{4}$ inches extended into a sharp point. This attractive clingstone peach, which appears to have promise for canning, ripens at Chico, Calif., about the third week in August. (Row 18, tree 4, old test nursery.)

63853 and 63854. *GARCINIA* spp. Clusiaceae.

From Manila, Philippine Islands. Seeds presented by the acting Director of Agriculture, Bureau of Agriculture. Received May 6, 1925.

63853. *GARCINIA BINUCAO* (Blanco) Choisy.
Binukao.

The binukao, a relative of the mangosteen, is a handsome tree which is very common in certain parts of the Philippine Islands, notably in Luzon and the Visayan Islands. W. H. Brown, in *Wild Food Plants of the Philippines*, states that the yellowish rounded fruits, nearly 2 inches in diameter, with a very acid pulp and numerous seeds, are eaten with fish by the Filipinos. The small red flowers are borne in dense clusters. The binukao will probably not endure low temperatures, since it comes from a tropical region.

For previous introduction see S. P. I. No. 59376.

63854. *GARCINIA VENULOSA* (Blanco) Choisy.

Like the preceding [S. P. I. No. 63853], the *katuri* is also a wild Philippine relative of the mangosteen. It is described by P. J. Wester (*Food Plants of the Philippines*, p. 105) as a tree about 40 feet high, with large oblong leathery leaves, which is widely distributed throughout the Philippines, but not cultivated. The round fruits, about 2 inches in diameter, have an acid pulp containing several flat seeds. The natives eat this fruit with fish, and it would probably make good preserves.

63855. *CAREX PUMILA* Thunb. Cyperaceae. Sedge.

From New Zealand. Seeds presented by W. C. Coker, University of North Carolina, through A. S. Hitchcock, Bureau of Plant Industry. Received May 9, 1925.

Sent by Captain Ellis, State forester of New Zealand, who says this is the best sand binder of that country. (Coker.)

63856 to 63866. OLEA EUROPAEA L.
Oleaceae. Olive.

From Pescia, Province of Lucca, Italy. Plants purchased from E. d'Uliva & Fratelli. Received May 11, 1925. Notes taken from the catalogue of d'Uliva & Fratelli.

A collection of Italian varieties, not known in the American trade, introduced for trial in the olive-growing sections of the United States.

63856. Ascolana. A canning variety cultivated from time immemorial in Ascoli. It is a constant and abundant fruiter, with large, dark-green, lightly undulate leaves. The large fruits are almost spherical, with rich, delicate flesh of pleasant flavor; the seed is small.

63857. Asiolani.

63858. Dolce del Marocco. A variety with fruits larger than those grown for oil, especially adapted for drying.

63859. Enifujiolo.

63860. Frantoi. Cultivated for oil.

63861. Grappolo. Rather large olives, produced in clusters. The fruits are rich in oil.

63862. Lecci. A vigorous variety cultivated for oil.

63863. Maurini. An excellent new variety, producing oil of good quality.

63864. Racemo. A prolific variety, disease resistant, with ashy green leaves; the ovoid fruits are rich in oil.

63865. Moraioli. A vigorous drought-resistant and disease-resistant variety which yields an abundance of oil of good quality.

63866. Zantis.

63867. BRASSICA SP. Brassicaceae.

From Kwangtung Province, China. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received May 7, 1925.

No. 118. March 9, 1925. *Yau tsoi*. Seeds collected from plants which had escaped from cultivation, growing along the bank of the West River near Lohyanchung. (McClure.)

63868. NEOGLAZIOVIA VARIEGATA (Ar-ruda) Mez (Billbergia variegata Schult.). Bromeliaceae.

From Bahia, Brazil. Plants obtained from Dr. H. H. Brown, St. Albans, Vt., through L. H. Dewey, Bureau of Plant Industry. Received May 6, 1925.

The carofá is a plant 4 or 5 feet high, of the same family as the pineapple, and is found wild in the caatingas or dry regions of eastern Brazil. The natives extract the fiber for the purpose of making baskets, ropes, and hammocks, but the quantity obtained is not sufficient for export. It is now introduced for trial in the southern United States by fiber-plant specialists. It is also being tested as a possible paper material.

63869 to 63875.

From Kwangtung Province, China. Seeds and rhizomes collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received May 7, 1925. Notes by Mr. McClure.

63869. PISUM SATIVUM L. Fabaceae.

Pea.

No. 119. Village of Heunglokeuk, March 13, 1925. *Maak tau, Suet tau, Chun tau*. Seeds of a sturdy, low-growing, self-supporting vine which produces, in fair abundance, rather large peas of good flavor and quality. The flowers are very ornamental, the lower petal being pale lavender, the next pair wine red, and the inner pair pink. This variety, planted here in November, begins to bear in December or January and continues until March.

63870 to 63875. (Undetermined.) Po-aceae. Bamboo.

63870. (Undetermined.)

No. 108. March 14, 1925. *Kom chuk*. A variety growing wild along a small stream in the Chunwong Mountains, near the village of Heunglokeuk, at an altitude of 300 meters. The young shoots of this bamboo are highly esteemed by the Chinese of this neighborhood. This bamboo, as seen in its native habitat, is rather small in stature, being only 2 to 2.5 meters in height and 1 to 1.5 centimeters in diameter between the lower nodes. Its best shoots are produced on the loose silt loam banks of the stream, but it can not hold its own here so well as on the wet sand and gravel at the edge of the water, where it produces an impenetrable network of rhizomes. It might be used to excellent advantage for preventing erosion in such situations.

63871. (Undetermined.)

No. 109. March 14, 1925. *Wong kom chuk*. Obtained from the wild, at an altitude of 300 meters, in the Chunwong Mountains, near Heunglokeuk. A dense grove of this bamboo, whose canes are about 3 meters in height and 1.5 to 2 centimeters in diameter between the lower nodes, completely conceals the tiny stream, along which these rhizomes were growing, for a considerable distance. This variety, like No. 108 [S. P. I. No. 63870], forms its toughest and most impenetrable network of rhizomes in the wet sand immediately at the edge of the water, but its finest shoots are produced in the rich-brown loose soil of the bank near by. The shoots are edible, but the Chinese say that it is necessary to parboil them in order to remove the slightly bitter taste. The canes are put to a number of uses, particularly to the weaving of garden fences. The upper portions of the canes, with their numerous, slender side branches, are bound into brooms which are widely used locally and are shipped even as far as Canton.

63872. (Undetermined.)

No. 110. March 14, 1925. *Fat t'o chuk, Fat chuk*. These rhizomes are from the native vegetation in a ravine near Heunglokeuk, in the Chunwong Mountains, where this variety had been planted. This is another relatively small bamboo (2 to 2.5 meters high

63869 to 63875—Continued.

and 2 centimeters in diameter), whose edible shoots are considered a close second in quality to those of No. 108 [S. P. I. No. 63870]. This variety begins to sprout in early April, and here again, as elsewhere observed, I found the best shoots growing in damp loose loam. A peculiar characteristic of the canes is that prominent swellings occur just below the lower nodes, which are quite close together. The name Fat t'o probably refers to this peculiarity. In earlier days the lower sections of these canes brought a good price for handles of fans, but in recent years they are more in demand as pipe stems.

63873. (Undetermined.)

No. 111. Near the village of Heung-loekuk. March 14, 1925. *Kan chuk*. This bamboo is commonly planted on the mountain sides and allowed to shift for itself among the native vegetation. Under these conditions the plant attains a height of 2 to 3 meters and a diameter of 1.5 to 2 centimeters. The coarse red soil in which these plants were growing is formed from granite. A thin layer of dark soil accumulates where the natural vegetation is permanent. The bamboo flourishes best, of course, where this layer is thickest. The young shoots are eaten, being taken just as they appear at the top of the ground. Its season begins about the middle of April.

63874. (Undetermined.)

No. 112. March 13, 1925. This bamboo was growing near the village of Heungloekuk, where it is allowed to shift for itself among the native vegetation on the steep banks of a ravine. The canes reach a height of 4 meters and a diameter of 2 to 2.5 centimeters between the nodes in the habitat described, but the variety is said to become much larger under more favorable cultural conditions. The young shoots are of excellent quality and fair size. Their season begins in April.

63875. (Undetermined.)

[Sent in without notes.]

63876 to 63879. PISUM SATIVUM L.
Fabaceae. Pea.

From Wellington, New Zealand. Seeds obtained from F. Cooper, through D. N. Shoemaker, Bureau of Plant Industry. Received May 8, 1925.

Locally developed strains.

63876. *Austral*.

63877. *Richard Seddon*.

63878. *Te Aroha*.

63879. *Wellington*.

63880 to 63889. PISUM SATIVUM L.
Fabaceae. Pea.

From Bretigny sur Orge, France. Seeds obtained from L. Clause, through D. N. Shoemaker, Bureau of Plant Industry. Received May 8, 1925.

Locally developed strains.

63880 to 63889—Continued.

63880. *Duc de Manchester*.

63881. *Gris de Printemps*.

63882. *Gris d'Hiver*.

63883. *Gros blanc géant Victoria*.

63884. *Gros vert pour grande culture*.

63885. *Mangetout Nain Debeve*.

63886. *Sabre, race de Paris*.

63887. *Serpette améliorée, race de Paris*.

63888. *Trophy, très tardif*.

63889. *Union Jack*.

63890 to 63894. GOSYPIUM BARBADENSE
L. Malvaceae. Cotton.

From Egypt. Seeds presented by R. H. Forbes, Compagnie Générale des Colonies, Kulikoro, French Sudan, French West Africa. Received May 6, 1925. Notes by Mr. Forbes.

The following seeds are from the Bahtien Farm.

63890. No. 46a. Saka. *Fathi*.

63891. No. 46b. Upper Egypt.

63892. No. 46c. Saka. *Pilion*.

63893. No. 46d. Saka. *Ashmouni*.

63894. No. 46e. Saka. *Cazzouli*.

63895 to 63900.

From Tammisto, Malm, Finland. Seeds presented by J. O. Saulis, manager of the plant-breeding station, through C. R. Ball, Bureau of Plant Industry. Received May 12, 1925.

A collection of local varieties originated at Tammisto.

63895 to 63897. AVENA SATIVA L. Poaceae. Oats.

63895. *Esa*.

63896. *Pelso*.

63897. *Vyto*.

63898 and 63899. HORDEUM DISTICHON PALMELLA Harlan. Poaceae.

Two-rowed barley.

63898. *Halikko No. 2*.

63899. *Uurainen*.

63900. HORDEUM VULGARE PALLIDUM Seringe. Poaceae. Six-rowed barley.

Early 0283.

63901 to 63904. ORYZA SATIVA L. Poaceae. Rice.

From Jorhat, India. Seeds presented by Dr. S. K. Mitra, Economic botanist to the Government of Assam. Received May 8, 1925.

The following varieties are from the Karimganj Farm.

63901. No. S-149. *Indra Sail*.

63902. No. S-156. *Nagra Sail*.

63903. No. S-159. *Dudshar*.

63904. No. S-232. *King's Own*.

63905 and 63906. TRITICUM AESTIVUM
L. (*T. vulgare* Vill.). Poaceae.
Common wheat.

From Tammisto, Malm, Finland. Seeds presented by J. O. Saulis, manager of the plant-breeding station, through C. R. Ball, Bureau of Plant Industry. Received May 12, 1925.

Local varieties originated at Tammisto.

63905. *Winter Sukkula*.

63906. *Spring Tammi*.

63907. LYCOPERSICON ESCULENTUM Mill.
Solanaceae. Tomato.

From Bordeaux, France. Seeds presented by Prof. L. Beille, director, Jardin Botanique de Talence. Received May 7, 1925.

Var. *cerasiforme*. A yellow-fruited form of the cherry tomato.

63908 to 63967.

From Chihli Province, China. Seeds obtained by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received May 5, 1925. Notes by Mr. Dorsett.

63908. AMYGDALUS PERSICA L. (*Prunus persica* Stokes). Amygdalaceae. Peach.

No. 2393. March 14, 1925. *T'u t'ao* (wild peach) from Lijetsu, which is a big deciduous fruit-growing section in an immense broad level valley near Paotingfu. This variety is also called "earth peach" by the natives. It is used for stock upon which to graft or bud the commercial varieties.

63909. BENINCASA HISPIDA (Thunb.) Cogn. Cucurbitaceae. Wax gourd.

No. 2408. Loutai, near Peking. March 17, 1925. A winter variety.

63910 to 63915. BRASSICA spp. Brassicaceae.

Paotingfu. March 10, 1925.

63910. BRASSICA sp.

No. 2327. *Anhsu ta pai ts'ai* (large Anhsu cabbage). This variety is planted the latter part of July, later transplanted, and during October it is cut and stored in the cellar. The average weight is 15 to 16 pounds.

63911. BRASSICA sp.

No. 2328. *Pao tou pai ts'ai* (folding head cabbage), planted in July and later transplanted. This variety, the leaves of which fold in, grows to a height of about 14 inches and weighs 12 to 13 pounds.

63912. BRASSICA sp.

No. 2329. *Hsiao pai k'ou pai ts'ai* (small white mouth cabbage). A variety, about 12 to 13 inches high and with the leaves spreading out, which is planted in July or earlier. It is not commonly planted, but is said to be of very good quality.

63913. BRASSICA sp.

No. 2330. *Ho t'ao wen pai ts'ai* (walnut-hulled cabbage), commonly planted here. This variety, the head resembling a walnut hull, grows 13

63908 to 63967—Continued.

to 14 inches in height and weighs about 8 to 10 pounds.

63914. BRASSICA sp.

No. 2331. A variety which is said to have a diameter of 4 to 6 inches.

63915. BRASSICA sp.

No. 2332. *Shansi pe'i lan* (kohlrabi of Shansi). This seed came from Shansi Province and is said to grow to 8 or more inches in diameter.

63916. CANNABIS SATIVA L. Moraceae. Hemp.

No. 2335. Paotingfu. March 10, 1925.

63917 and 63918. CITRULLUS VULGARIS Schrad. Cucurbitaceae. Watermelon.

63917. No. 2333. Paotingfu. March 10, 1925. *Ta hei kuan hsi kua* (large black-vase watermelon), said to have originally come from Shantung Province. This variety grows from 10 to 15 inches in diameter and 16 to 18 inches in length; the skin is black and the flesh yellow.

63918. No. 2334. Paotingfu. March 10, 1925. A small red-seeded watermelon also said to have originally come from Shantung Province. It is a red-fleshed, yellow-skinned variety about 8 inches in diameter and 16 to 20 inches in length.

63919. EUCONYMUS sp. Celastraceae.

No. 2318. En route from Mentoukou to Toli. *Niang niang ch'uan* (empress hand). Obtained from a shrub growing out of the top of a monk's tomb or monument in what is known as Tartar Cemetery.

63920 and 63921. FAGOPYRUM VULGARE Hill (*F. esculentum* Moench). Polygonaceae. Buckwheat.

63920. No. 2355. Poyi. March 11, 1925. A locally grown variety.

63921. No. 2386. Shenchou. March 14, 1925. A locally grown variety.

63922. HIBISCUS CANNABINUS L. Malvaceae. Ambari hemp.

No. 2338. Paotingfu. March 10, 1925. *Ching ma* (green hemp). A locally grown variety.

63923. HOLCUS SORGHUM L. (*Sorghum vulgare* Pers.) Poaceae. Sorghum.

No. 2413. Loutai. March 17, 1925. A sticky white variety.

63924. HORDEUM sp. Poaceae. Barley.

No. 2341. Paotingfu. March 10, 1925. Called "king barley" or "awn barley."

63925. HORDEUM sp. Poaceae. Barley.

No. 2397. Tunkechuang. March 15, 1925. Called by the Chinese "rice barley."

63926. HORDEUM sp. Poaceae. Barley.

No. 2411. Loutai. March 17, 1925. These seeds are also called "rice barley" by the Chinese.

63927 and 63928. PANICUM MILIACEUM L. Poaceae. Proso.

63927. No. 2400. Loutai. March 17, 1925. An early variety which is used mostly for food during the New Year season.

63908 to 63967—Continued.

63928. No. 2409. Loutai. March 17, 1925. Seeds of a sticky variety of millet.
- 63929 to 63934. *PHASEOLUS ANGULARIS* (Willd.) W. F. Wight. Fabaceae. **Adsuki bean.**
63929. No. 2348. Paotingfu. March 10, 1925. A small black variety.
63930. No. 2352. Poyi. March 11, 1925. Small white beans.
63931. No. 2404. Loutai. March 17, 1925. A small bean mottled gray and black.
63932. No. 2405. Loutai. March 17, 1925. A variety having small red beans.
- 63933 and 63934. No. 2412. Peking. March 17, 1925. A small variety which appears to be a mixture.
63933. A. Light-brown variety.
63934. B. Dirty straw-colored variety.
- 63935 to 63938. *PHASEOLUS AUREUS* Roxb. Fabaceae. **Mung bean.**
63935. No. 2351. Paotingfu. March 10, 1925. A locally grown green variety.
63936. No. 2354. Poyi. March 11, 1925. A locally grown green variety.
63937. No. 2383. Shenchou. March 14, 1925. This is another locally grown green variety.
63938. No. 2398. Loutai. March 17, 1925. A yellow variety.
63939. *PHASEOLUS VULGARIS* L. Fabaceae. **Common bean.**
- No. 2336. Paotingfu. March 10, 1925. A large red garden bean imported from northwestern China.
- 63940 to 63951. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceae. **Soy bean.**
- 63940 to 63950. Locally grown varieties.
63940. No. 2344. Paotingfu. March 10, 1925. A black variety.
63941. No. 2345. Paotingfu. March 10, 1925. *Ch'a tou* (tea soy bean). A large dark-brown variety.
63942. No. 2346. Paotingfu. March 10, 1925. This is a large green soy bean.
63943. No. 2347. Paotingfu. March 10, 1925. Small yellow variety.
63944. No. 2349. Paotingfu. March 10, 1925. Small green soy bean.
63945. No. 2353. Poyi. March 11, 1925. Green variety.
63946. No. 2357. Poyi. March 11, 1925. A large green soy bean.
63947. No. 2359. Poyi. March 11, 1925. This is a rather small black variety.
63948. No. 2381. Shenchou. March 14, 1925. A small black soy bean.
63949. No. 2382. Shenchou. March 14, 1924. A large deep-green variety.

63908 to 63967—Continued.

63950. No. 2384. Shenchou. March 14, 1925. This variety is small and light green.
63951. No. 2406. Loutai. March 17, 1925. *Ch'a tou* (tea soy bean). A variety having large mahogany-brown seeds.
63952. *SPINACIA OLERACEA* L. Chenopodiaceae. **Spinach.**
- No. 2337. Paotingfu. March 10, 1925. *Paoting po ts'ai* (spinach of Paotingfu). A locally grown variety.
- 63953 to 63957. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceae. **Common wheat.**
63953. No. 2350. Paotingfu. March 10, 1925. A locally grown winter wheat.
63954. No. 2356. Poyi. March 11, 1925. Locally grown winter variety.
63955. No. 2387. Shenchou. March 14, 1925. Winter wheat which is locally grown.
63956. No. 2402. Loutai. March 17, 1925. White wheat, which is said to make the best flour.
63957. No. 2410. Loutai. March 17, 1925. Spring wheat.
- 63958 and 63959. *VIGNA SESQUIPEDALIS* (L.) Fruwirth. Fabaceae. **Yard Long bean.**
63958. No. 2339. Paotingfu. March 10, 1925. A rather small, reddish, locally grown bean called by the Chinese "vegetable bean."
63959. No. 2401. Loutai. March 17, 1925. A terra-cotta colored variety also called "vegetable bean."
- 63960 to 63965. *VIGNA SINENSIS* (Torner) Savi. Fabaceae. **Cowpea.**
63960. No. 2342. Paotingfu. March 10, 1925. A locally grown brown-eyed cowpea.
63961. No. 2343. Paotingfu. March 10, 1925. A pink cowpea mottled pink and white which is said to be locally grown.
63962. No. 2358. Poyi. March 11, 1925. A locally grown brown-eyed cowpea.
63963. No. 2385. Shenchou. March 14, 1925. A locally grown variety mottled brown.
63964. No. 2388. Shenchou. March 14, 1925. This is a brown-eyed variety which is locally grown.
63965. No. 2403. Loutai. March 17, 1925. A brown mottled cowpea.
- 63966 and 63967. *ZEA MAYS* L. Poaceae. **Corn.**
63966. No. 2399. Loutai. March 17, 1925. An early yellow flint corn.
63967. No. 2407. Loutai. March 17, 1925. A late yellow flint variety.
63968. *BAUHINIA BLAKEANA* Dunn. **Caesalpinaceae.**
- From China. Cuttings collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received May 20, 1925.

No. 122. Hong Kong Botanic Gardens. April 4, 1925. *Tsz king, Hung ja tsz king.* A beautiful tree 10 meters high, with gray to buff-colored bark and large deep-green 2-lobed leaves whose shape suggests the common English name, "camel's foot." The deep-red flowers of this species are enormous compared with those of the other species known here (being as much as 7 centimeters in diameter), and are borne abundantly. They occur in long spikes, opening one floret at a time progressively from the bottom. The species is not known to have produced fruits here, the pistil dropping from the receptacle with the rest of the flower. Mr. Green, the superintendent of the gardens, says he has tried hand pollinating without success. The advantage of this species as far as the conditions here are concerned is that it is evergreen, its foliage being very healthy and verdant throughout the year, and that its flowers open during the winter months before the advent of the June bugs (usually in March or April), from whose voracious appetites no ornamental is immune. (*McClure.*)

63969. ORYZA SATIVA L. Poaceae.

Rice.

From Bangkok, Siam. Seeds presented by Phya Sihasakti Snidvongs, Director of Agriculture, through Dr. H. M. Smith, director Siamese Bureau of Fisheries. Received June 15, 1925.

A locally grown strain.

63970 and 63971. SESBAN spp. Fabaceae.

From Pretoria, Union of South Africa. Seeds presented by I. B. Pole Evans, chief, division of botany. Received June 18, 1925.

63970. SESBAN AEGYPTIACUM Poir.

A stout shrubby plant, 6 to 10 feet in height, which, according to J. F. Rock (*The Leguminous Plants of Hawaii*, p. 154), is native in tropical Asia and northern Australia. The yellow flowers, spotted with purple, are borne in axillary clusters about 4 inches long. In Australia the leaves are much relished by livestock, and the wood is used in making charcoal for gunpowder.

63971. SESBAN CINERASCENS Welw.

Like the preceding, this tropical African shrub, according to Oliver (*Flora of Tropical Africa*, vol. 2), has yellow flowers spotted with purple. It has a graceful habit, with slender branches and compound leaves composed of 15 to 20 pairs of leaflets. The flowers are in lax clusters, and the pods are up to a foot in length.

63972. POA FLABELLATA (Lam.) Hook. f. Poaceae. Tussock grass.

From Kew, Surrey, England. Seeds presented by Dr. Thomas V. Chipp, Royal Botanic Gardens. Received June 18, 1925.

These seeds originally came from the Falkland Islands. (*Chipp.*)

According to Hogg (*Vegetable Kingdom*, p. 823), this is a coarse grass which grows on peaty soil near the sea in the Falkland

Islands. It forms dense masses of stems which frequently rise to the height of from 4 to 6 feet, and the long tapering leaves hang over gracefully in curves, from 5 to 8 feet long and an inch wide at the base. The plant is much relished by cattle, being very nutritious and containing saccharin. The inner portion of the stem a little way above the root is soft and crisp and flavored like a hazelnut; the inhabitants of the Falkland Islands are very fond of it. They also boil the young shoots and eat them like asparagus.

63973 and 63974. PHALARIS BULBOSA Jusl. Poaceae.

From Paris, France. Seeds purchased from Vilmorin-Andrieux & Co. Received June 22, 1925.

A perennial, tufted grass, 2 to 3 feet high, with shiny leaves about two-fifths of an inch wide, native to the Mediterranean countries. It is now cultivated in New South Wales, where it appears to be an excellent permanent winter grass for coastal and table-land districts. It is drought resistant. Seed is difficult to save on account of shattering.

63973. No. 1. Received as *Phalaris coerulescens*, but sample has been identified as *P. bulbosa*.

63974. No. 2.

63975. PHOENIX DACTYLIFERA L. Phoenicaceae. Date palm.

From Cairo, Egypt. Offshoots purchased through Ernest Wright and Mahmoud Bey Abaza, director of the horticultural section of the Egyptian Ministry of Agriculture, at the request of S. C. Mason, Bureau of Plant Industry. Received June 27, 1925.

The Samany date is one of the most striking and characteristic varieties of Lower Egypt, and by the natives it is counted one of the best. The trees are very heavy bodied and have longer leaves than any other variety I have measured. In fruit the Samany is easily the most striking and peculiar of all the delta varieties. The heavy, compact bunches are borne unevenly on coarse, strong strands, the fruits being about 2½ inches long and 1½ inches broad and rather oblique. The Samany never becomes a packing date, but is gathered hard ripe and used in confections or is eaten in the rutab stage. The offshoots command the highest prices of any variety in Egypt, for the reason that they are in great demand for planting in the gardens of the new country and suburban places around Alexandria. The feature that makes the Samany of especial promise is its ability to succeed in the cool, humid climate of the coastal region. (*Mason.*)

63976. BAMBOS sp. Poaceae. Bamboo.

From Algiers, Algeria. Plant collected by David Fairchild, agricultural explorer, Bureau of Plant Industry. Received April 6, 1925.

Jardin d'Essais. A beautiful blue-stemmed species which is distinguished by the culm sheaths either being entirely devoid of ligules or else the ligules are very evanescent. (*Fairchild.*)

63977. GENISTA SPHAEROCARPA Lam.
Fabaceae.

From Morocco. Cuttings collected by David Fairchild, agricultural explorer, Bureau of Plant Industry. Received June 24, 1925.

From near Demnat. May 31, 1925. A charming drooping desert shrub covered with delicate brilliant yellow flowers somewhat resembling small orchids. (*Fairchild*.)

63978 to 63997.

From Paris, France. Seeds presented by Prof. D. Bois, Paris Museum of Natural History. Received June 5, 1925.

A collection introduced chiefly for testing as forage plants.

63978 to 63983. ASTRAGALUS spp. Fabaceae.**63978. ASTRAGALUS BUBALOCERAS Maire.****63979. ASTRAGALUS FRIGIDUS A. Gray.**

A perennial upright or ascending, entirely unbranched or with very few branches. Native to alpine slopes throughout northern Europe and Asia.

63980. ASTRAGALUS GALEGIFORMIS L.

A perennial upright, slightly hairy plant 1 to 3 feet high, native to south-eastern Europe and Asiatic Minor.

63981. ASTRAGALUS GLYCYPHYLLOIDES DC.

A perennial plant with ascending stems and rather large oval leaflets. Native to eastern Europe and Asia Minor.

63982. ASTRAGALUS HAMOSUS L.

An annual gray-green hairy plant with prostrate or ascending stems 8 inches to a foot in length. Native to sunny places in the Mediterranean countries.

63983. ASTRAGALUS PONTICUS Pall.

A hairy-stemmed species with dense axillary flower heads. Native to southern Russia.

63984. ERODIUM CICONIUM (Jusl.) Willd.
Geraniaceae.

An annual hairy plant, belonging to the geranium family, with stout ascending branches, oval leaves, and purple flowers. Native to southern Europe and Asia Minor.

63985. ERODIUM MANESCAVI Coss. Geraniaceae.

A perennial plant, belonging to the geranium family, about a foot and a half high, with narrow leaves 6 inches or more in length and rosy purple flowers about 2 inches across. It grows wild in the Pyrenees Mountains.

63986. GAUDINIA FRAGILIS (L.) Beauv.
Poaceae. Grass.

An annual ascending grass, 8 inches to 2 feet high, with thick, roughly hairy leaves, confined almost entirely to the Mediterranean countries.

63987. JACARANDA CHELONIA Griseb. Bignoniaceae.**63978 to 63997—Continued.**

An Argentinian tree, sometimes as much as 90 feet tall, with a rounded habit and attractive fernlike foliage. The large blue flowers are in terminal panicles a foot long. The wood is valued in Argentina for cabinetwork.

63988 to 63990. MELICA spp. Poaceae.

Grass.

63988. MELICA ALTISSIMA L.

A rather tall perennial European grass, 3 to 4 feet in height, with creeping rhizomes, which forms a loose turf. The leaf sheaths and the backs of the leaves are very rough.

63989. MELICA CILIATA L.

A gray-green perennial grass, with stolons 4 inches or more long and stems up to 3 feet in height. The leaf blades are narrow, with rough, bristly margins. Native to rocky places in eastern Europe.

63990. MELICA UNIFLORA Retz.

A bright-green perennial grass, native to shady humid places in eastern Europe. The creeping rhizome is about 4 inches long, and the thick lax stems bear three or four narrow leaves.

63991. PASPALUM RACEMOSUM Lam. Poaceae.

A tropical American grass which is best adapted to the moist or alluvial soils of the Southern States. It grows from a rootstock, with rather coarse tender stems and leaves, reaching a height of about 2 feet. It has promise as a hay or pasture grass. (*C. V. Piper, Bureau of Plant Industry*.)

63992. PHLEUM PHLEOIDES (L.) Karst. (P. boeheimeri Wibel.). Poaceae. Grass.

A perennial, gray-green, loosely caespitose grass, with a short creeping rhizome and stems 1 to 2 feet high. Native to dry stony places throughout central Europe.

63993. POECILANTHE PARVIFLORA Benth.
Fabaceae.

The *lapachillo*, as it is called in its native home on the Uruguay River, is a tree of great beauty, with its finely divided leaves and small but dense clusters of pink flowers. The heartwood is dark brown, very hardy, heavy, and durable.

63994. TRIFOLIUM RUBENS L. Fabaceae.

A perennial clover with a widely creeping rhizome and upright glabrous stems 1 to 2 feet high. Native to rocky places and thickets in the Mediterranean region.

63995. TRIFOLIUM SQUARROSUM L. Fabaceae.

An upright or ascending robust annual, with branches up to 30 inches in length, native to the Mediterranean countries. The pink or white flower heads are oval when young, becoming more elongated later.

63996. TRIGONELLA ENSIFERA Trautv. Fabaceae.

An annual leguminous plant, very closely allied to the fenugreek (*Trigonella foenum-graecum*), from which it differs chiefly in having hairy pods and the lack of odor in its seeds. Its native country is unknown.

63978 to 63997—Continued.

63997. *TRIGONELLA HAMOSA* L. Fabaceae.

An annual leguminous plant, native to northern Africa and Asia Minor, with elongated prostrate stems up to 2 inches long.

63998 to 64001.

From Sydney, New South Wales. Seeds presented by J. A. Whittet, agrostologist, New South Wales Department of Agriculture. Received June 22, 1925.

63998. *ACACIA ANEURA* F. Muell. Mimosaceae.

In New South Wales, where this tall shrub is native, it is known as the mulga, or yarren, and in times of severe drought it is considered a good source of forage for livestock. The wood is very hard and is valued as timber.

63999. *ACACIA PENDULA* A. Cunn. Mimosaceae.

A handsome evergreen tree, native to Australia, where the leaves and young branches are eagerly eaten by cattle and sheep. In times of drought the myall, as the tree is called in Australia, is frequently cut down and fed to stock, which seem to thrive on this fodder. Horses do not care for it.

For previous introduction see S. P. I. No. 62867.

64000. *GEIJERA PARVIFLORA* Lindl. Rutaceae.

The wilga is a tall shrub or a tree, native to the interior of New South Wales, where it reaches a height of about 30 feet. It has slender pendulous branches, narrow leaves 3 to 6 inches long, and when well developed has a highly ornamental appearance with something of the aspect of a weeping willow. It has remarkable drought-enduring qualities, and the leaves are often fed to sheep, which are very fond of them.

For previous introduction see S. P. I. No. 62865.

64001. *STERCULIA DIVERSIFOLIA* Don. Sterculiaceae.

A tall evergreen Australian tree with shining green foliage. In New South Wales it is called the "kurrajong." The leaves are fed to cattle in the arid interior lands. This may be the same as the tree now grown in California under the same name.

For previous introduction see S. P. I. No. 49002.

64002 and 64003. *Gossypium* spp. Malvaceae. Cotton.

From Rabat, Morocco. Seeds presented by Em. Miège, chief, Service de l'Expérimentation Agricole au Maroc. Received June 23, 1925.

Sar-sar cotton. According to its discoverer, Mr. Miège, this cotton has been given the name of the native tribe which has been growing it from time immemorial. In all probability it is a hybrid between *Gossypium peruvianum* and *G. punctatum*. As described by Mr. Miège, in his Note sur un Cotonnier Marocain, published in the Annales du Musée Colonial de Marseille, series 4, vol. 2, 1924, this is a variety which in actual tests in Rabat and Casa

Blanca has proved to possess an unusual degree of precocity, resistance to drought, and length of fiber and strength which classes it with the Yuma in value to the spinners. While still unimproved sufficiently to be called a pure cotton, its behavior under the dry-land conditions of Morocco on laterite silicious soils where the rainfall is only 800 millimeters per year warrants its being thoroughly studied by American cotton breeders. (David Fairchild, Bureau of Plant Industry.)

64002. *Gossypium* sp.

Seeds from the 1923 crop.

64003. *Gossypium* sp.

Seeds from the 1924 crop.

64004. *HORDEUM VULGARE PALLIDUM* Ser nge. Poaceae. Six-rowed barley.

From Algiers, Algeria. Seeds presented by Dr. L. Trabut. Received June 23, 1925.

Orge Chedret. Collected in the Sahara Desert. April, 1925. (Trabut.)

64005. *IRIS PUMILA* L. Iridaceae.

From Tiflis, Georgia, Caucasus. Seeds presented by the director of the botanic garden. Received June 30, 1925.

Var. *violacea*.

A dwarf hardy iris with linear leaves 2 to 4 inches long, stemless or nearly so, with bright-blue flowers. It is native to southeastern Europe and Asia Minor, and under cultivation spreads rapidly.

64006 to 64013. *MUSA PARADISIACA SAPIENTUM* (L.) Kuntze. Musaceae. Banana.

From Honolulu, Hawaii. Suckers presented by Willis T. Pope, horticulturist, Hawaii Agricultural Experiment Station. Received May, 1925.

64006. The *Brazilian*, as it is known locally, is considered by some authorities as the finest variety in the Hawaiian Islands for eating raw. According to Bulletin 7 of the Hawaii Agricultural Experiment Station, page 45, it was introduced into Hawaii from Tahiti about 1855 and probably is the same as the variety known in Java as pisang rajah or pisang medji, the "dessert banana." The plant is a vigorous grower, 25 to 35 feet high, roots firmly and withstands winds, ratoons freely and serves as a windbreak for more delicate varieties. The flower end of the fruit is drawn out into a kind of beak. The skin is yellow, easily separating from the fruit. The variety is not satisfactory for shipping, because the fruit falls from the stem.

For previous introduction see S. P. I. No. 58447.

64007. *Chamaluco*. This variety is described as follows in Bulletin 25, Departamento de Agricultura y Trabajo, Porto Rico, page 19: The plant is from 10 to 15 feet in height, with medium-sized leaves, and, when grown in fertile soil, the bunches of fruit are rather large. There are two types, one with green and the other with gray fruits. The greater part of these fruits are eaten cooked at the time when other varieties are ripe.

64006 to 64013—Continued.

For previous introduction see S. P. I. No. 58448.

64008. Chinese. A variety introduced from Tahiti into the Hawaiian Islands about 1855 and described in Bulletin 7 of the Hawaii Agricultural Experiment Station, page 44, as follows: The plant is of very low growth, the fruit of good flavor, and the bunch of large size. It is an excellent variety for shipping.

For previous introduction see S. P. I. No. 58449.

64009. Largo. According to J. E. Higgins (Bulletin 7, Hawaii Agricultural Experiment Station), this variety was introduced into Hawaii from Mexico. The plant is of medium height, and the fruits, borne in long-stemmed bunches, have buttery pink flesh of fair flavor.

For previous introduction see S. P. I. No. 55250.

64010. Porto Rico.

64011. Red Spanish. This variety, also known as Red Jamaica, has red-skinned fruits which are shorter and thicker than those of the Gros Michel, and the bunches are smaller. It is found in the West Indies and Central America. Although the fruits have a pleasant flavor, there is a very limited demand for this variety.

64012. Ice Cream.

64013. Iholena. In Bulletin No. 7 of the Hawaii Agricultural Experiment Station this is described as a low plant, usually about 9 feet high. The rather stout petioles are light green with pink margins, and the young leaves are slightly bronzed on the lower surfaces. The fruits are loosely arranged, in small bunches, and stand out almost at right angles. The mature fruits are angular, and black areas appear on the yellow skin when thoroughly ripe. The flesh is pink. This is regarded as one of the best native bananas for eating raw or cooked.

64014 and 64015.

From Kwangtung Province, China. Collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received April 20, 1925. Notes by Mr. McClure.

64014. COLOCASIA ESCULENTA (L.) Schott.
Araceae. **Taro.**

No. 86. Lintan. February 18, 1925. *Tsat tsuen u.* Tubers of a cylindrical variety whose possibilities as to size are expressed in its name, the "seven-inch taro." It is said to be a good yielder and keeps well, and the flavor is excellent. The Chinese use it in making a delicious dish called U Ha, which is prepared by shredding the taro and frying it in deep fat.

64015. MARANTA ARUNDINACEA L., Mar-
rantaceae. **Arrowroot.**

No. 87. Takhing. February 19, 1925. *Shek chuk u.* These rhizomes were purchased under the name Kaau sun. This variety is eaten to a certain extent by the Chinese, but is quite fibrous and to me not very palatable.

64016 to 64021. VIGNA SINENSIS (Tor-
ner) Savi. Fabaceae. **Cowpea.**

From Giza, Egypt. Seeds presented by Dr. Tewfik Fahmy, Ministry of Agriculture. Received May 16, 1925.

Locally developed strains.

64016. Dirry No. 2.

64017. Rust Immune.

64018. Baladi.

64019. Dirry No. 4.

64020. Asmerli.

64021. Dirry Nos. 3 and 5.

64022 to 64029.

From Tashkent, Russia. Seeds presented by the Tashkent Experiment Station. Received May 16, 1925.

Locally grown seeds.

64022. HORDEUM VULGARE PALLIDUM Ser-
inge. Poaceae. **Six-rowed barley.**

64023 to 64026. PHASEOLUS AUREUS Roxb.
Fabaceae. **Mung bean.**

64023. No. 1. 64025. No. 3.

64024. No. 2. 64026. No. 4.

64027 to 64029. VIGNA SINENSIS (Torner)
Savi. Fabaceae. **Cowpea.**

64027. No. 1. 64029. No. 3.

64028. No. 2.

64030 to 64044.

From Rio de Janeiro, Brazil. Seeds presented by Dr. Pacheco Leão, director, Botanic Garden. Received May 18, 1925.

64030. ABUTILON RAMIFLORUM St. Hil.
Malvaceae.

This is described by St. Hilaire (Flora Brasiliae Meridionalis, vol. 1, p. 199) as a shrubby, densely hairy plant with stems up to 6 feet in height, heart-shaped leaves, and panicles of yellow flowers.

64031. AESCHYNOMENE ELAPHROXYLON
(Guill. and Perr.) Taub. Fabaceae.

The ambash has light foliage similar to that of the ordinary acacia, but differs in having very large pealike orange-yellow flowers. It forms at times a trunk 10 inches in diameter, and the wood is exceedingly light, a log 10 feet long weighing only a few pounds. Along the upper Nile it is much used in making rafts and huts. It should be valuable in a great many ways. (Note by H. L. Shantz under S. P. I. No. 61634.)

64032. WENDEROTHIA MATTOGROSSENSIS
(Barb. Rodr.) Piper (*Canavalia mat-*
togrossensis Malmc.). Fabaceae.

A Brazilian vine, described by C. V. Piper (Contributions from the United States National Herbarium, vol. 20, pt. 14) as a slender-stemmed herbaceous plant, with oval membranous leaflets, lilac flowers, and densely hairy pods.

64033. CRACCA ADUNCA (Benth.) Kuntze
(*Tephrosia adunca* Benth.). Fabaceae.

A herbaceous perennial leguminous plant, with a decumbent hairy stem, which grows wild in the dry pastures of Minas Geraes, Brazil.

64030 to 64044—Continued.

64034. *DYSOLOBIUM GRANDE* (Kurz) Prain. Fabaceae.

A woody climbing plant from the mountains of northeastern India, with bright-green hairy leaves and reddish flowers about an inch broad in racemes 6 to 9 inches long. Probably suited best for growing in southern Florida.

64035. *FLEMINGIA STROBILIFERA* (L.) Ait. Fabaceae.

An erect purple-flowered shrub, 8 to 10 feet high, with slender velvety branches and oblong leaves with silky lower surfaces. It is native to India. The flowers are in zigzag racemes 3 to 6 inches long, with large bracts which nearly hide the flowers. It is tropical in its requirements and is adapted for growing only in the warmest parts of the United States.

64036. *INDIGOFERA SUFFRUTICOSA* Mill. (*I. anil* L.). Fabaceae.

A bushy shrub, 3 to 5 feet high, with hairy pinnate leaves and yellow pealike flowers. It is commonly cultivated throughout the Tropics as a dye plant and is said to be native to tropical America.

64037. *MANIHOT GLAZIOVII* Muell. Arg. Euphorbiaceae. Ceara rubber.

Ceara rubber, obtained from this tree, is one of the important rubbers of commerce.

For previous introduction see S. P. I. No. 61497.

64038 to 64040. *MEIBOMIA* spp. Fabaceae.

64038. *MEIBOMIA GYRANS* (L. f.) Kuntze (*Desmodium gyrans*, DC.). Telegraph plant.

An erect perennial plant, 2 feet or less high, which is said to be useful as fodder. It is native to moist situations in southern and eastern India.

64039. *MEIBOMIA LABURNIFOLIA* (Poir.) Kuntze (*Desmodium laburnifolium* DC.).

A white-flowered shrub from the mountainous districts of the tropical Himalayas. The shining green rigid leaflets and white flowers may render the shrub of ornamental value for the Southern States.

64040. *MEIBOMIA PULCHELLA* (L.) Kuntze (*Desmodium pulchellum* Benth.).

A red-flowered leguminous shrub with hairy trifoliate leaves, which is native to southern India. The flowers are in spikelike racemes. The plant may have merit as an ornamental shrub for the Southern States, and possibly also as forage.

64041. *ORMOSIA ARBOREA* (Vell.) Harms. Fabaceae.

According to Vellozo (*Flora Fluminensis*, p. 303), this tree has arborescent stems, little-branched pinnate leaves, and terminal compound racemes of violet flowers. The oblong pods inclose round red seeds marked with black spots. Native to southern Brazil.

64042 to 64044. *PAVONIA* spp. Malvaceae.

64030 to 64044—Continued.

64042. *PAYONIA PANICULATA* Cav.

A shrub, described (Cavanilles, *Disseritationes*, vol. 1, p. 135) as about 4 feet high, having white hairs, heart-shaped leaves, and yellow flowers about an inch across. Native to Peru.

64043. *PAYONIA SEPIUM* St. Hill.

A Brazilian shrub described by St. Hilaire (*Flora Brasiliæ Meridionalis*, vol. 1, p. 225) as 2 to 6 feet high, with slender terete branches and oval-oblong leaves 3 to 4 inches in length. The solitary golden-yellow flowers are about an inch wide.

64044. *PAYONIA SPINIFEX* (L.) Cav.

A slender shrub, sometimes 20 feet high, with hairy oval heart-shaped leaves and handsome large yellow flowers. It is native to southern South America and yields a fiber said to be of fine texture and excellent quality.

64045 to 64047. *PISUM SATIVUM* L. Fabaceae. Pea.

From Sydney, New South Wales. Seeds obtained from Anderson & Co., through D. N. Shoemaker, Bureau of Plant Industry. Received May 25, 1925.

Locally developed strains.

64045. *Greenfeast*. A very prolific early dwarf variety grown extensively for market purposes. (*Catalogue of Anderson & Co.*)

64046. *Home Delight*. A second early variety, 18 inches to 2 feet in height, which is strong and vigorous. The foliage and pods are pale green; each pod bears five to six large peas with a fine marrowfat flavor. In a test this variety produced 30½ bushels of peas from a quarter of an acre.

64047. *Richard Seddon*. One of the finest of the early dwarf varieties, having a height of 20 inches. The pods are large and well filled. (*Catalogue of Anderson & Co.*)

64048 to 64051.

From Dunoon, New South Wales. Seeds obtained from H. J. Rumsey, through D. N. Shoemaker, Bureau of Plant Industry. Received May 25, 1925.

Locally developed strains.

64048 to 64050. *PISUM SATIVUM* L. Fabaceae. Pea.

64048. *Greenfeast*.

For previous introduction and description see S. P. I. No. 64045.

64049. *Richard Seddon*.

For previous introduction and description see S. P. I. No. 64047.

64050. *Te Aroha*. Large dark-green pods. (*Rumsey*.)

64051. *LOTUS TETRAGONLOBUS* L. Fabaceae.

A purple-flowered annual from the eastern Mediterranean countries, where, according to Bonnier (*Flore Complète de France, Suisse, et Belgique*, vol. 3, p. 43),

64048 to 64051—Continued.

it frequents the edges of cultivated fields, roadsides, etc. It is more or less hairy with obovate leaflets. The edible seeds are sometimes used as a substitute for coffee, and the plant is often cultivated as an ornamental.

For previous introduction see S. P. I. No. 56670.

64052 and 64053. HIPPEASTRUM spp. Amaryllidaceae. Amaryllis.

From Brazil. Bulbs collected by Agnes Chase, Bureau of Plant Industry. Received May 28, 1925. Notes by Mrs. Chase.

64052. HIPPEASTRUM sp.

May 3, 1925. An amaryllis found below the summit of Pontao Crystal, Serra da Caparaó, Minas Geraes, at an altitude of about 8,000 feet.

64053. HIPPEASTRUM sp.

A crimson-flowered amaryllis, about 6 inches long, from the summit of Serra da Gramma, Minas Geraes, at an altitude of about 6,000 feet.

64054 to 64056. BAMBOS spp. Poaceae. Bamboo.

From Kwangtung Province, China. Offshoots collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received June 3, 1925. Notes by Mr. McClure.

64054. BAMBOS sp.

No. 123. Canton Christian College. January 28, 1925. *Tai t'au tim chuk*. A large bamboo, 6 to 10 meters high and 6 to 10 centimeters in diameter, which is the most commonly and extensively cultivated variety around Canton. When the plants become established and the canes reach mature size, they are fertilized during January or February with liquid or well-rotted manure. The earth is then banked up around the base of the clump to a height of about 4 to 6 decimeters, and when the young sprouts appear above this they are unearthed by means of a hoe. This bamboo is a gross feeder and requires much fertilizer in order to make its best growth. It seems to be particular as to the soil.

64055. BAMBOS sp.

No. 124. Canton Christian College. January 28, 1925. *Tiu shi k'au chuk*. A medium-sized bamboo 6 to 8 meters high and 3 to 5 centimeters in diameter, whose young shoots are edible.

64056. BAMBOS sp.

No. 125. Canton Christian College. January 28, 1925. A very large bamboo, attaining in fertile, moist soil a height of 15 meters and a diameter of 12 centimeters. The young shoots are edible and very sweet, hence the name *T'im chuk*.

64057. GLADIOLUS BYZANTINUS Mill. Iridaceae.

From Morocco. Seeds collected by David Fairchild, agricultural explorer, Bureau of Plant Industry. Received June 4, 1925.

From the cork-oak forest of Mamora, near Rabat. April 27, 1925. A slender, delicate species with purple-red flowers and much

more grasslike in habit than the cultivated forms generally. It might give delicacy of form to hybrids. (*Fairchild*.)

64058 to 64065. CROTALARIA spp. Fabaceae.

From Kirstenbosch, Cape Province, Union of South Africa. Seeds presented by Prof. R. H. Compton, director, National Botanic Gardens. Received June 26, 1925.

A collection of crotalarias, introduced for testing as cover crops.

64058. CROTALARIA CAPENSIS Jacq.

A stout, much-branched South African shrub about 4 feet in height, with broadly oval leaves and pure-yellow flowers in many-flowered racemes.

For previous introduction see S. P. I. No. 59319.

64059. CROTALARIA INCANA L.

A tropical American plant about 3 feet high, erect, branched, and somewhat shrubby, and softly gray pubescent. The yellow flowers are crowded in 12 to 20 flowered elongated racemes 2 to 8 inches long. This plant occurs in waste places throughout the Tropics and is in flower all the year.

For previous introduction see S. P. I. No. 51834.

64060. CROTALARIA LEOLOBA Bartling.

A species from the mountainous districts of northeastern India, and also distributed throughout the East Indies. It is one of the more robust of the herbaceous species, with fine-silky branches and leaves, the latter being oblong and about 2 inches in length.

For previous introduction see S. P. I. No. 59320.

64061. CROTALARIA RETUSA L.

An annual plant, a foot or more high, distributed throughout the Tropics of both hemispheres. The flowers, which are yellow streaked with purple, are in terminal racemes.

For previous introduction see S. P. I. No. 51842.

64062. CROTALARIA SPECTABILIS Roth.

A stout shrub, 3 to 5 feet high, native to India and sometimes cultivated in the Punjab for the sake of its yellowish purple flowers produced in dense lax racemes often 20 inches in length.

For previous introduction see S. P. I. No. 51839.

64063. CROTALARIA STRIATA DC.

A handsome perennial tropical plant, ultimately about 6 feet high, with spikes of yellow flowers. In Guatemala the young leaves are eaten boiled with rice or meat, and the plant is considered good forage.

For previous introduction see S. P. I. No. 52531.

64064. CROTALARIA USARAMOENSIS Baker f.

This East African crotalaria has been tested in Java as a green manure, according to P. J. S. Cramer, director of the Department of Agriculture, Buitent-

64058 to 64065—Continued.

zorg. Doctor Cramer states that it has proved very successful as a green manure when grown in alternation with corn, producing large quantities of vegetation rich in nitrogen. In the cinchona plantations it is very satisfactory, as it endures partial shade and forms a dense low growth which keeps the edges of the terraces together.

For previous introduction see S. P. I. No. 57831.

64065. *CROTALARIA VERRUCOSA* L.

An annual leguminous plant, cosmopolitan in the Tropics, which reaches a height of a foot and a half, with simple oval leaves, and racemes of showy white and blue flowers

For previous introduction see S. P. I. No. 51119.

64066 to 64070.

From Giza, Egypt. Seeds presented by Mah. Abaza, director, horticultural section, Ministry of Agriculture. Received June 27, 1925.

To be tested as green-manure and cover-crop plants.

64066 to 64068. *CROTALARIA* spp. Fabaceae.64066. *CROTALARIA CANDICANS* Wight and Arnott.

A stiffly erect, much-branched, shrubby species, with hairy and somewhat leathery, broadly rounded leaves, and panicles of small silky yellow flowers. Native to southwestern India.

For previous introduction see S. P. I. No. 59318.

64067. *CROTALARIA LEIOLOBA* Bartling.

A species from the mountainous districts of northeastern India and also distributed throughout the East Indies. It is one of the more robust of the herbaceous species, with fine silky branches and leaves, the latter being oblong and about 2 inches in length.

For previous introduction see S. P. I. No. 59320.

64068. *CROTALARIA TETRAGONA* Roxb.

An erect stiff shrub, often 6 feet in height, which grows wild in the Himalayas of northeastern India, ascending to an altitude of 3,500 feet. The silky membranous narrow leaves are sometimes a foot long, and the lemon-yellow flowers are produced in lax racemes 6 inches or more in length.

For previous introduction see S. P. I. No. 59321.

64069. *SESBAN ACULEATUS* (Schreb.) Poir. Fabaceae.

A tall-growing annual plant from tropical and subtropical Asia, which is used there as green manure and also for fodder. It is a vigorous grower and is said to thrive in semiarid regions.

For previous introduction see S. P. I. No. 58978.

64070. *SESBAN SERICEUM* (Willd.) DC. Fabaceae.

An unarmed shrubby annual, often several feet in height, native to the plains

64066 to 64070—Continued.

of Ceylon. The silky pinnate leaves are about a foot in length, and the flowers, pale yellow dotted with red, are in lax racemes.

For previous introduction see S. P. I. No. 59322.

64071 to 64074.

From Kwangtung Province, China. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received June 30, 1925. Notes by Mr. McClure.

64071. *PISUM SATIVUM* L. Fabaceae. Pea.

No. 147. Ahliuwat, near Taip'ingshi. April 20, 1925. *Suet tau, Chun tsu*. A pea grown rather extensively in this region and promising for two reasons: The vines are self-supporting, and the young pods are tender enough to be eaten. I have eaten them and find them deliciously tender and sweet.

64072. *RUBUS* sp. Rosaceae.

No. 144. En route from Want'ong to Kongt'uen. April 23, 1925. *P'o tsai lak, Tam p'o tsai*. A wild red berry with a flavor somewhat resembling that of a blackberry. The fruits do not separate readily from the receptacle. The brambles are low, being $1\frac{1}{2}$ to 3 feet in height, and very spiny. They seem to be growing well on a red subsoil laid bare by erosion.

64073. *RUBUS* sp. Rosaceae.

No. 145. Near Kongtuen. *She p'auu lak*. A large, globular, loosely organized wild raspberry which bears white flowers. The fruits separate freely from the receptacle. The low herbaceous brambles appear to thrive well on the sandy soil near streams, where they grow in profusion.

64074. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceae. Common wheat.

No. 148. Ahliuwat, near Taip'ingshi. April 20, 1925. *Min nak*. A locally grown wheat sown broadcast in September or October, after the last rice crop is harvested (usually during the month of March), or in time for the first crop of rice. It is sown at about the rate of 24 pounds per acre, and soy-bean cake, peanut cake, or animal excreta are applied as fertilizer.

64075 to 64083.

From Lamao, Bataan, Philippine Islands. Seeds presented by S. Youngberg, acting director, Bureau of Agriculture. Received June 18, 1925.

64075 to 64081. *COIX LACRYMA-JOBI* MAYUEN (Rom.) Stapf. Poaceae. Adlay.

The ma-yuen, or adlay, has attracted considerable attention as a cereal for tropical regions. According to P. J. Wester, it is better than upland rice for tropical agriculture in being more drought resistant, a heavier yielder, and much less expensive to cultivate. The seeds can be used largely in the same manner as corn.

64075. *Cebu*.64076. *Cotabato*.64077. *Lamao*.64078. *La Union Red*.

64075 to 64083—Continued.

64079. *La Union White*.64080. *Momungan*.64081. *Mount Province*.64082 and 64083. *HOLCUS SORGHUM* L.
(*Sorghum vulgare* Pers.). Poaceae.
Sorghum.64082. *Basso*.64083. *Basso Red*.64084. *COSMOS* sp. Asteraceae.

Cosmos.

From Reading, England. Seeds purchased from Sutton & Sons. Received February 25, 1925. Numbered April, 1925.

Miniature Yellow. A variety with rich-yellow starlike flowers produced in great abundance; the plants form compact bushes about 18 inches high. (*Sutton's Catalogue*, 1924.)

64085. *HIPPEASTRUM* sp. Amaryllidaceae.

From Brazil. Bulbs collected by Agnes Chase, Bureau of Plant Industry. Received June 19, 1925.

Serra do Caparaó, Minas Geraes. This I believe to be the same as the plant seen at Serra da Gramma [S. P. I. No. 64053], which had red lilylike flowers 5 to 6 inches long, borne in twos or threes at the apex of the scape. The leaves are about 2 inches wide and a foot long, and fleshy, like hyacinth leaves. (*Mrs. Chase*.)

64086 and 64087.

From Rabat, Morocco. Bulbs collected by David Fairchild, agricultural explorer, Bureau of Plant Industry. Received June 29, 1925. Notes by Doctor Fairchild.

64086. *DIPCADISEROTINUM* Medic. Liliaceae.

A bulbous plant growing about a foot high and producing a slender spike of salmon-colored flowers shaped much like those of a hyacinth. It forms patches in the deep sandy soil of the forest of Mamora.

64087. *LEUCOJUM TRICHOPHYLLUM* Schousb. Amaryllidaceae.

A graceful bulbous plant, 2 feet high, found in the sandy soil in the forest of Mamora. This plant, with its white hanging flowers, three or four on each stem, gives a delicate touch to the border.

64088 and 64089. *SACCHARUM OFFICINARUM* L. Poaceae. Sugar cane.

From Santiago de las Vegas, Cuba. Cuttings presented by Gonzalo M. Fortun, director, Estación Experimental Agronomica, through E. W. Brandes, Bureau of Plant Industry. Received June 8, 1925.

Locally developed strains.

64088. *C. O. 210*.64089. *C. O. 213*.

64090 to 64099.

From Tiflis, Caucasus. Seeds presented by the director of the Botanic Garden. Received May 18, 1925.

64090 to 64099—Continued.

64090 to 64092. *AGROPYRON* spp. Poaceae.
Grass.64090. *AGROPYRON CRISTATUM* (L.) Gaertn.

A perennial thickly caespitose grass, with stout rhizomes, native to southeastern Europe.

64091. *AGROPYRON ORIENTALE* (L.) Roem. and Schult.

An annual much-branched grass, prostrate-ascending in habit, native to sandy places in Asia Minor and Turkestan.

For previous introduction see S. P. I. No. 61389.

64092. *AGROPYRON ORIENTALE LASIANTHUM* Boiss.

An annual grass, thickly branched at the base, with numerous mostly prostrate stems scarcely 8 inches high. Native to Asia Minor and North Africa.

64093. *AVENA BARBATA* Brot. Poaceae.
Grass.

An annual or biennial grass, up to 30 inches in height. Native to southern Europe.

64094. *AVENA LUDOVICIANA* Durieu. Poaceae.
Grass.

An annual or biennial grass, very similar to *Avena sterilis*, but smaller. Native to southern Europe.

64095. *ORYZOPSIS HOLCIFORMIS* (Bieb.) Hack. Poaceae.
Grass.

A perennial grass, with a thick short rhizome and stems 3 feet or more in height. The panicles are a foot or more long. Native to southern and southeastern Europe.

64096. *ORYZOPSIS PARADOXA VIRESCENS* (Trin.) Richter. Poaceae.
Grass.

A perennial densely caespitose grass, with rough stems up to 4 feet in height. The spreading panicles are about 8 inches long. Native to southern Europe and Asia Minor.

64097 to 64099. *TRITICUM* spp. Poaceae.
Grass.64097. *TRITICUM CYLINDRICUM* (Host) Ces. Pass. and Gib.

An ornamental annual grass with stiff, upright stems and narrow leaves. Native to dry sandy places in southern and southeastern Europe.

64098. *TRITICUM SPELTOIDES* (Tausch) Grenier.

A bushy grass, branching from the base, with slender erect stems bearing rough narrow leaves and stiff rather loose spikes of long-awned flowers. It is a native of western Asia, found especially in Syria, and is considered to have been one of the species from which the cultivated wheats were derived.

64099. *TRITICUM TRIUNCIALE* (L.) Gren. and Godr.

A thickly branched annual grass, with ascending stems and flat rough leaves. Native to dry places in the Mediterranean region.

64100. *MEDICAGO SATIVA* L. Fabaceae.
Alfalfa.

From Santiago, Chile. Seeds presented through H. L. Westover, Bureau of Plant Industry. Received May 23, 1925.

Alfalfa seeds received from the Ministerio de Industria y Obras Publicas, Estacion Biologica de Chile. (Westover.)

64101. *CROTON FLORIBUNDUS* Spreng.
Euphorbiaceae.

From Sao Paulo, Brazil. Seeds presented by Amadeu Barbiellini. Received May 18, 1925.

Vulgarly known as *Copiranguê*. A wild tree which produces an abundance of seeds. These constitute an ideal cheap food for domestic animals, especially chickens. (Barbiellini.)

64102. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceae.

Common wheat.

From Sweden. Seeds presented by H. A. Ahlstrom, Svenska Utnyttjningsförsamlingen. Received May 18, 1925.

Sammetsvård. An old unimproved "land" wheat which is still cultivated here and there in central Sweden. It is exceedingly winterhardy and of excellent quality, but has no lodging resistance, is susceptible to rust, and is of relatively low production. (Åkerman.)

64103 to 64108. *ORYZA SATIVA* L. Poaceae.
Rice.

From Nekkenshimachi, Hokkaido, Japan. Seeds presented by Dr. T. Watanabe, director, Kitami branch, Hokkaido Agricultural Experiment Station. Received May 23, 1925. Notes by Doctor Watanabe.

64103. No. 1. *Kitami*. A mass variety with awned ears.

64104. No. 2. *Barugogo*. No. 3. A pure line selected in our station, with awnless ears. This variety is rather late in maturing.

64105. No. 4. *Barugogo*. No. 4. A pure line selected in our station.

64106. No. 5. *Hokkaido*. A fixed hybrid selected in our station. This is an excellent awnless variety.

64107. No. 6. *Watanabe*. A mass variety with awnless ears, which is fragrant when cooked. An early ripening variety.

64108. No. 7. *Sakigake*. A mass variety with red awns and brown hulls.

64109 to 64113. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceae.

Common wheat.

From Kharkov, Russia. Seeds obtained from the All-Ukrainian Seed-Producing Association, through J. A. Clark, Bureau of Plant Industry. Received June 1, 1925.

Locally developed strains.

64109. *Kooperatorka*. From the Odessa Experiment Station.

64110. No. 351. From the Uchistskaia Experiment Station.

64111. *Semka*.

64109 to 64113—Continued.

64112. The "*Our-Concur*." From the Ivanovskaja Experiment Station.

64113. No. 401. From the Verchnichskaja Experiment Station.

64114 to 64116.

From Cape Town, Cape Province, Union of South Africa. Seeds presented by Dr. Rudolph Marloth, through H. L. Shantz, Bureau of Plant Industry. Received June 3, 1925. Notes by Doctor Shantz.

64114. *CYANELLA CAPENSIS* L. Amaryllidaceae.

No. 495. This plant, known in South Africa as "*Raap unitje*" or "*Raaprol*," has lilac flowers with yellow anthers; these flowers appear in summer when the leaves are mostly withered. The corms form an article of food for the natives.

64115. *ERICA NANA* Salisb. Ericaceae.

No. 497. A very small shrubby plant, with prominent stems and relatively large yellowish flowers. This was probably grown by Doctor Marloth in his gardens at Cape Town.

64116. *PSEUDOGALTONIA PECHUELLI* Kuntze. Liliaceae.

No. 496. A bulbous plant, native to Great Namaqualand and Hereroland. The flowers are green and white, and under normal conditions the plant flowers in a leafless condition just before the rainy season; under cultivation the leaves often come first, before the flowers. The plant is very poisonous.

64117 to 64122.

From Darjiling, India. Seeds presented by G. H. Cave, curator, Lloyd Botanic Garden. Received May 19, 1925.

64117 to 64119. *BOEHMERIA* spp. Urticaceae.

64117. *BOEHMERIA PLATYPHYLLA* D. Don.

A large shrub or small tree, native to eastern and southern India, which, according to Watt (Dictionary of the Economic Products of India, vol. 1, p. 481) is said to yield good fiber. The reddish brown wood is moderately hard.

64118. *BOEHMERIA BUGLOSA* Wedd.

A small tree with gray-brown branches, which is native in the mountainous districts of northeastern India. The moderately hard durable reddish wood is used in the manufacture of buckets, boxes, etc.

64119. *BOEHMERIA SIDAEPOLIA* Wedd.

A slender shrubby plant, erect or bushy, with oval hairy leaves; it is native to subtropical regions of northeastern India. Several species of this genus are valued in India as fiber-producing plants.

64120. *CROTALARIA TETRAGONA* Roxb. Fabaceae.

An erect stiff shrub, often 6 feet in height, which grows wild in the Himalayas of northeastern India, ascending to an altitude of 3,500 feet. The thin silky membranous narrow leaves are

64117 to 64122—Continued.

sometimes a foot long, and the lemon-yellow flowers are produced in lax racemes 6 inches or more in length.

For previous introduction see S. P. I. No. 59321.

64121. *PIERIS OVALIFOLIA* (Wall.) D. Don (*Andromeda ovalifolia* Wall.). Ericaceae.

Although this shrub or small tree may prove of value as a semihardy ornamental because of its racemes of bluish or white flowers, it is used as an insecticide in its native country, India, because of the presence of a poisonous principle in the young leaves and buds. The oblong leathery leaves are 3 to 6 inches long.

For previous introduction see S. P. I. No. 60653.

64122. *THEMEDA GIGANTEA* (Cav.) Hack. Poaceae.

A tall erect stout grass, 8 to 16 feet high, with very narrow leaves 4 to 8 feet long and oblong panicles 1 to 3 feet in length. It is native to eastern Asia and is closely related to the kangaroo grass of Australia, which is considered a valuable fodder.

64123 to 64125. *GOSSYPIUM* spp. Malvaceae.

From Natal, Brazil. Seeds presented by E. C. Green. Received May 19, 1925.

Selections of Brazilian cotton, probably hybrids of *Gossypium peruvianum* and *G. vitifolium*.

64123. *GOSSYPIUM* sp.

A.

64124. *GOSSYPIUM* sp.

B.

64125. *GOSSYPIUM* sp.

C.

64126 to 64152.

From Chihli, China. Seeds obtained by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received May, 1925. Notes by Mr. Dorsett.

64126 and **64127.** *FAGOPYRUM VULGARE* Hill (*F. esculentum* Moench). Polygonaceae. Buckwheat.

64128. No. 2552. Miyunhsien. March 26, 1925.

64127. No. 2567. Kaoliying. March 27, 1925.

64128. *HORDEUM* sp. Poaceae. Barley. No. 2547. Niulan Mountain. March 26, 1925. *Wang ta mai* (king barley).

64129. *HORDEUM* sp. Poaceae. Barley. No. 2561. Kaoliying. March 27, 1925. *Wang ta mai* (king barley).

64130 to **64133.** *PHASEOLUS ANGULARIS* (Willd.) W. F. Wight. Fabaceae. Adsuki bean.

64130. No. 2545. Niulan Mountain. March 26, 1925. A small black bean.

64126 to 64152—Continued.

64131. No. 2559. Miyunhsien. March 26, 1925. A small gray variety.

64132. No. 2563. Kaoliying. March 27, 1925. A small white bean.

64133. No. 2564. Kaoliying. March 27, 1925. A small red variety.

64134 to **64137.** *PHASEOLUS AUREUS* Roxb. Fabaceae. Mung bean.

64134. No. 2543. Niulan Mountain. March 26, 1925. This is a green variety.

64135. No. 2557. Miyunhsien. March 26, 1925. A green bean.

64136. No. 2565. Kaoliying. March 27, 1925. A hairy variety.

64137. No. 2571. Niulan Mountain. March 31, 1925. These beans are of a dull grayish brown and were separated from the green mung beans sent in under No. 2543 [S. P. I. No. 64134].

64138. *PISUM SATIVUM* L. Fabaceae. Pea. No. 2340. Paotingfu. March 10, 1925. A white field pea.

64139 to **64145.** *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceae. Soy bean.

64139. No. 2544. Niulan Mountain. March 26, 1925. A black soy bean.

64140. No. 2546. Niulan Mountain. March 26, 1925. A green variety.

64141. No. 2548. Niulan Mountain. March 26, 1925. Yellow soy bean.

64142. No. 2549. Niulan Mountain. March 26, 1925. A small, green soy bean.

64143. No. 2556. Miyunhsien. March 26, 1925. Yellow soy bean.

64144. No. 2560. Miyunhsien. March 26, 1925. Black variety.

64145. No. 2566. Kaoliying. March 27, 1925. Yellow soy bean.

64146 to **64149.** *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceae. Common wheat.

64146. No. 2542. Niulan Mountain. March 26, 1925. A spring wheat.

64147. No. 2550. Niulan Mountain. March 26, 1925. Winter wheat.

64148. No. 2553. Miyunhsien. March 26, 1925. Winter wheat.

64149. No. 2554. Miyunhsien. March 26, 1925. Spring wheat.

64150. *VICIA FABA* L. Fabaceae. Broad bean.

No. 2558. Miyunhsien. March 26, 1925. *Ts'an tou* (silkworm bean) or English horse bean.

64151. *VIGNA SINENSIS* (Toner) Savi. Fabaceae. Cowpea.

No. 2551. Miyunhsien. March 26, 1925. A mottled cowpea.

64152. *ZEA MAYS* L. Poaceae. Corn. No. 2562. Kaoliying. March 27, 1925. Seeds of a white corn.

64153 and 64154.

From Satyagrahashram, Sabarmati, India. Seeds presented by Magaulal K. Gandhi, at the request of Richard B. Gregg, Ahmedabad, Sabarmati. Received June 3, 1925.

64153. *CUCUMIS SATIVUS* L. Cucurbitaceae.
Cucumber.

A long bulky cucumber which has flesh and flavor resembling a muskmelon, though not so sweet. (Gandhi.)

64154. *CUCURBITA MOSCHATA* Duchesne. Cucurbitaceae.
Cushaw.

Sugar pumpkin (Indian name "Sakkakola"). A prolific variety of small pumpkin, round in shape and of a beautiful reddish color, resembling a half-ripe tomato. As the name suggests, the flavor is sweet. It is an earlier bearer than any of the other varieties and is a good keeper if stored in a dry place. (Gandhi.)

64155 and 64156.

From Mexico. Seeds collected by C. R. Orcutt. Received May 21, 1925.

64155. *PHASEOLUS VULGARIS* L. Fabaceae.
Common bean.

From the market at San Luis Potosi. (Orcutt.)

64156. *VIGNA SINENSIS* (Torner) Savi. Fabaceae.
Cowpea.

No. 1749. 1924. Alvarez. *Takil*. (Orcutt.)

64157. *GOSSYPIUM* sp. Malvaceae.

Cotton.

From Rabat, Morocco. Seeds presented by Em. Miège, chief, Service de l'Expérimentation Agricole au Maroc, through David Fairchild, agricultural explorer, Bureau of Plant Industry. Received May 29, 1925.

A seedling of the native cotton known as *Sar-sar*; the latter is described under S. P. I. Nos. 64002 and 64003.

64158 and 64159.

From China. Plants collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received May 20, 1925.

64158. *LIRIOPE GRAMINIFOLIA* (L.) Baker (*L. spicata* Lour.). Liliaceae.

No. 121. Hong Kong Botanic Gardens. March 4, 1925. *Koai ts'in t'ao*. A dark-green variety which is of low habit and spreads rapidly by rhizomes. It is said to produce fruits only very sparingly. Used extensively in the place of grass in situations where the dense shade, shallow rooting of some trees, or other conditions prevent the growth of a satisfactory grass sod. (McClure.)

64159. *OPHIOPOGON* sp. Liliaceae.

A tropical, grasslike plant with small white or bluish flowers; collected in southeastern China.

64160 and 64161. *LOLIUM TEMULENTUM* L. Poaceae.

Darnel.

From Ariana, near Tunis, Tunisia, Africa. Seeds presented by the chief of the Botanical Service. Received March 9, 1925. An annual European grass.

64160 and 64161—Continued.

64160. Received as *Lolium canadense*.

64161. Received as *Lolium brevicaulis*.

64162 and 64163. *MUSA PARADISIACA SAPIENTUM* (L.) Kuntze. Musaceae.
Banana.

From Santiago de las Vegas, Cuba. Suckers presented by Gonzalo Fortun, director, Estación Experimental Agronomica. Received June 3, 1925.

64162. *Enano*. A dwarf banana which may be different from the Cavendish variety now being grown in Florida.

64163. *Congo*. This is similar to the *Enano* variety, but it appears to be immune to the Panama disease. It bears enormous bunches of fruits which sometimes weigh more than 100 pounds. (Fortun.)

64164 and 64165. *LANDOLPHIA* spp. Apocynaceae.

From Kisantu, Belgian Congo, Africa. Seeds presented by Frère J. Gillet. Received June 5, 1925.

64164. *LANDOLPHIA KLAIRII* Pierre.

A tropical African climbing shrub which is said (Flora of Tropical Africa, vol. 4, sect. 1) to be the principal rubber-producing plant in the Gabon district, French Equatorial Africa. The oblong leathery leaves are glossy green, and the hard globose fruits are 6 to 10 inches in diameter.

For previous introduction see S. P. I. No. 63737.

64165. *LANDOLPHIA OWARIENSIS* Beauv.

This is described (Wildeman and Gentil, *Lianes Caoutchoutifères du Congo*, p. 53) as an enormous tropical creeper, found throughout the Belgian Congo, which attains a length of over 300 feet and a stem diameter of about 15 inches. The wedge-shaped elliptic leaves are 2 to 4 inches long. While the rubber-producing latex obtained from this species is often of good quality, frequently individual specimens yield latex which is practically useless.

For previous introduction see S. P. I. No. 58517.

64166 to 64183.

From Nice, France. Seeds presented by Dr. A. Robertson Proschowsky. Received June 3, 1925.

64166. *ABROMA AUGUSTA* L. f. Sterculiaceae.

A large spreading shrub, native to tropical Asia, with heart-shaped soft-hairy leaves and dingy-purple flowers. In India a fiber is extracted from the twigs which is valued for its beauty, softness, and durability.

64167. *ACER OSMASTONI* Gamble. Aceraceae.
Maple.

A large Himalayan maple, described (Kew, *Bulletin of Miscellaneous Information*, 1908, p. 446) as a tree up to 100 feet tall, growing wild in Sikkim, India, at an altitude of about 7,000 feet. The leaves, 1 to 3 lobed, are papery and about 5 inches long.

For previous introduction see S. P. I. No. 61742.

64166 to 64183—Continued.

64168. *ARAUJIA MEGAPOTAMICA* Don. Asclepiadaceae.

A shrubby evergreen climbing plant, with opposite leaves and whitish or rose bell-shaped flowers. It is native to Brazil and can be grown under glass or in the open in summer.

64169. *ARCTOTIS STOCHADIFOLIA* Bergius. Asteraceae.

A bushy composite from the Cape of Good Hope, which according to Harvey and Sonder (*Flora Capensis*, vol. 3, p. 454) has long hairy branches with whitish hairy leaves and large showy orange-colored flower heads.

64170. *ARGYROLOBIMUM LINNAEANUM* Walp. Fabaceae.

A perennial caespitose half-woody leguminous plant, usually 4 to 8 inches high, with trifoliolate leaves and terminal yellow flowers. It is native to the Mediterranean regions.

64171 to 64173. *CITRUS MEDICA* L. Rutaceae. Citron.

64171. Received as *Citrus lumia*, which is now referred to as *C. medica*.

64172. *Lumus Valentina*.

64173. Var. *Perettone*.

64174. *CROTALARIA TETRAGONA* Roxb. Fabaceae.

An erect stiff shrub, often 6 feet in height, which grows wild in the Himalayas of northeastern India, ascending to an altitude of 3,500 feet. The thin silky membranous narrow leaves are sometimes a foot long, and the lemon-yellow flowers are produced in lax racemes 6 inches or more in length.

For previous introduction see S. P. I. No. 59321.

64175. *ECCREMOCARPUS SCABER* Ruiz and Pav. Bignoniaceae.

A Chilean relative of the Trumpet creeper, which is a shrubby vine with crimson and yellow flowers. It has bipinnate leaves and becomes 10 feet or more in length.

64176. *EUCALYPTUS ALGERIENSIS* Trabut. Myrtaceae.

A hybrid between *Eucalyptus rostrata* and *E. rudis* which has become naturalized in North Africa and now covers considerable areas of the hills around Algeria. It differs from *E. rudis* by its smooth trunk and its small flowers with the hemispherical operculum not beaked, and from *E. rostrata* by its buds, which are white like those of *E. rudis*. *Eucalyptus rudis* flowers in the spring, while *E. rostrata* flowers in July and August. (Note by David Fairchild under S. P. I. No. 62666.)

64177. *MEIBOMIA GYROIDES* (DC.) Kuntze (*Desmodium gyroides* DC.). Fabaceae.

A shrubby leguminous plant, 8 to 10 feet high, from the warmer parts of the central and eastern Himalayas. It has hairy leaves and terminal clusters of red flowers.

For previous introduction see S. P. I. No. 61613.

64166 to 64183—Continued.

64178. *MEIBOMIA PULCHELLA* (L.) Kuntze (*Desmodium pulchellum* Benth.). Fabaceae.

An erect hairy shrub with trifoliolate leaves and spikelike clusters of red flowers. It is native to southeastern Asia and is introduced chiefly for testing as a forage plant.

64179. *NEPTUNIA OLERACEA* Lour. Mimosaceae.

According to Ridley (*Flora of the Malay Peninsula*, vol. 1, p. 653), this floating leguminous plant, with white fleshy stems, is used as a potherb. The bipinnate leaves are 3 inches long, and the flower heads are yellow.

64180. *ONCOCALAMUS* sp. Phoenicaceae. Palm.

The members of this tropical African genus are climbing palms with long stems and pinnate leaves.

64181. *PANCRATIUM COLLINUM* Coss. and Dur. Amaryllidaceae.

A bulbous plant from Algeria, described by Baker (*Handbook of Amaryllidaceae*, p. 118) as having five or six linear leaves about 2 feet long and greenish white fragrant flowers in 5 to 10 flowered umbels.

64182. *VERNONIA VOLKAMERIAEFOLIA* DC. Asteraceae.

A small stout tree with large leaves, about a foot in length, and very numerous whitish flower heads in terminal panicles. The tree is native in the mountainous districts of northeastern India.

64183. *ZANTHOXYLUM ALATUM* PLANTSPINUM (Sieb. and Zucc.) Rehd. and Wils. Rutaceae.

According to the *Revue Horticole* (vol. 85, p. 17), this Japanese shrub is 7 to 13 feet high, much branched at the base, sometimes with a short trunk. The dark-brown spreading branches, drooping a little at the tips, bear stout straight spines in pairs and evergreen pinnate leaves, dark green above and paler beneath. The small red fleshy fruits are persistent and emit a very agreeable aromatic odor when bruised. The shrub should be more extensively planted as an ornamental; in addition it makes a very formidable hedge. Propagation is by seeds or cuttings.

64184 to 64195.

From northern Africa. Collected by David Fairchild, agricultural explorer, Bureau of Plant Industry. Received June 4, 1925. Notes by Doctor Fairchild.

64184. *ANCHUSA UNDULATA* L. Boraginaceae.

April 27, 1925. Var. *lamprocarpa*. Seeds of what appears to be one of R. Maire's new subspecies which is native to Morocco. As I saw it on the sand land, about 14 miles north of Kenitra, Morocco, it appeared to be a very attractive flowering perennial which should be introduced into our gardens and improved through selection. The dark-purple flowers contrast strikingly with the red-purple of the stiff inflorescence, which has a great deal of style to it.

64184 to 64195—Continued.

64185. *CAPSIUM ANNUUM* L. Solanaceae.
Red pepper.

Sidi Bel Abbes, Algeria. March 12, 1925. Seeds purchased in the market. I have not seen this particular variety of the sweet red pepper of Spain since I was in Murcia, Spain, 25 years ago. The Spanish grind it up into a very fine powder and flavor their soups and other dishes. It is one of the finest flavored varieties and is not the least bit sharp; a large spoonful of the ground fruit can be put into a plate of soup or stewed with chicken. I believe it is also used fresh in the making of what we in America call "pimento."

64186. *CERINTE GYMNDRA* Gasp. Boraginaceae.

April 27, 1925. There are several species of *Cerinte* scattered along the coast of northern Africa which differ in the size and color of the flowers and in the tint of black-purple which characterizes their large floral bracts. If used in a border properly it might be a most effective plant, furnishing a dark-purple background for all sorts of other flowering plants. These seeds were gathered in the valley back of the old town of Ouezzan, Morocco, which is about 30 miles from the Riff frontier.

64187. *DIPCADY SEROTINUM* Medic. Liliaceae.

Forest of Mamora, near Rabat, Morocco. April 23, 1925. Seeds of a bulbous plant growing about a foot high and producing a slender spike of salmon-colored flowers which are shaped like those of a hyacinth. It forms patches in the deep sandy soil of the forest of Mamora.

64188. *ECBALLIUM ELATERIUM* (L.) A. Rich. Cucurbitaceae.

From a roadside near Sidi Bel Abbes, Algeria. March 24, 1925.

Seeds of the "squirting cucumber," a perennial trailing vine, native to the Mediterranean countries. It is cultivated as an annual in gardens of the Temperate Zone and is a curiosity because of its peculiar habit of violently ejecting its seeds and juice. A drug, *elaterium*, is obtained from the juice. In flower and foliage characters the plant closely resembles the cucumber, and the fruit is like a small greenish elliptical gourd covered with soft greenish prickles.

64189. *HELIANTHEMUM AEGYPTIACUM* Mill. Cistaceae.

Forest of Boulhout, near Rabat, Morocco. April 23, 1925. The superb yellow color of this small species attracted my attention at once, and although the flowers last only a short time, they have so delicate a charm about them that I could not resist sending in seeds in order that an attempt should be made to naturalize the species in the oak forests and on the sandy soils of southern California. This variety appears to be common in Algeria and Tunisia, as well as here in Morocco.

64190. *IRIS ALATA* Poir. Iridaceae.

Seeds of a low-growing species which grows wild in the wet gumbo soils about 66 miles north of Kenitra, Morocco. It is a purple-flowered species, and R. Maire

64184 to 64195—Continued.

tells me it is well worth growing in our borders for its large flowers, which in Algiers appear during October and November. It produces numerous tubers on its roots.

64191. *LEUCOJUM AUTUMNALE* L. Amaryllidaceae.

April 17, 1925. Seeds collected in the forest of Mamora, about 9 miles from Rabat, Morocco.

An autumn-blooming bulbous plant, sometimes called the "autumn snowflake." The threadlike leaves usually appear after the flowers; these are white, tinged with red, and are borne on a slender scape 3 to 9 inches long. Native to the Mediterranean countries and best suited for growing in sandy soil in the southern half of the United States.

64192. *MYOPORUM* sp. Myoporaceae.

May 3, 1925. Seeds presented by the Jardin d'Essais, Rabat, Morocco, where there are many hundreds of yards of hedges of this variety. It was introduced into Morocco and has now become the principal hedge plant and windbreak of the whole coast. It is one of the best plants I have ever seen for hedges down near the sea, but not right on the very edge of the surf. It stands clipping admirably well and is an evergreen of a pleasing dark-green color. It grows with the greatest ease from cuttings, makes a very dense windbreak, and will stand several degrees of frost without injury. It is reported that grasshoppers do not care for this species.

64193. *ORNITHOGALUM UNIFOLIUM* (L.) Ker. Liliaceae.

Bulbs from the forest of Mamora, near Rabat, Morocco. April 21, 1925.

A Portuguese relative of the star of Bethlehem which is described (Curtis's Botanical Magazine, pl. 935) as a little bulbous plant a foot or less high, with but one leaf, which is narrow, concave, and terminated by a long recurved point. The three to five white flowers are borne on a scape shorter than the leaf.

64194. *RHUS PENTAPHYLLA* (Jacq.) Desf. Anacardiaceae.

Boulhout, Morocco. April 22, 1925. Seeds of a beautiful shrub at present covered with berries which are just beginning to ripen. The fruits become intense red later in the season, and the bark is a source of tannin.

64195. *TRADESCANTIA* sp. Commelinaceae.

The spiderworts are perennial herbs, all native to North America and cultivated in the greenhouse or out of doors, according to their hardness, for the sake of their bright flowers, which are blue, red, or white, and attractive foliage. Cuttings of a North African species.

64196 to 64198.

From Avondale, Auckland, New Zealand. Seeds presented by H. R. Wright. Received June 5, 1925.

64196. *MERTIA SINCLAIRII* (Hook. f.) Seem. Araliaceae.

A small, very attractive New Zealand tree, described by Laing and Blackwell (Plants of New Zealand, p. 312) as about 20 feet high, with shining-green

64196 to 64198—Continued.

leaves 9 to 20 inches long, and erect panicles of greenish yellow flowers. It probably is adapted for growing only in Florida and California.

64197. PHORMIUM TENAX Forst. Liliaceae. **New Zealand flax.**

Var. *atropurpureum*. A horticultural variety with reddish purple foliage. The plant has rigid sword-shaped leaves 6 feet or more in length and a flower stalk sometimes 15 feet high, which bears numerous dull-red flowers. Adapted for growing outdoors in Florida and California and as a tub plant farther north.

64198. VITEX LUCENS Kirk. Verbenaceae. **Puriri.**

A handsome New Zealand evergreen tree, described by Laing and Blackwell (Plants of New Zealand, p. 350) as being about 60 feet in height, with bright glossy green leaves composed of three to five leaflets. The pink or red two-lipped flowers, produced more or less continuously throughout the year, are in axillary clusters. The wood is very strong and durable and is not injured by dampness. The roots do not penetrate deeply into the ground, so the tree is easily blown over by heavy winds. The tree will probably not endure much frost.

64199 to 64205. HOLCUS SORGHUM L. (*Sorghum vulgare* Pers.). Poaceae. **Sorghum.**

From Potchefstroom, Transvaal, Union of South Africa. Seeds presented by Jacq. P. F. Sellschop, School of Agriculture. Received June 11, 1925.

Locally grown strains.

64199. Bird Proof.

64200. Brown Sudan Durra.

64201. Ordinary Red.

64202. Short Red.

64203. White Coligny.

64204. White Sudan Durra.

64205. Yanzu.

64206. CARICA PAPAYA L. Papayaceae. **Papaya.**

From Santiago de las Vegas, Cuba. Seeds presented by Gonzalo M. Fortun, director, Estación Experimental Agronomica. Received June 10, 1925.

Mamey. This is a fine papaya of medium size, with red flesh of fine flavor. (Fortun.)

64207 to 64209. COIX LACRYMA-JOBI MA-YUEN (Rom.) Stapf. Poaceae.

Adlay.

From Lamao, Bataan, Philippine Islands. Seeds presented by S. Youngberg, acting Director, Bureau of Agriculture, Manila. Received June 23, 1925.

The ma-yuen, or adlay, has attracted considerable attention as a cereal for tropical regions. According to P. J. Wester, it is better than upland rice for tropical agriculture in being more drought resistant, a heavier yielder, and much less expensive to cultivate. The seeds can be used largely in the same manner as corn.

64207 to 64209—Continued.

64207. Batangas.

64208. Bukidnon.

64209. Lamao White.

64210. POA FLABELLATA (Lam.) Hook. f. Poaceae. **Tussock grass.**

From Stanley, Falkland Islands. Seeds presented by James Reid, forest officer. Received June 12, 1925.

For previous introduction and description see S. P. I. No. 63972.

64211 to 64214. RUBUS spp. Rosaceae.

From the Philippine Islands. Seeds presented by P. J. Wester. Received June 12, 1925. Notes by Mr. Wester unless otherwise stated.

Collected February 24 to 27, 1925, in the vicinity of Mount Pulog, Benguet Province, Luzon.

64211. RUBUS ELLIPTICUS J. E. Smith. **Raspberry.**

Adouay. February 27. A very stout shrub which, especially when young, is densely covered with long red hairlike spines. The flowers are white, and the deep-yellow, almost orange, very juicy, acid fruits, which ripen earlier on the mountains than in the valley, are collected by the hill tribes and brought to the markets. (J. F. Rock.)

64212. RUBUS FRAXINIFOLIUS Poir. **Raspberry.**

Palanau. A tropical raspberry, described (Brown, Wild Food Plants of the Philippines, p. 63) as a scrambling shrub, with branches 2 to 4 meters long, which is very common in the mountains from Luzon to Mindanao, Philippine Islands. The stems and leaves are armed with sharp spines, and the white flowers are about 2 centimeters across. The bright red berries, 10 to 15 millimeters in diameter, borne in clusters, are fairly juicy and edible, but rather tasteless.

64213. RUBUS PECTINELLUS Maxim.

Atibu. A trailing plant with small heart-shaped hairy leaves and weak spines on all parts of the plant. It grows at an altitude of 5,000 feet or more, from northern Luzon to Mindanao. The berries, three-fifths of an inch in diameter, are bright red, juicy, subacid, and of excellent flavor and quality. This is the choicest species of Rubus in the Philippines, but it is not in cultivation.

64214. RUBUS NIVEUS Thunb. **Raspberry.**

Below Camp 42, trail to Adouay. *Pilay*. A bramble found in northern Luzon at altitudes ranging from 4,000 to 7,000 feet, with spiny canes up to 7 feet in length. The five to nine foliolate leaves are white beneath. The hemispherical berries are bluish, subacid, and of good flavor. This plant is not cultivated, but is well worthy of domestication.

64215. ACACIA GIRAFFAE Willd. Mimosaceae.

From Kirstenbosch, Cape Province, Union of South Africa. Seeds presented by Prof. R. H. Compton, director, National Botanic Gardens. Received June 12, 1925.

The *kameel doorn* of the Transvaal is a valuable timber tree for arid regions in the warm Temperate Zone, according to J. Burtt Davy, formerly director of the Burtt-Davy seed farms at Burttholm, Vereeniging, Transvaal. The ripe pods are greedily eaten by stock. The tree thrives in sandy soil, attains a large size, and the dark reddish brown wood is used by the natives in making spoons, knife handles, etc.

64216. CARICA PAPAYA L. Papayaceae.
Papaya.

From Santiago de las Vegas, Cuba. Seeds presented by Gonzalo M. Fortun, director, Estación Experimental Agronomica. Received June 13, 1925.

One of the larger papaya types, sent to me by Mario Escobar y Ferrer, of Colonia "Bellamar" Jagueyal. (*Fortun.*)

64217. MEIBOMIA LEOCARPA (Spreng.) Kuntze (*Desmodium leiocarpum* Don.). Fabaceae.

From Buenos Aires, Argentina. Seeds presented by Carlos D. Girola, Museo Agrícola de la Sociedad Rural Argentina. Received June 12, 1925.

In northern Argentina and southern Brazil this native leguminous plant is eaten readily by stock, according to Señor Girola (Boletín del Ministerio de Agricultura, Buenos Aires, vol. 25, p. 375). The plant becomes 6 feet or more in height, more or less branched, with trifoliate leaves 2 inches or more long. For use as forage the plants are cut at the level of the ground, just before flowering; this practice causes the plants to renew their growth most rapidly.

64218. PANICUM LAEVIFOLIUM Hack.
Poaceae. Grass.

From Pretoria, Transvaal, Union of South Africa. Seeds presented by H. A. Mellé, Department of Agriculture, through C. V. Piper, Bureau of Plant Industry. Received June 17, 1925.

Sweet grass is an annual, widely distributed over the Transvaal and the Orange Free State. Owing to its rapid growth in cultivated lands, it is regarded as a troublesome weed. It is a very rapid grower, heading within six weeks after the seed has germinated, and has a remarkably heavy yield. The mown grass, if properly cured, makes excellent hay of the best palatability, which during the winter months is eaten greedily by stock. (*Mellé.*)

64219 and 64220. SACCHARUM OFFICINARUM L. Poaceae. Sugar cane.

From Fortuna, Porto Rico. Cuttings presented by J. Matz, through E. W. Brandes, Bureau of Plant Industry. Received June 24, 1925.

64219. *B. 6032.*

64220. *B. 6308.*

64221 and 64222.

From Chingkansan, Hupeh, China. Seeds presented by Rev. A. S. Cooper. Received June 15, 1925.

64221. *PYRACANTHA* sp. Malaceae.

Firethorn.

The firethorns are ornamental shrubs grown chiefly for their bright-red fruits. This Chinese species is as yet unidentified.

64221 and 64222—Continued.

64222. LILIUM LEUCANTHUM CHLORASTER (Baker) Wilson. Liliaceae. Lily.

An unidentified Chinese lily. To be grown to ascertain its horticultural value.

64223 to 64230. PYRUS spp. Malaceae.
Pear.

The following seedlings, grown at the Plant Introduction Garden, Chico, Calif., are from hybrids between one of the *Pyrus communis* types and a Chinese pear, raised by the late Walter Van Fleet in 1907 and hitherto carried collectively at the Chico garden under the S. P. I. No. 28497. Numbered in April, 1925, for convenience in distribution.

64223. PYRUS sp.

A medium-sized pear, 3½ inches long and 2¾ inches wide, which is obovate-acute-pyriform, some specimens tending to oblong-pyriform. The thick, tough skin is light yellow overlain with bronze or light pink on the exposed surface and is slightly roughened by numerous large conspicuous russet dots. The flesh is white, fairly juicy and firm, sweet but insipid. The tree is very prolific and ripens its fruits at Chico from the middle of August to the middle of September. (Row 42, tree 3, and row 44, tree 3.)

64224. PYRUS sp.

Fruits medium to large, averaging 3 inches long and 2¾ inches wide; acute-obovate-pyriform in shape with unequal sides. When ripe the skin is lemon yellow with a smooth waxy surface and numerous russet dots. The flesh is quite firm and juicy, slightly sweet, but lacking in flavor. Possibly of use for canning purposes. The fruits ripen at Chico from late in September to late in October. Row 26, tree 4, old test orchard.)

64225. PYRUS sp.

A medium-sized pear, yellowish green and rather rough. The flesh is light colored, rather coarse in texture, but juicy, sweet, and of fair quality. The tree is small and rather slow growing, bearing an average crop and showing no evidence of disease. Evidently a fair winter pear. The fruits ripen at Chico about the middle of August. (Row 26, tree 8, old test orchard.)

64226. PYRUS sp.

A medium-sized drooping vigorous tree, bearing an average crop of medium-sized pears. The fruits are greenish yellow and smooth. The flesh is juicy and slightly acid with a trace of astringency. This has a possible value as a late winter pear. (Row 26, tree 11, old test orchard.)

64227. PYRUS sp.

Fruits large and coarse, averaging 12 to 16 ounces in weight, with greenish yellow skin, slightly colored where exposed to the sun. The flesh is juicy and fairly sweet, but lacking in flavor. The tree is vigorous, free from blight, and bears a heavy crop of fruit which ripens late in September or early in October at Chico, Calif. (Row 28, tree 8, old test orchard.)

64228. PYRUS sp.

A very vigorous tree showing as yet no evidence of blight and bearing a heavy

64223 to 64230—Continued.

crop of large obovate pears averaging 8 to 10 ounces in weight. The flesh is coarse, granular, juicy, and lacking in flavor. (Row 28, tree 10, old test orchard.)

64229. *PYRUS* sp.

Fruits medium sized, turbinate, averaging $2\frac{1}{2}$ inches long and $2\frac{1}{4}$ inches wide, with a fairly smooth surface, slightly roughened in spots by russet patches. The flesh is white, fairly juicy and firm, sweet, with a pleasant flavor. A satisfactory dessert pear which ripens early in September. (Row 34, tree 4, old test orchard.)

64230. *PYRUS* sp.

A pear averaging 7 or 8 ounces in weight, obovate in form, greenish yellow, and heavily dotted. The flesh is very coarse and gritty and would probably be of value only for cooking purposes. The tree is spreading, open, and vigorous and as yet shows no evidence of disease. Fruits ripen in October at Chico, Calif. (Row 27, tree 9, old test orchard.)

64231 to 64243.

From Leningrad, Russia. Seeds presented by A. Kol, chief of information and introduction, Institute of Applied Botany. Received June 12, 1925.

64231. *ABIES SIBIRICA NEPHROLEPIS* Trautv. Pinaceae.

A tall Siberian fir with a trunk 2 to 4 feet in diameter, dark yellow-green crowded leaves, and slender brownish yellow cones. This is said to be a very hardy fir, although the young growth is often injured by late frosts.

64232. *ACANTHOPANAX SENTICOSUM* (Rupr.) Harms. Araliaceae.

A very spiny shrub bearing palmate-divided leaves and having at the end of its long shoots small umbels of black berries. Grows generally in dense shade, and may prove useful as a park or garden shrub or as an undergrowth beneath tall trees. (Frank N. Meyer, note under S. P. I. No. 20309.)

64233. *ACER TEGMENTOSUM* Maxim. Aceraceae. Maple.

A small hardy Manchurian maple, very similar to *Acer rufinerve*. The bright-green three-lobed leaves are about 3 inches long and slightly less in width.

64234. *BETULA SCHMIDTII* Regel. Betulaceae. Birch.

A Japanese birch, described by C. S. Sargent (Plantae Wilsonianae, vol. 2, pt. 3, pp. 475 and 476) as a large tree with thick branches, found only in the Province of Shimotsuke, Hondo, Japan. It grows to be 65 feet tall, with a trunk $3\frac{1}{2}$ to $7\frac{1}{2}$ feet thick, and black bark which falls off in thick, rather small plates. The finely serrate leaves are short stemmed, and the catkins are narrow, stiff, and erect.

64235. *FRAXINUS MANDSHURICA* Rupr. Oleaceae. Ash.

An Asiatic ash, described by Bean (Trees and Shrubs Hardy in the British Isles, vol. 1, p. 569) as a handsome tree

64231 to 64243—Continued.

often 100 feet in height, native to Japan and the adjacent parts of the Asiatic mainland. The leaves are up to 15 inches in length, with dull-green bristly leaflets. The tree is said to be susceptible to late spring frosts.

64236. *LARIX DAHURICA* Turcz. Pinaceae. Larch.

A larch from Manchuria and south-eastern Siberia, sometimes as much as 70 feet in height. In many sections it is superior to the common European larch as a park tree. In the spring the young cones are very attractive because of their bright pink color.

64237. *MAACKIA AMURENSIS* Rupr. Fabaceae.

A small tree, native to eastern Asia, with orange-brown bark, dull-green compound leaves, and short erect clusters of small yellowish white flowers.

64238. *PICEA JEZOENSIS* (Sieb. and Zucc.) Carr. Pinaceae.

A handsome hardy spruce, native to eastern Asia, which becomes about 70 feet high, with low-spreading branches and a dense pyramidal habit. The leaves are silvery above and rich green beneath, and the staminate flowers are orange-crimson.

64239. *PRUNUS MAACKII* Rupr. Amygdalaceae. Cherry.

A Manchurian bird cherry, 40 feet or more in height, with very smooth brownish yellow bark which peels off like that of a birch. The leaves are pointed and very finely toothed, and the white flowers are in short racemes borne on the previous season's wood.

64240. *PRUNUS SALICINA* Lindl. Amygdalaceae. Plum.

Var. *koreana*. A horticultural form of the Japanese plum which will be grown to ascertain its horticultural value.

64241. *PYRUS USSURIENSIS* Maxim. Malaceae. Pear.

A hardy Chinese pear, some strains of which have shown unusual resistance to the pear blight. Introduced for horticulturists engaged in pear-breeding experiments.

64242. *SCHIZANDRA CHINENSIS* (Turcz.) Baill. Magnoliaceae.

A trailing vine of small growth, found among boulders and rocks. The leaves are not unlike those of *Actinidia kolumbika*, and the sour red berries are in small clusters. Might be of use as a small porch and trellis vine for the colder sections of the United States. (Frank N. Meyer, note under S. P. I. No. 36755.)

64243. *TILIA AMURENSIS* Rupr. Tiliaceae.

A Manchurian linden which according to Schneider (Illustriertes Handbuch der Laubholzkunde, vol. 2, p. 374) has a habit similar to that of the small-leaved linden (*Tilia cordata* Mill.), with ovate papery long-pointed leaves which are dark green above and blue-green below. It is distinguished from the small-leaved linden by its coarser dentations.

64244. LEUCOJUM AUTUMNALE L. Amar-
yllidaceae.

From Morocco. Bulbs collected by David Fairchild, agricultural explorer, Bureau of Plant Industry. Received June 4, 1925.

April 17, 1925. Collected in the forest of Mamora, about 9 miles from Rabat. (*Fairchild*.)

For introduction of seeds and description, see S. P. I. No. 64191.

64245 to 64272.

From Tibet, China. Seeds collected by F. Kingdon Ward and presented by Maj. Lionel de Rothschild, London, England. Received May 22, 1923. Notes by Captain Ward.

Collected in the Tsangpo Valley during the spring of 1924.

64245. ACER sp. Aceraceae. Maple.

No. 5832. A tree 20 to 30 feet high, growing in a mixed forest.

64246 to 64249. BERBERIS spp. Berberid-
aceae. Barberry.**64246. BERBERIS sp.**

No. 5773. A bush, 6 feet in height, with glaucous foliage which turns purple in the autumn. The flowers are yellow and the berries coral red.

64247. BERBERIS sp.

No. 5936. This bush, 6 feet in height, has scarlet foliage during the autumn. The bright-yellow flowers are very numerous, and the berries are scarlet.

64248. BERBERIS sp.

No. 5962.

64249. BERBERIS sp.

No. 6233. A small shrub, 1 to 1½ feet in height, growing on sunny grassy slopes in peaty soil among dwarf rhododendrons. The pendent berries are coral red.

64250. CARAGANA sp. Fabaceae.

No. 6267. A bush, 2 to 3 feet high, growing in alpine regions on open slopes facing the south. The flowers are pink (?).

64251. CASSIOPE sp. Ericaceae.

Nos. 5663 and 5770. Grows in peaty soil on alpine meadows.

64252. CLEMATIS sp. Ranunculaceae.

No. 6290.

64253. COTONEASTER sp. Malaceae.

No. 6400.

64254. ENKIANTHUS sp. Ericaceae.

No. 6254. A shrub, 6 to 10 feet high, found in thickets and on the margins of forests. The leaves are scarlet and orange in the autumn; the flowers were not seen.

64255. ILEX sp. Aquifoliaceae. Holly.

No. 6249. An evergreen undershrub about 1 foot high, with scarlet berries resembling those of the holly. Grows among dense shrub growth and boulders in peaty soil.

64245 to 64272—Continued.**64256. IRIS sp.** Iridaceae.

No. 5783.

64257. IRIS sp. Iridaceae.**64258 to 64260. LILIUM spp.** Liliaceae.
Lily.**64258. LILIUM sp.**

No. 5809. A lily, with maroon flowers, which grows 3 to 6 inches high, in peaty meadows, among dwarf rhododendrons.

64259. LILIUM sp.

No. 5893. Plant 3 feet high, found on sheltered banks among shrubs on granite rock and in loamy soil, at an altitude of 13,000 feet.

64260. LILIUM sp.

No. 6272.

64261 to 64263. LONICERA spp. Capri-
foliaceae. Honeysuckle.**64261. LONICERA sp.**

No. 5775. A bush 6 to 8 feet high found in forests. It bears white or pale-cream pendent flowers and handsome cherry-red translucent berries which are good to eat.

64262. LONICERA sp.

No. 5822. A shrub or small tree up to 20 feet high, found in heavily shaded forests. The leaves are glossy and the flowers maroon colored. The pendent fruits, scarlet and the size of small cherries, are produced on pedicels which are 2 inches in length.

64263. LONICERA sp.

No. 5918. A dwarf shrub, 1 foot high, with yellow flowers and blue-black stems and berries. It grows in peaty soil among dwarf rhododendrons on alpine meadows.

64264. NOMOCHARIS sp. Liliaceae.

No. 6232. A plant 8 to 12 inches high, found on alpine meadows in loam and sand. The flowers were not seen.

64265. ONOSMA sp. Boraginaceae.

No. 5965. A plant having decumbent stems and bright-blue flowers which appear from July to September. It grows in pure sand, gravel, or grit in open, dry, sunny situations and should make a good rock plant.

64266. POPULUS sp. Salicaceae. Poplar.

No. 5675. A golden poplar tree 100 feet high, found in villages by the river.

64267. RHEUM sp. Polygonaceae.

No. 5805. Plant 6 feet high growing among alpine granite boulders at an altitude of 15,000 feet.

64268. ROSA sp. Rosaceae. Rose.

No. 5834. A bush, 6 to 12 feet high, or scrambling from 15 to 20 feet, found in thickets, forests, hedges, etc. The flowers are rose, hips scarlet and flask-shaped.

64269 to 64271. SALIX spp. Salicaceae.
Willow.**64269. SALIX sp.**

No. 5755. A shrub 10 to 15 feet high, with large bright-colored staminate and pistillate catkins. Grows in open situations.

64245 to 64272—Continued.

64270. *SALIX* sp.

No. 5870. This dwarf willow, bearing large leaves and erect spikes 3 inches in length, is creeping in habit.

64271. *SALIX* sp.

No. 6239. A shrub a foot or 2 high, with erect spikes about 3 inches long. Grows on sheltered gravelly slopes and in marshy places.

64272. *THALICTRUM* sp. Ranunculaceae.

No. 5899. A plant 6 to 10 feet high, with small leaves and large mauve flowers. Resembles *Thalictrum dipterocarpum*, but probably the leaves are smaller and the flowers larger. Grows in loamy soil in shady places.

64273 to 64285.

From Chihli Province, China. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received May 27, 1925. Notes by Mr. Dorsett.

The following seeds were collected at the Botanical Garden, Peking, April 10, 1925.

64273. *HORDEUM VULGARE NIGRUM* (Willd.) Beaven. Poaceae.

Six-rowed barley.

No. 2658. *Feng Tien hei ta mai* (black barley of Mukden). This variety is said to have originally come from Mukden, Manchuria.

64274 to 64276. *HORDEUM VULGARE PAL-LIDUM* Seringe. Poaceae.

Six-rowed barley.

64274. No. 2649. *Wang ta mai* (king barley). This variety appears to be the most commonly grown barley.

64275. No. 2650. *Honan wang ta mai* (king barley of Honan), said to have originally come from Honan Province.

64276. No. 2659. *Eo Kuo ta mai* (Russian barley), originally from Russia.

64277 and 64278. *PHASEOLUS CALCARATUS* Roxb. Fabaceae. Rice bean.

64277. No. 2652. *Pai ch'ang hsiao tou* (white long small bean). This variety is said to be a product of Chihli Province.

64278. No. 2660. *Tsung so ch'ang hsiao tou* (long brown small bean). These were selected from the small white bean, No. 2652 [S. P. I. No. 64277], and may prove to be a different strain.

64279 to 64283. *PISUM SATIVUM* L. Fabaceae. Pea.

64279. No. 2653. *Eo Kuo pai wan tou* (white field pea of Russia), said to have come originally from Russia.

64280. No. 2654. *Szechwan pai wan tou* (white field pea of Szechwan). A product of Szechwan.

64281. No. 2655. *Feng Tien pai wan tou* (white field pea of Mukden), said to have come originally from Mukden, Manchuria.

64282. No. 2656. *Te Kuo lu wan tou* (green field pea of Germany). Originally from Germany.

64273 to 64285—Continued.

64283. No. 2657. *Szechwan lu wan tou* (green field pea of Szechwan), originally from Szechwan Province.

64284. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceae. Soy bean.

No. 2651. *Tsung se tou* (brown soy bean) said to be a product of Chihli Province.

64285. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceae. Common wheat.

No. 2648. *Pai mai tze* (white winter wheat). Originally from Chinghsien.

64286. *DAHLIA VARIABILIS* (Willd.) Desf. Asteraceae.

From Lima, Peru. Tuber collected by Wilson Popenoe, agricultural explorer, Bureau of Plant Industry. Received February 28, 1925. Numbered April, 1925.

This is considered to be the parent of the great majority of cultivated dahlia varieties, and is, as the name indicates, very variable in both vegetative and floral characters.

64287 and 64288.

From Rio de Janeiro, Brazil. Seeds presented by Dr. Pacheco Leão, director, Botanic Garden. Received June 29, 1925.

64287. *HOLCUS SORGHUM VERTICILLIFLORUS* (Steud.) Hitchc. Poaceae. Tabucki grass.

Locally grown seeds.

For previous introduction see S. P. I. No. 61674.

64288. *MEIBOMIA DISCOLOR* (Vogel) Kuntze (*Desmodium discolor* Vogel). Fabaceae.

A shrubby erect hairy plant from southern Brazil, with oval membranous leaflets and large panicles of light-blue flowers.

64289 to 64309.

From Tiflis, Georgia, Caucasus. Seeds presented by the director of the Botanic Garden. Received June 30, 1925.

64289. *ABIES SPECTABILIS* Lambert (*A. webbiana* Lindl.). Pinaceae. Fir.

An Asiatic fir, which, in its native home in the Himalayas, becomes at times 150 feet in height, according to Bean (Trees and Shrubs Hardy in the British Isles, vol. 1, p. 128). The dark-green leaves are arranged in two opposite series so as to leave a V-shaped opening along the top; the individual leaves are 1 to 2 inches long. The cones, about 5 inches long, are violet-purple at first, becoming brown. It is probable that this fir will prove hardy only in the southern United States.

64290. *ACER DIVERGENS* Koch and Pax. Aceraceae. Maple.

According to Koch (Engler's Botanische Jahrbücher, vol. 7, p. 234), this maple, native to the Caucasus, is probably a tree; the bark is ash brown. The leathery dark-green leaves are pale beneath and five lobed.

64289 to 64309—Continued.

64291. *ACER HYRCANUM* Fisch. and Mey.
Aceraceae. **Maple.**

A southern European maple of compact habit, about 25 feet high, with bright-green 5-lobed leaves, greenish yellow flowers, and samaras about an inch long.

64292 to 64294. *CORNUS* spp. Cornaceae.
Dogwood.

64292. *CORNUS AUSTRALIS* Meyer.

A close relative of the common European dogwood (*Cornus sanguinea*). It differs in minor characters only, and is native to Asia Minor and the Caucasus. The European dogwood is a shrub 12 feet high, with dark-red branches, pale-green leaves, dense cymes of greenish white flowers, and black fruits.

64293. *CORNUS IBERICA* Hort.

A horticultural variety.

64294. *CORNUS KOENIGI* C. Schneid.

A dogwood native to Transcaucasia, described by Schneider (Illustriertes Handbuch der Laubholzkunde, vol. 2) as a shrub 10 feet or more in height, upright in habit and closely related to the common European dogwood (*Cornus sanguinea*). The branches are purple-brown, the leaves shining green, and the fruits are black.

64295. *CUPRESSUS TORULOSA* Don. Pinaceae.

Var. *corneyana*. A tall pyramidal cypress, 150 feet or less high, with pendulous branches and deep-green leaves arranged irregularly. It is indigenous to the Himalayas, and will probably be hardy only in the southern United States.

64296. *FAGUS ORIENTALIS* Lipsky. Fagaceae. **Beech.**

A tall handsome beech with a pyramidal habit, which is distributed throughout the Caucasus. The leaves are oblong to elliptic, with entire margins. The wood is considered excellent for making furniture, tools, barrels, etc. This beech should be tried in the Southwest as a timber and shade tree.

64297 to 64301. *IRIS* spp. Iridaceae.

64297. *IRIS CARTHALINIAE* Fomin.

A Caucasian iris, described (Moniteur du Jardin Botanique de Tiflis, 1909) as having a thick rhizome and four or five flowered stems nearly 3 feet high. The sword-shaped leaves are about two-thirds of an inch wide, and the flowers are light blue. In its native country the plant grows in damp places.

64298. *IRIS CAUCASICA* Hoffm.

A rather dwarf iris described by Baker (Irideae, p. 45) as having about six bright-green very narrow leaves 3 to 6 inches long, a short stem, and pale or bright-yellow flowers which appear in March or April. It is native from Asia Minor to Turkestan, ascending to 6,000 feet above sea level.

64299. *IRIS MUSULMANICA* Fomin.

An iris from the vicinity of Elisabethpol, Caucasus, which, according to the Moniteur du Jardin Botanique de

64289 to 64309—Continued.

Tiflis (vol. 14, 1909), inhabits brackish swamps. It is less than 2 feet tall, and the flowers are either sky-blue or yellowish.

64300. *IRIS TASCHIA* Hort.

A horticultural variety.

64301. *IRIS WINOGRADOWI* Fomin.

A Caucasian iris.

64302. *JUNIPERUS ISOPHYLLOS* Koch. Pinaceae. **Juniper.**

An oriental juniper described by Koch (Linnaea, vol. 22, p. 304) as a shrubby tree, with light-brown bark and ovate leaves. It differs from *Juniperus pseudo-sabina* in being smaller and having keeled leaves.

64303 to 64306. *PAEONIA* spp. Ranunculaceae. **Peony.**

64303. *PAEONIA ABCHASICA* Hort.

A horticultural variety.

64304. *PAEONIA MLOKSEWITSCHI* Lomakin.

According to Curtis's Botanical Magazine (pl. 8173), this is a herbaceous perennial peony, with dark bluish green biternate leaves with red nerves and margins. The yellow flowers are 4 to 5 inches across, with numerous stamens and purple stigmas. This peony, considered the handsomest of the yellow-flowered forms, is native to the central Caucasus.

64305. *PAEONIA TRITERNATA* Pall.

A tall herbaceous peony, with carrot-shaped roots, which resembles *Paonia corallina*, but differs in having rounded leaves, green stems, and rose-colored or whitish flowers. It is native to southeastern Europe.

64306. *PAEONIA WITTMANNIANA* Hartwiss.

A herbaceous perennial peony 2 to 3 feet high, with biternate leaves 4 to 8 inches long and flowers about 4 inches across. The flowers are solitary, pale yellow, greenish or nearly white. Native to the Caucasus.

64307. *PINUS ELDARICA* Medw. Pinaceae. **Pine.**

An erect pine 40 to 50 feet high, native to southern Europe and western Asia, and closely related to the Aleppo pine (*Pinus halepensis*). It differs from the latter in having longer, more rigid leaves which are a deeper green.

64308. *PTEROCARYA FRAXINIFOLIA* (Lam.) Spach. (*P. caucasica* Meyer). Juglandaceae.

A handsome spreading tree 60 feet or less in height, with attractive dark-green pinnate leaves about a foot long. Its native land is the Caucasus, and it will probably not be hardy north of Massachusetts.

64309. *REICHARDIA DICHOTOMA* (Bieb.) Freyn. Cichoriaceae.

A perennial herbaceous composite, 2 to 3 feet high, native to Asia Minor, with a rosette of spatulate radical leaves and very small stem leaves. The white flowers are in rather large heads.

64310 to 64339.

From Harbin, Manchuria. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received June 19, 1925. Notes by Mr. Dorsett.

64310. *CANNABIS SATIVA* L. Moraceae.
Hemp.

No. 2802. Pniston, Harbin. May 5, 1925. From the market; said to be locally grown stock.

64311. *FAGOPYRUM VULGARE* Hill (*F. esculentum* Moench). Polygonaceae.
Buckwheat.

No. 2865. May 12, 1925. Obtained from a grain dealer in the Chinese section.

64312. *HELIANTHUS ANNUUS* L. Asteraceae.
Sunflower.

No. 2800. Pniston, Harbin. May 5, 1925. A large sunflower obtained in the market; said to be from stock growing near Harbin.

64313. *LINUM USITATISSIMUM* L. Linaceae.
Flax.

No. 2803. May 5, 1925. Presented by A. Dmelrieff, flax expert of the Chinese Eastern Railroad.

64314 and 64315. *NICOTIANA TABACUM* L. Solanaceae.
Tobacco.

64314. No. 2862. May 12, 1925. A round-leaved Russian tobacco obtained from a seed shop in the Chinese section.

64315. No. 2863½. May 12, 1925. A long-leaved Chinese variety grown in the vicinity of Harbin.

64316 to 64329. *PHASEOLUS* spp. Fabaceae.64316 to 64319. *PHASEOLUS ANGULARIS* (Willd.) W. F. Wight. Adzuki bean.

64316. No. 2794. May 5, 1925. A small red bean said to be from local stock.

64317. No. 2870. May 12, 1925. A small white bean obtained in the Chinese section in a grain shop; reported to have come from stock grown in the vicinity of Harbin.

64318. No. 2871. May 12, 1925. *Hua hsiao tou* (flowered small bean), obtained from a seed shop in the Chinese section; said to have come from stock grown in the vicinity of Harbin.

64319. No. 2873. May 12, 1925. A small bluish or black mottled bean obtained from a grain dealer in the Chinese section and said to be from stock grown in the vicinity of Harbin.

64320. *PHASEOLUS AUREUS* Roxb.
Mung bean.

No. 2791. May 5, 1925. A green mung bean known as "lucky bean" and used for making vermicelli and for sprouts.

64321. *PHASEOLUS COCCINEUS* L.
Scarlet Runner bean.

No. 2861. May 11, 1925. *Jih Pin ta pai tou* (large white bean from Japan), from locally grown stock.

64310 to 64339—Continued.

64322 to 64329. *PHASEOLUS VULGARIS* L.
Common bean.

64322. No. 2790. May 5, 1925. A white garden bean with blotches of pink about the hilum, from Te-yuanyung, Harbin. It is used as a vegetable cooked with kaoliang.

64323. No. 2793. May 5, 1925. A large mottled variety reported to be from locally grown stock.

64324. No. 2796. May 5, 1925. A white garden bean used largely by the Japanese.

64325. No. 2801. Pniston, Harbin. May 5, 1925. A deep-pink or red garden bean obtained in the market, reported to have come from locally grown stock.

64326. No. 2863. May 12, 1925. A purple-flowered garden bean obtained from a grain shop in the Chinese section; reported to have come from stock grown in the vicinity of Harbin.

64327. No. 2864. May 12, 1925. *Huang yun tou*, or *Wu yueh hsien yun tou* (yellow garden bean, or fifth month ripening bean). Obtained from a seed shop in the Chinese section.

64328. No. 2867. May 12, 1925. *Chiao tan yun tou*, or *Hua yun tou* (bird-egg bean, or flowered garden bean). Obtained from a seed shop in the Chinese section.

64329. No. 2872. May 12, 1925. A long brown bean known as "pole bean from Japan"; obtained from a grain dealer in the Chinese section of the town and said to have come from stock grown in the vicinity of Harbin.

64330 and 64331. *PISUM SATIVUM* L.
Fabaceae. Pea.

64330. No. 2797. May 5, 1925. A white variety from locally grown stock.

64331. No. 2858. May 11, 1925. *Uo Kuo lu wan tou* (green field pea of Russia). This variety, said to have come from locally grown stock, originally came from Russia.

64332. *RAPHANUS SATIVUS* L. Brassicaceae.
Radish.

No. 2866. May 12, 1925. A large round bright-red radish obtained from a seed man in the Chinese section. These radishes are sometimes as much as 8 to 10 inches in diameter.

64333 to 64336. *SOJA MAX* (L.) Piper
(*Glycine hispida* Maxim.). Fabaceae.
Soy bean.

64333. No. 2792. May 5, 1925. Yellow soy beans called in the Harbin market "round bean." These are the ones principally used in the manufacture of oil.

64334. No. 2795. May 5, 1925. *Jih Pin ta hei tou* (large black soy bean of Japan), from stock grown in the vicinity of Harbin. This variety seems as large as or larger than any other soy bean we have seen. They are boiled with milk and sugar.

64310 to 64339—Continued.

64335. No. 2798. May 5, 1925. Green-seeded soy bean from locally grown stock.

64336. No. 2859. May 11, 1925. A black soy bean, green inside, supposed to be from locally grown stock.

64337. *Vicia faba* L. Fabaceae.
Broad bean.

No. 2860. May 11, 1925. A rather small brown broad bean obtained in the market in the Chinese section; reported to be from locally grown stock. Known as "silkworm bean."

64338 and 64339. *Vigna sesquipedalis* (L.) Frutwirth. Fabaceae.
Yard Long bean.

64338. No. 2868. May 12, 1925. *Heien tau chico* (long pod threaded beans, obtained from a grain dealer in the Chinese section.

64339. No. 2869. May 12, 1925. A small black bean, used as a vegetable: from the Chinese section.

64340 to 64420.

From Manchuria. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received June 25 and 26, 1925. Notes by Mr. Dorsett.

64340. *ANETHUM GRAVEOLENS* L. Apiaceae.
Dill.

No. 2984. Harbin. May 14, 1925. *Ho Kuo hui hsiao* (Russian fennel). This variety, from locally grown stock, grows about 3 feet in height. Used for seasoning soups and meats.

64341. *APIUM GRAVEOLENS* L. Apiaceae.
Celery.

No. 2908. May 14, 1925. Chinese celery from locally grown stock. These seeds were secured from a seed dealer in the Chinese section of Harbin. Used to fry with meat.

64342. *AVENA NUDA* Hoefer. Poaceae.
Naked oats.

No. 2912. May 15, 1925. *Chiao mai* (bird wheat). Seeds received from R. C. Flory, Liaochou, Shansi, who says they are quite common on the hills around Liaochou.

64343. *AVENA SATIVA* L. Poaceae. Oats.

No. 2979. May 19, 1925. *Ling ta mia* (oats or ling barley). Manchurian oats procured in a grain shop in the Chinese section of Harbin, and said to have come from locally grown stock. This variety may be of Russian origin.

64344. *BRASSICA JUNCEA* (L.) Coss. Brassicaceae. Chinese mustard.

No. 2909. May 14, 1925. *Chieh tsai ke ta* (rooted mustard). Obtained from a seed dealer in the Chinese section of Harbin; from locally grown stock. Used mostly for making pickles.

64345. *BRASSICA* sp. Brassicaceae.
Mustard.

No. 2910. May 14, 1925. A Chinese leafy mustard from locally grown stock, used as greens and in making salted vegetables. Obtained from a seed dealer in the Chinese section of Harbin.

64340 to 64420—Continued.

64346. *BRASSICA* sp. Brassicaceae.
Mustard.

No. 2920. May 15, 1925. Received from R. C. Flory, Liaochou, Shansi. Mr. Flory reports this mustard as being very commonly used for seasoning and for making plasters, etc.

64347. *CANNABIS SATIVA* L. Moraceae.
Hemp.

No. 2915. May 15, 1925. Received from R. C. Flory, Liaochou, Shansi, which he reports is a very common variety.

64348 to 64350. *CAPSIUM ANNUM* L. Solanaceae.
Red pepper.

64348. No. 2905. May 14, 1925. *Ho Kuo ta tien chin chiao* (large Russian sweet pepper), obtained from a seed dealer in the Chinese section of Harbin. When ripe the fruits are red and 3 to 3½ inches in diameter.

64349. No. 2906. May 14, 1925. *Hung chang chin chiao* (red long pepper), from locally grown stock. Obtained from a seed dealer in the Chinese section of Harbin. The fruit when ripe is red and about 4 inches long.

64350. No. 2907. May 14, 1925. *Yang chi chiao chin chiao* (goat horn pepper), from locally grown stock, obtained from a seed dealer in the Chinese section of Harbin.

64351. *CHENTOCHLOA ITALICA* (L.) Scribn. (*Setaria italica* Beauv.). Poaceae.
Millet.

No. 2917. May 15, 1925. Yellow millet received from R. C. Flory, Liaochou, Shansi.

64352. *CHRYSANTHEMUM CORONARIUM* L. Asteraceae.

No. 2891. May 14, 1925. *Teng hao* (cone artemisia). Locally known as "chrysanthemum salad." The leaves and petals of some chrysanthemums are eaten in China as a vegetable.

64353. *CITRULLUS VULGARIS* Schrad. Cucurbitaceae.
Watermelon.

No. 2901. Harbin. May 14, 1925. *Tai li hung hai kua* (red-fleshed watermelon). The skin is striped light and dark green; the fruit is round and 10 to 12 inches in diameter.

64354 and 64355. *CORIANDRUM SATIVUM* L. Apiaceae.
Coriander.

64354. No. 2884. May 14, 1925. *Kao yen sui* (high coriander) obtained from a seed shop in the Chinese section of Harbin. The leaves and small leaf stems are chopped into fine pieces and used in seasoning soups and meats. This variety is said to grow like a shrub, being about 5 feet high, while the other variety, No. 2885 [S. P. I. No. 64353], said to have come originally from Shantung, grows only about a foot high.

64355. No. 2885. May 14, 1925. *Av yen sui* (short coriander) obtained from a seed shop in the Chinese section of Harbin. This variety grows about 1 foot high.

64340 to 64420—Continued.

64356. *CORYLUS* sp. Betulaceae. Hazel.

No. 2934. May 15, 1925. Manchurian hazel obtained from the market in the Chinese section of Harbin, said to have come originally from Nientzeshan, about 75 miles north of Harbin. The shell is very thick, and the kernel is small but of very good quality.

64357 and 64358. *CUCUMIS MELO* L. Cucurbitaceae. Melon.

64357. No. 2887. May 14, 1925. *Hu pi tsui kua* (tiger skin brittle melon) obtained in the Chinese section of Harbin. This melon, eaten mostly when boiled, is about 4 inches in diameter and 6 to 7 inches in length.

64358. No. 2893. Harbin. May 14, 1925. *Eo Kuo tien kua* (Russian melon). Mr. Skvortzow tells us that this is a hybrid between the Russian and Chinese varieties. The fruit, about 6 inches in diameter and 1 foot or more in length, is yellow and green.

64359 to 64361. *CUCUMIS SATIVUS* L. Cucurbitaceae. Cucumber.

64359. No. 2888. May 14, 1925. *Pai pi tsai kua* (white-skinned cucumber); a locally grown product. The fruit is 12 to 18 inches in length and is used as a vegetable boiled with meat.

64360. No. 2889. Harbin. May 14, 1925. *Kuai chang huang kua* (early ripening long cucumber), from locally grown stock. The fruit is a foot or more in length and is green inside.

64361. No. 2890. May 14, 1925. *Eo Kuo huang kua* (Russian common cucumber), grown generally about Harbin. It is from 5 to 6 inches long.

64362 and 64363. *CUCURBITA MAXIMA* Duchesne. Cucurbitaceae. Squash.

64362. No. 2896. Harbin. May 14, 1925. *Wo kua* (big pumpkin gourd). The yellow fruit is cut into small pieces, boiled, and eaten as a vegetable.

64363. No. 2921. May 15, 1925. *Nan kua* (white pumpkin), commonly grown by the farmers. Received from R. C. Flory, Liaochou, Shansi.

64364 and 64365. *CUCURBITA PEPO* L. Cucurbitaceae. Pumpkin.

64364. No. 2895. Harbin. May 14, 1925. *Eo Kuo hsi hulu* (Russian vegetable marrow). This pumpkin, of Russian origin, grows about 5 inches in diameter and 12 to 18 inches in length.

64365. These seeds, which are brown, were included in the lot sent in under Mr. Dorsett's No. 2921 [S. P. I. No. 64363].

64366. *FAGOPYRUM TATARICUM* (L.) Gaertn. Polygonaceae.

No. 2924. May 15, 1925. *K'u chiao mai* (bitter buckwheat), received from R. C. Flory, Liaochou, Shansi, which he reports as not being very common and which is made into cake flour.

64340 to 64420—Continued.

64367. *FAGOPYRUM VULGARE* Hill (*F. esculentum* Moench). Polygonaceae.

Buckwheat.

No. 2923. May 15, 1925. R. C. Flory, of Liaochou, Shansi, who presented these seeds, says that they are common up on the hills. They are made into flour and used as food by the people.

64368. *HOLCUS SORGHUM* L. (*Sorghum vulgare* Pers.). Poaceae. Sorghum.

No. 2913. May 15, 1925. *Hung kao-liang* (red kaoliang). Received from R. C. Flory, Liaochou, Shansi. He reports that this material is commonly grown.

64369 and 64370. *HORDEUM VULGARE PALIDUM* Seringe. Poaceae.

Six-rowed barley.

64369. No. 2931. May 15, 1925. R. C. Flory, Liaochou, Shansi, who presented this material, gives the following note: Not very common in this vicinity but seen frequently in the market.

64370. No. 2977. May 19, 1925. *Chi Lin ta mai* (barley of Kirin, Manchuria) obtained from a seed shop in the Chinese section of Harbin. Said to be from locally grown stock.

64371 to 64373. *LAGENARIA LEUCANTHA* (Duchesne) Rusby. Cucurbitaceae.

Gourd.

64371. No. 2902. Harbin. May 14, 1925. *Hsiao ya hulu* (small ornamental gourd). The fruit is about 4 inches in length.

64372. No. 2903. Harbin. May 14, 1925. *Ta ya hulu* (large ornamental gourd), which grows 12 inches long. From locally grown seed.

64373. No. 2904. May 14, 1925. *Ta hulu* (big gourd), from locally grown stock. This variety, used for making dippers, was obtained from a seed dealer in the Chinese section of Harbin.

64374. *LENTILLA LENS* (L.) W. F. Wight (*Lens esculenta* Moench). Fabaceae.

Lentil.

No. 2830. May 15, 1925. *Hsiao pien tou* (small flat bean). Received from R. C. Flory, Liaochou, Shansi.

64375 to 64377. *PANICUM MILIACEUM* L. Poaceae.

Proso.

64375. No. 2897. Harbin. May 14, 1925. *Kuai mei tze* (sticky millet), from locally grown stock. The Chinese make flour for bread out of this variety.

64376. No. 2918. May 15, 1925. *Nien ku tze* (glutinous millet), received from R. C. Flory, Liaochou, Shansi. He reports that this material is commonly used for food.

64377. No. 2919. May 15, 1925. *Mei tze* (Tsa millet), received from R. C. Flory, Liaochou, Shansi, who gives the following report: This variety is not so common as the above [S. P. I. No. 64376]. If the rains come late in the summer this can be planted and it will mature, whereas the common millet would not.

64340 to 64420—Continued.

64378 to 64404. *PHASEOLUS* spp. Fabaceae.

64378. *PHASEOLUS ANGULARIS* (Willd.) W. F. Wight. Adzuki bean.

No. 2929. May 15, 1925. *Hci hsiao tou* (black or mottled small bean), received from R. C. Flory, Liaochou, Shansi. He says this variety is used as food, and he thinks it is also made into bean curd.

64379. *PHASEOLUS AUREUS* Roxb. Mung bean.

No. 2914. May 15, 1925. According to R. C. Flory, of Liaochou, Shansi, who presented this variety, the name is *Lu tou* (green bean). It is commonly used as food and is especially used to produce sprouts.

64380. *PHASEOLUS COCCINEUS* L. Scarlet Runner bean.

No. 2899. Harbin. May 14, 1925. *K'an lua tou* (large-flowered bean). This variety produces large lavender and bluish black beans and large pink flowers.

64381 to 64404. *PHASEOLUS VULGARIS* L. Common bean.

64381. No. 2886. May 14, 1925. *Hsiao huang yun tou* (small yellow garden bean) obtained from a seed dealer in the Chinese section of Harbin. This is a rather small brownish yellow bean from stock said to be locally grown. We understand that this is not used very much as a green bean but is grown for the seed.

64382 to 64392. May 15, 1925. *P'a hsien tou* (string bean). These seeds, which were badly mixed, were received from R. C. Flory, Liaochou, Shansi. According to Mr. Flory, they are very common.

64382. No. 2916.

64383. No. 2916-A.

64384. No. 2916-B.

64385. No. 2916-C.

64386. No. 2916-D.

64387. No. 2916-E.

64388. No. 2916-F.

64389. No. 2916-G.

64390. No. 2916-H.

64391. No. 2916-I.

64392. No. 2916-J.

64393 to 64401. May 10, 1925. *Huang chiao tau ta tou* (yellow bird-egg bean), from locally grown stock, obtained in the Chinese section of Harbin. These seeds were very badly mixed.

64393. No. 2978. Creamy white streaked with brown.

64394. No. 2978-A.

64395. No. 2978-B.

64396. No. 2978-C.

64397. No. 2978-D.

64398. No. 2978-E.

64340 to 64420—Continued.

64399. No. 2978-F.

64400. No. 2978-G.

64401. No. 2978-H.

64402. No. 2980. May 19, 1925. *Pai yun tou* (white garden bean), said to be from locally grown stock. This variety, obtained in the Chinese section of Harbin, is a rather small white bean which somewhat resembles our navy bean.

64403. No. 2981. May 19, 1925. A yellowish brown mottled bean with a creamy base, obtained in the Chinese section of Harbin.

64404. No. 2985. Harbin. May 19, 1925. *Chiang mi tou* (white rice bean or small white bean), which is said to have come from locally grown stock. It is smaller than the one under No. 2980 [S. P. I. No. 64402].

64405 to 64407. *PISUM SATIVUM* L. Fabaceae. Pea.

64405. No. 2892. Harbin. May 14, 1925. *Ho Kuo tau tou* (Russian garden pea), said to be very good as a fresh vegetable. This variety, from locally grown stock, is said to be used also as a field pea.

64406. No. 2932. May 15, 1925. According to R. C. Flory, of Liaochou, Shansi, who sent this material to us, these field peas, or "round beans," as the Chinese call them, are not very common. They are sometimes grown on hills.

64407. No. 2982. May 19, 1925. A small variety, said to have come from locally grown stock, obtained from a grain dealer in the Chinese section of Harbin.

64408. *RICINUS COMMUNIS* L. Euphorbiaceae. Castor bean.

No. 2898. May 14, 1925. A small light and dark gray-brown mottled castor bean obtained from a shop in the Chinese section of Harbin. Said to be from locally grown stock.

64409 to 64414. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceae. Soy bean.

64409. No. 2922. May 15, 1925. A small black bean, received from R. C. Flory, Liaochou, Shansi, who says that it is commonly grown and is used as an animal feed.

64410 to 64413. May 15, 1925. Received from R. C. Flory, and according to him they are common and very often used to make bean curd.

64410. No. 2925. Yellow soy beans.

64411. No. 2926. Soy beans of a rather dark-green color.

64412. No. 2927. A light-green variety.

64413. No. 2928. A brown soy bean which is nearly round.

64414. No. 2983. May 19, 1925. A small black soy bean, said to be from locally grown stock, obtained from a grain dealer in the Chinese section of Harbin.

64340 to 64420—Continued.

64415. *SPINACIA OLERACEA* L. Chenopodiaceae. Spinach.

No. 2900. May 14, 1925. Locally grown Chinese spinach, obtained from a shop in the Chinese section of Harbin.

64416. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceae. Common wheat.

No. 2911. May 15, 1925. Received from R. C. Flory, Liaochou, Shansi.

64417 to 64419. *VIGNA SINENSIS* (Torner) Savi. Fabaceae. Cowpea.

64417. No. 2916-K. May 15, 1925. Received from R. C. Flory, of Liaochou, Shansi, and according to him they are very common.

64418. No. 2916-L. May 15, 1925. Received from R. C. Flory, Liaochou, Shansi, who says they are very common.

64419. No. 2984. May 19, 1925. *Ma chian tou* (mottled cowpea), from locally grown stock, obtained from a grain dealer in the Chinese section of Harbin. The cowpeas are creamy at the base and have brownish red markings.

64420. *ZEA MAYS* L. Poaceae. Corn.

No. 2933. May 15, 1925. A small-grained yellow corn received from R. C. Flory, Liaochou, Shansi. He says this is plentiful as food for both man and beast. The people use it as a cake flour.

64421. *CITRUS* sp. Rutaceae.

From Simla, India. Plants presented by H. E. J. Peake, Khaltoo Fruit Orchards, Solan Brewery. Received May 6, 1925.

A wild lemon, indigenous to the Simla Hills, which is ideal as a citrus stock. (Peake.)

64422 to 64428.

From Morocco. Bulbs and seeds collected by David Fairchild, agricultural explorer, Bureau of Plant Industry. Received June 29, 1925. Notes by Doctor Fairchild.

64422 and 64423. *NARCISSUS* spp. Amaryllidaceae.

A beautiful species accustomed to remain dormant as bulbs in the scorching

64422 to 64428—Continued.

soils of the near desert for six months at least, and then, in the early spring, when the rains come, to send up their slender leaves and delicate flower stalks with one to three white, almost translucent, nodding flowers. Found by Graham Fairchild on the outcropping of rocks called the Socrat en Nemra, near Boulhaut, northern Morocco.

64422. *NARCISSUS* sp.

Bulbs.

64423. *NARCISSUS* sp.

Seeds.

64424. *NARCISSUS* sp. Amaryllidaceae.

These bulbs were collected on the mountain near Ouezzan.

64425. *ORNITHOGALUM UNIFOLIUM* (L.) Ker. Liliaceae.

According to Prof. R. Maire, this is an attractive species and worthy a place in the amateur's collection. It occurs wild in the region around Marchang and near Rabat, Morocco.

A tender bulbous plant, native to the Mediterranean region, with greenish flowers. It is about 6 inches high.

64426. *ROMULEA BULBOCODIUM* (L.) Sebast. and Mauri. Iridaceae.

Bulbs from the plateau between Oujda and Taza, Morocco. The Arab boys and women dig the tiny corms, which are good to eat and rather sweet, and tie them into bundles. The baked clay soil in this region is peppered with little rosettes made by the slender grasslike leaves.

For previous introduction see S. P. I. No. 63482.

64427 and 64428. *ROMULEA ENGLERI* Bequinet. Iridaceae.

The *Romulea* is somewhat like a small-flowered crocus. Prof. R. Maire says that this is one of the best.

According to Engler's *Botanische Jahrbücher* (vol. 38, p. 324), the violet flowers of this bulbous plant are borne singly or in few-flowered clusters on scapes about 20 inches high. The leaves, which are longer than the scape, are flattened cylindrical.

64427. Bulbs.

64428. Seeds.

Introductory statement.....	1
Inventory.....	3
Index of common and scientific names.....	33

INTRODUCTORY STATEMENT

The Province of Manchuria, northeastern China, with an area of about 400,000 square miles, is largely an agricultural region. The winters are generally long and cold, with a minimum temperature sometimes as low as -40° F., while the summers are short and hot. Certain parts of the northwestern United States are subject to similar climatic conditions, and it is therefore of special interest that an agricultural explorer of this bureau, P. H. Dorsett, spent the greater part of the period covered by this inventory in Manchuria, with the result that large quantities of propagating material were collected. This material included such fruits as cherries, apricots, raspberries, and currents; also a number of native grasses and many miscellaneous vegetables and woody plants.

At the same time that Mr. Dorsett was in Manchuria, Doctor Fairchild was working along the northern coast of Africa and other parts of the Mediterranean countries, one of the oldest agricultural regions of the world. Among the most interesting plants sent in by Doctor Fairchild were those included in such leguminous genera as *Cytisus*, *Genista*, *Hedysarum*, *Lotus*, *Medicago*, *Scorpiurus*, and *Vicia*. Past experience has shown that plants from the Mediterranean region generally will thrive in the warmer sections of the Pacific States and parts of the Southwest, and many of the plants collected by Doctor Fairchild are promising, not only as forage but also as ornamentals. Among the latter were several species of iris, of value chiefly for breeding purposes, a native Moroccan grape hyacinth (*Muscari* sp., No. 64937), and two rockroses from Spain (*Cistus* spp., Nos. 65003 and 65004).

A specially selected collection of citrus-plant material (*Citrus* spp., Nos. 64603 to 64615) from the Botanic Garden at Buitenzorg, Java, was introduced through H. J. Webber, of the College of Agriculture at Berkeley, Calif. This included locally developed varieties and strains of oranges, shaddocks, and citrons, likely to prove of value to the citrus breeders of this country.

From the little-known region of South Australia has been received a unique collection of native shrubs of ornamental value (Nos. 64476 to 64497, 64798 to 64805). Most of these are previously unknown in American horticulture and have not been introduced previously by this office. Among the more interesting items may be mentioned *Balaustion pulcherrimum* (No. 64476), a prostrate myrtaceous shrub with rich red flowers an inch across, said to be

very rare in its native country; *Chorilaena quercifolia* (No. 64480), a tall rutaceous shrub, densely clothed with soft velvety hairs which assume a golden-yellow color; and *Melaleuca cordata* (No. 64802), a rigidly upright shrub with small round leaves and dense globular heads of small red flowers. A number of *Melaleucas* are already grown in the Pacific States, where their ability to grow rapidly and to resist drought, added to their ornamental quality, have made them popular.

The karoo bush (*Pentzia incana*, No. 64649) is held in high esteem in South Africa because it affords extensive pasturage for sheep. It is said to be able to withstand temperatures near zero Fahrenheit and is known to be very drought resistant. This introduction, therefore, should have special value for the Southwest on account of its possible value as a browse plant.

The botanical determinations of introductions have been made and the nomenclature determined by H. C. Skeels, and the descriptive matter has been prepared under the direction of Paul Russell, who has had general supervision of this inventory.

ROLAND MCKEE,

Acting Senior Agricultural Explorer in Charge.

OFFICE OF FOREIGN PLANT INTRODUCTION,
Washington, D. C., May 7, 1927.

INVENTORY¹

64429. CITRUS GRANDIS (L.) Osbeck.
Rutaceae. Grapefruit.

From Los Banos, Philippine Islands. Bud-wood presented by J. E. Higgins, College of Agriculture. Received September 9, 1925.

In a letter of September 22, 1925, to this office, T. Ralph Robinson, of the Bureau of Plant Industry, states that this pummelo was noted by W. T. Swingle some years ago at Los Banos, where trees were being grown under C. A. No. 1427. The only name given it is "Better pummelo."

64430 and 64431. CHAENOMELES SUPERBA (Frahm) Rehder. Malaceae.

Shrubs growing in the permanent planting area at the Bell Plant Introduction Garden, Glenn Dale, Md. Numbered July, 1925, for convenience in distribution. Notes taken from the Journal of the Arnold Arboretum, volume 2, page 58.

64430. A handsome ornamental shrub which apparently is a hybrid between *Chaenomeles japonica* and *C. lagenaria*. It differs from *C. japonica* chiefly in the larger, but narrower, more sharply serrate, darker green leaves and in the larger deep-red flowers. From *C. lagenaria* it differs in the smaller leaves, the pubescent young branchlets, and in the more upright and compact habit.

¹ It should be understood that the names of horticultural varieties of fruits, vegetables, cereals, and other plants used in this inventory are those under which the material was received when introduced by the Office of Foreign Plant Introduction, and, further, that the printing of such names here does not constitute their official publication and adoption in this country. As the different varieties are studied, their entrance into the American trade forecast, and the use of varietal names for them in American literature becomes necessary, the foreign varietal designations appearing in this inventory will be subject to change with a view to bringing the forms of the names into harmony with recognized horticultural nomenclature.

It is a well-known fact that botanical descriptions, both technical and economic, seldom mention the seeds at all and rarely describe them in such a way as to make possible identification from the seeds alone. Many of the unusual plants listed in these inventories are appearing in this country for the first time, and there are no seed samples or herbarium specimens with ripe seeds with which the new arrivals may be compared. The only identification possible is to see that the sample received resembles seeds of other species of the same genus or of related genera. The responsibility for the identifications therefore must necessarily often rest with the person sending the material. If there is any question regarding the correctness of the identification of any plant received from this office, herbarium specimens of leaves and flowers should be sent in, so that definite identification can be made.

64430 and 64431—Continued.

64431. Forma alba. A form of the above with white flowers.

64432 to 64442.

From Rabat, Morocco. Bulbs collected by David Fairchild, agricultural explorer, Bureau of Plant Industry. Received July 6, 1925. Notes by Doctor Fairchild.

64432. ARISARUM VULGARE Targ. Toz. Araceae.

A wild aroid which occurs in large quantities in the black gumbo soils around Kenitra. The medium-sized tubers, produced in this soil, are eaten by hogs.

64433. BIARUM BOVEI Blume. Araceae.

An aroidlike *Arisarum*, but producing larger tubers, found in black, sticky gumbo soil, about 60 miles north of Kenitra. R. Maire, of the University of Algiers, recommended it because it grows so abundantly and because the hogs are very fond of it.

64434. GLADIOLUS BYZANTINUS Mill. Iridaceae.

From the cork forest of Mamora, near Rabat. A slender delicate species with purple-red flowers and much more grass-like in habit than the cultivated forms generally. It might give delicacy of form to hybrids.

For introduction of seeds, see S. P. I. No. 64057.

64435 to 64439. IRIS spp. Iridaceae.

64435. IRIS ALATA Poir.

A low-growing species which grows wild in the wet gumbo soils about 66 miles north of Kenitra, Morocco. It is a purple-flowered species, and R. Maire tells me it is well worth growing in our borders for its large flowers which appear, in Algeria, during October and November. It produces numerous tubers on its roots.

For previous introduction, see S. P. I. No. 64190.

64436. IRIS FONTANESII Godr.

This species is very similar to *Iris tingitana*, but is much lighter in color. We found wild specimens nearly 5 feet high near Boulhaut, northern Morocco. Both of these species being bulbous, with their resting periods in the dry summer, they would be better adapted to southern California than to other iris-growing sections of the United States. These bulbs were collected by R. Maire.

64437. IRIS TINGITANA Boiss. and Reut.

Collected near Kenitra. A very tall, dark-purple species occurring wild in Tangier and along the roadsides throughout northern Morocco. At Kenitra the Arabs brought in armfuls of this iris, and under the electric light they appeared almost black.

64432 to 64442—Continued.

64438 and 64439. *IRIS* spp.

Two bulbous species, bearing blue flowers, found along the roadside between Meknes and Rabat.

64438. *IRIS* sp.

The plants of this species are 16 inches tall.

64439. *IRIS* sp.

A dwarf iris about 8 inches high.

64440. *LEUCOJUM AUTUMNALE* L. *Amaryllidaceae*.

A graceful white-flowered bulbous plant about a foot high which occurs in sandy soil in the forest of Mamora. It should be useful as a border plant in southern California.

64441. *NARCISSUS VIRIDIFLORUS* Schousb. *Amaryllidaceae*.

These bulbs were collected from the edge of a diya, or rainy season pond. R. Maire informs me that the flowers are clear green and that the plant is well worthy of cultivation by amateurs.

64442. *SCILLA PERUVIANA* L. *Liliaceae*.

Collected in the forest of Mamora. A very attractive plant worthy of naturalizing in the dry sandy soils in the oak forests of southern California, where conditions are similar to those of the cork-oak forest of Mamora. Its large hemispherical violet-blue inflorescence exhalates a delicate odor of ether.

For previous introduction, see S. P. I. No. 63483.

64443. *CARPOTROCHE BRASILIENSIS* (Raddi) Endl. *Flacourtiaceae*.

From Bello Horizonte, Minas Geraes, Brazil. Seeds presented by Alvaro da Silveira, Chefe da Comissão Geographica e Geologica de Minas Geraes. Received September 18, 1925.

This tree is known here in Minas Geraes as "canudo de pita" or "sapucainha." From the seeds is prepared an ointment used for skin affections and a sirup said to cure leprosy. (Silveira.)

64444 to 64447.

From Harbin, Manchuria. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received September 22, 1925. Notes by Mr. Dorsett.

64444. *BETULA JAPONICA* Siebold. *Betulaceae*. Birch.

No. 4001. August 12, 1925. Collected by B. W. Skvortzow from trees growing in the parks. This is one of the common trees in this region; so far we have not seen any very large trees.

For previous introduction, see S. P. I. No. 39489.

64445. *PRUNUS JAPONICA* Thunb. *Amygdalaceae*. Cherry.

No. 3909. August 8, 1925. Obtained from a plant in B. W. Skvortzow's garden. The small bright-red fruits, appearing at this time of the year, make this an attractive ornamental shrub. The fruit is not very good to eat when fresh, but is used for making jams and preserves.

For previous introduction, see S. P. I. No. 60983.

64444 to 64447—Continued.

64446. *PRUNUS* sp. *Amygdalaceae*. Plum.

No. 3918. August 8, 1925. From B. W. Skvortzow's garden. This is the common yellow plum which grows here; Mr. Skvortzow thinks it is not a native species.

64447. *ROSA* sp. *Rosaceae*. Rose.

No. 3862. August 4, 1925. Rose hips obtained from plants growing in the new Russian cemetery.

64448. *PRUNUS* sp. *Amygdalaceae*. Cherry.

From Choni, Kansu, China. Seeds collected by J. F. Rock, Arnold Arboretum, Jamaica Plain, Mass. Received September 28, 1925.

Nos. 12432 and 12527. July, 1925. A bush cherry which grows wild on the mountains around here; it is 6 to 10 feet high, occasionally higher. It has dark-green glabrous leaves and long pink tubular flowers. (Rock.)

64449. *ALLIUM CEPA* L. *Liliaceae*. Onion.

From Palma, Majorca, Balearic Islands. Seeds purchased by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received September 30, 1925.

No. 202. August 23, 1925. The giant flat onion. A white variety which is an amazing onion as seen in Iviza, for it measures 6 inches in diameter and is only 2½ inches thick. The special manner of using it, which we found very good, is to boil the onion intact and serve singly on a plate with a dressing of oil and vinegar, such as is made for lettuce. (Fairchild.)

64450. *GOSSYPIUM HIRSUTUM* L. *Malvaceae*. Cotton.

From Tucuman, Argentina. Seeds presented by W. E. Cross, director, Tucuman Experiment Station. Received July 28, 1925.

Selected seed which is the result of a few years' selection from the conglomerate generally cultivated in this country. This cotton is known as the Chaco variety. (G. L. Fawcett, Acting Director, Tucuman Experiment Station.)

64451 to 64475.

From Manchuria. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received July 22, 1925.

64451. *AMARANTHUS PANICULATUS* L. *Amaranthaceae*.

No. 3138. June 1, 1925. *Hsi fau ku* or *yu tze ku* (fish-egg millet). This seed was procured from a farmer about 1½ miles from Ertientientze. The Chinese women of this vicinity pop the seed in a small iron ladle which is heated over a charcoal fire. (Dorsett.)

64452. *ANEMONE CHINENSIS* Bunge. *Ranunculaceae*.

No. 3100. Ertientientze. June 1, 1925. A rather attractive herbaceous plant, which grows on the hillsides on more or less level land. The flower stems are 18 to 20 inches high, and the flower or seed heads are similar to those of the dandelion.

64451 to 64475—Continued.

64453. *CAREX* sp. Cyperaceae. Sedge.

No. 3301. Harbin. June 14, 1925. Found in exposed dry places in the new Russian cemetery.

64454. *FALCATA JAPONICA* Oliver. Fabaceae.

No. 3131. June 1, 1925. A small leguminous vine growing in thick shrubby places on the hills about Ertientientze.

64455 and 64456. *HIEROCHLOE GLABRA* Trin. Poaceae. Grass.

64455. No. 3016. Harbin. May 23, 1925. Collected from plants growing in one of the small parks just at the top of the hill, en route from Fuchiatien to New Town.

64456. No. 3020. Harbin. May 24, 1925. Collected in the new Russian cemetery. This grass is peculiar in that the fruiting stalk contains practically no leaves. It is not a bunch grass and apparently spreads not only by seeds but through slender underground shoots.

64457 and 64458. *LONICERA PRAEFLORENS* Batal. Caprifoliaceae. Honeysuckle.

64457. No. 3083. Ertientientze. June 1, 1925. An edible-fruited honeysuckle which grows in the shade of good-sized trees. The fruits, about the size of peas, are bright red.

64458. No. 3266. Hungtaohotze. June 10, 1925. Obtained from plants growing in rather open timberland on the mountain ridges in one of the V. F. Kavolsky forest concessions. We ate quite a few of these fruits and can say that while they are not excellent we have eaten worse.

64459 and 64460. *PANICUM MILIACEUM* L. Poaceae. Proso.

64459. No. 3137. June 1, 1925. A glutinous red-seeded variety procured from a Chinese farmer about 1½ miles to the northeast of Ertientientze.

64460. No. 3140. June 1, 1925. A very dark, almost black shiny-seeded variety obtained from a Chinese farmer about 1½ miles northeast of Ertientientze.

64461. *POA* sp. Poaceae. Grass.

No. 3299. Harbin. June 14, 1925. Collected in a dry exposed place in the new Russian cemetery.

64462. *PRUNUS* sp. Amygdalaceae. Cherry.

No. 3174. Harbin. June 4, 1925. *Yen tai ying tao* (Chefoo cherry) obtained in the market and said to have been shipped in from Chefoo. The seeds are rather large and appear to be somewhat different from the ordinary cherry.

64463 to 64472. *ULMUS* sp. Ulmaceae. Elm.

64463. *ULMUS MACROCARPA* Hance.

No. 3156. Ertientientze. June 1, 1925.

64464 and 64465. *ULMUS PUMILA* L.

64464. No. 2986. May 20, 1925. Collected from trees, exposed to drought and severe cold, growing

64451 to 64475—Continued.

on a sandy knoll a mile or so to the north of Harbin, in bottomland across the Sungari River.

64465. No. 2995. May 22, 1925. Obtained from trees growing in the old Russian cemetery, located about two blocks east of the American legation. These trees are better shaped than the others.

64466 and 64467. *ULMUS JAPONICA* Sarg.

64466. No. 3072. May 31, 1925. Obtained from a tree located on the southwestern slope of the hill near Ertientientze. The leaves of this tree are more or less rough, and the fruits are small.

64467. No. 3127. Ertientientze. June 1, 1925.

64468 to 64471. *ULMUS PUMILA* L.

64468. No. 3128. Ertientientze. June 1, 1925. An attractive tree with pendulous branches.

64469. No. 3129. June 1, 1925. Collected on the hillside northeast of Ertientientze.

64470. No. 3132. Ertientientze. June 1, 1925. More or less cork was found on the branches of this tree.

64471. No. 3267. June 10, 1925. *Hsiao yueh hung yü shu* (small-leaved red elm). This variety was obtained in the river bottom in the V. F. Kavolsky forest concession about 20 miles from Hengtaohotze.

64472. *ULMUS LACINIATA* (Trautv.) Mayr.

No. 3065. May 31, 1925. From a small tree growing on a northern mountain slope to the northeast of Ertientientze. This species has rather long fruits and large leaves. The tree is said to be rather large, but so far we have seen only one small one.

64473 to 64475. *VIOLA* sp. Violaceae. Violet.

64473. *VIOLA VARIEGATA* Fisch.

No. 3105. Ertientientze. June 1, 1925. A species with cyclamenlike leaves, white along the veins, and light purple flowers.

64474. *VIOLA COLLINA* Bess.

No. 3106. Ertientientze. June 1, 1925. The large light-green leaves are produced on long stems; the stems and leaves are hairy.

64475. *VIOLA* sp.

No. 3130. June 1, 1925. A wild Chinese violet found on the hillsides to the northeast of Ertientientze.

64476 to 64497.

From Blackwood, South Australia. Seeds presented by W. L. Wheeler, Eden Hills, through Edwin Ashby, "Wittunga." Received July 31, 1925. Notes by Mr. Wheeler.

64476. *BALAUSTION PULCHERRIMUM* Hook. Myrtaceae.

A low prostrate shrub, native to Western Australia, with a short thick trunk, narrow rigid leaves, and large

64476 to 64497—Continued.

solitary rich-red flowers about an inch across. It is said to be very rare in its native country.

64477. *BOSSIAEA* sp. Fabaceae.

A shrub 6 to 15 feet high; very ornamental.

64478. *CALOTHAMNUS CHRYSANTHERUS* F. Muell. Myrtaceae.

A rather small shrub, native to Western Australia, described by Bentham (*Flora Australiensis*, vol. 3) as erect, with thick corky branches and thick, terete, sharp-pointed leaves 2 to 4 inches long. The chief beauty of the shrub lies in the bundles of deep-red stamens which protrude an inch or more from the yellowish flowers.

64479. *CASSIA PLEUROCARPA* F. Muell. Caesalpinaceae.

An Australian cassia, which, according to Bentham (*Flora Australiensis*, vol. 2) is a tall, erect shrub with rather thick linear leaflets and loose clusters of yellow flowers, the individual flowers being about three-fourths of an inch wide.

64480. *CHORILAENA QUERCIFOLIA* Endl. Rutaceae.

The branches of this tall Australian shrub are densely clothed with soft velvety hairs which often assume a golden-yellow color, according to Bentham (*Flora Australiensis*, vol. 1). The leathery oval leaves are about 3 inches long, densely covered below with velvety hairs.

64481. *CROWEA ANGUSTIFOLIA* Turcz. Rutaceae.

According to Bentham (*Flora Australiensis*, vol. 1) this low shrub from Western Australia has small, very narrow leaves and rather large red or white flowers about half an inch long, either solitary or in pairs.

64482. *CYANOSTEGIA ANGUSTIFOLIA* Turcz. Verbenaceae.

An erect shrub, native to Western Australia, which according to Bentham (*Flora Australiensis*, vol. 5) has small linear leaves and loose pyramidal panicles of small purple flowers.

64483. *HAKEA LAURINA* R. Br. Proteaceae.

A tall Australian shrub, 30 feet or less high, remarkable for its showy crimson flowers. These are in globular heads about 2 inches in diameter, from which the numerous golden-yellow styles protrude an inch or so in all directions.

64484 and 64485. *HAKEA MULTILINEATA* Meism. Proteaceae.

64484. This tall Australian shrub is closely related to the preceding (*Hakea laurina*), differing only in the venation of the leaves, the oblong shape of the flower cluster, and other minor characters.

64485. Variety *rhynchocarpa*, which has beaked fruits.

64486. *HELIPTERUM RUBELLUM* (A. Gray) Benth. Asteraceae.

An annual composite from Western Australia, with solitary heads of red flowers. Several species of this genus

64476 to 64497—Continued.

have become popular as "everlastings." This plant is about 8 inches high, with slender hairy stems and narrow alternate leaves.

64487. *HOVEA ELLIPTICA* (J. E. Smith) DC. Fabaceae.

A leguminous shrub, described by Bentham (*Flora Australiensis*, vol. 2) as up to 10 feet in height, with slender branches, small, narrowly oval leaves, and short axillary clusters of small blue flowers. Native to Western Australia.

64488. *KUNZEA SERICEA* (Labill.) Turcz. Myrtaceae.

A tall Australian shrub described by Bentham (*Flora Australiensis*, vol. 3) as having rigid, tortuous branches and silvery white, very stiff leaves less than an inch in length. The yellowish flowers are either solitary or in terminal clusters.

64489. *LEUCOPOGON VERTICILLATUS* R. Br. Epacridaceae.

The leaves of this Australian shrub are crowded at the ends of the branches in such a manner as to appear verticillate, according to Bentham (*Flora Australiensis*, vol. 4). The shrub is tall and erect, and the small reddish flowers are in slender spikes.

64490. *MARIANTHUS ERUBESCENS* Putterl. Pittosporaceae.

A perennial twining vine with red flowers, collected in Merredun, Western Australia.

64491. *MELALEUCA VIOLACEA* Schauer. Myrtaceae.

A handsome shrub, native to Western Australia, which according to Bentham (*Flora Australiensis*, vol. 3) is low and spreading in habit, with rigid small oval leaves and terminal heads or small clusters of purple-red flowers.

64492. *MELALEUCA* sp. Myrtaceae.

A shrub 4 feet high.

64493. *PHEBALIUM TUBERCULOSUM* (F. Muell.) Benth. Rutaceae.

A yellow-flowered, narrow-leaved evergreen shrub from Western Australia which might be suitable for coolhouse culture in the northern United States, or perhaps for growing out of doors in the south. The plant becomes about 4 feet high and blooms early in the spring.

64494. *PITYRODIA TECKIANA* (F. Muell.) E. Pritz. Verbenaceae.

A low shrub, about 2½ feet high, clothed with cottony wool and thickly covered with sessile linear leaves. The green and yellow flowers are solitary or in clusters. Native to Victoria, Australia.

64495. *SIDA CALYXHYMENIA* J. Gay. Malvaceae.

According to Bentham (*Flora Australiensis*, vol. 1), this is an erect shrub, entirely covered with a whitish pubescence, with yellow flowers, solitary or in twos. Native to southern and Western Australia.

64496. *THOMASIA BRACHYSTACHYS* Turcz. Sterculiaceae.

A tall hairy shrub from Western Australia, which is described by Ben-

64476 to 64497—Continued.

tham (*Flora Australiensis*, vol. 1) as having heart-shaped leaves and dense clusters of small white flowers.

64497. TRYMALIUM BILLARDIERI Fenzl.
Rhamnaceae.

A tall shrub, about 12 feet high, with broadly oval leaves and loose clusters of greenish-yellow flowers. Native to Western Australia.

64498. GOSSYPIUM BARBADENSE L. Malvaceae. **Cotton.**

From Nassau, Bahamas. Seeds presented by F. C. M. Albury, secretary, Board of Agriculture. Received August 5, 1925.

A sample of this cotton was recently sent to England and the following report was received: Color good, staple $1\frac{1}{8}$ inches long, strong, rather irregular in length, and rougher than American. (*Albury*.)

64499 to 64501. COIX LACRYMA-JOBI MA-YUEN (Rom.) Stapf. Poaceae. **Adlay.**

From Manila, P. I. Seeds presented by S. Youngberg, acting director, Bureau of Agriculture. Received August 7, 1925.

The ma-yuen, or adlay, has attracted considerable attention as a cereal for tropical regions. According to P. J. Wester, it is better than upland rice for tropical agriculture in being more drought resistant, a heavier yielder, and much less expensive to cultivate. The seeds can be used largely in the same manner as corn.

64499. Dark-brown ma-yuen.

64500. Light-brown ma-yuen.

64501. White ma-yuen.

64502. GOSSYPIUM sp. Malvaceae. **Kidney cotton.**

From San Juan, P. R. Seeds presented by C. A. Figueroa, assistant agricultural adviser, Department of Agriculture and Labor. Received August 12, 1925.

Locally grown seeds.

64503 and 64504.

From Manchuria. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received July 17, 1925. Notes by Mr. Dorsett.

64503. ARACHIS HYPOGAEA L. Fabaceae. **Peanut.**

No. 3722. Harbin. July 18, 1925. This variety, the smallest we have seen since arriving here, is said to have been shipped in from Kalgan, Chihli Province.

64504. ULMUS PUMILA L. Ulmaceae. **Elm.**

No. 3395. Tsitsihar. June 22, 1925. This may prove to be more cold resistant in the northern United States than the type now growing there.

64505 and 64506. FRAGARIA spp. Rosaceae. **Strawberry.**

From Dundas, New South Wales. Plants presented by Herbert J. Rumsey. Received July 31, 1925. Notes by Mr. Rumsey.

Varieties not offered by American nurserymen.

64505 and 64506—Continued.**64505. FRAGARIA SP.**

Fendalcino (Etters). This is a solid-fruited variety with very robust foliage. The berries, deep red and of fine size, are produced in regular crops well into the summer. The plants stand drought well, and this promises to be a magnificent commercial variety as well as one for the home garden.

64506. FRAGARIA SP.

Illawarra. This variety, as the name implies, is a local seedling. It is said to be a cross between an American variety called Gandy, which it somewhat resembles, and Cresswell's Seedling. The fruit of Illawarra is particularly handsome, its prominent seeds studding the enormous fruits like jewels. The large bright-green cap makes it very handsome, and it is no uncommon event to find from one to six large fruits in a bunch, each weighing from 1 to 2 ounces.

64507. SACCHARUM OFFICINARUM L. Poaceae. **Sugar cane.**

From Santiago de las Vegas, Cuba. Cuttings presented by Gonzalo M. Fortún, director, Estación Experimental Agronómica. Received September 22, 1925.

D. 247.

A locally grown strain.

64508 and 64509.

From Jalisco, Chiapas, Mexico. Seeds presented by C. A. Purpus, Zacuapam, Huatusco, Vera Cruz, Mexico. Received August 7, 1925.

64508. ANNONA MURICATA L. Annonaceae. **Soursop.**

A local variety.

64509. GOSSYPIUM sp. Malvaceae. **Cotton.**

A variety grown in Oaxaca, Mexico.

64510. MIMUSOPS ZEYHERI Sond. Sapotaceae.

From Pretoria, Transvaal, Union of South Africa. Seeds presented by I. B. Pole Evans, chief, division of botany. Received August 12, 1925.

Moepel.—This magnificent shade tree is evergreen and bears an edible fruit with which H. L. Shantz was very much taken when he was last here. It grows along the western slopes of the Magaliesburg Range and extends from Pretoria westward to Zeerust. (*Pole Evans*.)

According to Harvey and Zonder (*Flora Capensis*, vol. 4, sec. 1, p. 441), this tree has long-stemmed narrow leaves about 4 inches long, and edible drupes, about an inch long, with sweet-flavored flesh.

For previous introduction, see S. P. I. No. 50165.

64511. CANAVALI PLAGIOSPERMA Piper. Fabaceae.

From Port of Spain, Trinidad, British West Indies. Seeds presented by W. G. Freeman, director, Department of Agriculture. Received August 14, 1925.

This plant, known here under the name of *Canavalia gladiata*, is a weak climber

and is usually grown as a bush bean. It appears to be intermediate between *C. gladiata* and *C. ensiformis*. (Freeman.)

For previous introduction, see S. P. I. No. 52861.

64512. CROTALARIA sp. Fabaceae.

From Southern Provinces, Nigeria, Africa. Seeds presented by D. H. Urquhart, superintendent of agriculture, Umuahia Agricultural Station. Received August 19, 1925.

Introduced for trial as a cover crop in the United States.

64513. HELIANTHUS TUBEROSUS L. Asteraceae. Jerusalem artichoke.

From Auckland, New Zealand. Tubers purchased from Arthur Yates & Co. Received August 19, 1926.

Locally grown tubers.

64514 to 64517. SACCHARUM OFFICINARUM L. Poaceae. Sugar cane.

From Rio de Janeiro, Brazil. Cuttings presented by Antonio Carlos Pentana, director, General Experiment Station, Campos. Received August 25, 1925.

Locally grown strains.

64514. 2443-C.

64516. 4473-C.

64515. 3100-C.

64517. 4475-C.

64518. DAHLIA sp. Asteraceae.

From Cayoacan, D. F., Mexico. Cuttings presented by Mrs. Zelia Nuttall. Received February 14, 1925. Numbered July, 1925.

A giant or tree dahlia, up to 20 feet in height, with great panicles of single rosy mauve blossoms. (Nuttall.)

The tree dahlias are native to tropical America and are tropical in cultural requirements.

64519. GARCINIA MANGOSTANA L. Clusiaceae. Mangosteen.

From Paris, France. Seeds purchased from Vilmorin-Andrieux & Co. Received August 27, 1925.

Mangosteen seeds introduced for testing in the tropical dependencies of the United States.

For previous introduction, see S. P. I. No. 61301.

64520 and 64521.

From San Remo, Italy. Seeds presented by Mario Calvino, Stazione Sperimentale di Floricoltura. Received August 19, 1925. Notes by Doctor Calvino.

64520. LOTUS sp. Fabaceae.

A very rare leguminous plant, about 1 meter in height, suitable for growing in wet soil.

64521. PSORALEA BITUMINOSA L. Fabaceae.

A leguminous perennial which thrives in dry calcareous soil. It has blue flowers and is native to the Mediterranean countries.

64522 to 64526.

From Kotgarh, Simla Hills, Punjab, India. Seeds collected by S. E. Stokes and Richard B. Gregg. Received August 20, 1925. Notes by Mr. Gregg.

64522. ELEUSINE CORACANA (L.) Gaertn. Ragi. Poaceae.

July 4, 1925. Local native name, Koda.

64523. HORDEUM VULGARE PALLIDUM Se- Six-rowed barley. ringe. Poaceae.

July 3, 1925. A bearded barley.

64524. HORDEUM sp. Poaceae. Naked barley.

July 3, 1925. Beardless barley.

64525. TRITICUM AESTIVUM L. (T. vulgare Vill.). Poaceae. Common wheat.

July 15, 1925. Red winter wheat which ripened about June 1, 1925. These seeds are the best kernels from 17 selected ears.

64526. ZEA MAYS L. Poaceae. Corn.

June 20, 1925. Maize, a relatively quick-ripening variety.

64527 to 64530.

From Westport, West Coast, New Zealand. Seeds presented by D. McLellan, Sergeants Hill. Received August 20, 1925.

64527. DANTHONIA PILOSA R. Br. Poaceae. Grass.

In Australia this is considered an excellent pasture grass; it seeds freely and gives good fodder in early spring.

For previous introduction, see S. P. I. No. 49017.

64528. HOLCUS SORGHUM SUDANENSIS (Piper) Hitchc. Poaceae. Sudan grass.

A local strain.

For previous introduction, see S. P. I. No. 50781.

64529. POA sp. Poaceae. Grass.

64530. TRIFOLIUM SUBTERRANEUM L. Fabaceae. Subterranean clover.

Experiments carried on by the Office of Forage-Crop Investigations and by State experiment stations in cooperation with this department during 1921 and 1922 have established the fact that this clover will survive the winter as far north as Knoxville, Tenn. At this station, as well as several others, the plants from fall seeding made some growth in the fall, held their own during the winter, and made a rapid and heavy growth early in the spring of 1922. This clover made a strong growth on sandy land at McNeill, Miss.; in this case finely ground bone meal had been used as fertilizer. Preliminary trials have been encouraging, and the department is making further tests. (A. J. Pieters, Bureau of Plant Industry.)

For previous introduction, see S. P. I. No. 55707.

64531 to 64535. CROTALARIA spp. Fabaceae.

From Nairobi, Kenya Colony, British East Africa. Seeds presented by J. McDonald, Scott Agricultural Laboratories.

64531 to 64535—Continued.

Received August 22, 1925. Notes by Mr. McDonald.

A collection of crotalarias introduced for testing as cover-crop plants in the southern United States.

64531. CROTALARIA JUNCEA L.

Sunn hemp.

No. 1. An erect yellow-flowered annual, 4 to 5 feet high, native to tropical Asia generally. It is cultivated in many places in India and also in northern Ceylon for the sake of the strong and useful fiber obtained from the stems. This fiber is used in India for making coarse canvas, cordage, and fishing nets, and an average yield is about 640 pounds an acre. A light rich soil is considered best for growing this plant, although with cultivation it may be grown on almost any soil.

For previous introduction, see S. P. I. No. 44124.

64532. CROTALARIA INTERMEDIA Kotschy.

No. 2. From the Scott Agricultural Laboratories.

64533. CROTALARIA sp.

No. 3. Collected on a roadside in the forest, Mile 8, Londiani, Eldoret Road.

64534. CROTALARIA sp.

No. 4. Collected in a rather dry situation along a roadside.

64535. CROTALARIA DILLONIANA Baker.

No. 5. From Muhoroni. A low erect herbaceous plant with pale-green trifoliate leaves and purple-striped yellow flowers in dense terminal racemes up to 6 inches in length.

64536. COMBRETUM COCCINEUM (Sonner.) Lam. Combretaceae.

From Addis Ababa, Abyssinia. Seeds presented by Charlotte Lambie, through H. V. Harlan, Bureau of Plant Industry. Received August 31, 1925.

A handsome woody climber from Madagascar with narrow evergreen leaves and small but brilliant-red flowers; these are in loose spikes or panicles and are characterized by long exserted stamens. It should be tried in the southern end of Florida.

64537. CUPHEA BALSAMONA Cham. and Schlecht. Lythraceae.

From Bahia, Brazil. Seeds presented by Rev. P. Camillo Torrend, Collegio Antonio Viera. Received August 25, 1925.

According to an article published in *Chacaras E. Quinates* (vol. 31, p. 426, May 15, 1925) by Father Torrend, this plant has acquired an excellent reputation in southern Brazil as forage. Even when other fodder plants are abundant, cattle are said to consume with avidity the "barba de San Pedro," as it is called.

64538. VITIS sp. Vitaceae.

From Ambato, Ecuador. Cuttings presented by Augusto H. Martinez, Escuela de Agricultura. Received September 9, 1925.

When at Ambato in February of this year [1925] I saw this grape growing in the quinta La Liria, belonging to the Martinez family. Augusto Martinez informed me that this plant was brought to Ambato

from the region of Santo Domingo de los Colorados, where it grows wild. Due probably to the cool climate of Ambato, as compared with that of Santo Domingo (which lies at a low elevation on the western slope of the Andes), the plant fails to produce fruit at La Liria, but it vegetates luxuriantly and flowers profusely.

In general appearance the plant resembles *Vitis caribaea*, yet I believe it to be distinct from that species. Don Augusto says that it bears an edible fruit of good quality and that it may prove to be of value in connection with the development of new grapes for tropical regions. It should be planted in Florida and the West Indies for use in breeding work. (*Wilson Popeo*, *Bureau of Plant Industry*.)

64539. FRAGARIA sp. Rosaceae.

Strawberry.

From Hingan, Manchuria. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received August 25, 1925.

No. 3583. July 3, 1925. A fruit having a very pleasant odor. (*Dorsett*.)

64540. TRITICUM AESTIVUM L. (T. vulgare Vill.). Poaceae. Common wheat.

From Angers, France. Seeds presented by F. B. Godineau. Received September 14, 1925.

This variety is the Early of Milly, which is a selection of Gentile Rosse. It has a rougher straw and a longer spike than the latter and is more accustomed to the cold weather, having been grown in the north of France for several years. (*Godineau*.)

64541. FUNTUMIA ELASTICA (Preuss) Stapf. Apocynaceae.

Lagos rubber tree.

From Paris, France. Seeds purchased from Vilmorin-Andrieux & Co. Received September 19, 1925.

A large forest tree which is very widely distributed throughout central Africa and is the source of the Lagos rubber of commerce.

For previous introduction, see S. P. I. No. 61491.

64542. HEVEA BRASILIENSIS (H. B. K.) Muell. Arg. Euphorbiaceae.

From Bayeux, Haiti. Seeds presented by L. G. Polhamus, Bureau of Plant Industry. Received September 23, 1925.

The Para rubber tree, native to Brazil and now extensively cultivated in the East Indies, has always ranked as the principal and most important rubber-producing tree in the world.

In 1922 the world's production of rubber amounted to 379,200 tons, of which 354,980 tons, or 93 per cent, came from this source. (*Alfred Keys, Bureau of Plant Industry*.)

For previous introduction, see S. P. I. No. 57943.

64543 to 64546. GOSSYPIMUM spp. Malvaceae. Cotton.

From Papeete, Tahiti, Society Islands. Seeds presented by Père Emmanuel Rougier. Received September 10, 1925. Notes by Père Rougier.

Locally developed varieties.

64543 to 64546—Continued.

64543 and 64544. *GOSSYPIMUM BARBADENSE* L.

64543. *Metafl.* Introduced here recently as Algerian cotton.

64544. *Tahiti* cotton, which is probably a hybrid of several species introduced into this colony. Our agricultural expert, Mr. Brugiroux, thinks it is the variety best suited for our needs.

64545. *GOSSYPIMUM* sp.

Caledonian. From New Caledonia and New Hebrides; recently introduced.

64546. *GOSSYPIMUM* sp. **Kidney cotton.**

Taone, which is probably a hybrid of several species introduced into this colony.

64547. *CAPSICUM ANNUUM* L. **Solanaceae.** **Red pepper.**

From Mahon, Minorca, Balearic Islands. Seeds collected by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received September 30, 1925.

No. 218. August 24, 1925. A superb variety discovered by Mr. Armour in the little market at Mahon. It is 4 inches long, 2 inches in diameter, and of a conical shape almost identical with that of the Hachiya variety of Japanese persimmon. The color is exceptionally clear and attractive, and the flavor is excellent. (*Fairchild.*)

64548. *ILLECEBRUM VERTICILLATUM* L. **Silenaceae.**

From Rabat, Morocco. Roots collected by David Fairchild, agricultural explorer, Bureau of Plant Industry. Received June 29, 1925. Numbered July, 1925.

A tall graceful plant which is a perennial occurring in the cork forests around Boulhaut, northern Morocco. The pendent white flowers are produced in April, and the bulbs are subjected to six months of drought in the sandy-argillaceous soils of this region. These roots were found by R. Maire near an outcropping of rocks called Socrat en Nemra. (*Fairchild.*)

64549. *ASPARAGUS ALTISSIMUS* Munby. **Convallariaceae.**

From Marrakesh, Morocco. Seeds presented by Auguste Tornezy, inspector of agriculture, Marrakesh, through David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received September 30, 1925.

No. 187. June 1, 1925. A tall-growing, slender species, probably from the Great Atlas Mountains, which may prove of value as a greenhouse plant for its attractive sprays. (*Fairchild.*)

64550 to 64552.

From Kotgarh, Simla Hills, Punjab, India. Seeds collected by S. E. Stokes and Richard B. Gregg. Received July 18, 1925. Notes by Mr. Gregg.

64550. *BRASSICA* sp. **Brassicaceae.**

June 4, 1925. *Baraf Gobi* (snow cabbage) is planted the end of June, during the early rains, and matures in the late

64550 to 64552—Continued.

autumn. It is not cut and gathered like our cabbage, but is left in the field, and the leaves are broken off and used as needed, as are those of spinach and chard. This cabbage remains green all during the snows, and only attains its best flavor after the first frosts and snows. It therefore furnishes fresh greens during the winter, even as late as April.

64551. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). **Poaceae.** **Common wheat.**

June 2, 1925. *Kotgarh*, red-bearded winter wheat, is planted in this region during September and October and ripens during the latter part of May. It has a strong stem, does not lodge easily, and endures heavy snows. It is especially liked because it does not tend to sprout during the heavy rains which are apt to occur during the harvest season.

64552. *ZEA MAYS* L. **Poaceae.** **Corn.**

June 8, 1925. This variety of maize ripens very quickly compared with most other varieties, as it is planted after the other corn has gotten a good start, and ripens about the same time. It is planted about the first week in June and ripens in about 90 days. Compared with the American corn, the kernels are small.

64553 and 64554. *HEDYSARUM* spp. **Fabaceae.**

From Oran, Algeria. Seeds presented by Herbier A. Faure. Received July 20, 1925.

64553. *HEDYSARUM CAPITATUM* Desf.

An annual ascending leguminous plant with purple flowers. Native to the Mediterranean countries.

64554. *HEDYSARUM PALLIDUM* Desf.

A perennial procumbent leguminous plant, native to northern Africa, where it thrives on steep hillsides.

64555. *ARUNDINARIA ALPINA* Schum. **Poaceae.** **Bamboo.**

From Nairobi, Kenya Colony, British East Africa. Seeds presented by the conservator of forests, Forest Department. Received July 17, 1925.

A bamboo with narrow leaves about 3 inches long and less than half an inch wide and large lax panicles composed of small spikelets a little more than an inch in length.

64556. *PROSOPIS NANDUBEY* Lorentz. **Mimosaceae.**

From Montevideo, Uruguay. Seeds presented by Luis Guillot, director técnico, Dirección General de Paseos Públicos. Received July 25, 1925.

A Uruguayan tree which, according to Arechavaleta (*Flora Uruguaya*, vol. 1, p. 419), is considered valuable timber because of the great durability of the wood which is used for various industrial purposes. The numerous small flowers appear in the spring, and the sickle-shaped pods inclose pulp of acid flavor.

For previous introduction, see S. P. I. No. 57936.

64557. OMPHALEA OLEIFERA Hemsl.
Euphorbiaceae.

From Moyuta, Guatemala. Seeds presented by Francisco Morcucci. Received July 27, 1925.

This Central American tree, known in Guatemala as palo de queso and hoja de queso, is called tambor in Salvador, according to Standley (Pharmaceutical Journal, vol. 110, p. 489). The main value of the tree lies in the fruit and seeds. From the latter is obtained an oil with the same properties as castor oil, but with an agreeable flavor. This oil is also used for making soap, for illumination, and in cooking. The immature fruits when boiled are said to have an excellent flavor, and the ripe seeds are eaten as a delicacy.

64558. VIOLA GUATEMALENSIS (Hemsl.) Warburg. Myristicaceae.

From San Antonio Sachitepequez, Guatemala. Seeds presented by Jorge G. Salas, director general de agricultura, City of Guatemala. Received July 27, 1925.

A Central American tree which, according to O. Warburg (Monographie der Myristicaceen, p. 220), bears fruits which yield a valuable oil. The natives of Guatemala collect the oil for making soap and candles.

64559. PSIDIUM GUAJAVA L. Myrtaceae. Guava.

From Victoria, Cameroon, West Africa. Seeds presented by F. J. Evans. Received July 27, 1925.

An exceptionally good white variety. (Evans.)

64560 to 64565.

From Kenitra, Morocco. Seeds presented by Gaston Durand, inspecteur d'agriculture. Received July 27, 1925.

64560. ANCHUSA UNDULATA L. Boraginaceae.

A hardy perennial, about 2 feet high, with panicked clusters of purple flowers. It is native to Spain and thrives best in sunny locations.

64561. LAVATERA sp. Malvaceae.

A number of lavateras have very showy flowers, sometimes 2 to 4 inches across, and variously colored. They are either herbaceous or shrubby and mostly native to the Mediterranean countries.

64562. MALCOMIA LITTOREA Ait. Brassicaceae.

An annual branching plant, a foot or less in height, with large showy pink-purple flowers in loose racemes. It is native to the western Mediterranean countries.

64563. MALOPE sp. Malvaceae.

These are showy annuals belonging to the mallow family, all native to the Mediterranean region. In height they range from 1 to 3 feet, and the flowers are violet, pink, or white.

64564. TRIFOLIUM sp. Fabaceae. Clover.**64565. IRIS TINGITANA Boiss. and Reut.** Iridaceae.

An iris originally discovered in the vicinity of Tangiers, Morocco, whence it was introduced into cultivation several

64560 to 64565—Continued.

years ago. The stout stems, about 2 feet high, are one or two-headed, and the flowers are borne in clusters of two or three. The standards are bright lilac, about 3 inches long, and the falls are flushed with yellow in the center. Introduced for iris breeders.

64566. BAUHINIA ESCULENTA Burchell. Caesalpiniaceae.

From Kirstenbosch, Cape Province, Union of South Africa. Seeds presented by R. H. Compton, director, National Botanic Garden. Received July 27, 1925.

The "Tamani berry" or "Gemsbok bean," native to South Africa, is described in the Journal of the Department of Agriculture of the Union of South Africa (vol. 8, p. 613) as a leguminous plant whose seeds form the staple diet of the Kalahari bushmen; animals are also very fond of the seeds, which are excellent for fattening. The seed kernels are rich in protein and oil, the latter resembling cottonseed oil.

64567. SACCHARUM OFFICINARUM L. Poaceae. Sugar cane.

From Santiago de las Vegas, Cuba. Cuttings presented by Gonzalo M. Fortún, director, Estación Experimental Agronómica, through E. W. Brandes, Bureau of Plant Industry. Received August 7, 1925.

A locally grown strain.

64568 to 64586.

From China. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received July 28, 1925. Notes by Mr. McClure.

64568. MYRICA RUBRA Sieb. and Zucc. Myricaceae.

No. 168. Shuisaits'uen, Lohkongtung. May 23, 1925. *Yung mui*. This is a very handsome tree, averaging 5 or 6 meters in height, with dark-green glossy foliage which sets off to fine advantage the bright-red to pink fruits. The fruits are globular in shape and quite acid in flavor. Owing to their fragility and peculiar structure they do not ship well, but small leafy branches distributed among them as they are placed in the baskets are said to protect them somewhat. The fresh fruits are too soft to appeal to the Chinese palate, and they are used for the most part in much the same manner as the *Tsing mui* (*Prunus mume*), that is, salted and dried.

64569 to 64582. PRUNUS MUME Sieb. and Zucc. Amygdalaceae. Japanese apricot.

Tsing mui. The fruits of this group are so sour that they are rarely eaten fresh. The most common method of treatment is to place them in large wooden vats having a capacity of nearly 400 cubic feet, with salt at the rate of 1.3 pounds of salt to 10 pounds of fruit. By means of mats and stones the fruits are weighted down and kept in this condition for 10 days or so. They are then spread out on bamboo trays and dried in the sun. When dry they are white with an incrustation of salt. They may be kept indefinitely in this condition so long as they are kept dry. They are used by confectioners to make a great variety of confections, most of which have as their chief flavoring principles licorice and saccharine.

64568 to 64586—Continued.

The following material was obtained during the middle of May, 1925, from trees growing in the Canton Christian College orchards:

64569. No. 152. *Taai wat tsing mui*.
 64570. No. 153. *Ngoh shue mui*.
 64571. No. 154. *Waang wat mui*.
 64572. No. 155. *Taai mui*. This variety is distinguished from the other members of the *tsing mui* group by the following characteristics: It has larger, almost circular leaves with long acuminate tips, the fruits are larger than the average size, and the branches are fewer and stouter.
 64573. No. 156. This variety is said to be identical with *taai mui*, No. 155 [S. P. I. No. 64572].
 64574. No. 157. *Wong mui*. I find that on the markets the name *wong mui* (yellow mui) is applied only to those that have turned yellow in ripening.
 64575. No. 158. *Taai wat tsing mui*. The same as No. 152 [S. P. I. No. 64569], but from trees with a different ancestry.
 64576. No. 159. *Ngoh shue mui*. This material is the same as No. 153 [S. P. I. No. 64570], but from trees with a different ancestry.
 64577. No. 160. *Waang wat mui*. The same as No. 154 [S. P. I. No. 64571], but from trees having a different ancestry.
 64578. No. 161. *Cha ip mui*. This member of the *tsing mui* group is said to be distinguished from the other members by having slightly thinner skin, for which reason it bruises more easily in transit.
 64579. No. 162. *Waang wat mui*. The same as Nos. 154 and 160 [S. P. I. Nos. 64571 and 64577], but it is from trees with a different ancestry.
 64580. No. 163. *Paak uen tau mui*. The same as No. 156 [S. P. I. No. 64573], but from trees with a different ancestry.
 64581. No. 164. *Taai wat tsing mui*. The same as Nos. 152 and 158 [S. P. I. Nos. 64569 and 64575], but from trees having a different ancestry.
 64582. No. 165. *Hang mui chi*.
 64583. *PRUNUS SALICINA* Lindl. Amygdalaceae.
 No. 167. May, 23, 1925. *Hang mui*. Purchased from Mr. Chung Ch'iu Chue, of Shuisatsuen, Lohkongtung. This fruit belongs in a group with No. 169 [S. P. I. No. 64584] and is quite distinct from the *tsing mui* group, Nos. 152 to 165 [S. P. I. Nos. 64569 to 64582]. This tree has an upright habit not to be found in any of the other muis. The leaves are lanceolate, acuminate, and serrulate; the fruits are globular, pale yellow when ripe, and have a slightly pubescent skin. The flesh is golden yellow, mealy in texture, but rather fibrous near the seed, to which it adheres. The flesh is sweeter and more fragrant than that of any of the *tsing muis*, although it is slightly inferior in these respects to No. 169 [S. P. I. No. 64584].

64568 to 64586—Continued.

64584. *PRUNUS SALICINA* Lindl. Amygdalaceae.

No. 169. *Hang mui*. Obtained during the middle of May, 1925, from trees growing in the Canton Christian College orchards. This fruit belongs in a group with *hang mui*, No. 167 [S. P. I. No. 64583], which is quite distinct from the *tsing mui* group, Nos. 152 to 165 [S. P. I. Nos. 64569 to 64582]. The tree has slender branches and a spreading habit; the leaves are lanceolate, acuminate, and serrulate, and can not be distinguished from those of *hang mui*. The fruits are globular in shape, and the purplish red skin is slightly pubescent. The golden-yellow flesh is slightly juicy, sweet, and fragrant, but near the seed, which is a cling, it is fibrous, sour, and bitter. By the addition of 1 part of sugar to 1 part of the flesh, including the skin, and rapidly cooking for a short time, an attractive and delicious jam may be prepared. These fruits also make excellent pies which have a spicy fragrance and flavor. The fruits are never salted by the Chinese, but are eaten fresh. They soften much more quickly after picking than do the fruits of the *tsing muis* or of *hang mui*, and are the first to disappear from the market. This is partly due to the fact that they ripen among the very first and partly to the fact that they are not good keepers.

64585. *RUBUS* sp. Rosaceae.

No. 166. May 25, 1925. *She p'au lak*. Found on a roadside in Lohkongtung, in rather loamy to sandy granite soil. A sturdy, very thorny bush, 4 to 6 decimeters high, with small lavender flowers and red fruits whose large drupelets separate very readily. The flavor is fair.

64586. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceae. Common wheat.

No. 172. June 3, 1925. *Siu mak* and *min mak*. A bearded variety obtained from the Canton Christian College farm, where it has been growing for several years. It is sown about the middle of November and harvested in March.

64587. *SOLANUM TUBEROSUM* L. Solanaceae. Potato.

From Paget East, Bermuda. Tubers presented by E. A. McCallan, director, Department of Agriculture. Received July 30, 1925.

Locally grown tubers.

64588. *HELIANTHUS TUBEROSUS* L. Asteraceae. Jerusalem artichoke.

From Sydney, New South Wales. Tubers purchased from Anderson & Co. Received August 11, 1925.

A locally grown white variety.

64589 to 64591. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceae. Soy bean.

From Buitenzorg, Java. Seeds presented by L. Koch, chief, Plant Breeding Station. Received August 5, 1925.

64589. *Zwarte* No. 16.

64590. *Witte* No. 26.

64591. *Zwarte* No. 27.

64592. TRIFOLIUM SUBTERRANEUM L.
Fabaceae. Subterranean clover.

From Sydney, New South Wales. Seeds purchased from Foster & Sons. Received August 7, 1925.

For previous introduction and description, see S. P. I. No. 64530.

64593 and 64594.

From Teneriffe, Canary Islands. Collected by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received August, 1925. Notes by Doctor Fairchild.

64593. SEMPERVIVUM CANARIENSE L.
Crassulaceae.

July 10, 1925. Plants from the cliffs near San Juan de la Rambla, not far from Orotava. This forms an immense rosette of leaves, sometimes as much as 14 inches across, which lies perfectly flat against perpendicular walls of lava rock. When there are many they give the appearance of a lot of large green dinner plates stuck to the cliffs. From the center of these plates arise the flowering racemes, and since the dinner plates are all about to form these racemes, they swell out in the middle and become like mammae. The flower clusters are striking but not particularly beautiful, since the flowers themselves are greenish in color. These could be grown on the back-yard walls of the homes in southern California.

64594. TAMARIX GALLICA L.
Tamaricaceae. Tamarisk.

July 11, 1925. The use of the tamarisk as a windbreak is almost universal in Algeria, Morocco, and the Canary Islands. The form of tamarisk which one sees everywhere appears to be slightly different in Teneriffe from the form which I saw in Algiers. Cuttings of this were collected on the beach at Orotava. We discovered there that a curious slimy salty liquid was actually dripping off the leaves and branches in such quantities that one could not walk under them without ruining his clothes. Evidently the plant roots like the salty water and eliminate the salt through the leaves. I remember that Volkens discussed this feature of the tamarisk many years ago in his *Egyptische Arabische Wüste*.

64595. HETEROSPATHE ELATA Scheff.
Phoenicaceae. Palm.

From Manila, P. I. Seeds presented through P. J. Wester. Received August 7, 1925.

A tall, unarmed palm, with a straight, slender stem and long pinnate leaves, growing in protected situations and where the rainfall is evenly distributed. It is one of the most attractive and graceful palms that I have seen, and from my experience with it at Lamao it will make a good plant for the conservatory and possibly a good house palm. (Wester.)

For previous introduction, see S. P. I. No. 61323.

64596. RAPHANUS SATIVUS L.
Brassicaceae. Radish.

From Kagoshima, Japan. Seeds presented by Shiganari Kawagoe, Kagoshima. Im-

64596—Continued.

perial College of Agriculture and Forestry, through Masao Yoshikawa, Bureau of Plant Industry. Received August 11, 1925.

A late variety of *Sakurajima daikon* (*Sakurajima* horse radish). All varieties of *Sakurajima daikon*, especially the late one, grow to giant size, often nearly 2 feet in diameter. The shape of this late variety is like a turnip, almost round, while that of the early varieties is rather long. The growth is mysteriously limited to *Sakurajima* Island, and in Kagoshima or the near-by villages, scarcely more than 2 miles from the island, we can not grow the real giant radish. The *Sakurajima daikon* is a very delicious vegetable, juicy and tender. The planting season on *Sakurajima* Island, for the late variety, is about the first of August. The seeds are sown in rows, 4 feet apart, and the distance between plants should be about 3 feet. (Yoshikawa.)

64597. BILLARDIERA LONGIFLORA Labill.
Pittosporaceae.

From South Yarra, Victoria, Australia. Seeds presented by William Laidlaw, Government botanist, National Herbarium of Victoria. Received August 11, 1925.

A twining shrub, sometimes several feet in length, with leaves varying from oval to linear in shape and from half an inch to 2 inches in length. The blue flowers are pendulous on solitary stems an inch long. This plant grows wild along watercourses in Australia and Tasmania.

For previous introduction, see S. P. I. No. 61326.

64598. CERATONIA SILIQUA L.
Caesalpiniaceae. Carob.

From La Palma, Majorca, Balearic Islands. Scions collected by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received September 1, 1925.

No. 188a. August 16, 1925. I found this water sprout coming up from the roots of a large tree of the *Panesca* variety which bore hermaphrodite flowers and an abundance of large thick pods of apparently good quality. This may prove to be slightly different from the typical *Panesca*. (Fairchild.)

64599 to 64601. COIX LACRYMA-JOBI MAYUEN (Rom.) Stapf.
Poaceae. Adlay.

From Buitenzorg, Java. Seeds presented by P. J. S. Cramer, director, General Experiment Station. Received September 1, 1925.

The *ma-yuen*, or *adlay*, has attracted considerable attention as a cereal for tropical regions. According to P. J. Wester, it is better than upland rice for tropical agriculture in being more drought resistant, a heavier yielder, and much less expensive to cultivate. The seeds can be used largely in the same manner as corn.

64599. *Djoli bras.*

64600. *Djoli brasbruin.*

64601. *Djoli Hetan.*

64602. DEGUELIA TRIFOLIATA (Lour.)
Taub. (*Derris uliginosa* Benth.).
Fabaceae.

From Peradeniya, Ceylon. Seeds presented by F. A. Stockdale, Director of Agriculture. Received September 1, 1925.

A stout climbing shrub, native to eastern Asia. The roots of some species of *Deguelia* are used as fish poison in parts of India and Africa, and this Indian species is introduced for possible use as an insecticide.

For previous introduction, see S. P. I. No. 46019.

64603 to 64615. CITRUS spp. Rutaceae.

From Buitenzorg, Java. Collected by H. J. Webber, College of Agriculture, Berkeley, Calif. Received August 20, 1925. Notes by Doctor Webber.

Budwood from the citrus collection at the Buitenzorg Botanical Garden.

64603. CITRUS AURANTIFOLIA (Christm.)
Swingle. Lime.

No. 6. Mendado. Forma *amblycarpa*. Garden No. XV J. B. XI 5. A rough-skinned variety.

64604. CITRUS GRANDIS (L.) Osbeck (C. decumana Murr.).

No. 4. Sumatra. Var. *sphaerocarpa*. Garden No. III G. 86.

64605. CITRUS MEDICA SARCODACTYLIS
(Nooten) Swingle. Fingered citron.

No. 10. The Buddha-fingered citron from P. J. S. Cramer's private garden.

64606. CITRUS sp.

No. 9. A citron or lemon type, probably a hybrid, which is known to give very peculiar seedlings.

In Java I found that the citrus fruits in the market at this time of year include various types of a red or pink-fleshed shaddock and types of Mandarin oranges, some of which are fairly large and of good quality. The following numbers are of seeds taken from especially selected fruits.

64607 to 64612. CITRUS GRANDIS (L.) Osbeck (C. decumana Murr.). Shaddock.

64607 to 64610. Pink-fleshed shaddock.

64607. No. 11. 64609. No. 13.

64608. No. 12. 64610. No. 14.

64611. No. 18. Deep red-fleshed variety.

64612. No. 19. Pink-fleshed variety.

64613 to 64615. CITRUS NOBILIS DELICIOSA
(Ten.) Swingle. Mandarin orange.

64613. No. 15. 64614. No. 16.

64615. No. 17. A spicy variety.

64616 to 64646.

From Leningrad, Russia. Seeds presented by B. L. Issatschenko, director, Botanic Garden. Received August 22 and 24, 1925.

64616. AESCHYNOMENE INDICA L. Fabaceae.

A bushy leguminous annual 1 to 3 feet high, with pale-green feathery leaves. Native to the Tropics. Procured for trial as fodder and as green manure.

For previous introduction, see S. P. I. No. 59294.

64616 to 64646—Continued.

64617 to 64624. ASTRAGALUS spp. Fabaceae.

64617. ASTRAGALUS ALPINUS L.

A perennial plant with ascending stems about 8 inches high. Native to the Alpine regions of central Europe.

64618. ASTRAGALUS ARMENIACUS Boiss.

A perennial caespitose plant, native to Armenia, with leaves about 4 inches long and small yellow flowers.

64619. ASTRAGALUS BOETICUS L.

An upright, often stout annual, with compound leaves usually composed of 9 to 15 pairs of very narrow leaflets and 6 to 15 pale-yellow flowers in a crowded raceme. Native to the Mediterranean countries.

For previous introduction, see S. P. I. No. 58693.

64620. ASTRAGALUS CICER L.

A European astragalus said to be valuable for forage. It is a perennial with prostrate or ascending stems.

64621. ASTRAGALUS ECHINUS DC.

A much-branched shrubby perennial, native to alpine regions in Asia Minor.

64622. ASTRAGALUS EXSCAPUS TRANSILVANICUS (Janka) Asch. and Graebn.

A perennial plant with very long roots and a rhizome which forms a thick mat. The stems are scarcely more than 4 inches high. Native to sunny places in the Mediterranean countries.

64623. ASTRAGALUS MACROCARPUS DC.

A perennial astragalus native to Palestine. The compound leaves consist of 12 to 15 pairs of leaflets, each about half an inch long.

64624. ASTRAGALUS MEMBRANACEOUS (Fisch.) Bunge.

A perennial plant with hairy swollen pods, native to Spain.

64625 to 64628. ELYMUS spp. Poaceae.
Grass.

64625. ELYMUS DAURICUS Turcz.

A tall perennial ryegrass with stout erect stems, native to dry stony places in Russia and Siberia.

For previous introduction, see S. P. I. No. 36796.

64626. ELYMUS EXCELSUS Turcz.

A leafy-stemmed perennial grass with a fibrous root and narrow leaves. Native to southeastern Siberia.

64627. ELYMUS sp.

64628. ELYMUS sp.

64629. LATHYRUS FILIFORMIS BAUHINI (Genty) Beck. (L. ensifolius Gay.).
Fabaceae.

A perennial leguminous plant, a foot or two high, with a creeping rhizome. Native to the Mediterranean region.

64630. LATHYRUS INCONSPICUUS L. Fabaceae.

An annual upright or ascending leguminous plant with very slender stems up to a foot in length. Native to the Mediterranean region.

64616 to 64646—Continued.

64631. *LOLIUM PERENNE* L. Poaceae.
Perennial rye grass.

Received as *Lolium unicolom*, which is now referred to *L. perenne*.

64632. *LOLIUM RIGIDUM* Gaud. Poaceae.
Grass.

An annual gray-green bushy grass with ascending stems 1 or 2 feet long. Native to southern and central Europe.

64633. *LOTUS HISPIDUS* Desf. Fabaceae.

A deeply rooted annual plant with usually prostrate stems, native to the Mediterranean countries.

64634. *MEDICAGO FALCATA* L. Fabaceae.
Alfalfa.

64635. *MEDICAGO SATIVA* L. Fabaceae.
Alfalfa.

64636. *MISCANTHUS SACCHARIFLORUS* (Maxim.) Hack. Poaceae.
Grass.

A stout perennial grass with long flat leaves and terminal spreading panicles. Native to southeastern Siberia.

64637. *ONOBRYCHIS CAPUT-GALLI* (L.) Lam. Fabaceae.

An annual or biennial prostrate or ascending plant with stems up to 3 feet in length. Native to dry situations in the Mediterranean region.

64638. *ORNITHOPUS PINNATUS* (Mill.) Druce (*O. ebracteatus* Brot.). Fabaceae.

An attractive annual leguminous plant about a foot and a half high, with spreading or prostrate stems. Native to the Mediterranean region.

64639. *PHASEOLUS VULGARIS* L. Fabaceae.
Common bean.

Locally grown beans.

64640. *PISUM ELATIUS* Bieb. Fabaceae.

A hardy annual, about 5 feet high, with leaves composed of one to three pairs of narrow leaflets and purple flowers. Native to woods and thickets in the alpine regions of Europe.

For previous introduction, see S. P. I. No. 58707.

64641. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceae.
Soy bean.

64642. *TRICHOLAENA ROSEA* Nees. Poaceae.
Natal grass.

Received as *Tricholaena grandiflora*, which is now referred to *T. rosea*.

- 64643 to 64645. *TRIFOLIUM* spp. Fabaceae.

64643. *TRIFOLIUM MARITIMUM* Huds.
Clover.

An annual erect or decumbent branching clover from Asia Minor, where it grows in fields and along the sea coasts. The flowers are white or pale flesh color.

For previous introduction, see S. P. I. No. 59370.

64644. *TRIFOLIUM PRATENSE* L.
Red clover.

Received as *Trifolium nivale*, which is now referred to *T. pratense*. Locally grown seeds.

64616 to 64646—Continued.

64645. *TRIFOLIUM STELLATUM* L.

An annual upright clover, up to a foot high, native to the Mediterranean region.

64646. *TRIGONELLA CAERULEA* (L.) Seringe. Fabaceae.

An annual upright plant, usually about a foot high and mostly unbranched, with bright-blue flowers having the same odor as the fenugreek (*Trigonella foenum-graecum*). Native to the Mediterranean region.

64647. *GLADIOLUS* sp. Iridaceae.

From Old Umtali, Rhodesia, Africa. Seeds presented by E. H. Greeley. Received September 4, 1925.

A native species of possible value for plant breeders.

64648. *PRUNUS ARMENIACA* L. Amygdalaceae.
Mikado apricot.

From Jamaica Plain, Mass. Bud sticks presented by E. H. Wilson, Arnold Arboretum. Received September 14, 1925.

A Japanese apricot under the name of "Mikado," a form of the common apricot (*Prunus armeniaca*), has been grown in the arboretum for several years, where it makes a small tree with erect branches and, flowering freely every spring, has proved here one of the handsomest and most satisfactory plants of its class. (Wilson.)

64649. *PENTZIA INCANA* (Thunb.) Kuntze (*P. virgata* Less.). Asteraceae.

From Middleburg, Cape Province, Union of South Africa. Seeds presented by the principal, Grootfontein School of Agriculture. Received September 10, 1925.

A low-growing, spreading bush which layers naturally when the tips of its branches arch over and touch the ground. In the eastern province of Cape Colony, where the rains occur in summer but where long, severe droughts are frequent, this is one of the most valuable of all the karoo plants for fodder purposes. It is especially good for sheep and goats, which eat it down almost to the ground. (David Fairchild.)

64650. *VITIS VINIFERA* L. Vitaceae.
Grape.

From Bay Saint Louis, Miss. Cuttings presented by George E. Murrell, horticulturist, Southern Railway. Received July 6, 1925.

From the Ransecar farm, about 1½ miles from Bay Saint Louis; owned by Mr. Hoffman. This grape was planted by R. R. Ware, who formerly owned the farm, and, according to George C. Husmann, Bureau of Plant Industry, it closely resembles the Listan variety. (Murrell.)

- 64651 and 64652. *BOUGAINVILLEA* sp. Nyctaginaceae.

From Port of Spain, Trinidad, British West Indies. Presented by W. G. Freeman, director of agriculture. Received July 11, 1925.

A pink variety originally brought from Ecuador. (Freeman.)

64651 and 64652—Continued.

64651. Plants.

64652. Cuttings.

The bougainvilleas are showy climbing shrubs, native to South America, which are adapted for growing under glass in the North and out of doors in the Gulf States and California.

64653 and 64654. *GLADIOLUS* spp. Iridaceae.

From Kirstenbosch, Cape Province, Union of South Africa. Seeds presented by R. H. Compton, director, National Botanic Gardens, through H. L. Shantz, Bureau of Plant Industry. Received August 20, 1925. Notes by Professor Compton.

64653. *GLADIOLUS CALLISTUS* Bolus f.

No. 498. A relatively new species which I have not had an opportunity to look up, but which belongs to the *Gladiolus blandus* group. It is an extremely beautiful, tall, upright-growing species of a fine form and color.

64654. *GLADIOLUS RECURVUS* L.

No. 499. One of the most promising of our gladioli from the hybridizer's point of view. The flowers are blue and quite fragrant. This variety is highly regarded as an ornamental, and, because of its color and perfume, should also prove valuable for hybridization.

64655. *CRYPTOSTEGIA* MADAGASCARIENSIS Bojer. Asclepiadaceae.

From Tananarive, Madagascar. Seeds presented by the Chief, Agricultural Service. Received July 1, 1925.

A climbing shrubby vine, native to Madagascar, which is grown as an ornamental in South Africa and elsewhere. The leaves are short and leathery, and the whitish or pink flowers are 2 to 3 inches wide. Of possible value as a source of rubber.

For previous introduction, see S. P. I. No. 60442.

64656 to 64660. *DIOSCOREA* spp. Dioscoreaceae. Yam.

From Rabaul, New Guinea. Tubers presented by G. Bryce, director of agriculture. Received July 6, 1925.

A collection of native yam varieties.

64656. *Allah*.64659. *Marut*.64657. *Lama*.64660. *Taniel*.64658. *Maine*.64661 and 64662. *SOLANUM* spp. Solanaceae.

From Lima, Peru. Tubers presented by Julio Gaudron, Escuela Agricultura. Received July 8, 1925. Notes by Wilson Popenoe, Bureau of Plant Industry.

64661. *SOLANUM* sp.

Though this plant is grown at the Botanic Garden in Lima under the name of *Solanum maglia*, W. E. Safford believes it is not this species. Its tubers, which are more or less round in form and 1 or 2 inches in diameter, are of no value as food. The plant, however, is of interest to breeders for hybridizing with the true potato.

For previous introduction, see S. P. I. No. 62697.

64661 and 64662—Continued.

64662. *SOLANUM TUBEROSUM* L. Potato.

The yellow-fleshed potato is one of the most interesting varieties found in the Andean region, home of many remarkable potatoes. The tubers are rather small and have deep eyes, so that they are not as easily prepared for the table as those of some other varieties; but in point of quality they yield to none that I have tasted. The flesh is the color of American butter and has a rich, nutty flavor suggesting that of the chestnut. It seems to me the variety might be improved, so as to do away with the objectionable eyes, and that it would then be worth extensive cultivation.

For previous introduction, see S. P. I. No. 56803.

64663. *ACACIA SCORPIOIDES* (L.) W. F. Wight (*A. arabica* Willd.). Mimosaceae.

From Alexandria, Egypt. Plants presented by W. A. Lancaster, at the request of S. H. Shearer, Indianapolis, Ind. Received July 10, 1925.

According to J. H. Holland (Useful Plants of Nigeria, pt. 2, p. 288), a large proportion of the gum arabic of commerce is furnished by this tree, which is native to northern Africa and southwestern Asia. True gum arabic, however, is said to come only from another species, *Acacia senegal*. The pods and bark of *A. scorpioides* are used for tanning, and the leaves and young pods are sometimes fed to cattle. The wood is hard and durable and is used in India for making tools.

For previous introduction, see S. P. I. No. 58379.

64664. *COIX LACRYMA-JOBI* MA-YUEN (Rom.) Stapf. Poaceae. Adlay.

From Peradeniya, Ceylon. Seeds presented by F. A. Stockdale, Director of Agriculture, Peradeniya, at the request of P. J. Wester. Received July 11, 1925.

Batangas. The ma-yuen, or adlay, has attracted considerable attention as a cereal for tropical regions. According to Mr. Wester it is better than upland rice for tropical agricultural regions in being more drought resistant, a heavier yielder, and much less expensive to cultivate. The seeds can be used largely in the same manner as corn.

64665. *PRUNUS TOMENTOSA* Thunb. Amygdalaceae. Bush cherry.

From Rochester, N. Y. Bud sticks collected by C. C. Thomas, Bureau of Plant Industry. Received July 25, 1925.

Durant Park. The largest fruited and most prolific of any of the varieties in fruit in the park. (Thomas.)

64666. *EUCALYPTUS DELEGATENSIS* R. T. Baker. Myrtaceae.

From Hobart, Tasmania. Seeds presented by L. A. Evans, Secretary of Agriculture, Agricultural and Stock Department. Received September 9, 1925.

A variety, commonly called "Gum-topped stringy bark," obtained at an altitude of about 3,000 feet by J. B. Milsom, near the Great Lake. (Evans.)

This tree, originally described by Hooker under the name *Eucalyptus gigantea*, is re-

ported to attain large dimensions. It is described as erect, the branches usually short and ascending, the bark thin and fibrous, and the foliage very similar to that of *E. obliqua*. For trial in the extreme southern United States and in California.

For previous introduction, see S. P. I. No. 58628.

64667. NEYRAUDIA MADAGASCARIENSIS
(Kunth) Hook. f. Poaceae. Grass.

From Tananarive, Madagascar. Seeds presented by the chief, Agricultural Service. Received July 15, 1925.

A tall, coarse, perennial grass, closely allied to the giant reed (*Arundo donax*). Although native to Madagascar, it is found in many parts of tropical Asia and Africa. The flat narrow leaves, 1 or 2 feet long, are on leafy, solid stems, 6 to 10 feet high. The shining silky erect panicles are 1 to 3 feet in length. In Madagascar the leaves are said to be used for making hats.

For previous introduction, see S. P. I. No. 39690.

64668. SALVIA COCCINEA PSEUDOCOCCINEA
(Jacq.) A. Gray. Menthaceae.

From Yucatan, Mexico. Seeds collected by Ernest L. Crandall, Bureau of Plant Industry. Received July 20, 1925.

A perennial sage with flowers the same shade of intense red as that of the cardinal flower (*Lobelia cardinalis*). The plants, which have two to five stems, vary in height from 15 to 30 inches and grow in little pockets of soil on limestone rocks in very dry sunny places. Each morning the fully opened flowers drop off before 11 o'clock. (Crandall.)

64669. PRUNUS INCISA Thunb. Amygdalaceae.

From Jamaica Plain, Mass. Seeds presented by C. S. Sargent, director, Arnold Arboretum. Received July 20, 1925.

An ornamental Japanese cherry which is described (Arnold Arboretum, Bulletin of Popular Information, vol. 8, no. 3) as a large shrub, or sometimes a small tree, about 25 feet high. The flowers, which appear in drooping clusters before the deeply cut leaves, are white or rosy, with bright-red calyxes, and the anthers are bright yellow. The petals fall early, but the calyxes, which gradually grow brighter, remain on the young fruits for some time and are quite showy.

64670 to 64672. SACCHARUM OFFICINARUM L. Poaceae. Sugar cane.

From Santiago de las Vegas, Cuba. Cuttings presented by Gonzalo M. Fortún, director, Estación Experimental Agronómica. Received July 20, 1925.

Locally grown strains.

64670. Co. 205.

64672. Co. 281.

64671. D. 247.

64673. MUSA URANOSCOPOS Lour. (*M. coccinea* Andr.). Musaceae. Banana.

From Canton, China. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received July 28, 1925.

No. 151. May 19, 1925. *Wat chiu* and *shui tsui*. Obtained from a tree in an old

deserted yamen (Hok T'oi Nga Moon) on Kauifung. The plants, 4 to 5 meters high, have leaves which are longer and narrower than those of the usual cultivated bananas here. The bracts of the flowers curl, one at a time, back from the bud, exposing the brilliant-red inner surface, thus permitting the fertilization of the flowers. Unlike those of the cultivated edible banana, these bracts persist after the fruits reach maturity. The fruits are short and thick, being only 9 centimeters long, including the rather slender base by which they are attached to the stalk, and 11.5 centimeters in circumference. The skin turns a rich yellow when the fruits are ripe. The interior of the fruits is so packed with seeds that there is practically no flesh. (McClure.)

64674 to 64719. SOJA MAX (L.) Piper
(*Glycine hispida* Maxim.). Fabaceae. Soy bean.

From Kagoshima, Japan. Seeds presented by K. Tamari, Kagoshima Imperial College of Agriculture and Forestry. Received July 23, 1925. Notes by Mr. Tamari.

64674 to 64683. Grown at the Prefecture Akita, in 1924, and obtained through C. Kanamoto, Yokozawamura, Akita.

64674. No. A-1. *Hanshiro Mame*. A half-white variety.

64675. No. A-2. *Mejiro*. White-eyed soy bean.

64676. No. A-3. *Goyo Mame*. A five-leaved variety.

64677. No. A-4. *Wase Akazaya*. An early variety having a reddish pod.

64678. No. A-5. *Ko Abakoku*. A small abakoku soy bean.

64679. No. A-6. *Kuro Mame*. Black variety.

64680. No. A-7. *Kuro Zaya*. Black-podded soy bean.

64681. No. A-8. *Akita*.

64682. No. A-9. *Ani*.

64683. No. A-10. *Tamazdukuri*. This variety was grown at Tamazdukuri.

64684 to 64701. Grown in Chosen during 1924 and collected by the courtesy of the director of the agricultural experiment station of Chosen, Suigen.

64684. C-1. *Suigen* No. 5.

64685. C-2. *Suigen* No. 8.

64686. C-3. *Suigen* No. 9.

64687. C-4. *Suigen* No. 10.

64688. C-5. *Ciarukon*.

64689. C-6. *Chūhoku Shiro*. A white soy bean grown at the Prefecture Chūhoku.

64690. C-7. *Tansen Tanryoku*. Light green variety grown in Tansen.

64691. C-8. *Chōzui*.

64692. C-9. *Niku Awo Cha Dai-ku*. A green variety with a brown skin.

64693. C-10. *Urusan*.

64694. C-11. *Himashi Dai-ku*. Castor soy bean.

64695. C-12. *Kōshiu Chūryū*. From Kōshiu.

64674 to 64719—Continued.

64696. No. C-13. *Awo Daizdu*. Green soy bean.
64697. No. C-14. *Kuro Daizdu*. A black variety.
64698. No. C-15. *Kuro Satō Daizdu*. A black, sugar soy bean.
64699. No. C-16. *Ryūhan Daizdu*. Dragon-colored variety.
64700. No. C-17. *Chūnenkon*.
64701. No. C-18. *Moyashi Daizdu*. A variety used for bleaching.
- 64702 to 64705. Grown in Hokkaido in 1924, and obtained through the director of the agriculture experiment station at Hokkaido, Sapporo.
64702. No. H-1. *Ōyachi*.
64703. No. H-2. *Mizdukuguri*. (Diver soy bean.)
64704. No. H-3. *Turunoko*. (Crane chick soy bean.)
64705. No. H-4. *Yukikorogashi*. (Snow-ball soy bean.)
- 64706 to 64717. Grown during 1924 at the Prefecture Kumamoto and obtained through M. Jyo. of the prefectural authorities, Kumamoto.
64706. No. K-1. *Higo*.
64707. No. K-2. *Aoji*. A green variety.
64708. No. K-3. *Aka Wase*. An early, red variety.
64709. No. K-4. *Ki Zaya*. Yellow-podded variety.
64710. No. K-5. *Wase Kin Daizdu*. An early golden soy bean.
64711. No. K-6. *Riku U No. 3*. This variety was bred at the Riku U Agricultural Experiment Station.
64712. No. K-7. *Shiro Zaya*. A white-podded soy bean.
64713. No. K-8. *Kin Daizdu*. A golden variety.
64714. No. K-9. *Karyo Daizdu*. The improved soy bean.
64715. No. K-10. *Hachikoku*. (Eight koku soy bean; very productive.)
64716. No. K-11. *Asahi*. (The morning sun soy bean.)
64717. No. K-12. *Takiya*.
- 64718 and 64719. Grown during 1924 at the Prefecture Aichi and obtained through the director of the agricultural experiment station of the Prefecture Aichi, Anjyo, Mikawa.
64718. No. N-1. *Kyōto-Kuro Daizdu*. Kyōto black soy bean.
64719. No. N-2. *Ko Mame*. Small-seeded variety.
- 64720 to 64749. SOJA MAX (L.) Piper (*Glycine hispida* Maxim.). Fabaceae. Soy bean.
- From Aizu Wakamatsu, Japan. Seeds presented by Rev. Christopher Noss, Japan mission of the Reformed Church. Received July 23, 1925.
- Locally grown strains.

64720. No. 1. 64723. No. 4.
64721. No. 2. 64724. No. 5.

64755. No. 6. 64761. No. 12.

64762. ELAAGNUS PHILIPPENSIS Perr. (*E. philippinensis* Wester). Elaeagnaceae.

From the Philippine Islands. Seeds presented by P. J. Wester. Received August 26, 1925.

Lingaro. Seeds sent to me from the Philippines by Mrs. R. M. McCrory. This is an attractive climbing wild shrub with small pointed leaves, silvery beneath, and smooth pink oblong edible fruits about an inch long. These fruits have subacid or sour flesh of good flavor and make excellent jelly. (Wester.)

64763. ALANGIUM LONGIFLORUM Merr. Cornaceae.

From Los Banos, P. I. Seeds presented by Eduardo Quisumbing, assistant professor in plant physiology, College of Agriculture. Received September 9, 1925.

A handsome deciduous tropical tree, described by Merrill (Philippine Journal of Science, vol. 7, C, no. 5) as about 30 feet high with thin oblong leaves and small axillary clusters of white flowers.

64764. LILIUM sp. Liliaceae. Lily.

From Ertsingientze, Manchuria. Bulbs collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received September 9, 1925.

No. 3845. July 30, 1925. This is reported to be a drooping red lily, with recurved petals, which grows on the mountain sides. (Dorsett.)

64765 to 64797.

From Manchuria. Seeds and bulbs collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received August 24, 1925. Notes by Mr. Dorsett.

64765 to 64797—Continued.

64765. *AGROPYRON CILIARE* (Trin.) Franch.
Poaceae. Grass.

No. 3697. Harbin. July 11, 1925. A tall-growing short-awned grass found in the new Russian cemetery.

64766. *AQUILEGIA OXYSEPALA* Trautv. and Mey. Ranunculaceae. Columbine.

No. 3526. June 29, 1925. An herbaceous plant, having more or less square flowers with four points; obtained in rocky situations at Jalatun and Barun.

64767. *OXYTROPIS OXYPHYLLA* (Pall.) DC. Fabaceae.

No. 3610. Hailar. July 5, 1925. Obtained from plants growing in the sand dunes.

64768. *CARAGANA PYGMAEA* (L.) DC. Fabaceae. Dwarf pea tree.

No. 3677. Chalaioerh. July 7, 1925. A small thorny shrub.

For previous introduction, see S. P. I. No. 55769.

64769. *CARAGANA* sp. Fabaceae.

No. 3702. Harbin. July 11, 1925. Obtained in the new Russian cemetery.

64770. *ERODIUM* sp. Geraniaceae.

No. 3383. Tsitsihar. June 22, 1925. From the nursery of the forester of the Chinese Eastern Railway.

64771. *FESTUCA OVINA* L. Poaceae. Sheep fescue.

No. 3599. Hilar. July 3, 1925. A rather tall-growing grass found in the sand dunes located to the north of the city. The location is very much exposed, and at this season, at least, it is very dry.

64772. *HORDEUM VIOLACEUM* Boiss. Poaceae. Grass.

No. 3589. Hilar. July 3, 1925. One of the commonest grasses we have found in the regions thus far visited.

64773. *LILIUM TENUIFOLIUM* Fisch. Liliaceae. Lily.

No. 3477. June 27, 1925. Bulbs of a low-growing lily with recurved drooping pink or red flowers, found on the granite mountain to the east of Jalatun.

64774. *LILIUM CONCOLOR BUSHIANUM* (Lodd.) Baker. Liliaceae. Lily.

No. 3478. Jalatun. June 28, 1925. Bulbs of an upright red-flowered lily growing on the lower levels and occasionally on the sides of the hills. The petals of this lily do not recurve, and the flowers do not droop but stand erect.

64775. *MELICA GMELINI* Turcz. Poaceae. Grass.

No. 3469. Barun. June 29, 1925. Found on the mountain side in exposed rocky situations.

64776. *PAPAVR NUDICAULE* L. Papaveraceae. Poppy.

No. 3479. Jalatun. June 27, 1925. An attractive sulphur-yellow long-stemmed poppy which is abundant in this region.

64777. *PHOENIX DACTYLIFERA* L. Phoenixaceae. Date palm.

No. 3307. June 15, 1925. "Eggplant" date, received from E. M. Lamb, director,

64765 to 64797—Continued.

First Sino-Turkestan Motion Picture Expedition, and called by him Tsao erh, meaning "Tibetan jujube." It is my understanding that these fruits are grown in Tibet.

64778 to 64786. *POA* spp. Poaceae. Grass.

64778 and 64779. *POA CHAIXII* Vill.

64778. No. 3313. June 17, 1925. A rather coarse, very open-headed grass obtained from the small park near New Town, Harbin.

64779. No. 3552. Batun. July 1, 1925. A very open-headed grass with brittle stems.

64780. *POA NEMORALIS* L.

No. 3363. June 22, 1925. Obtained from the dry prairie land north of Tsitsihar. This is one of the most common grasses we have seen on the prairie.

64781. *POA PALUSTRIS* L. Fowl meadow grass.

No. 3314. June 17, 1925. Found in the small parks on the hill just outside of New Town, Harbin.

64782 to 64784. *POA PRATENSIS* L. Bluegrass.

64782. No. 3517. June 29, 1925. Plants found growing in moist gravelly soil at Barun.

64783. No. 3542. Barun. June 30, 1925. This is a single-stemmed, rather open-headed grass, found in a river-bottom area.

64784. No. 3664. Hailar. July 6, 1925. Obtained in the prairie, Argon river bottom.

64785 and 64786. *POA SPHONDYLODES* Trin.

64785. No. 3371. Tsitsihar. June 21, 1925. From a hot dry field near the railroad station.

64786. No. 3625. Hailar. July 5, 1925.

64787. *POPULUS SUAVEOLENS* Fisch. Salicaceae. Poplar.

No. 3480. Jalatun. June 27, 1925. From trees growing in the parks.

64788 and 64789. *PRUNUS ARMENIACA* L. Amygdalaceae. Apricot.

64788. No. 3704. Harbin. July 12, 1925. A medium-sized, almost round, deep-yellow apricot with golden-yellow flesh which, though not juicy, is of very good quality. This looks as though it may be a plumcot; the seeds appear to be somewhat different from the ordinary apricot.

64789. No. 3710. Harbin. July 20, 1925. This variety, called "Large red apricot," was shipped in from Tientsin. It is about the hand-somest apricot we have seen, being bright golden yellow with a very attractive pink blush and yellow flesh. The seed is large and quite flat. The fruit is a freestone, not juicy, and, according to our standard, the quality is low, but this may be due to the fruit having been picked quite green.

64765 to 64797—Continued.

64790. *PRUNUS AVIUM* L. Amygdalaceae.
Sweet cherry.

No. 3338. Harbin. June 18, 1925. A creamy white cherry, the fruits of which vary considerably in size, purchased in the market.

64791. *PRUNUS PADUS* L. Amygdalaceae.
European bird cherry.

No. 3607. Hailar. July 5, 1925. This cherry was procured in the sand dunes. It may prove to be of interest as a shade and ornamental tree for the Great Plains region.

64792 and 64793. *PUCCINELLIA DISTANS* (L.) Parl. Poaceae. Grass.

64792. No. 3315. Harbin. June 17, 1925. We found this grass being eaten by cattle, but that may have been because they had little else to eat.

64793. No. 3634. July 5, 1925. A grass of medium height collected at Hailar.

64794. *RIBES DIACANTHA* Pall. Grossulariaceae. Currant.

No. 3600. July 3, 1925. Found wild in the sand dunes to the north of Hailar.

64795. *SAMBUCUS* sp. Caprifoliaceae. Elder.

No. 3703. Harbin. July 11, 1925. A dark-brown seeded elderberry growing in the new Russian cemetery.

64796. *SPIRAEA* sp. Rosaceae. Spirea.

No. 3495. Jalatun. June 28, 1925. Found on the west side of the Granite Mountain across from the railway station. The plants showed evidence of having flowered very freely, and they did not show any winterkilling.

64797. *LONICERA* sp. Caprifoliaceae.

No. 3685. Bukedoo. July 8, 1925. A variety having dark-purple or black berries which are very acid, mucilaginous, and of good flavor.

64798 to 64805.

From Blackwood, South Australia. Seeds presented by Edwin Ashby, "Wittunga." Received September 3, 1925. Notes taken from Benth. *Flora Australiensis*.

64798. *ACACIA SCAPELLIFORMIS* Meisn. Mimosaceae.

A tall shrub from Western Australia, with the phyllodia (leaflike stems) triangular lanceolate and about an inch long. The pods are very long and narrow, twisting readily.

64799. *ACACIA SIGNATA* F. Muell. Mimosaceae.

A straggling shrub, 6 to 8 feet high, with narrowly linear phyllodia about 4 inches long and short flat leathery pods. Native to Western Australia.

64800. *ISOPOGON ASPER* R. Br. Proteaceae.

Usually a low shrub, with erect branches 1 or 2 feet high, and crowded pinnate leaves with rigid leaflets, the entire leaf generally not more than an inch long. The red flowers are in small dense cones which are either terminal or axillary. Native to Western Australia.

64798 to 64805—Continued.

64801. *LEPTOSPERMUM ROEI* Benth. Myrtaceae.

A slender-branched shrub, indigenous to Western Australia, covered with silky pubescence, and with flat oblong leaves 3 to 6 inches long. The rather large white flowers are either solitary or in pairs.

64802 to 64804. *MELALEUCA* spp. Myrtaceae.

64802. *MELALEUCA CORDATA* Benth.

A rigid shrub with numerous small round or oval spreading leaves and dense globular heads of rather small red flowers. Native to Western Australia.

64803. *MELALEUCA HOLOSENICEA* Schauer.

A bushy shrub, from Western Australia, generally 2 to 3 feet high, with the leaves and branches covered with white pubescence. The leaves are linear and half an inch long. The pink flowers are in dense terminal heads.

64804. *MELALEUCA LONGICOMA* Benth.

The large rich-red flowers of this Australian shrub are in small cylindrical spikes at the bases of the young leafy branches. The oblong leaves are less than 2 inches long.

64805. *TEMPLETONIA RETUSA* (Vent.) R. Br. Fabaceae.

A tall Australian leguminous shrub with small leathery leaves and large bright-red flowers, more than an inch long, either solitary or in few-flowered clusters.

64806 and 64807.

From Richmond, Victoria, Australia. Seeds presented by F. H. Baker. Received September 8, 1925.

64806. *ACACIA VERNICIFLUA* A. Cunn. Mimosaceae.

According to Curtis's Botanical Magazine (pl. 3266), this is a slender much-branched shrub with leathery, very narrow phyllodia [leaflike stems] about 2 inches in length and deep-yellow flowers in small heads which are generally in pairs. It is native to the barren hills around Bathurst, New South Wales.

For previous introduction, see S. P. I. No. 56569.

64807. *CANDOLLEA GRAMINIFOLIA* (Swartz) F. Muell. (*Styidium graminifolium* Swartz). Candolleaceae.

An ornamental Australian plant which, according to Benth. (*Flora Australiensis*, vol. 4, p. 10), has stiff grasslike leaves, sometimes 9 inches long and always growing in a tuft from the end of a very short stem, and scapes 6 to 18 inches long bearing a simple raceme of pink flowers.

For previous introduction, see S. P. I. No. 56563.

64808 to 64810.

From Dehra Dun, United Provinces, India. Seeds presented by R. N. Parker, forest botanist, Forest Research Institute and College. Received September 14, 1925. Notes taken from Munro's Monograph of the Bambusaceae.

64808 to 64810—Continued.

64808. CEPHALOSTACHYUM PERGRACILE
 Munro. Poaceae. **Bamboo.**

A beautiful arborescent bamboo, cespitose in habit, with erect stems 40 feet in height and sometimes 10 inches in circumference. The narrowly lanceolate leaves are usually about 10 inches long and an inch wide. The flowering panicles are sometimes 18 inches long. One of the chief bamboos of Burma.

For previous introduction, see S. P. I. No. 40887.

64809. DENDROCALAMUS HAMILTONII Nees and Arn. Poaceae. **Bamboo.**

The common bamboo of the eastern Himalayas, where it grows to a height of from 40 to 60 feet, with horizontal branches and stems 4 to 7 inches in diameter. The foliage is very variable, the broadly lanceolate leaves being 4 to 16 inches long and up to 5 inches wide. The plant is said to flower every year, and the young shoots are eaten when boiled.

For previous introduction, see S. P. I. No. 53909.

64810. DENDROCALAMUS MEMBRANACEUS
 Munro. Poaceae. **Bamboo.**

A bamboo native to eastern India, probably arborescent, with comparatively small leaves about 4 inches long and one-tenth as wide.

64811. OMPHALEA OLEIFERA Hemsl.
 Euphorbiaceae.

From Moran, Amatitlan, Guatemala. Seeds presented by J. G. Salas, director general de agricultura, City of Guatemala, through P. C. Standley, United States National Museum. Received September 14, 1925.

For previous introduction and description, see S. P. I. No. 64557.

64812 to 64842.

From Avondale, Auckland, New Zealand. Plants presented by H. R. Wright. Received September 19, 1925. Notes by Mr. Wright.

64812 to 64814. AMYGDALUS PERSICA L.
 (*Prunus persica* Stokes). Amygdalaceae. **Peach.**

64812. Allen's Late.

64813. Golden Queen. A yellow-fleshed clingstone, claimed to be one of the best canning sorts. The tree is compact in habit and a heavy cropper; fruits of medium size.

64814. Lee's Salway. The best of the Salway type; a very fine peach.

64815 and 64816. AMYGDALUS PERSICA
 NECTARINA Ait. Amygdalaceae. **Nectarine.**

64815. Early Rivers. Fruits very large; skin light yellow with crimson cheek; flesh tender, juicy, sweet, with rich flavor; season very early.

64816. Zealandia. One of the largest of all nectarines.

64817 and 64818. CYDONIA OBLONGA Mill.
 Malaceae. **Quince.**

64817. Manning Seedling. A super-quince.

64812 to 64842—Continued.

64818. Smyrna. Tree strong growing and prolific, bearing often in second year from budding. Fruits very large; flesh tender when cooked, with a delicious flavor.

64819 to 64821. DIOSPIROS KAKI L. f.
 Diospyraceae. **Kaki.**

64819. Charming. Not yet tested for fruit; autumn foliage very fine.

64820. Hazelwood.

64821. Wright's Poltrialot.

64822 to 64825. ERIOBOTRYA JAPONICA
 (Thunb.) Lindl. Malaceae. **Loquat.**

64822. Hunter. An Australian variety.

64823. Myer's Best. A New Zealand variety.

64824. Smith. An Australian variety.

64825. Success. A New Zealand variety.

64826. FICUS CARICA L. Moraceae. **Fig.**

Mrs. Williams. Of unknown origin; given to Mrs. Williams, of Auckland, by an old sea captain. The fruits are large, brown, often weighing 12 ounces, of excellent flavor. The tree is strong and prolific.

64827. MALUS PUMILA Mill. Malaceae.
Paradise apple.

To be tested as a dwarf stock.

For previous introduction, see S. P. I. No. 54386.

64828 to 64832. MALUS SYLVESTRIS Mill.
 Malaceae. **Apple.**

64828. Aromatic.

64829. Cox's Early.

64830. Crisp's Russet. Fruit large, conical, and regular; flesh crisp, firm, and juicy; of first-class quality. Season late.

64831. Granny Smith.

64832. Sturmer Pippin. Fruit medium sized, roundish oblate; skin yellow, almost covered with brownish red; flesh firm, crisp, very rich; grown largely in Tasmania for export.

64833. MALUS sp. Malaceae. **Crab apple.**

Gorgeous. The best red crab I have ever seen; up to an inch in diameter, and a real marvel for cropping. A Japanese seedling.

64834. MALUS sp. Malaceae. **Crab apple.**

Golden beauty. A yellow crab worked on *Prunus prunifolia*, the only stock for it. A Japanese seedling.

64835 to 64838. PRUNUS ARMENIACA L.
 Amygdalaceae. **Apricot.**

64835. Bolton.

64836. Cattles Early.

64837. Cattles Red.

64838. Trevatt.

64839. PRUNUS sp. Amygdalaceae. **Plum.**
Raglan.

64840. PRUNUS sp. Amygdalaceae. **Plum.**
Blüelana.

64812 to 64842—Continued.

64841. *PRUNUS* sp. Amygdalaceae. Plum.*Early Gem.* A very early-maturing cherry plum raised in Australia.64842. *PRUNUS* sp. Amygdalaceae. Plum.*Jenkin's Seedling.*64843 and 64844. *PINUS* spp. Pinaceae.
Pine.

From Zernez, Switzerland. Seeds presented by Mr. Bessole, of Veuve Roner & Co., at the request of Augustine Henry, College of Science for Ireland, Dublin. Received September 11, 1925.

64843. *PINUS MONTANA PUMILIO* (Haenke) Willk.

A handsome hardy low shrubby pine with ascending branches densely clothed with bright-green foliage. Before maturity the cone is usually violet-purple, becoming yellowish or dark brown when fully ripe. This form is native to the mountains of central Europe.

For previous introduction, see S. P. I. No. 59697.

64844. *PINUS MONTANA UNCINATA* Willk.

A variety of *Pinus montana* which becomes 60 to 80 feet high, with bluntly pyramidal cones. It is found in France and Spain.

64845 to 64854. *CITRUS* spp. Rutaceae.

From Avondale, Auckland, New Zealand.

Plants presented by H. R. Wright. Received September 19, 1925. Notes by Mr. Wright.

64845 to 64851. *CITRUS NOBILIS DELICIOSA* (Ten.) Swingle. Mandarin orange.

64845. *Beauty of Glen Retreat.* I have seen these more than 8 inches in diameter.

64846. *Early Imperial.* The earliest mandarin to ripen here.

64847. *Early Shipping.* An orange-mandarin hybrid; very early.

64848. *Ellendale Beauty.*

64849. *Jacob Special.*

64850. *Navel orange.*

64851. *Thorny.*

64852 to 64854. *CITRUS SINENSIS* (L.) Osbeck. Sweet orange.

64852 and 64853. *Best's Seedless*, a selected strain; quality excellent.

64852. On rough-lemon stock.

64853. On sour-orange stock.

64854. *Groverly Navel.* A prolific variety.

64855 to 64868.

From Manchuria. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received September 8, 1925. Notes by Mr. Dorsett.

64855. *FESTUCA RUBRA* L. Poaceae.

Red fescue grass.

No. 3742. Hingan. July 22, 1925. A tall grass with slender stems and panicles and fine leaves. From plants growing about halfway up the mountain.

64855 to 64868—Continued.

64856. *FRAGARIA* sp. Rosaceae.

Strawberry.

No. 3753. Hingan. July 22, 1925. Fruits purchased from a Chinese who gathered them on the hills about here.

64857. *MALUS* sp. Malaceae. Apple.

No. 3830. Harbin. July 25, 1925. Green and very delicate pink-skinned fruits, of irregular size, with mealy white flesh of a sweet flavor. We think this the best-flavored Chinese apple we have tasted.

64858. *POA NEMORALIS* L. Poaceae.

Grass.

No. 3753a. Hingan. July 22, 1925.

64859. *RIBES* sp. Grossulariaceae.

Currant.

No. 3729. July 22, 1925. Seeds of a black currant obtained from a Chinese who collected them near Bukedoo.

64860. *RIBES* sp. Grossulariaceae.

Currant.

No. 3800. Hingan. July 23, 1925. Seeds of a black currant purchased from a Chinese at the railway station.

64861. *RIBES* sp. Grossulariaceae.

Currant.

No. 3801. July 23, 1925. Seeds obtained from a Chinese, who collected the fruits at Hingan.

64862. *RUBUS* sp. Rosaceae. Raspberry.

No. 3803. Hingan. July 23, 1925. Found on the old railway grade on the mountain.

64863. *RUBUS* sp. Rosaceae. Raspberry.

No. 3831. Harbin. July 25, 1925. A large-fruited red-capped raspberry purchased in the market, where it had been shipped in from Yimienpo in the mountains southeast of Harbin.

64864. *RUBUS* sp. Rosaceae. Raspberry.

No. 3832. July 25, 1925. A light creamy yellow raspberry purchased in the market, where it had been shipped in from Yimienpo in the mountains southeast of Harbin. This is the best raspberry we have seen. It is of good size and quality and of very good appearance.

64865. *SAMBUCUS RACEMOSA* L. Caprifoliaceae.

Red elder.

No. 3792. Hingan. July 23, 1925. An attractive ornamental, about 12 feet in height, found on the mountain side. It produces clusters of bright-red berries.

64866. *SPIRAEA MEDIA* Schmidt. Rosaceae.

Spirea.

No. 3741. Hingan. July 22, 1925. Plants 12 to 18 inches high, growing on the top of the mountain to the south of the railroad station. The flowers are white.

64867. *VACCINIUM VITIS-IDAEA* L. Vacciniaceae.

No. 3745. Hingan. July 23, 1925.

64868. *VACCINIUM* sp. Vacciniaceae.

No. 3802. Hingan. July 23, 1925. Fruits mostly round and deep purple with considerable bloom.

64869 to 64887.

From Harbin, Manchuria. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received September 16, 1925. Notes by Mr. Dorsett.

64869 and 64870. *CITRULLUS VULGARIS* Schrad. Cucurbitaceae. Watermelon.

64869. No. 3835. July 27, 1925. "Three good friends." A light-green thin-skinned watermelon, of fair quality, with red flesh and black seeds, shipped in from Tashihyngkou.

64870. No. 3917. August 8, 1925. A small green or maybe striped watermelon from Hailar, where it is said the best melons are grown.

64871 to 64875. *CUCUMIS MELO* L. Cucurbitaceae. Melon.

64871. No. 3834. July 27, 1925. "Chinese striped melon." A green and yellow melon with a pleasant aroma. The white flesh is of fair quality.

64872. No. 3857. August 4, 1925. "White melon." A small white melon with faint reddish brown stripes and white flesh which is crisp and watery.

64873. No. 3858. August 4, 1925. A small green and yellow striped melon with green, rather firm, thin sweet watery flesh of only fair quality. This and the other small melon, No. 3857 [S. P. I. No. 64872], may be short-season varieties.

64874. No. 3874. August 4, 1925. A small light-green melon purchased in the market at Pristan. The thin crisp green flesh is watery and sweet and of poor quality. A short-season variety.

64875. No. 3861. August 4, 1925. The Russian melon with yellowish green skin and rather melting sweetish yellow flesh.

64876. *HORDEUM VULGARE NIGRUM* (Willd.) Beaven. Poaceae.

Six-rowed barley.

No. 3878. August 5, 1925. "Black barley" obtained from the test garden of the Manchurian Agricultural Society, Harbin.

64877 and 64878. *HORDEUM VULGARE PAL-LIDUM* Seringe. Poaceae.

Six-rowed barley.

August 5, 1925. Obtained from the test garden of the Manchurian Agricultural Society, Harbin.

64877. No. 3879. A local variety of barley, No. 4 in the garden series.

64878. No. 3880. A local variety of barley, No. 6 in the garden series.

64879. *PRINSEPIA SINENSIS* Oliver. Amygdalaceae.

No. 3847. Ertsingientzi. July 30, 1925. A "thorn cherry." The fruits, which grow abundantly here, are edible but not especially good. They are rather large and vary considerably in size.

64880 to 64886. *PRUNUS ARMENIACA* L. Amygdalaceae. Apricot.

64880. No. 3842. Ertsingientzi. July 30, 1925. A wild apricot found on the mountain side. The seeds vary considerably in size and general appearance.

64869 to 64887—Continued.

64881 to 64883. Obtained through the superintendent of the botanical garden of the Manchurian Agricultural Society.

64881. No. 3910. August 8, 1925. A large-fruited variety.

64882. No. 3911. August 8, 1925. A very dark reddish variety with relatively small seeds, from tree No. 17.

64883. No. 3912. August 8, 1925. A yellow variety from tree No. 20.

64884. No. 3914. August 5, 1925. Presented by B. W. Skvortzow; selected from the best types growing here.

64885. No. 3915. August 8, 1925. Presented by B. W. Skvortzow; selected from a private garden.

64886. No. 3916. August 8, 1925. Presented by B. W. Skvortzow; a large-fruited variety.

64887. *RUBUS CRATAEGIFOLIUS* Bunge. Rosaceae. Siberian raspberry.

No. 3841. Ertsingientzi. July 30, 1925. Obtained from wild plants growing on the mountains. The fruits are red and for a wild variety large, but of poor quality.

64888. *ALLIUM NIGRUM* L. Liliaceae.

From Morocco. Bulbs collected by David Fairchild, agricultural explorer, Bureau of Plant Industry. Received June 29, 1925. Numbered September, 1925.

Collected near Ouezzan; of possible value for borders. (Fairchild.)

A tall species, about 3 feet in height, native to southern Europe. The attractive pale-violet or whitish flowers are produced in summer.

For previous introduction, see S. P. I. No. 58878.

64889 to 64892. *GOSSYPIUM* spp. Malvaceae. Cotton.

From Bangalore, India. Seeds presented by V. N. Ranganatha Rao, assistant botanist, Department of Agriculture. Received September 11, 1925.

Locally grown strains.

64889. *GOSSYPIUM ARBOREUM* L.

This cotton is commonly grown in Mysore. (Rao.)

For previous introduction, see S. P. I. No. 52384.

64890 and 64891. *GOSSYPIUM HERBACEUM* L. Variety *melanospermum*. A black-seeded variety.

64890. No. 1. **64891.** No. 2.

64892. *GOSSYPIUM OBTUSIFOLIUM* Roxb.

One of our indigenous cottons. (Rao.)

For previous introduction, see S. P. I. No. 45326.

64893 to 64896. *CITRUS* spp. Rutaceae.

From Avondale, Auckland, New Zealand. Plants presented by H. R. Wright. Received September 30, 1925. Notes by Mr. Wright.

64893 to 64896—Continued.

64893. CITRUS SINENSIS (L.) Osbeck.
Sweet orange.

Best's Seedless orange; on rough-lemon stock. A selected strain.

64894. CITRUS sp.

Byfieldon; on rough-lemon stock.

64895. CITRUS sp.

Muscio Seedling; on mandarin stock.

64896. CITRUS sp.

Pride of Ellendale; on mandarin stock.

64897 to 64904. GLADIOLUS spp. Iridaceae.

From Pretoria, Transvaal, Union of South Africa. Bulbs presented by I. B. Pole Evans, Chief, Division of Botany. Received August 12, 1925.

These gladioli, lifted from my own garden, have been collected on various occasions in different parts of the country. (Pole Evans.)

64904. GLADIOLUS sp.

No. 255.

64905 and 64906. AVERRHOA spp. Oxalidaceae.

From Manila, P. I. Plants presented by S. Youngberg, acting director, Bureau of Agriculture. Received August 24, 1925.

According to P. J. Wester, formerly of the Bureau of Science, Manila, the following are superior varieties of the bilimbi and carambola. They are introduced for testing in the warmest parts of the United States.

64905. AVERRHOA BILIMBI L. Bilimbi.

Camia c 5135. The bilimbi, a tree 20 to 60 feet high, is extensively cultivated in parts of South America and the West Indies for the sake of its greenish yellow, cucumber-shaped, acid fruits, which are pickled or used as a relish with meat. It is tropical in its requirements.

64906. AVERRHOA CARAMBOLA L. Carambola.

Carambola c 5134. The carambola is similar to the bilimbi, but the yellow or golden-brown fruits are somewhat larger and less acid. The tree is smaller, varying in height from 15 to 30 feet, and is grown occasionally in the warmest parts of Florida.

64907 to 65000.

From the Mediterranean region. Collected by David Fairchild, agricultural explorer, Bureau of Plant Industry. Received September, 1925. Notes by Doctor Fairchild.

64907. ARGANIA SPINOSA (L.) Skeels (A. *sideoxyylon* Roem. and Schult.). Sapotaceae.

Collected in the Sous Valley, near Agadir, Morocco, June, 1925. The argan tree, one of the most drought-resistant trees known, covers thousands of acres of the rockiest, driest soil in all Morocco and furnishes the only green foliage for goats during the terrifically dry summers. This tree is related to the saponilla, being of the Sapotaceae, but with fruits which, when raw, are extremely acid; they are eaten by cattle, sheep, and goats. The seeds contain a strongly flavored oil which, after being heated to drive off the odor, is excellent to use for frying and is preferred by some to olive oil.

64908 and 64909. ASPHODELUS FISTULOSUS L. Liliaceae.

A small stemless annual up to 20 inches in height with a dense rosette of very narrow leaves about a foot long and racemes of small, pinkish, lilylike flowers. Native to the Mediterranean countries.

64908. No. 16. Found near Agadir, on the road to Mogador, June 8, 1925.

64909. No. 48. Found near Marrakesh, on the road to Mogador, May 17, 1925.

64910. ASPRIS sp. Poaceae. Grass.

No. 88. Near Rabat, Morocco. June 17, 1925. A small beautiful grass with delicate panicles of very ornamental flowers.

64911 and 64912. BISERRULA PELECINUS L. Fabaceae.

An annual leguminous shrub, prostrate or ascending in habit, with numerous slender stems up to a foot long, unequally pinnate leaves, and globular clusters of light-yellow flowers. Native to waste places in the Mediterranean countries.

64911. No. 90. Near Rabat, on the road to Casa Blanca, May 8, 1925.

64912. No. 110. From the pasture land near Algeciras, Spain, June 27, 1925.

64913. BOCCONIA FRUTESCENS L. Papaveraceae.

No. 116. From the Santa Brigida Hotel gardens, Las Palmas, Grand Canary, Canary Islands, July 23, 1925. A large showy shrub 10 feet in height, with very large attractive leaves which are deeply lobed and pale beneath. The yellow flowers are borne in large pendent panicles followed by very interesting fruits with brilliant-red arils.

For previous introduction, see S. P. I. No. 33102.

64914. BROMUS sp. Poaceae. Grass.

No. 46. Near Marrakesh, Morocco, May 17, 1925. A dry-land grass growing on baked clay soil in a wheat field.

64915. CAESALPINIA PECTINATA Cav. (C. *tinctoria* Domb.). Caesalpinaceae.

No. 119. From the garden of Raphael Cabrera, Yaiza, Lanzarote, Canary Islands.

A tall upright spiny shrub or small tree, often planted for hedges in Peru.

64907 to 65000—Continued.

The largest trees attain a height of 25 to 30 feet, with trunks 6 to 8 inches in diameter. The foliage is deep green, with the leaflets smooth and polished on the upper surface. The greenish yellow flowers, in cylindrical open spikes, are not very conspicuous, but the pods are produced in large clusters, and the exposed surfaces show bright scarlet for a long time before maturing. This tree might have value as a hedge plant or windbreak in the drier, warmer parts of the Southwestern States. (O. F. Cook, Bureau of Plant Industry.)

For previous introduction, see S. P. I. No. 41323.

64916. *CANARINA CANARIENSIS* (L.) Kuntze (*C. campanulata* L.). Campanulaceae.

No. 111. Presented by Juan Bolinaga, Directeur du Jardin de Acclimatation, Orotava, Teneriffe, Canary Islands, July 8, 1925.

According to Doctor Fairchild's note, under S. P. I. No. 9664, this is a pretty creeper, native to the Canary Islands, with luxuriant light-green foliage and bell-shaped orange-red flowers which are very showy. It requires much moisture and grows naturally in shaded valleys of the Canary Islands.

64917. *COTYLEDON UMBILICUS* L. Crasulaceae.

No. 175. Tubers from an Arab cemetery near Amismiz, south of Marrakesh, in the Great Atlas Mountains of Morocco, May 29, 1925. A drought-resistant plant grown on the tile roofs of houses in Morocco, giving them a look of age.

A perennial fleshy plant up to a foot high with succulent orbicular leaves and pendulous racemes of yellowish green flowers. Native to western Europe.

64918. *DATURA* sp. Solanaceae.

No. 120. From the garden of Señor Machado, Icod, Teneriffe, Canary Islands, July 8, 1925. A variety having pure-white trumpet-shaped flowers.

64919. *EBENUS PINNATA* Ait. Fabaceae.

No. 15. Near Agadir, on the road to Mogador, Morocco, June 8, 1925. A beautiful legume with lovely heads of pink flowers on long peduncles, and gray-green foliage, which forms clumps on dry roadsides.

64920. *ECHIUM FASTUOSUM* Salish. Boraginaceae.

No. 114. From the La Paz estate, Orotava, Teneriffe, Canary Islands, July 10, 1925. A much-branched shrub 8 feet high with gray-green foliage and spikes of sky-blue flowers streaked with white.

For previous introduction, see S. P. I. No. 35672.

64921. *ECHIUM SIMPLEX* DC. Boraginaceae.

No. 103. From the La Paz estate, Orotava, Teneriffe, Canary Islands, July 10, 1925. "Pride of Teneriffe." An amazing plant which produces an enormous spike of white flowers, 10 feet high, from a basal rosette of leaves.

64922. *FUCHSIA SPECIOSA* Hort. Onograceae. Fuchsia.

No. 127. These seeds were obtained from Juan Bolinaga, Directeur du Jardin

64907 to 65000—Continued.

de Acclimatation, Orotava, Teneriffe, Canary Islands, and came from the Hijuera or branch botanical garden at Orotava, July 8, 1925. The seeds of this form, which are produced in great abundance, are exported from Teneriffe to Europe, where strains of peculiarly vigorous plants are produced from them.

64923. *GENISTA MONOSPERMA* (L.) Lam. Fabaceae.

No. 150. From the old Perez garden, now the Hotel Victoria, Orotava, Teneriffe, Canary Islands.

An ornamental leguminous shrub, native to Spain, about 10 feet high with slender grayish branches and small, very narrow leaves. The fragrant white flowers are in short lateral racemes.

For previous introduction, see S. P. I. No. 51145.

64924 to 64926. *GENISTA MONOSPERMA* (L.) Lam. Fabaceae.

A remarkable leguminous shrub with white fragrant flowers. This variety is used as a sand binder on the dunes near Mogador, Morocco.

64924. No. 37. From bushes near Mogador, June 2, 1925.

64925. No. 37a. Presented by Louis Beauchamp, chef des eaux et forêts, Mogador, June 4, 1925.

64926. Growing beside the road to Boulhout near its junction with the Rabat-Casa Blanca highway, Morocco, May 8, 1925.

64927. *GENISTA SPHAEROCARPA* Lam. Fabaceae.

No. 4. Demnat, Morocco, May 31, 1925. A charming drooping desert shrub covered with delicate brilliant yellow flowers somewhat resembling small orchids.

For previous introduction, see S. P. I. No. 63977.

64928. *GYMNOSPORIA CASSINOIDES* (L'Her.) Masf. Celastraceae.

No. 132. Presented by Juan Bolinaga, Directeur du Jardin de Acclimatation, Orotava, Teneriffe, Canary Islands, July, 1925.

A spiny shrub of rigid habit with small leathery leaves and inconspicuous whitish flowers; of possible value for hedges in the Southern States. Native to Madeira.

64929. *HABENARIA* sp. Orchidaceae.

No. 123. A terrestrial orchid growing on rocky dry places, near San Andres, Palma, Canary Islands, July 18, 1925.

64930. *HEDYSARUM CORONARIUM* L. Fabaceae.

No. 97. Amismiz, Morocco, June, 1925.

A perennial or biennial European plant, 2 to 4 feet high, with odd-pinnate foliage and axillary racemes of deep-red fragrant flowers.

64931. *HEDYSARUM SPINOSISSIMUM* L. Fabaceae.

No. 17. Found in the dry soil along a small "oued" or stream near Marrakesh on the road to Asni, May 28, 1925.

A low-growing annual plant with numerous stems sometimes over a foot

64907 to 65000—Continued.

long. The lower leaves are in a basal rosette. The pink or purplish flowers are in short racemes. Native to dry places in the Mediterranean countries.

64932. *HIPPOCREPIS SCABRA* DC. Fabaceae.

No. 8. Near Amismiz, Morocco, May 19, 1925.

A herbaceous perennial leguminous plant, with axillary nodding yellow flowers, native to the western Mediterranean region. The leaves are unequally pinnate.

64933. *IRIS* sp. Iridaceae.

No. 10. Found on the roadside between Casa Blanca and Fedhala, Morocco, May 10, 1925.

64934. *JASMINUM ODORATISSIMUM* L. Oleaceae.

No. 142. From the park at Icod, Tenerife, Canary Islands, July, 1925. A beautiful yellow flowering variety, native to Tenerife, which forms a large and attractive shrub.

For previous introduction, see S. P. I. No. 43804.

64935. *LAVATERA CRETICA* L. Malvaceae.

No. 135. A small plant with narrow deep-pink striped petals growing as a weed near Ronda, on the road to Grazalema, Spain, July 1, 1925.

64936. *LENTILLA LENS* (L.) W. F. Wight (*Lens esculenta* Moench.). Fabaceae. Lentil.

No. 147. This native variety of lentil was presented by Julio Cutillas, of Santa Cruz, Palma, Canary Islands, July 18, 1925.

64937. *LEUCOJUM TRICHOPHYLLUM* Schousb. Amaryllidaceae.

No. 35. Collected on the road between Casa Blanca and Fedhala, Morocco, May 10, 1925.

This graceful bulbous plant, 2 feet high, with its white hanging flowers, three or four on each stem, gives a delicate touch to the border. (Note under S. P. I. No. 64087 by Doctor Fairchild.)

64938. *LIMONIUM* sp. Plumbaginaceae.

No. 14. A large-growing species found near Agadir en route to Mogador, June 8, 1925.

64939. *LIMONIUM* sp. Plumbaginaceae.

No. 87. Collected in the Forest of Mamora, near Rabat, Morocco, June 14, 1925. A tall delicate species with a single stem from the rosette of leaves. The flowers are pale bluish white.

64940. *LOTUS BERTHOLETH* Masf. Fabaceae.

No. 149. Obtained from Juan Bolinaga, Directeur du Jardin de Acclimatation, Orotava, Tenerife, Canary Islands, July 9, 1925. "Pigeon's Beak." This ornamental is used in hanging baskets, and the gray-green foliage sets off the attractive scarlet flowers.

64941. *LOTUS CITISOIDES* L. Fabaceae.

No. 148. Collected in the cork-oak forest near Ronda, Spain, July 1, 1925.

64907 to 65000—Continued.

A perennial prostrate or ascending herbaceous plant, native to the Mediterranean countries. The stems are up to a foot and a half long, and the flowers are orange-yellow.

For previous introduction, see S. P. I. No. 51860.

64942. *LUPINUS TERMIS* Forsk. Fabaceae. Lupine.

No. 144. Barranco de la Galga, Palma, Canary Islands, July 20, 1925. The "chocho" of the Canary Islands is an unusually vigorous tall-growing species which is grown to enrich the soil on the terraces of the barrancos of Palma and the other islands. It is fed to stock after being soaked in cold water for 24 hours.

For previous introduction, see S. P. I. No. 52172.

64943. *MANDEVILLA SCAEVOLENS* Lindl. Apocynaceae.

No. 121. Presented by Juan Bolinaga, Directeur du Jardin de Acclimatation, Orotava, Tenerife, Canary Islands, July 8, 1925. A superb fragrant white-flowered climber which can be grown in the tops of high trees and on pergolas. The flowers are 2 inches long and resemble those of the jasmine.

For previous introduction, see S. P. I. No. 33984.

64944. *MATTHIOLA PARVIFLORA* (Schousb.) R. Br. Brassicaceae.

No. 101. From the road between Marrakesh and Mogador, June, 1925. A desert relative of the common stock (*Matthiola bicornis*) which may have value for breeding purposes.

A purple-flowered annual plant about 6 inches high, which blooms in July.

64945 to 64952. *MEDICAGO* spp. Fabaceae.

64945 to 64947. *MEDICAGO LACINIATA* (L.) Mill.

An annual medick with upright or ascending habit, about 6 inches high, native to the Mediterranean countries.

64945. No. 43. From the road between Casa Blanca and Marrakesh, May 13, 1925.

64946. No. 82. From the cultivated fields in the Barranco de las Augustias, near the caldera or old crater above the town of Los Llanos, Palma, Canary Islands, July 16, 1925.

64947. From the Barranco de las Augustias, July 16, 1925.

64948 to 64951. *MEDICAGO LITTORALIS* Rhode.

An annual leguminous plant, usually prostrate in habit, with stems up to a foot and a half long, branched from the base. Native to sandy places in the Mediterranean region.

64948. No. 1. Near the Pont des Espagnole, on the road between Casa Blanca and Fedhala, May 10, 1925.

64949. No. 36. Near Marabout, above Sale, Morocco, May 5, 1925. Growing on shell sand near cliffs swept by salt spray.

64907 to 65000—Continued.

64950. No. 62. A nearly spineless form from the road between Fedhala and Casa Blanca, May 10, 1925.

64951. No. 79. Growing on dry rocky soil near Icod, Teneriffe, Canary Islands, July 10, 1925.

64952. *MEDICAGO SOLEIROLII* Duby. Fabaceae.

No. 2. Collected on the road between Rabat and Casa Blanca, May 9, 1925. A spineless annual bur clover with rather large spineless pods; a vigorous grower and adapted to very dry roadside conditions and a region of winter rainfall.

For previous introduction, see S. P. I. No. 31007.

64953 and 64954. *MELICA CUPANI* Guss. Poaceae. Grass.

64953. No. 26. Collected between Mogador and Marrakesh, Morocco, May 17, 1925. A grass with tall dense heads, growing under the protection of *Ziziphus lotus* growth which keeps the goats from destroying it. This variety seems to thrive in hard baked clay soil.

64954. No. 86. A tall-growing species found on the sun-baked soil by the roadside, between Marrakesh and Mogador, Morocco, May 22, 1925.

64955. *MELILOTUS SPECIOSA* Durieu. Fabaceae.

No. 107. From a few plants along the railroad between Rabat and Sale, Morocco, near the bridge across the Bou Regreg River, June 14, 1925. A vigorous plant which should have distinct value as a forage when grown in a region of light rainfall (19 inches annual), moderately high temperatures (maximum 115° and minimum 27° F.), and a soil of stiff clay. The plant grows to a height of about 4 feet and carries a good quantity of leaves.

64956. *MORUS NIGRA* L. Moraceae. Black mulberry.

No. 134. From Barranco Ruis, Orotava, Teneriffe, Canary Islands, July 11, 1925. A black mulberry which has grown wild on Teneriffe in the barrancos and bears immense quantities of deliciously acid fruits.

For previous introduction, see S. P. I. No. 41459.

64957. *MUSCARI* sp. Liliaceae. Grape hyacinth.

No. 102. From Ito Plateau, near Azrou, Morocco, June 17, 1925. A species peculiar to the Middle Atlas Mountains, found at an altitude of 1,300 meters.

A spring-blooming bulbous plant with blue or white flowers in racemes or spikes.

64958. *MYOPORUM INSULARE* R. Br. Myoporaceae.

No. 92. Presented by M. Pochon, Jardin d'Acclimatation, Rabat, Morocco, May, 1925. An Australian tree which has come to be widely used in Morocco as a windbreak and a hedge plant near the sea, as it withstands the salt air well. The evergreen foliage presents a pleasing appearance.

64907 to 65000—Continued.

64959. *NERIUM OLEANDER* L. Apocynaceae. Oleander.

No. 96. Seeds from a wild form growing in the Sous Valley, near Agadir, Morocco, June 7, 1925. It may be worth testing for drought resistance and for resistance to scale infestation.

64960. *OCOTEA FOETENS* (Ait.) Benth. and Hook. Lauraceae.

From trees near Moya, Canary Islands, July 27, 1925. The "til" tree of the Canary Islands is a species which is rapidly disappearing. It has beautiful glossy evergreen leaves and attractive fruits. The handsome dark wood is used for cabinetwork.

For previous introduction, see S. P. I. No. 31903.

64961. *UCHNA MULTIFLORA* DC. Ochnaceae.

No. 128. From the old garden of the famous botanist Wildpret at Orotava, Teneriffe, Canary Islands, July 11, 1925. An extremely ornamental low-growing shrub with purple berries which are borne on a red receptacle.

64962. *ADENOCARPUS FOLIOLOSUS* (Dryander) DC. Fabaceae.

No. 124. A yellow-flowered ornamental shrub growing along the road to Monte de las Lomitas, near San Andres, Palma, Canary Islands, July 19, 1925.

64963. *ORCHIS PAPILIONACEA* L. Orchidaceae.

No. 38. Found in a Berber cemetery, near Amizmiz, in the Great Atlas Mountains, south of Marrakesh, Morocco, May 30, 1925. A terrestrial orchid, about 18 inches high, which grows in soil that bakes as hard as a brick before the last of May. This variety produces tubers the size of a pigeon's egg, also attractive red flowers.

64964. *ORNITHOPUS COMPRESSUS* L. Fabaceae.

No. 89. Collected between Casa Blanca and Fedhala, Morocco, May 10, 1925. A forage legume which seems to be a rather constant factor in the pastures of Morocco, Spain, and the Canary Islands.

A slender spreading annual plant with pinnate leaves and very small yellow flowers.

64965. *PANDOREA AUSTRALIS* (R. Br.) Spach (*Tecoma australis* R. Br.). Bignoniaceae.

No. 141. From the Santa Brigida Hotel gardens, Monte, Grand Canary, Canary Islands, July 23, 1925.

An evergreen climbing shrub with glossy dark-green odd-pinnate leaves and yellowish flowers with violet spots in the throat. Native to Australia.

For previous introduction, see S. P. I. No. 46384.

64966. *PAPAVER* sp. Papaveraceae. Poppy.

No. 138. A dwarf form of very delicate habit with peculiarly brilliant scarlet flowers, inhabiting the dry talus of lava rocks in the caldera (dry crater) of the extinct volcano near Los Llanos, Palma, Canary Islands, July 16, 1925.

64907 to 65000—Continued.

64967. *PERSIA INDICA* (L.) Spreng. Lauraceae.

No. 165. Collected in private gardens at Las Palmas, Grand Canary, Canary Islands, July 22, 1925. A handsome medium-sized tree native to the Canary Islands and the Azores, where it is used as a shade tree in private gardens.

For previous introduction, see S. P. I. No. 39054.

64968. *PHOENIX DACTYLIFERA* L. Phoenicaceae. Date.

No. 31. Brought from Timimoun, 15 days' caravan ride from Figuig, by C. L. Fournier, of Targa, Marrakesh, Morocco, and presented by M. Sarazin, May 17, 1925. This date is said to be one of the best of the Moroccan Sahara.

64969. *PODACHAENIUM EMINENS* (Lag.) Schultze-Bip. (*P. paniculatum* Benth.). Asteraceae.

No. 117. A rapidly growing ornamental shrubby composite from Mexico with showy yellow flowers, found in the Jardin de Acclimatation, Orotava, Tenerife, Canary Islands, July 12, 1925.

For previous introduction, see S. P. I. No. 48285.

64970. *PSORALEA BITUMINOSA* L. Fabaceae.

No. 143. Barranco Ruiz, Orotava, Tenerife, Canary Islands.

The federa is a perennial plant which one finds everywhere along the roads and trails through the barrancos of the islands. On some of the terraces, where the soil is too shallow and dry for alfalfa, it is cultivated for its hay. It is said to be a splendid milk producer.

64971. *RHAMNUS CRENULATA* Ait. Rhamnaceae.

No. 125. From the Barranco de la Galga, Palma, Canary Islands, July 30, 1925. A bush 4 feet high, with large numbers of stiff short branches of a spiny character and red berries. May prove to be a valuable plant for hedges.

64972. *RHUS PENTAPHYLLA* (Jacq.) Desf. Anacardiaceae.

No. 19. Collected on the road between Rabat and Casa Blanca, May 8, 1925. A drought-resistant shrub which, when in fruit, is covered with very beautiful red berries. The trunk and roots yield a valuable tannin which is an article of export.

64973. *ROSA SEMPERVIRENS* L. Rosaceae. Rose.

No. 95. A wild white single rose found in the Oued Korida, near Boulhout, May, 1925.

For previous introduction, see S. P. I. No. 56820.

64974. *SALVIA* sp. Menthaceae. Sage.

No. 100. A handsome light blue-flowered sage found near Rabat, Morocco, May, 1925.

64975. *SCIRPUS HOLOSCHOENUS* L. Cyperaceae.

No. 140. From the Barranco Ruiz, Orotava, Tenerife, July 10, 1925. A giant rush growing to 7 feet in height

64907 to 65000—Continued.

and used in years past by the Tenerife peasants for basket work. It is the handsomest rush I have ever seen, and it would be worth growing as an ornamental plant.

64976 to 64978. *SCORPIURUS SULCATA* L. Fabaceae.

An annual leguminous plant, native to the Mediterranean region, with one to three prostrate or ascending stems up to a foot and a half in length and simple narrow leaves. The flowers are yellow.

64976. No. 9. From an abandoned wheat field near Amizmiz, Morocco, May 19, 1925.

64977. No. 93. On the road between Casa Blanca and Fedhala, Morocco, May 10, 1925.

64978. No. 105. From the side of an irrigation ditch, near Marrakesh, Morocco, May 17, 1925.

64979. *SCORPIURUS VERMICULATA* L. Fabaceae.

No. 33. Collected on the road between Casa Blanca and Fedhala, Morocco, May 10, 1925.

A trailing annual with leaves tapering into the stems and with yellow flowers. Native to the Mediterranean countries.

64980. *SIDAILE HERBALE* L. Poaceae. Rye.

No. 27. A high-altitude rye of Berber origin from the Atlas Mountains which Auguste Tournay, the inspector of agriculture at Marrakesh, has found to be an unusually good forage variety. Presented by Mr. Tournay, May 17, 1925.

64981. *SEMPERVIVUM PALMENSE* (Webb) Christ. Crassulaceae.

A remarkable species whose young rosettes of leaves look like rosebuds. Found on the dry perpendicular rocks of the caldera or old crater of the volcano near Los Llanos, Palma, Canary Islands, July 16, 1925.

64982. *SEMPERVIVUM* sp. Crassulaceae.

No. 113. From San Andres, Palma, Canary Islands, July 20, 1925. A charming species growing on the sun-baked cliffs in Palma Island. When young the plants resemble rosebuds in shape and are very attractive.

64983. *SEMPERVIVUM* sp. Crassulaceae.

No. 115. From the Barranco Ruiz, near Orotava, Tenerife, Canary Islands, July 11, 1925. A beautiful velvety leaved species which turns reddish when old and is altogether a charming form.

64984. *SOLANUM AUCULABE* Forst. f. Solanaceae.

No. 118. From the old garden of the great botanist Willdenow, Orotava, Tenerife, Canary Islands, July 11, 1925. A beautiful blue-flowered yellow-fruited shrub with lacinate leaves.

64985. *SPERGULARIA DIANDRA* Boiss. Sileneae.

No. 145. A very pretty annual with pink flowers, which stands a great deal over the ground in a mat. Found on a roadside near Ronda, Spain, July 1, 1925.

64907 to 65000—Continued.

64986 to 64988. *STIPA TORTILIS* Desf.
Poaceae. Grass.

An annual bushy grass with prostrate or ascending stems up to a foot and a half long and gray-green leaves. Native to sandy and stony places in the Mediterranean countries.

64986. No. 12. From the road between Mogador and Marrakesh, Morocco, May 17, 1925.

64987. No. 44. Collected in a wheat field, near Marrakesh, Morocco, on the road to Mogador, May 17, 1925.

64988. From the road between Mogador and Marrakesh, Morocco, May 16, 1925.

64989. *TAMARIX GALLICA* L. Tamaricaceae. Tamarisk.

No. 139. July, 1925. Var. *canariensis*. A very attractive form of the common variety which is used in the island of Tenerife as a windbreak to protect the banana plantations.

64990 to 64997. *TRIFOLIUM* spp. Fabaceae. Clover.

64990. *TRIFOLIUM ANGUSTIFOLIUM* L.

No. 91. From the Barranco de la Galga, Palma, Canary Islands, July 20, 1925.

An annual clover, native to the Mediterranean region, with one to three prostrate or ascending stems up to a foot or more in length.

For previous introduction, see S. P. I. No. 46811.

64991. *TRIFOLIUM ISTHMOCARPUM* Brot.

No. 39. From the road between Casa Blanca and Fedhala, Morocco, May 10, 1925.

A many-stemmed annual clover, about a foot high, with dense heads of pink flowers. Native to Spain and North Africa.

64992. *TRIFOLIUM STRIATUM SPINESCENS* Lange.

No. 164. From the road between Ronda and Grazalema, Spain, July 1, 1925. A tiny dwarf clover not over 4 inches high, which forms patches of considerable size in the region near Ronda.

64993 to 64995. *TRIFOLIUM TOMENTOSUM* L.

A dense low-growing annual or biennial clover with stems usually less than 8 inches long. Native to dry barren places in the Mediterranean region.

64993. No. 24. From an irrigation ditch just outside of Marrakesh, Morocco, May 17, 1925.

64994. No. 42. From the edge of an irrigation ditch near the experimental farm, Marrakesh, Morocco, May 17, 1925.

64995. No. 98. From the road between Casa Blanca and Fedhala, May 10, 1925.

64996. *TRIFOLIUM* sp.

No. 30. A dwarf clover, not over 3 inches high, which forms dense mats

64907 to 65000—Continued.

in the dry soil on the road between Rabat and Casa Blanca, Morocco, May 8, 1925.

64997. *TRIFOLIUM* sp.

No. 41. A dwarf clover, not over 5 inches high, forming patches of considerable size in the dry clay soil near Marabout, beyond Amismiz, Morocco, May 30, 1925.

64998. *TRITICUM DURUM* Desf. Poaceae. Durum wheat.

No. 34. From the experimental farm, Marrakesh, presented by Auguste Tornezy, inspector of agriculture at Marrakesh, May 17, 1925. Var. *dredria*. A native Moroccan variety which, according to Mr. Tornezy, has the advantage of keeping the birds from stealing the grain because the heads bend as they ripen, throwing the awns into an upright position which the birds do not like.

64999 and 65000. *VICIA SATIVA* L. Fabaceae. Common vetch.

64999. No. 11. From a hedgerow along the road between Tanaourt and Marrakesh, Morocco, May 17, 1925.

65000. No. 45. From wheat fields between Mogador and Marrakesh, Morocco, May 17, 1925.

65001 to 65047.

From the Mediterranean region. Collected by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received September, 1925. Notes by Doctor Fairchild.

65001 and 65002. *CAPSICUM ANNUUM* L. Solanaceae. Red pepper.

65001. No. 197. Obtained in the market at Inca, Majorca, Balearic Islands, August 19, 1925. A remarkable, extremely large, handsome scarlet variety of fine flavor. The pods measure 8 inches in length and 9 inches in the largest circumference. Nearly all of the seeds are located on the central placenta.

65002. No. 217. Obtained in the market at Port Mahon, Minorca, Balearic Islands. A variety of "bull-nose" pepper of unusual size, being 4 inches long and 4 inches across. It is rather too deeply lobed to be ideal in shape, nevertheless it is large enough to be quite attractive.

65003. *CISTUS CRISPUS* L. Cistaceae.

No. 158b. From the Montelirio estate near Ronda, Spain, July 1, 1925. A pink-flowered species growing with No. 158a [S. P. I. No. 65004] in cork-oak forests near Ronda.

A compact hairy shrub about 2 feet high, with sessile, very narrow leaves and three to four flowers about 2 inches across. Native to southern Europe.

65004. *CISTUS* sp. Cistaceae.

No. 158a. A beautiful white-flowered rockrose of southern Spain which covers great stretches of country in the cork-oak forests around Ronda. From the Montelirio estate near Ronda, July 1, 1925.

65005. *CITRULLUS VULGARIS* Schrad. Cucurbitaceae. Watermelon.

No. 220. From the market at Las Palmas, Grand Canary, Canary Islands. Au-

65001 to 65047—Continued.

gust, 1925. A delicious dark-fleshed variety, perfectly round, with a thin dark-green rind.

65006. *COTYLEDON UMBILICUS* L. Crasulaceae.

No. 157. From Barranco de la Galga, Palma, Canary Islands, July 20, 1925. A plant with tubers which enable it to live on the tile roofs of houses in the dry burning summer climate of Morocco and the Canary Islands.

65007. *CUCUMIS MELO* L. Cucurbitaceae. Melon.

No. 203. Seeds of the "Francesca" and "Valencianos" varieties of melon purchased from the seed dealer Bartolome Amengual Delmau, Palma, Majorca, Balearic Islands, August 22, 1925.

65008 to 65011. *CYTISUS* spp. Fabaceae.

65008. *CYTISUS FILIPES* Webb and Berth.

No. 167. From the Barranco de la Galga, Palma, Canary Islands, July 20, 1925. A shrub which is grown for its fragrant white flowers, on the terraces of the barrancos of the island. It resembles superficially a *Genista*.

65009. *CYTISUS PALMENSIS* (Christ) Tagasaste.

No. 180b. From the hillside above Santa Cruz, Palma, Canary Islands, July 16, 1925. One of the varieties of tagasaste which is deserving of trial as a forage shrub for the cool, but not cold, regions of California and Arizona. Unless the bushes are cut they become so woody and hard that the stock refuse to eat them. The shrub, 12 feet or less in height, has long slender hairy branches, narrow leaves, silky beneath, and axillary clusters of white flowers. Native to the Canary Islands.

65010. *CYTISUS PEREZII* Hutchinson. Escabon.

No. 180a. From Osario, Terror, Grand Canary, Canary Islands, July 26, 1925. The escabon of the Canary Islanders, who grow it for firewood largely, but do not cut it for forage as they do tagasaste [S. P. I. No. 65009]. The flowers are white and are said to be fragrant. This is an ornamental of some promise.

65011. *CYTISUS STENOPETALUS* (Webb) Christ.

Nos. 151 and 152. From the old Perez garden, now part of the grounds of the Hotel Victoria, Orotava, Tenerife, Canary Islands, July 9, 1925. The "gacia" or "gacio" is a forage crop of the Canary Islands used particularly for feeding goats; it is said to induce milk production. It is a shrub or small tree, 20 feet or less in height, with crowded silky pubescent foliage and elongated racemes of bright-yellow flowers. Native to the Canary Islands.

For previous introduction, see S. P. I. No. 44832.

65012. *DOLICHOS JACQUINI* DC. (*D. lignosus* Jacq., not L.). Fabaceae.

No. 179. From an old garden wall at Chella, the old Moorish ruin of Kasba, near Rabat, Morocco, June 21, 1925.

65001 to 65047—Continued.

The profuse blooming habit and the extreme elegance of foliage make this Australian vine valuable for covering porches. It is an evergreen perennial with leaves much smaller than those of *Dolichos lablab*. The flowers are white or purplish.

For previous introduction, see S. P. I. No. 48668.

65013. *EPHEDRA ALTISSIMA* Desf. Gneta-ceae.

No. 227. Collected in an Arab cemetery near Amismiz, south of Marrakesh, Morocco, May 30, 1925.

A climbing much-branched shrub, up to 20 feet in height, with green branches resembling the stems of the horsetail (*Equisetum*), very small leaves, and beryllike scarlet fruits. Native to North Africa.

For previous introduction, see S. P. I. No. 57930.

65014. *FUCHSIA CORYMBIFLORA* Ruiz and Pav. Onagraceae.

No. 155. From the old Perez garden, now part of the grounds of the Hotel Victoria, Orotava, Tenerife, Canary Islands, July 12, 1925.

A handsome Peruvian fuchsia with large serrate taper-pointed leaves and deep-red flowers. The plant becomes tall, but requires support to attain full height, and is therefore adapted for pillars or pergolas in the warmest parts of the United States.

65015 to 65018. *GENISTA* spp. Fabaceae.

65015. *GENISTA MONOSPERMA* (L.) Lam.

No. 172. From the park at Icod, Tenerife, Canary Islands, July 9, 1925.

For previous introduction and description, see S. P. I. Nos. 64924 to 64926.

65016. *GENISTA RHODORHIZOIDES* Webb and Berth.

No. 173. From a private garden at Yaiza, Lanzarote, Canary Islands, July 30, 1925. A white-flowered fragrant shrub growing 10 to 12 feet in height when cultivated. Useful probably as a sand binder and also for forcing purposes in greenhouses because of its fragrant flowers.

65017. *GENISTA SPHAEROCARPA* Lam.

No. 159. From the hillsides near Ronda, Spain, July 1, 1925.

For previous introduction and description, see S. P. I. No. 64927.

65018. *GENISTA* sp.

No. 186. From Mercedes, Tenerife, Canary Islands, at an altitude of 2,300 feet, July 12, 1925. A leguminous shrub which may have value as a soil improver.

65019. *GOSSYPIUM* sp. Malvaceae.

Cotton.

No. 206. San Antonio, Iyiza, Balearic Islands, August 14, 1925. From a single plant which most likely had escaped from some garden.

65020. *JUNIPERUS PHOENICEA* L. Pinaceae.

Juniper.

No. 207. Collected near San Giuseppe, Iyiza, Balearic Islands, August 16, 1925.

65001 to 65047—Continued.

As seen in the Balearic Islands, this is a small pyramidal tree; and in the mountains of Algeria and Morocco, where the land is stony and dry, the temperature reaching over 95° F., and no rain falling during the summer, it is a spreading bushy tree. It produces an abundance of reddish brown fruits and is said to yield an aromatic resin, although I did not hear of this being collected in the regions where it grows.

For previous introduction, see S. P. I. No. 54919.

65021. LONICERA IMPLEXA Ait. Caprifoliaceae. **Honeysuckle.**

No. 193. Growing wild on the rocky hillsides at the Coll de Soller, Majorca, Balearic Islands, August 19, 1925. A rather small shrubby honeysuckle with perfoliate leaves and pink berries in the axils of the leaves.

65022. LOTUS sp. Fabaceae.

No. 183. Near Icod, Tenerife, Canary Islands, July 10, 1925. A very deep-rooted species found on dry rocky hillsides.

65023. LYCOPERSICON ESCULENTUM Mill. Solanaceae. **Tomato.**

No. 201. From Vanalbufar, Majorca, Balearic Islands, August 22, 1925. A small round tomato, 1½ inches in diameter, of a brilliant red color and extraordinary drying qualities. The fruits, about 90 to a bunch, are strung up on threads and dried in special rooms. The semidried fruits are shipped to Spain in immense quantities. This variety has very few seeds and a strong but agreeable tomato flavor.

65024. MEDICAGO ARBOREA L. Fabaceae.

No. 221. From Barranco Simon, Minorca, Balearic Islands, August 24, 1925. This shrubby species is grown extensively, I am informed, as a hedge plant in the island of Minorca, and the branches are cut and fed to stock.

For previous introduction, see S. P. I. No. 28277.

65025 and 65026. MELILOTUS SULCATA Desf. Fabaceae.

An annual pale-green leguminous plant, upright in habit, branched from the base, and up to a foot and a half high. The flowers are small and yellow. Native to the Mediterranean countries.

For previous introduction, see S. P. I. No. 43597.

65025. No. 181. Found by the roadside between Azrou and Meknez, Morocco, June 16, 1925.

65026. No. 212. From the roadside near Soller, Majorca, Balearic Islands, August 20, 1925.

65027 and 65028. ORNITHOPUS COMPRESSUS L. Fabaceae.

A slender spreading annual plant with pinnate leaves and very small yellow flowers.

For previous introduction, see S. P. I. No. 64964.

65027. No. 154. From the fields near Algeciras, Spain, June 27, 1925.

65001 to 65047—Continued.

65028. No. 155. From the Barranco de la Galga and Punta Llama, Palma, Canary Islands, July 20, 1925.

65029. ORNITHOPUS PINNATUS (Mill.) Druce (*O. ebracteatus* Brot.). Fabaceae.

No. 161. From Monte de las Lomitas, Palma, Canary Islands, July 19, 1925. A slender-stemmed annual plant, sometimes 20 inches high, prostrate or ascending in habit, with small yellow flowers. Native to the Mediterranean region.

65030. PANCRACTIUM MARITIMUM L. Amarillidaceae.

No. 209. From the beach at Cala Parte, near Port Mahon, Minorca, Balearic Islands, August 25, 1925. I never saw a more beautiful sight than that produced by thousands of this maritime lily growing in pure sand on the tiny beach at Cala Parte. The fragrance from these beautiful white flowers, over 2 inches long, was delightful.

65031. PERSEA INDICA (L.) Spreng. Lauraceae.

No. 169. From the old Perez garden, now a part of the grounds of the Hotel Victoria, Orotava, Tenerife, Canary Islands.

For previous introduction and description, see S. P. I. No. 64967.

65032. PLOCAMA PENDULA Ait. Rubiaceae.

No. 185. Collected on the road to Ingenio, Grand Canary, Canary Islands, July 26, 1925. A dwarf drooping willowlike shrub, light green, which grows to an old age in the driest soils of the dry regions of the island of Tenerife. It bears great clusters of small white berries resembling those of the mistletoe.

For previous introduction, see S. P. I. No. 55920.

65033. PSORALEA BITUMINOSA L. Fabaceae.

No. 177. Presented by Cesar Martinez Barreda, Santa Cruz, Palma, Canary Islands, July 17, 1925.

For previous introduction and description, see S. P. I. No. 64970.

65034. RUBUS DISCOLOR Weihe and Nees. Rosaceae.

No. 192. From Soller, near Palma, Majorca, Balearic Islands, August 19, 1925. A very spiny species loaded with black fruits which were rather dry but sweet. The individual fruits were round. It is inferior to our cultivated varieties, but of possible value for breeding purposes.

For previous introduction, see S. P. I. No. 42750.

65035 to 65037. SCORPIURUS spp. Fabaceae.

65035. SCORPIURUS SUBVILLOSA L.

No. 196. Collected on the road between Palma and Soller, Majorca, Balearic Islands, August 19, 1925. A decumbent or ascending annual with one to three stems up to 20 inches in length, long-stemmed simple grass-green narrow leaves, and small yellow flowers. Native to the Mediterranean countries.

65001 to 65047—Continued.

For previous introduction, see S. P. I. No. 58710.

65036. *SCORPIURUS SULCATA* L.

No. 160. From Monte de las Lomitas, Palma, Canary Islands, July 19, 1925.

For previous introduction and description, see S. P. I. No. 64976.

65037. *SCORPIURUS VERMICULATA* L.

No. 176. Collected near Algeciras, Spain, June 27, 1925.

For previous introduction and description, see S. P. I. No. 64979.

65038. *SEMPERVIVUM* sp. Crassulaceae.

No. 153. From Barranco de la Gomera, Palma, Canary Islands, July 17, 1925. A handsome species, turning a beautiful red in summer, which is worth cultivating because of its ability to grow on stone walls in southern latitudes and withstand long periods of drought. The leaves, fringed with short hairs, form a great rosette on a short stem.

65039. *SEMPERVIVUM* sp. Crassulaceae.

No. 166. A strikingly handsome species which produces rosettes of thick, fleshy, but glaucous leaves resembling half-opened rosebuds. It grows from crevices in the precipitous cliffs of the so-called Barranco de las Aguas, near Monte de las Lomitas, Palma, Canary Islands, July 19, 1925.

65040. *SONCHUS* sp. Cichoriaceae.

Nos. 170 and 171. From the old Perez garden, now part of the grounds of the Hotel Victoria, Orotava, Teneriffe, Canary Islands, July 18, 1925. A large yellow-flowered species with rather succulent leaves. It is much sought after by goats.

65041 to 65044. *TRIFOLIUM* spp. Fabaceae.

Clover.

65041. *TRIFOLIUM* sp.

No. 162. A species forming mats of considerable size on the cultivated terraces where barley and wheat are grown in the Barranco de la Galga, Palma, Canary Islands, July 20, 1925.

65042. *TRIFOLIUM* sp.

No. 163. A small dwarf species growing in pasture land in the hills near Algeciras, Spain, June 27, 1925.

65001 to 65047—Continued.

65043. *TRIFOLIUM* sp.

No. 210. A small dwarf clover forming a fine mat of herbage in a rather moist meadow near the torrente or dry watercourse of Molinar, near Palma, Majorca, Balearic Islands, August 21, 1925.

65044. *TRIFOLIUM* sp.

No. 214. I found the dry pasture land in the Barranco de Cala Parte, near Port Mahon, Minorca, Balearic Islands, August 25, 1925, covered with dry clover heads of this small species.

65045. *WARIONIA SAHARAE* Benth. and Coss. Asteraceae.

No. 129. Collected near Agadir, Morocco, on the road to Mogador, June 8, 1925. A very striking tree composite, native to the Sahara Desert of western Algeria and Morocco, which forms a tree 10 feet or more high and bears great yellow flowers which are almost as large as those of the artichoke.

65046 and 65047. *ZEA MAYS* L. Poaceae.

Corn.

65046. No. 182. Collected near Uga, Lanzarote, Canary Islands, July 31, 1925. The dwarf maize of Lanzarote, which I take to be a distinct race and which is practically the only variety grown on that volcanic cinder-covered island, appears to be a brachytic dwarf with stems as large in diameter as ordinary corn but only about 24 inches high. Ordinarily only a single ear of corn is borne, and its lower end is so close to the ground that it gives the impression of rising right out of the gray cinders. I was told that six months are required to produce these small ears. This corn does not appear to be of especially good quality. Lanzarote has a cool climate, there being heavy dews every night, although for two years there has been no rain.

65047. No. 219. From Las Palmas, Grand Canary, Canary Islands, July 25, 1925. A very brilliantly colored variety grown extensively all over this island of Grand Canary. It has a translucent appearance quite foreign to the corns in America. In the dry portion of the island this corn makes a stunted, slow growth, but it is not a true dwarf such as No. 182 [S. P. I. No. 65046].

<i>Library</i> -----	CLARIBEL R. BARNETT, <i>Librarian.</i>

This inventory is a contribution from

<i>Bureau of Plant Industry</i> -----	WILLIAM A. TAYLOR, <i>Chief.</i>
<i>Office of Foreign Plant Introduction</i> -----	DAVID FAIRCHILD, <i>Senior Agricultural Explorer, in Charge.</i>

UNITED STATES DEPARTMENT OF AGRICULTURE

INVENTORY No. 85

Washington, D. C.

Issued July, 1928

PLANT MATERIAL INTRODUCED BY THE OFFICE OF FOREIGN PLANT INTRODUCTION, BUREAU OF PLANT INDUSTRY, FROM OCTOBER 1 TO DECEMBER 31, 1925 (NOS. 65048 TO 65707)

CONTENTS

Introductory statement.....	Page 1
Inventory.....	3
Index of common and scientific names.....	30

INTRODUCTORY STATEMENT

The outstanding feature of this inventory is the large proportion of introductions from P. H. Dorsett, agricultural explorer, who continued his work in Manchuria. The importance of this region for agricultural exploration was discussed in the introductory statement to Inventory No. 84.

The nature of the plant material obtained by Mr. Dorsett was quite general and included everything of economic value available at a given place and time. The products of the native markets were carefully scrutinized and propagating material collected of any fruits or vegetables which appeared to be superior in any way to varieties now grown in the United States. Many wild plants also were collected, including such as might be of ornamental value or useful as forage. Transportation to various parts of the country was greatly facilitated through the courtesy of the Chinese Eastern Railway, and the cooperation of the Manchurian Research Society made it possible to procure selected types of cereals and forage plants from their experiment stations.

J. F. Rock, working under the direction of the Arnold Arboretum and as a collaborator of this office, continued his botanical exploration of the Province of Kansu, western China, collecting a number of interesting woody plants. These include several hardy ornamental spruces (*Picea* spp., Nos. 65689 to 65692) which appear to be new to horticulture.

A collection of tubers of wild potatoes (*Solanum* spp., Nos. 65444 to 65449), presented by Elbert Reed of the Instituto Agrícola Bunster, Angol, Chile, will be of special interest to potato breeders. These tubers were collected on the island of Chiloe and on the mainland of Chile north of this island, part of the region considered by many horticulturists to be the original home of the potato.

A collection of local varieties of the kaki (*Diospyros kaki*, Nos. 65578 to 65583) was sent in by F. A. McClure, agricultural explorer, from Honam Island, a few miles east of Canton, China. With this bud wood Mr. McClure transmitted detailed notes on the character and uses of the fruits of these varieties.

Aleurites trisperma (No: 65297), a Philippine relative of the Chinese tung-oil tree (*Aleurites fordii*), is the source of bagilumbang oil, similar in composition to tung oil, but somewhat lighter in color. The tree is tropical in its requirements, but may succeed in southern Florida. The precise value of the oil in the paint and varnish industries has yet to be determined, but this Philippine species should be included in tropical experiments with this group of oil-producing trees.

Attention may well be called again to the species of *Actinidia*, several of which are included in this inventory. Both *A. arguta* and *A. chinensis* have fruited in the United States and have sufficient good qualities to make them decidedly worthy the attention of horticulturists and plant breeders. Hybridization is possible, as already shown by a cross between *A. arguta* and *A. chinensis* made by Doctor Fairchild (*Journal of Heredity*, vol. 18, No. 2, 1927), and improvement by selection likewise offers a promising field. Horticulturists also should give attention to the cultural requirements of the several species.

Arachis nambyquarae (No. 65296) has proved very interesting in preliminary experiments by reason of its great variability. Selections made have differed widely, some giving very low yields of seed while others have given very high yields. The value of this species is yet to be determined, but it is very promising for experimental work.

Crotalaria striata (No. 65295) is but another introduction of this species which has proved of so much promise as an orchard cover and green manure in northern Florida. It needs to be widely tested throughout the southern parts of the Gulf States and west to southern California.

Interest in stocks at the present time justifies calling special attention to a German type of mazzard cherry (*Prunus avium*, No. 65127) which is reported of possible value for this purpose on account of its longevity and resistance to disease.

One of the most interesting ornamentals in this inventory is *Euonymus macropterus* (No. 65490). The brilliant coloring and pendulous habit of the floral parts in its native habitat are very striking, and these characteristics together with its bright-colored autumnal foliage should make it a pleasing addition to any landscape.

Another introduction, *Edgeworthia gardneri* (No. 65250), a handsome yellow-flowered bush from the temperate Himalayas, should be given further trial in the more humid regions of the southern United States, where it may succeed better than it has in the drier portions of the Southwest and California. Besides its ornamental value, it yields a strong, tough fiber, from which excellent paper has been made in Nepal.

The botanical determinations of introductions have been made and the nomenclature determined by H. C. Skeels, and the descriptive matter has been prepared under the direction of Paul Russell, who has had general supervision of this inventory.

ROLAND MCKEE,
Acting Senior Agricultural Explorer in Charge.

OFFICE OF FOREIGN PLANT INTRODUCTION,
Washington, D. C., June 6, 1927.

INVENTORY¹

65048. LODOICEA SONNERATI (Gisek)
Baill. (*L. callypige* Comm.). Phoenicaceae. **Double coconut.**

From the Seychelles Islands. Seeds presented by P. R. Dupont, Director of Agriculture. Received October 17, 1925.

The double coconut, or coco de mer, as described by Bailey (Standard Cyclopedia of Horticulture, p. 1899), is a lofty palm, frequently 100 feet in height, with palmate leaves the blades of which are 6 feet across. The fruits are probably the largest known, the individual nuts sometimes weighing 50 pounds; from the time of flowering to the full maturity of the seeds is said to cover a period of 10 years, and the palm itself does not attain full growth until after a hundred years. It is native to the Seychelles.

65049. ROSA ROULETTII Correvon.
Rosaceae. **Rose.**

From Chene Bourg, near Geneva, Switzerland. Plants purchased from H. Correvon. Received December 19, 1925.

A dwarf shrubby rose of the general type *Rosa lauranciana*, but even smaller than the latter. As grown in my garden, it does not become more than 4 inches high, and the very numerous red flowers are produced continuously from May to January if the plant is sheltered. (Correvon.)

For previous introduction, see No. 61853.

65050. ARGYROXIPHUM SANDWICENSE
MACROCEPHALUM (A. Gray) Hillebr.
Asteraceae. **Silversword.**

From Honolulu, Hawaii. Seeds presented by C. S. Judd, Superintendent of Forestry. Received October 1, 1925.

Collected in the crater of Haleakala on the island of Maui, at an altitude of approximately 8,000 feet above sea level. (Judd.)

The silversword plant of Hawaii is, according to W. J. Hooker (Icones Plantarum, pl. 75), about 2 feet high, with long, narrow, basal leaves copiously covered with long, silvery white hairs, and a flowering stem a foot or two in length which bears a large number of silvery asterlike flowers.

¹ It should be understood that the names of horticultural varieties of fruits, vegetables, cereals, and other plants used in this inventory are those under which the material was received when introduced by the Office of Foreign Plant Introduction, and, further, that the printing of such names here does not constitute their official publication and adoption in this country. As the different varieties are studied, their entrance into the American trade forecast, and the use of varietal names for them in American literature becomes necessary, the foreign varietal designations appearing in this inventory will be subject to change with a view to bringing the forms of the names into harmony with recognized horticultural nomenclature.

It is a well-known fact that botanical descriptions, both technical and economic, seldom mention the seeds at all and rarely describe them in such a way as to make possible identification from the seeds alone. Many of the unusual plants listed in these inventories are appearing in this country for the first time, and there are no seed samples or herbarium specimens with ripe seeds with which the new arrivals may be compared. The only identification possible is to see that the sample received resembles seeds of other species of the same genus or of related genera. The responsibility for the identifications, therefore, must necessarily often rest with the person sending the material. If there is any question regarding the correctness of the identification of any plant received from this office, herbarium specimens of leaves and flowers should be sent in, so that definite identification can be made.

65051 and 65052. PRUNUS spp. Amygdalaceae. **Plum.**

From Paris, France. Seeds presented by Vilmorin-Andrieux & Co. Received October 2, 1925.

65051. PRUNUS BRIGANTINA Vill. **Alpine plum.**

The Alpine plum is a shrub or small spineless tree, native to the French Alps; the small, smooth, subacid fruits are about the size of small green-gage plums.

For previous introduction, see No. 62298.

65052. PRUNUS COCOMILIA Ten. **Italian plum.**

The Italian plum, allied to the Cherry plum (*Prunus cerasifera*), is a bush or small tree with thorny branches, oval, sharp-toothed leaves, and small globular fruits which are fairly good for eating.

For previous introduction, see No. 62299.

65053 and 65054. GUILIELMA UTILIS
Oerst. Phoenicaceae. **Pejibaye.**

From Gatun, Canal Zone. Seeds presented by Joseph A. Close. Received October 3, 1925.

Two varieties of pejibaye from the headwaters of the Ciricito arm of Gatun Lake, about 30 miles west of Gatun, at an altitude of about 100 feet. (Close.)

65053. No. 1. 65054. No. 2.

See No. 56158 for a descriptive note.

65055. DENDROCALAMUS SIKKIMENSIS
Gamble. Poaceae. **Bamboo.**

From Kew, Surrey, England. Seeds presented by Dr. Thomas F. Chipp, assistant director, Royal Botanic Gardens. Received October 12, 1925.

This is described (Annals of the Royal Botanic Garden, vol. 7, p. 82) as a beautiful tufted bamboo native to Sikkim, India, where the dark-green culms reach a height of 60 feet or more and a diameter of 5 to 7 inches. The species is easily distinguished by its large, reddish-brown, globular flower heads and densely velvety stem sheath. The long, narrow leaves are said to be poisonous, and from the stems are made the "chugas" or native buckets, used for carrying water and milk and for churning.

For previous introduction, see No. 56457.

65056. BUMELIA sp. Sapotaceae.

From San Francisco, Calif. Seeds presented through Miss Alice Eastwood, California Academy of Sciences, Golden Gate Park. Received October 6, 1925.

A recent expedition of the California Academy of Sciences to Lower California visited Socorro Island, where there was discovered a tree whose fruits were being eaten by parrots and other birds. These fruits are said to be about the size, shape, and color of a ripe olive, with a sweet, delicious pulp. One of the collectors of the expedition, Mr. Mason, obtained seeds which were presented to this office through Miss Eastwood.

65057. IRIS HOOGIANA Dykes. Iris. Iris. Iris.

From Westminster, England. Rhizomes presented by William R. Dykes, Secretary, Royal Horticultural Society. Received October 13, 1925.

This attractive iris was originally described by Mr. Dykes in the *Gardeners' Chronicle* (vol. 60, ser. 3, p. 216). It is a native of Turkestan and has been cultivated in England by Mr. Dykes since 1913. It is remarkable for the fact that the flowers, unlike those of the other members of the *Regelia* section, are of a uniform pale lavender, set off by the brilliant orange beard of closely set hairs. The leaves are about 16 inches long, glaucous green, and the stem, 20 inches high, bears a single cluster of two or three flowers.

65058 and 65059. LILIUM spp. Lily. Lily.

From Mefun, Manchuria. Bulbs collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received October 15, 1925.

65058. LILIUM sp.

No. 4144. September 13, 1925. From the top of the mountain.

65059. LILIUM sp.

No. 4143. September 13, 1925.

65060 to 65086.

From Harbin, Manchuria. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received October 1, 1925.

65060. ACTINIDIA sp. Dilleniaceae.

No. 4056. August 24, 1925. Presented by Mr. Erwin, of the Methodist Mission, who secured the fruits at Mefun. The fruit resembles an oblong white grape, and the pulpy flesh, inclosing small seeds, resembles that of a currant or gooseberry.

65061. ASTRAGALUS CHINENSIS L. f.

No. 3288. July 29, 1925. A herbaceous plant with white or creamy yellow pea-shaped flowers.

65062. BETULA JAPONICA Siebold. Betulaceae. Birch.

No. 4050. August 16, 1925. From white-barked birch trees in the garden of N. N. Prikashchikoff, Yaomin.

65063. CITRULLUS VULGARIS Schrad. Cucurbitaceae. Watermelon.

No. 4009. Yaomin. August 15, 1925. A small, round, very dark green, thin-skinned watermelon with deep-red flesh and black seeds. This proved to be a very good variety.

65064 to 65066. CUCUMIS MELO L. Cucurbitaceae. Melon.

65064. No. 4010. Yaomin. August 15, 1925. White seeds from a small oblong melon.

65060 to 65086—Continued.

65065. No. 4011. Yaomin. August 15, 1925. A yellow-skinned oblong melon with reddish seeds and thin white flesh.

65066. No. 4018. August 16, 1925. A small, bright-yellow melon with blotches of green and traces of brownish stripes, especially at the blossom end. A very fragrant variety, known as the pomegranate melon, pocket melon, and Persian apple melon.

65067 and 65068. CUCUMIS SATIVUS L. Cucurbitaceae. Cucumber.

65067. No. 4047. August 21, 1925. Said to be a hybrid between the local Chinese variety and a Russian variety; the seeds are from the Harbin Experiment Station, from fruits borne in the first and second leaf axils, which are said to give the earliest fruits, maturing in 50 days.

65068. No. 4048. August 21, 1925. Also from the Harbin Experiment Station, but from the second to the fifth leaf axils. This strain is said to be exceptionally good for outdoor planting, and matures later than the preceding, No. 4047 [No. 65067].

65069. ERIOCHLOA VILLOSA (Thunb.) Kunth. Poaceae. Grass.

No. 3994. August 18, 1925. A tall-growing, open-headed, large-seeded grass.

65070. MALUS sp. Malaceae. Crab apple.

No. 4046. August 21, 1925. A greenish yellow crab apple of medium size, with a pink cheek; secured from the nursery of the Chinese Eastern Railway at Harbin. The seedlings of this variety are used as stock for the variety itself.

65071. MEDICAGO FALCATA L. Fabaceae. Alfalfa.

No. 3186. July 29, 1925. Obtained from strong-growing plants on high, exposed ground in the new Russian cemetery.

65072. MELILOTUS OFFICINALIS (L.) Lam. Fabaceae. Sweet clover.

No. 4045. August 18, 1925. A tall, yellow-flowered variety found in the new Chinese cemetery.

65073. PHASEOLUS COCCINEUS L. Fabaceae. Scarlet Runner bean.

No. 3996. August 8, 1925. An ornamental vine used on trellises and fences in the new Russian cemetery. The flowers, which are large and very showy, are bright salmon; the beans are large and light or dark purple.

65074. POA sp. Poaceae. Grass.

No. 4051. Ertsingientze. August 23, 1925. A tall, open-headed grass found on low ground.

65075. PRUNUS ARMENIACA L. Amygdalaceae. Apricot.

No. 4015. Yaomin. August 15, 1925. The fruits are said to be yellow with a red blush and are freestone.

65076 to 65078. PRUNUS JAPONICA Thunb. Amygdalaceae. Cherry.

65076. No. 4006. Yaomin. August 14, 1925. The largest fruited cherry we have seen. The fruits of this ornamental shrub are said to be used for making jam.

65077. No. 4007. Yaomin. August 14, 1925. The second largest fruited variety; from the garden of the Chinese Eastern Railway.

65078. No. 4008. Yaomin. August 14, 1925. A small-fruited variety of the Manchurian cherry secured from N. N. Prikashchikoff.

65060 to 65086—Continued.

65079. *PYRUS* sp. Malaceae.

Pear.

No. 4053. Ertsingientze. August 23, 1925. A wild Chinese variety from Mr. Wakefield's summer home; it produces hard, woody fruits. The trees are about a foot in diameter and 30 feet in height.

65080. *RIBES MANSHURICUM* (Maxim.) Komarov. Grossulariaceae.

Currant.

No. 4005. Yaomin. August 14, 1925. A wild Manchurian red currant which produces the largest fruit we have seen, either wild or cultivated. The fruits, produced in bunches, are quite sour. We are told that this variety always bears a good crop and does not winterkill and that in this region it is not affected with rust, although we understand that it is so affected in the eastern part of Manchuria.

For previous introduction, see No. 40460.

65081. *PRUNUS* sp. Amygdalaceae.

Plum.

No. 4013. Yaomin. August 15, 1925. From a single tree of one of the best of the seedling yellow plums in Mrs. Erenoff's orchard. The fruit of this plum is bright golden yellow and of very good quality. The tree is hardy and bears a regular crop.

65082. *PRUNUS* sp. Amygdalaceae.

Plum.

No. 4014. Yaomin. August 15, 1925. A mixed lot of seeds from two hardy seedling trees in Mrs. Erenoff's orchard; this variety bears regular crops.

65083. *PRUNUS* sp. Amygdalaceae.

Plum.

No. 4031. Yaomin. August 15, 1925. The largest sized yellow plum in the garden of the Chinese Eastern Railway. It is of very good quality.

65084. *PRUNUS* sp. Amygdalaceae.

Plum.

No. 4033. Yaomin. August 15, 1925. The largest and best red-fruited plums, from a single tree in Mrs. Erenoff's orchard.

65085. *VICIA AMOENA* Fisch. Fabaceae.

Vetch.

No. 3840. July 29, 1925. A leguminous plant, common in the vicinity of Harbin.

65086. *VITIS AMURENSIS* Rupr. Vitaceae.

Amur grape.

No. 4052. Ertsingientze. August 23, 1925. Wild grapes consisting mostly of seed, juice, and skin, used for making wine.

For previous introduction, see No. 57367.

65087 to 65121.

From Harbin, Manchuria. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received October 6, 1925.

65087 to 65089. *AVENA SATIVA* L. Poaceae. Oats.

August 5, 1925. Local varieties of oats obtained from the experimental grounds of the Manchurian Agricultural Society, through the courtesy of B. W. Skvortzow and Wilhelm Croushul.

65087. No. 3875.

65088. No. 3876.

65089. No. 3877.

65090. *ELYMUS* sp. Poaceae.

Grass.

No. 3863. August 9, 1925. A tall variety of grass with a long ryelike bearded head.

Numbers 65091 to 65101 (August 5, 1925) are seeds obtained through the courtesy of B. W. Skvortzow and Wilhelm Croushul,

65087 to 65121—Continued.

from the experimental grounds of the Manchurian Agricultural Society.

65091. *HORDEUM DISTICHON PALMELLA* Harlan. Poaceae.

Two-rowed barley.

No. 3874. Originally from Czechoslovakia.

65092 to 65094. *HORDEUM VULGARE PALLIDUM* Seringe. Poaceae.

Six-rowed barley.

65092. No. 3872. Bearded barley, originally from Hilar.

65093. No. 3881. Bearded barley, originally from a field in Echo.

65094. No. 3893. Bearded barley, obtained by B. W. Skvortzow at Muling, July 27, 1925.

65095. *SECALE CEREALE* L. Poaceae.

Rye.

No. 3873. A local variety of four-rowed rye, said to occur as a weed in wheat. This appears to be very promising.

65096 to 65121. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceae.

Common wheat.

65096. No. 3866. A local variety of bearded wheat with reddish brown heads.

65097. No. 3867. A local variety of straw-yellow wheat.

65098. No. 3868. A Japanese wheat originally from the Kungchuling Experiment Station.

65099. No. 3869. Awnless wheat; a local variety.

65100. No. 3870. A local variety of beardless wheat known at the station as "Mel-lurme."

65101. No. 3871. A local variety of bearded spring wheat.

65102 to 65121. August 5, 1925. This material was collected in different fields by B. W. Skvortzow.

(Numbers 65102 to 65111 were collected at Echo.)

65102. No. 3882. [Type not known.]

65103. No. 3883. Bearded wheat.

65104. No. 3884. Bearded wheat.

65105. No. 3885. Bearded wheat.

65106. No. 3886. Beardless wheat.

65107. No. 3887. Beardless wheat.

65108. No. 3888. Bearded and beardless wheat.

65109. No. 3889. Bearded and beardless wheat.

65110. No. 3890. Bearded wheat.

65111. No. 3891. Bearded wheat.

(Numbers 65112 to 65121 were collected at Muling.)

65112. No. 3892. [Type not known.]

65113. No. 3894. Beardless wheat.

65114. No. 3895. Beardless wheat.

65115. No. 3896. Beardless wheat.

65116. No. 3897. Beardless wheat.

65117. No. 3898. Beardless wheat.

65118. No. 3899. Bearded wheat.

65119. No. 3900. Bearded wheat.

65120. No. 3901. Beardless wheat.

65121. No. 3902. Bearded and beardless wheat.

65122 and 65123. QUERCUS MONGOLICA
Fisch. Fagaceae. Oak.

From Manchuria. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received October 15, 1925.

65122. No. 4037. Hsiaoling. August 28, 1925. Obtained from small trees growing on the mountain side southwest of Mr. Petroff's summer home. This oak is the hardest wood in northern Manchuria and is used for flooring, etc. The trees do not appear to grow very large.

65123. No. 4150. Mefun. September 11, 1925. Mongolian oak, the hardest of the Manchurian woods, obtained from the mountain side.

65124 and 65125. GOSSYPIMUM PERUVIANUM Cav. Malvaceae. Cotton.

From Lima, Peru. Seeds presented by C. E. Guyant, American consul in charge. Received October 1, 1925.

Full Rough Peruvian cotton. These seeds are from the north of Peru. The plant grows from 10 to 12 feet high; about 5 per cent of the bolls are brown, the rest being white. (Guyant.)

65124. Light colored.

65125. Dark colored.

65126. ACACIA sp. Mimosaceae.

From Mandelieu, Alpes Maritimes, France. Seeds presented by A. Richon, Horticulturist, Etablissement Mogadette. Received October 8, 1925.

This acacia, 30 feet high, and having green leaves with very long, thin leaflets, is supposed to be a chance seedling of *Acacia decurrens*, which is nearly as hardy as *A. dealbata*. It is the best for the production of cut flowers. The time of flowering on the French Riviera is between the middle of January and the middle of February. (Richon.)

65127. PRUNUS AVIUM L. Amygdalaceae. Mazzard cherry.

From Germany. Seeds presented by Dr. W. L. Howard, acting director, University Farm, Davis, Calif. Received October 10, 1925.

Hartz Bird cherry. A tree with smooth, silvery bark; the fruits are small, almost white, and with colorless juice. Apparently this is grown only in the Black Forest, Baden, and most of the trees are wild. This type of mazzard is reputed to be very resistant to trunk diseases and troubles like gummosis and sunburn, and the roots are hardy and long-lived. Some trees are said to be 200 years old. (Howard.)

65128 to 65131. CITRUS spp. Rutaceae.

From Catania, Sicily, Italy. Plants purchased from Giardino Allegra. Received October 16, 1925. Notes from the 1924 catalogue of Giardino Allegra.

65128. CITRUS AURANTIUM L. Sour orange.

Chinotti. Fruit small, closely resembling the mandarin; quite popular for candying. Plant very productive.

65129. CITRUS BERGAMIA Risso. Bergamot.

Bergamotto. Fruit medium sized and somewhat spherical; not suited for eating, but is excellent for the essential oil which it yields, the extraction of which is an extensive industry.

65130 and 65131. CITRUS LIMONIA Osbeck. Lemon.

65130. *Spatafora.* The best table variety, very large, good shape, juicy, and of good flavor.

65131. *Spatafora Peretto.* Smaller than the preceding [No. 65130] and abundantly produced.

65132. THESPESTIA LAMPAS (Cav.) Dalz. and Gibs. Malvaceae.

From Manila, Philippine Islands. Seeds presented by S. Youngberg, acting director, Bureau of Agriculture. Received October 16, 1925.

A bushy herbaceous plant, commonly found in the jungles of India, with palmately lobed, hairy leaves about 5 inches across and yellow bell-shaped flowers over 2 inches wide with crimson centers. The plant is a near relative of *Gossypium* and is introduced for the use of cotton specialists.

For previous introduction, see No. 54550.

65133 to 65155. AVENA spp. Poaceae. Oats.

From Dookie, Victoria, Australia. Seeds presented by the Dookie Agricultural College. Received October 19, 1925.

65133 to 65145. AVENA SATIVA L.

65133. Algerian. **65140.** Early Ripe.

65134. Ascot White. **65141.** Fulguleum.

65135. Belar. **65142.** Golden.

65136. Calcutta Cape. **65143.** Great Northern.

65137. Dookie No. 19. **65144.** Grey.

65138. Early Blonde. **65145.** Lachlan.

65139. Early.

65146. AVENA NUDA Hoejer. Naked oats.

Laurel Skinless.

65147 to 65155. AVENA SATIVA L.

65147. Mortgage Lifter. **65152.** White Horse.

65148. Mulga. **65153.** White No. 1.

65149. Sunrise. **65154.** Yarran.

65150. Sid. 3999. **65155.** Dookie No. 12.

65151. Stable King.

65156. FELICIA BERGERIANA (Spreng.) O. Hoffm. Asteraceae.

From Ness, Neston, near Birkenhead, England. Seeds presented by A. K. Bulley. Received October 14, 1925.

This is perhaps the loveliest thing I saw in South Africa. It is an annual, with indescribable blue flowers. (Bulley.)

65157. GOSSYPIMUM BARBADENSE L. Malvaceae. Cotton.

From Point a Pitre, Guadeloupe. Seeds presented by C. T. Alder, director, Station Agronomique. Received October 20, 1925.

This is the primitive cotton which grows spontaneously in Les Saintes, one of the dependencies of Guadeloupe. (Alder.)

65158. COFFEA ARABICA L. Rubiaceae. Coffee.

From Mayaguez, Porto Rico. Seeds presented by the Agricultural Experiment Station through O. F. Cook, Bureau of Plant Industry. Received October 13, 1925.

Variety *erecta*. According to Bulletin No. 30 of the Porto Rico Agricultural Experiment Station, Mayaguez, this variety came originally from the Botanic Gardens at Buitenzorg, Java, where it was said to occur from time to time in plantations of typical *Coffea arabica* and where it was considered especially suited for situations exposed to heavy winds. In Porto Rico it yielded in 1917 the maximum for Arabian coffee when treated with fertilizer. Its productivity and vigorous growth recommend it for further trial.

65159 to 65172. ORYZA SATIVA L.
Poaceae. Rice.

From Coimbatore, India. Seeds presented by the Government economic botanist, Agricultural College. Received October 16, 1925.

Locally grown strains.

65159. A. D. T. No. I, *Red Sirumani*.

65160. A. D. T. No. II, *White Sirumani*.

65161. A. D. T. No. III, *Kuruvai Early*.

65162. A. D. T. No. V, *Nellore Samba*.

65163. G. E. B. No. 24.

65164. *Coimbatore No. I*.

65165. *Coimbatore No. II*.

65166. *Coimbatore No. III*.

65167. T. No. 298, *Jeeraga Samba*.

65168. T. No. 414, *Basangi*.

65169. T. No. 329, *Ratnachudi*.

65170. P. S. No. 18, *Anaikomban-Tinnevely*.

65171. P. S. No. 25, *Sornavari*.

65172. P. S. No. 55, *Rasangi*.

65173 and 65174.

From Teneriffe, Canary Islands. Seeds presented by Juan Bolinaga, Directeur du Jardin de Aclimatación de Orotava. Received October 17, 1925.

65173. *ARBUTUS CANARIENSIS* Dunham. Ericaceae.

According to a note by W. T. Swingle, of the Bureau of Plant Industry, published under No. 56529, this is a beautiful evergreen tree attaining a height of 40 feet. It is, as the name indicates, a native of the Canary Islands. The pretty rose-colored flowers, in racemes, are followed by orange-colored fruits about an inch in diameter, which are beautiful as seen against the shining-green foliage. The fruits are sweeter and more pulpy than those of the strawberry tree, *Arbutus unedo*, and are considered very good by the natives, in spite of their rather numerous seeds. The bark is smooth and very thin; the wood is rose colored and useful in cabinetmaking. This species should be used by plant breeders in hybridizing with the strawberry tree.

65174. *FUCHSIA CORYMBIFLORA* Ruiz and Pav. Onagraceae.

A handsome Peruvian fuchsia with large, serrate, taper-pointed leaves and deep-red flowers. The plant becomes tall, but requires support in order to attain full height, and is therefore adapted for pillars or pergolas in the warmest parts of the United States.

For previous introduction, see No. 65014.

65175. DOLICHOS LABLAB L.
Fabaceae. Hyacinth bean.

From Port of Spain, Trinidad, British West Indies. Seeds presented by H. Caracciolo. Received October 20, 1925.

Waby bean. This has been cultivated by Professor Waby, who was for a long time in charge of the Botanic Gardens of British Guiana. It is an excellent salad bean. (Caracciolo.)

65176. MUSA DAVYAE Stapf.
Musaceae.

From Pretoria, Union of South Africa. Seeds presented by the chief, division of botany. Received October 20, 1925.

A South African banana which, as described by Dr. Otto Stapf (Kew, Bulletin of Miscellaneous In-

formation for 1913, p. 102), is about 40 feet high, with erect, rigid leaves sometimes 15 feet long and up to 2 feet in width. The fruit is not edible, but the plant is said to yield a fiber used by the natives. In its native habitat, the Transvaal, this banana grows at an altitude of about 4,500 feet on the Drakenberg Range.

65177 to 65195.

From Manchuria. Collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received October 15, 1925.

65177. *ACTINIDIA ARGUTA* (Sieb. and Zucc.) Planch. Dilleniaceae.

No. 4086. Hsiaolin, August 29, 1925. Seeds of a large growing vine bearing fruits which are quite sweet and good; these are eaten fresh or made into jam.

For previous introduction, see No. 45241.

65178. *AMPELOPSIS BREVIPEDUNCULATA* (Maxim.) Koehne. Vitaceae.

No. 3723. Harbin. September 4, 1925. Seeds from an attractive vine which may make a good ornamental, found in the new Russian cemetery. The fruits are yellow when ripe.

For previous introduction, see No. 63332.

65179. *AQUILEGIA* sp. Ranunculaceae. **Columbine.**

No. 4149. September 13, 1925. Roots of an ornamental flowering plant, collected at the base of a small hill at Mefun.

65180. *ASPARAGUS SCHOBERIODES* Kunth. Convallariaceae. **Asparagus.**

No. 4095. Hsiaolin. August 29, 1925. Black seeds of what appears to be a very good ornamental.

65181. *CAPSICUM ANNUUM* L. Solanaceae. **Red pepper.**

No. 4120. Harbin. September 3, 1925. Seeds from a locally grown variety of large, red, bell-shaped peppers which are sweet and of good flavor.

65182. *CONVALLARIA MAJALIS* L. Convallariaceae. **Lily of the valley.**

No. 4141. Mefun. September 11, 1925. A quantity of pips from an exceptionally fine variety.

65183. *DIOSCOREA NIPPONICA* Makino. Dioscoreaceae. **Yam.**

No. 4148. Mefun. September 13, 1925. Roots of a wild species found on the mountain side. This vine is quite common here and in several other places we have visited.

65184. *FRAGARIA* sp. Rosaceae. **Strawberry.**

No. 4147. September 13, 1925. Plants growing wild near the station at Mefun.

65185. *IRIS KAEMPFERI* Sieb. Iridaceae. **Iris.**

No. 4146. Mefun. September 13, 1925. Plants of what is said to be the handsomest of the Manchurian varieties of iris, found along the edge of a bay.

65186. *IRIS* sp. Iridaceae. **Iris.**

No. 4129. Harbin. September 6, 1925. Roots collected from sand ridges across the Sungan.

65187. *MENISPERMUM DAURICUM* DC. Menispermaceae.

No. 4090. Hsiaolin. August 29, 1925. A few seeds of a vigorous growing vine with large leaves, found in a jungle.

For previous introduction, see No. 62184.

65177 to 65195—Continued.

65153. *PAEONIA OBOVATA* Maxim. Ranunculaceae. Peony.

No. 4142. Mefun. September 11, 1925. Roots of a variety reported to be a good ornamental, found at the base of hills adjacent to swamps.

65159. *PRINSEPIA SINENSIS* Oliver. Amygdalaceae.

No. 4057. Hsiaolin. August 29, 1925. Seeds of a variety which may prove useful as a hedge or ornamental; secured from a river bottom.

For previous introduction, see No. 57309.

65190. *PRUS* sp. Malaceae. Pear.

No. 4072. Harbin. August 26, 1925. Seeds of a wild pear (Chinese name, *Ba li hsian*), from fruits shipped in from Hungshankou, in the Mukden fruit region. Prof. F. C. Reimer, of the Oregon Agricultural Experiment Station, says this is by far the most valuable of all the Chinese pears in regard to blight resistance. The fruits are small to medium sized and rather long stemmed with a raised shoulder on one side. They are yellow with a pink blush on some of the fruits; the calyx is persistent.

65191. *PRUS* sp. Malaceae. Pear.

No. 4097. Hsiaolin. August 29, 1925. Seeds of a wild Chinese pear of value as a hardy stock. The fruit is hard, gritty, and exceedingly sour.

65192. *PRUS* sp. Malaceae. Pear.

No. 4122. September 3, 1925. A small light-yellow pear known as *Hsiao sui li*. These seeds are from fruits purchased in the Fuchiatien market, in Harbin, where they had been shipped in from Kuangning, near Mukden.

65193. *ROSA* sp. Rosaceae. Rose.

No. 4074. Hsiaolin. August 28, 1925. Seeds of a wild rose from plants growing to the south of Mr. Petroff's summer home.

65194. *RUBUS CRATAEGIFOLIUS* BUNGE. Rosaceae.

No. 4093. Hsiaolin. August 29, 1925. An erect hardy shrub, about 7 feet high, with white flowers an inch across and small red berries. Native to northeastern Asia.

65195. *SPODIOPOGON SIBIRICUS* Trin. Poaceae. Grass.

No. 3995. Harbin. September 4, 1925. A tall, rather open-headed grass with small rhizomes similar to bamboo. Found in the new Russian cemetery.

For previous introduction, see No. 57343.

65196 to 65216. *HORDEUM* spp. Poaceae.

From Chengtu, China. Seeds presented by Frank Dickinson, Chengtu, through D. E. Stephens, superintendent, dry-farm branch station, Moro, Oreg. Received November 3, 1925.

65196 to 65200. *HORDEUM DISTICHON PALMELLA* Harlan. Two-rowed barley.

65196. No. 12. From Nanking.

65197. No. 14. From Taihsin, Shansi.

65198. No. 15. Collected near Chengtu.

65199. No. 16. From Santai, a six-day's journey from Chengtu.

65200. No. 18. From Chengtu.

65201 and 65202. *HORDEUM VULGARE COELESTE* L. Six-rowed barley.

65201. No. 5. Collected at a town about a day's journey from Chengtu.

65202. No. 19. From Tungkiang, a six-days' journey from Chengtu.

65196 to 65216—Continued.

65203. *HORDEUM VULGARE NIGRUM* (Willd.) Beaven. Six-rowed barley.

No. 17. Collected near Peking, Chihli.

65204 to 65216. *HORDEUM VULGARE PALLIDUM* Scribn. Six-rowed barley.

65204. No. 1. From Pachong, about a six-days' journey from Chengtu.

65205. No. 2. From Taihsin, Shansi.

65206. No. 3. From Tongkiang.

65207. No. 4. Collected on the northeast road from Chengtu.

65208. No. 6. Collected about a two-days' journey from Chengtu.

65209. No. 7. Collected at a small town near Chengtu.

65210. No. 8. Collected about a day's journey from Chengtu.

65211. No. 9. Collected at a town a day's journey from Chengtu.

65212. No. 10. Collected near Chengtu.

65213. No. 11. From Gwangfan, a 10-days' journey from Chengtu.

65214. No. 13. From the Province of Shansi.

65215. No. 20. From Pehhsien, near Canton.

65216. No. 21. From Giahwa, a seven-days' journey from Chengtu.

65217. *MUSA TEXTILIS* Nee. Musaaceae. Abaca.

From the island of Mindanao, Philippine Islands. Seeds collected by H. T. Edwards, Bureau of Plant Industry. Received October 31, 1925.

From the plantation of the Gulaman Co., Malita, Province of Davao. August 21, 1925. This variety is known in the Philippine Islands as *Maguindanao*. (Edwards.)

65218 and 65219.

From Chene Bourg, Geneva, Switzerland. Seeds collected by David Fairchild, agricultural explorer, Allison V. Armour expedition. Received, November 11, 1925.

65218. *CAESALPINIA JAPONICA* Sieb. and Zucc. Caesalpinaceae.

October 11, 1925. A handsome, scandent shrub, bearing gorgeous yellow flowers, from H. Correvon's place. This plant had climbed into the top of a tall tree near by.

65219. *SAMBOCUS GAUTSCHII* Wettst. Caprifoliaceae.

A rank, tender shrub with large, coarse leaves and umbels of pink fruits, growing in the botanic gardens of Geneva. Native to the Himalayas.

65220. *RUBUS* sp. Rosaceae. Blackberry.

From Maidstone, England. Plants purchased from George Bunyard & Co., The Royal Nurseries. Received November 23, 1925.

British blackberry. The best variety for flavor and strongly recommended. (Bunyard, 1924-25 catalogue.)

65221. *ALTYGYNE HAKEAEFOLIA* (Giordano) Alefeld (*Fugosia hakeaeifolia* Hook.). Malvaceae.

From Perth, Western Australia. Seeds presented by W. M. Carne, botanist and plant pathologist, Western Australia Department of Agriculture. Received October 28, 1925.

An Australian shrub, of erect habit, with narrow, lobed or deeply cut leaves and large purple-lilac flowers. It is a close relative of *Gossypium*.

65222 to 65235. BERBERIS spp. Berberidaceae. Barberry.

From Kew, England. Seeds presented by Dr. A. W. Hill, Director, Royal Botanic Gardens. Received October 28, 1925.

65222. BERBERIS ACTINACANTHA Mart.

A Chilean barberry, which, as described in Edward's Botanical Register (vol. 31, pl. 55), is an evergreen bush, with peculiar five-parted spines, roundish oval, rigid, spiny dentate leaves, and deep-yellow, sweet-scented flowers. In cultivation it reaches 3 or 4 feet in height and grows freely in a rich sandy loam.

For previous introduction, see No. 44523.

65223. BERBERIS ANGULOSA Wall.

An ornamental shrub from the mountainous sections of northern India, which becomes about 4 feet high, with dark glossy green leaves and elliptical scarlet berries nearly an inch long. The autumnal coloring of the foliage is said to be very striking, and the fruits, less acid than most barberries, are edible.

For previous introduction, see No. 49616.

65224. BERBERIS ATROCARPA C. Schneid.

As described by Sargent (*Plantae Wilsonianae*, vol. 3, p. 437), this is an ornamental shrub, 3 to 5 feet tall, with leathery evergreen leaves, shining rich green above and yellowish green beneath. It is native to western Szechwan. The almost globose fruits are jet black.

For previous introduction, see No. 53629.

65225. BERBERIS BEANIANA C. Schneid.

As described by Camillo Schneider (*Plantae Wilsonianae*, vol. 3, p. 439), this barberry, collected in western Szechwan, China, is a shrub with slender yellow spines, thick papery narrow leaves, yellow flowers about a quarter of an inch wide, and purple ellipsoidal berries.

For previous introduction, see No. 58137.

65226. BERBERIS CONCINNA Hook, f.

A low spreading bush up to 3 feet in height, native to the mountainous regions of Sikkim, India. The slender spines are three parted, and the semievergreen obovate leaves are an inch or less in length. The flowers are bright yellow, and the berries are red.

For previous introduction, see No. 58101.

65227 and 65228. BERBERIS CONSIMILIS C. Schneid.

A densely branched hardy shrub about 5 feet high, native to western Szechwan, China, with yellowish spines about a third of an inch long, leaves up to 1½ inches long, yellow flowers, and dark purplish elliptic fruits about three-fourths of an inch long.

65227. No. 1.

65228. No. 2.

65229. BERBERIS EDGEWORTHIANA C. Schneid.

A barberry from the subtropical Himalayas which, as described in the Bulletin Herbar Boissier (ser. 2, vol. 8, p. 263), is a small shrub with two-parted yellowish spines less than half an inch long, narrowly elliptic leaves about the same length as the spines, and dense clusters of small flowers.

For previous introduction, see No. 52930.

65222 to 65235—Continued.

65230. BERBERIS FRANCISCI-FERDINANDI C. Schneid.

The drooping panicles of scarlet berries borne by this Chinese barberry are very handsome, according to Alfred Rehder (Bailey, Standard Cyclopedia of Horticulture, vol. 1, p. 490). It is a shrub up to 10 feet high, with red-brown branches, long spines, bright-green papery leaves 1 or 2 inches long, and narrow panicles of yellow flowers.

For previous introduction, see No. 58104.

65231. BERBERIS GUIMPILI Koch and Bouche.

A hardy, graceful barberry from the Caucasus. It is about 5 feet high, with slender branches, grayish green, narrowly oblong leaves, and pendulous clusters of ovoid, purple berries.

For previous introduction, see No. 52876.

65232. BERBERIS HOOKERI Lem.

An evergreen barberry from the Himalayas, which, as described by W. J. Bean (*Trees and Shrubs Hardy in the British Isles*, vol. 1, p. 243), is a dense shrub 3 to 5 feet high, with usually three-parted spines, dark-green, leathery, spiny-margined leaves, and cylindrical black-purple berries which often persist on the shrub until spring.

For previous introduction, see No. 53635.

65233. BERBERIS NERVOSA Pursh.

A dwarf shrubby barberry, by some authorities referred to Mahonia: it is native to western North America. The leafstalks are up to 4 inches long, and the pale-green, spiny-toothed, narrow leaflets are 1 to 3 inches in length. The oblong berries are blue.

65234. BERBERIS ORTHOBOTRYS Bienert.

A shrubby barberry from Kashmir, India, which, as described by Schneider (*Illustriertes Handbuch der Laubholzkunde*, vol. 1, p. 3100), attains a height of 3 feet, with narrowly obovate leaves and elongated berries.

For previous introduction, see No. 53637.

65235. BERBERIS UMBELLATA Wall.

A hardy subevergreen Himalayan shrub about 3 feet high, with narrow leaves slightly glaucous beneath, and umbellike racemes of yellow flowers.

For previous introduction, see No. 53645.

65236. COFFEA ARABICA L. Rubiaceae. Coffee.

From Porto Rico. Seeds obtained through O. F. Cook, Bureau of Plant Industry. Received November 7, 1925.

In Bulletin No. 30, Porto Rico Agricultural Experiment Station, entitled, "Coffee Varieties in Porto Rico," T. B. McClelland states that *Bourbon* is an early variety, nearly half of the crop being harvested by the end of September. In yield it has averaged, since 1913, 1.8 liters of cherries per tree. It is said to have a very fine aroma, and one authority states that it is grown on the richest soils on one-fifth of the plantations of Sao Paulo, Brazil.

65237 to 65240. BERBERIS spp. Berberidaceae. Barberry.

From Edinburgh, Scotland. Seeds presented by William Wright Smith, Regius Keeper, Royal Botanic Gardens. Received November 4, 1925.

65237 to 65240—Continued.

65237. *BERBERIS CRETICA* L.

A low deciduous shrub, sometimes prostrate in habit, indigenous to southeastern Europe. The very narrow leaves, usually entire, are about half an inch long, the flowers are yellow, and the globular berries are almost black.

For previous introduction, see No. 35162.

65238. *BERBERIS HETEROPODA* Schrenk.

As described by Alfred Rehder (Bailey, Standard Cyclopedia of Horticulture, vol. 1), this is a handsome spreading shrub 3 to 6 feet high, with spines, when present, often 2 inches long; and broadly oval, pale blue-green entire leaves an inch or two in length. The fragrant orange flowers are in five-flowered to seven-flowered racemes, and the dark-blue berries are covered with a glaucous bloom. Native to Turkestan.

For previous introduction, see No. 25567.

65239. *BERBERIS PURPUREA* EGBERTII Hort.65240. *BERBERIS STENOPHYLLA* Lindl.

A hybrid between *Berberis darwinii* and *B. empetrifolia* which first appeared, according to Bean (Trees and Shrubs Hardy in the British Isles, vol. 1), in the nursery of Fisher and Holmes, near Sheffield, England, several years ago. As described by Bean it is an evergreen bush about 10 feet high, which forms a dense thicket of slender interlacing stems. The small deep-green leaves are spine tipped, and the small golden yellow flowers are profusely borne in small clusters. The globular fruits are covered with a blue-white bloom.

For previous introduction, see No. 62756.

65241 to 65243.

From Kansu, China. Seeds collected by J. F. Rock, Arnold Arboretum, Jamaica Plain, Mass. Received November 9, 1925. Notes by Mr. Rock.

65241. *Iris* sp. Iridaceae.

Collected north of Titao, August 30, 1925. A bushy plant, 1 to 2 feet high, found in the meadows along the banks of the Tao River, near Choui, to the Kikonor. It is a very hardy plant and thrives best in well-drained, moist loamy soil. The flowers, of which there are many to a clump, are 3 inches or more in diameter, and white, bright blue, or purplish.

65242. *PRINSEPIA* sp. Amygdalaceae.

August 30, 1925. *Ma Teng Ko*. A spiny shrub, 5 feet in height, with long semierect branches, found in the Tao River Valley, between Taichow and Titao, and on the Yellow River, near Lanchowfu. The scarlet pendent drupes are edible, having a peppery flavor. It is best suited to well-drained loess soil along river banks and in sandy plains.

65243. *AILANTHUS* sp. Simaroubaceae.

September, 1925. This tree, 40 feet in height, is found on the loess plains to the northwest of Lanchow, at Sincheng, on the Yellow River, at an altitude of 5,600 feet, where the winter temperature is said to go to -10° F. The bark is light brown, the leaves and leaflets large, and the fruits, produced in large, drooping racemes, are pale yellow when mature. This tree is often planted near temples.

65244. *CORYLUS SIEBOLDIANA* MANDSHURICA (Maxim.) C. Schneid. Betulaceae. Hazelnut.

From Harbin, Manchuria. Plants collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received November 11, 1925.

No. 4249. Hsiaoliu. September 30, 1925. *Mao cheu tze* (hairy hazelnut). (Dorsett.)

65245. *RUBUS* sp. Rosaceae.

From Exeter, England. Plants purchased from Robert Veitch & Son, The Royal Nurseries. Received November 13, 1925.

The Veitchberry, as described in the 1925 catalog of Laxton Bros. (Bedford, England), is the best of all their berries. The fruits are the color of a well-ripened black mulberry and about twice the size of an ordinary blackberry. The flavor is delicious, resembling that of the blackberry and raspberry combined. It is self-fertile and sets all of its fruits. The bush is semierect, a strong grower, and needs only a stake to support it. Its ripening season is after that of the raspberries and before that of the blackberries.

65246 to 65269.

From Darjiling, India. Seeds presented by G. H. Cave, Curator, Lloyd Botanic Garden. Received October 20, 1925.

65246. *ACACIA CATECHU* (L. f.) Willd. Mimosaceae.

The pale-yellow gum obtained from this acacia has very strong adhesive powers and is considered a better substitute for gum arabic than that from *Acacia arabica*, according to Watt (Dictionary of the Economic Products of India vol. 1). The tree is found wild in parts of India and Burma, where it sometimes becomes 70 feet high, though usually smaller. The leaves are very finely pinnate, and the white or pale-yellow flowers are in spikes.

For previous introduction, see No. 61593.

65247. *ALSTONIA SCHOLARIS* (L.) R. Br. Apocynaceae.

A Himalayan tree, which, as described by Watt (Dictionary of the Economic Products of India, vol. 1, p. 197), is a tall evergreen tree, widely cultivated throughout India for ornamental purposes. The tree yields an inferior quality of gutta-percha, and from the bark is obtained a bitter principle known as ditain, which has a medicinal effect similar to that of quinine.

65248. *ALSTONIA VENENATA* R. Br. Apocynaceae.

Unlike the preceding, *Alstonia scholaris* (No. 65247), this is described by Hooker (Flora of British India, vol. 3, p. 642) as a shrub 6 to 8 feet high, with narrow leaves in whorls of four to six.

Since a number of the *Alstonias* yield gutta-percha, this Himalayan species will be tested as a possible source of that substance.

65249. *DRIMYCARPUS RACEMOSUS* (Roxb.) Hook. f. Anacardiaceae.

A lofty Himalayan tree with large, shining-green leathery leaves sometimes a foot long and red fruits an inch in diameter, produced in axillary clusters. This note is from Hooker's Flora of British India (vol. 2, p. 36), which gives the distribution as the mountains of Sikkim and Bhutan, India.

65250. *EDGEWORTHIA GARDNERI* (Wall.) Meisn. Thymelaeaceae.

A handsome shrub native to the Himalayas, whose branches are covered with dense clusters of yellow sweet-scented flowers before the leaves appear. The strong tough fiber which is obtained from the long straight twigs seems very promising as paper-making material, according to Watt (Dictionary of the Economic Products of India, vol. 3, p. 202). The finest qualities of Nepal paper are made from this plant, according to the same authority.

For previous introduction, see No. 57887

65246 to 65269—Continued.

65251. *ELAEOCARPUS SIKKIMENSIS* Masters. Elaeocarpaceae.

A handsome evergreen tree, native to Sikkim, India, with erect racemes of small white flowers. The sharp-pointed serrate leaves are about 8 inches long.

For previous introduction, see No. 61603.

65252. *ERIOBOTRYA HOOKERIANA* Decaisne. Malaceae.

According to Hooker (Flora of British India, vol. 2, p. 371), this is a small stout-branched tree with thick, leathery, oblong, sharply toothed leaves up to a foot in length, large panicles of small white flowers, and egg-shaped yellow fruits about three-fourths of an inch long. It is a native of the eastern Himalayas at altitudes of 6,500 to 8,000 feet.

For previous introduction, see No. 55679.

65253. *GARCINIA STIPULATA* T. Anders. Clusiaceae.

A wild relative of the mangosteen (*Garcinia mangostana*) which, as described by Hooker (Flora of British India, vol. 1, p. 267), is a tree about 60 feet high, with dark-green, thick-leathery, oblong leaves 6 to 12 inches long and smooth oblong fruits about a quarter of an inch long. The tree is a native to moist subtropical forests of the eastern Himalayas.

65254. *GAULTHERIA FRAGRANTISSIMA* Wall. Ericaceae.

A very fragrant evergreen shrub or small tree, found in the mountains of India from Nepal eastward to Bhutan. In summer it is loaded with white or pinkish flowers which are followed by beautiful racemes of blue-purple fruits.

For previous introduction, see No. 61746.

65255. *HYPERICUM PATULUM* Thunb. Hypericaceae.

An ornamental, spreading, evergreen Japanese shrub from 1 to 3 feet in height, with red stems and branches. It has bright-green leaves and numerous large yellow flowers, about 2 inches across, borne in terminal few-flowered cymes.

For previous introduction, see No. 47695.

65256. *ILEX INSIGNIS* Hook. f. Aquifoliaceae.

An attractive holly from the Sikkim Himalayas, where it grows at an altitude of 7,000 feet. It forms a small tree or shrub with thick, grooved branches which are purplish when young. The dark-green leathery leaves are pinnately lobed, with the lobes spine tipped and alternately raised and depressed, so that there appears to be a double row of spiny lobes on each side. This holly has proved hardy in Ireland and may be suited for growing in the Gulf States and southern California.

For previous introduction, see No. 60646.

65257. *INDIGOFERA DOSUA TOMENTOSA* Baker. Fabaceae.

A low, shrubby, hairy indigo from the temperate parts of the Himalayas, where it grows at altitudes of 1,000 to 5,000 feet. The dull-green compound leaves, 9 inches in length, and the long racemes of bright-red flowers, make this a decidedly ornamental species.

For previous introduction, see No. 60647.

65258. *JASMINUM DISPERSUM* Wall. Oleaceae.

This Himalayan jasmine, as described by Hooker (Flora of British India, vol. 3, p. 602), is a climbing shrub common in temperate regions of the Himalayas at altitudes of 2,000 to 8,000 feet. It bears very numerous white flowers in axillary cymes and terminal panicles sometimes containing a hundred flowers.

For previous introduction, see No. 55684.

65246 to 65269—Continued.

65259. *JASMINUM UNDULATUM* (L.) Ker. Oleaceae.

A climbing Asiatic jasmine with slender hairy branches, opposite leaves about 2 inches long, and white long-tubed flowers in terminal clusters of 6 to 10 flowers. Native to the Himalayas.

65260. *LEUCOSCEPTRUM CANUM* J. E. Smith. Menthaceae.

A stout-branched, densely hairy tree, commonly about 30 feet high, with large, narrowly ovate leaves, silvery hairy beneath and at times a foot long. The small white or pinkish flowers are in spikes. Native to temperate regions in the Himalayas.

For previous introduction, see No. 61609.

65261. *LEYCESTERIA FORMOSA* Wall. Caprifoliaceae.

A handsome ornamental bush, about 6 feet high, closely allied to the honeysuckles. The purplish flowers are in drooping spikes or spike-like racemes, and the dark-red berries are sometimes eaten by birds. It is native to the cooler sections of the Himalayas.

For previous introduction, see No. 52864.

65262. *LEYCESTERIA GLAUCOPHYLLA* (Hook. f. and Thoms.) C. B. Clarke. Caprifoliaceae.

A slender plant, closely allied to the honeysuckles, with pale-green leaves and bearing, in the early winter, a profusion of pink flowers, in short axillary spikes. It is native to the subtropical Himalayas at an altitude of 5,000 feet.

For previous introduction, see No. 61611.

65263. *PERIS FORMOSA* (Wall.) D. Don. Ericaceae.

A Himalayan bush, 15 to 20 feet high, which bears large terminal clusters of white flowers resembling those of the lily of the valley. The glossy green foliage, which persists throughout the winter, makes a very effective background for the early blooming flowers.

For previous introduction, see No. 55909.

65264. *PRUNUS CERASOIDES* D. Don. (*P. puddum* Roxb.). Amygdalaceae.

The pendulous flowers of this species are campanulate and deep rosy red. They are said to appear before the foliage, which is a bright glossy green. The tree, native to the highlands of Burma, is said to endure some frost in its native country.

For previous introduction, see No. 61619.

65265. *ROSA MACROPHYLLA* Lindl. Rosaceae. Rose.

This Himalayan rose, as described by Brandis (Forest Flora of India, p. 203), is an erect, often unarmed shrub, with large red flowers 2 inches or less in width, and large soft edible fruits an inch long. In its native home this rose is found at an altitude of 10,000 feet, and plants introduced into England have proved hardy in that country.

For previous introduction, see No. 63368.

65266. *RUBUS ELLIPTICUS* J. E. Smith. Rosaceae. Raspberry.

A Himalayan raspberry, described as follows by J. F. Rock, of the Bureau of Plant Industry, under No. 55499: A very stout shrub which, especially when young, is densely covered with long, red, almost hairlike spines. The flowers are white and the deep-yellow, almost orange, very juicy, acid fruits are collected by the hill tribes and brought to the markets; the fruits ripen earlier on the mountains than in the valley. The shrub is found at altitudes of 6,000 to 7,000 feet.

65246 to 65269—Continued.

65267. *RUBUS ROSAEFOLIUS* J. E. Smith. Rosaceae.

A Philippine raspberry, which, as described by Brown (Wild Food Plants of the Philippines, p. 66), is a spiny shrub, rarely over 3 feet high, common in the mountains of Luzon, the Bisaya Islands, and Mindanao, Philippine Islands. The red fruits, borne singly or in clusters, are about 1.5 centimeters (half an inch) in diameter; they are juicy, but rather insipid.

For previous introduction, see No. 59274.

65268. *SACRAUJA FASCICULATA* Wall. Dilleniaceae.

According to Hooker (Flora of British India, vol. 1, p. 287), this is a bush or small tree about 30 feet high, native to the eastern subtropical regions of the Himalayas at altitudes of 2,000 to 4,000 feet. The long narrow leaves are very hairy, especially beneath; and the flowers, which are first white, then pink, are borne in red-branched cymes.

For previous introduction, see No. 55702.

65269. *SENECIO UNCINELLUS* DC. (*S. densiflorus* Wall.). Asteraceae.

According to Hooker (Flora of British India, vol. 3, p. 355), the branches and leaves of this shrubby composite are covered with gray cottony wool. The narrowly oval leaves are sometimes 9 inches long and 3 inches wide, and the small yellow flowers are in dense axillary and terminal clusters. Native to the central and western Himalayas.

For previous introduction, see No. 47792.

65270 and 65271.

From Darjiling, India. Seeds presented by G. H. Cave, curator, Lloyd Botanic Garden. Received October 20, 1925.

65270. *HELICIA ERRATICA* Hook. f. Proteaceae.

As described by Hooker (Flora of British India, vol. 5, p. 189), this is a small tree with shining green leathery leaves about 6 inches long, and pale yellowish flowers an inch across, borne in racemes 6 to 9 inches in length. The fruit is a hard nut an inch and a half in diameter. This tree is common in the mountains of Sikkim, India.

65271. *PINUS KHASIA* Royle. Pinaceae.

Although usually a small tree, this southern Asiatic pine sometimes attains a height of 200 feet and a diameter of over 3 feet in the mountains of Burma, according to Watt (Dictionary of the Economic Products of India, vol. 6, pt. 1, p. 241). A note in the India Forest Bulletin, Delhi, p. 57, 1923, states that the bark of this pine yields a large amount of tannin which makes good leather, with the further observation that it should be possible to harvest the bark without injury to the tree.

65272. *CEDRELA FISSILIS* Vell. Meliaceae.

From Tucuman, Argentina. Seeds presented by Dr. W. E. Cross, Director, Estacion Experimental Agricola. Received October 27, 1925.

A tall ornamental tree, native to Brazil and Paraguay, with pinnate leaves 10 to 15 inches long. Because of its handsome foliage, it should be suitable for growing as an avenue tree in the warmer parts of the United States.

For previous introduction, see No. 43417.

65273 to 65294.

From Manchuria. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received October 28, 1925.

65273 to 65294—Continued.

65273. *ACANTHOPANAX SENTICOSUM* (Rupr.) Harms. Araliaceae.

No. 4072. Hsiao lin. August 29, 1925. A rather low-growing, thorny-stemmed plant obtained in the woods on the mountain side near Mr. Petroff's summer home. This may prove to be of value in ornamental plantings and for use in cross-pollination work with some of the large species.

For previous introduction, see No. 57274.

65274. *CHLORIS VIRGATA* Swartz. Poaceae. Grass.

No. 4125. Harbin. September 6, 1925. The Chinese call this variety "brush grass." We collected it in the Ming Tombs section, where it is well distributed. The seed heads resemble Rhodes grass.

65275. *CIMICIFUGA* sp. Ranunculaceae.

No. 4167. Mefun. September 11, 1925. A tall-growing herbaceous plant with small fragrant flowers in long spikes.

65276. *ERAGROSTIS* sp. Poaceae.

No. 4127. Harbin. September 6, 1925. A fine seed-headed grass secured across the Sungan River.

65277. *ERAGROSTIS* sp. Poaceae.

No. 4128. Harbin. September 6, 1925. A fine, long, seed-headed grass.

65278. *FALCATA JAPONICA* Oliver. Fabaceae.

No. 4222. Hsiao lin. September 13, 1925.

For previous introduction, see No. 21899.

65279. *JUGLANS MANDSHURICA* Maxim. Juglandaceae.

No. 4133. Harbin. September 7, 1925. Presented by B. W. Skvortzow, who obtained the seed from a tree growing in his garden. In general appearance and flavor the nut resembles the butternut (*Juglans cinerea*).

For previous introduction, see No. 56405.

65280. *LESPEDEZA STIPULACEA* Maxim. Fabaceae.

No. 3865. Harbin. September 8, 1925. A low-growing plant with small, pea-shaped, pink to purple flowers, which is quite abundant in the new Russian cemetery.

For previous introduction, see No. 59379.

65281. *LILIUM DAURICUM* Ker. Liliaceae. Candlestick lily.

No. 4131. Harbin. September 7, 1925. From plants about 3 feet in height, growing in B. W. Skvortzow's garden.

For previous introduction, see No. 58553.

65282. *LONICERA* sp. Caprifoliaceae. Honeysuckle.

No. 4234. Ertsingientze. September 16, 1925.

65283. *MEDICAGO RUTHENICA* (L.) Trautv. Fabaceae.

No. 4055. Harbin. September 3, 1925. A yellow bronze-colored, flowering variety.

For previous introduction, see No. 40749.

65284. *PRUNUS ARMENIACA* L. Amygdalaceae. Apricot.

No. 4130. Harbin. September 7, 1925. A large-fruited apricot, presented by B. W. Skvortzow.

65285. *PYRUS* sp. Malaceae. Pear.

No. 4232. Ertsingientze. September 16, 1925. Wild pears from the mountain sides.

65273 to 65294—Continued.

65286 and 65287. SCHIZANDRA CHINENSIS (Turcz.) Baill. Magnoliaceae.

For previous introduction, see No. 57314.

65286. No. 4098. Hsiaolin. August 29, 1925.

65287. No. 4160. Mefun. September 11, 1925. A vine found on the mountain side, which is very handsome with its masses of compact bunches of small bright-red berries.

65288. SOJA MAX (L.) Piper (*Glycine hispida* Maxim.). Fabaceae. Soy bean.

No. 4132. Harbin. September 7, 1925. A light-yellow soy bean which is the result of eight years of selection work at the experiment station.

65289. SYNTHESISMA ISCHAEMUM (Schreb.) Nash. Poaceae. Grass.

No. 4126. September 6, 1925. A chicken-foot grass collected in the Sungan River bottom across from Harbin.

65290. VACCINIUM VITIS-IDAEA L. Vacciniaceae.

No. 4137. Harbin. September 9, 1925. Small, bright-red fruits resembling cranberries, but round and not so large, bought in the market where they were said to have come from the Eastern Hills. The flesh is white and the seeds, few in a fruit, are very small and of a yellowish color.

For previous introduction, see No. 50344.

65291. VICIA AMOENA Fisch. Fabaceae. Vetch.

No. 3840. Harbin. September 4, 1925.

For previous introduction and description, see No. 65085.

65292. VICIA JAPONICA A. Gray. Fabaceae. Vetch.

No. 4134. Harbin. September 8, 1925. The leaves of this are broader and not so coarse as those of the preceding [No. 65291].

65293. VICIA JAPONICA A. Gray. Fabaceae. Vetch.

No. 4229. Harbin. September 15, 1925. This is one of the best fruiting wild varieties. There are about 15 pods in a cluster, and because the pods do not fly open like many of the other varieties, they could be harvested to good advantage.

65294. ASTRAGALUS MELILOTOIDES Pall. Fabaceae.

No. 4070. Harbin. September 8, 1925. A small, narrow-leaved, upright growing variety with lavender flowers; collected in the new Russian cemetery.

65295. CROTALARIA STRIATA DC. Fabaceae.

From Eala, Belgian Congo, Africa. Seeds presented by V. Goossens, Directeur du Jardin Botanique d'Eala. Received October 28, 1925.

An ornamental shrubby leguminous plant, described in Curtis's Botanical Magazine (pl. 3200) as low growing, with rounded green branches and elongated terminal clusters of drooping yellow flowers, the petals striped with deep orange-brown. It is to be tested as a cover plant in the southern United States.

For previous introduction, see No. 52531.

65296. ARACHIS NAMBYQUARAE Hoehne. Fabaceae.

From Sao Paulo, Brazil. Seeds presented by H. Hoehne, Chefe da Seção de Botânica do Museu Paulista. Received November 6, 1925.

A Brazilian relative of the peanut, which according to Hoehne (*Historia Natural Botanica*, Matto Grosso, Brazil, pt. 12), is a rather shrubby, much-branched, prostrate or ascending plant. The pod is 2 to 3 inches long, with usually two seeds which are edible and very oily.

For previous introduction, see No. 62099.

65297. ALEURITES TRISPERMA Blanco. Euphorbiaceae. Banucalag.

From Manila, Philippine Islands. Seeds presented by S. Youngberg, acting director, Bureau of Agriculture. Received November 12, 1925.

This Philippine relative of the tung-oil tree of China (*Aleurites fordii*), as described in Bulletin No. 20 of the Bureau of Forestry of the Philippine Department of Agriculture, is a tree 30 to 50 feet in height, with heart-shaped leaves and rounded three-angled fruits about 2 inches in diameter. Each of the three cells of the fruit usually contains one seed; this is flattened circular, with a brittle shell and a white embryo surrounded by a large oily endosperm. This oil, known as bagilumbang oil, is of a light amber color somewhat paler than the commercial grades of tung, or lumbang, oil as it appears in the market. It is said to be so closely allied to tung oil as to be almost indistinguishable. The shells are much more easily broken than those of the lumbang (*A. moluccana*), and the kernel is not so difficult to separate from the shell.

For previous introduction, see No. 47942.

65298 to 65308.

From Buitenzorg, Java. Seeds presented by Dr. W. M. Docters Van Leeuwen, Director. Botanic Garden. Received November 3, 1925.

65298. CLITORIA HETEROPHYLLA Lam. Fabaceae.

As described by Lamarek (*Encyclopédie Méthodique Botanique*, vol. 2, p. 51), this East Indian plant is a climbing perennial with thread-like stems and compound leaves consisting of five small green leaflets which vary in form from orbicular to linear, borne on a winged axis. The blue flowers are borne singly in the leaf axils.

For previous introduction, see No. 22748.

65299. CROTALARIA VALETONII Backer. Fabaceae.

An East Indian plant described by C. A. Backer (*Bulletin du Jardin Botanique, Buitenzorg*, vol. 2, p. 324) as an erect, densely branched herb, 1 to 4 feet high, with simple hairy leaves and yellow flowers in terminal, 5-flowered to 12-flowered racemes.

65300. CROTALARIA VERRUCOSA L. Fabaceae.

A much-branched leguminous herb, about 2 feet high, found throughout the Tropics of both hemispheres. The white and blue flowers are in many-flowered compact racemes.

For previous introduction, see No. 51119.

65301. CROTALARIA VITELLINA Ker. Fabaceae.

A Brazilian shrub, which, as described in the Botanical Register (vol. 6, pl. 447), is about 3 feet high, of slender habit, with oval-oblong leaflets, gray beneath, and erect terminal racemes of reddish yellow flowers. The oblong pods, scarcely an inch long, are covered with velvety pubescence.

65302. CYMBOPOGON CITRATUS (DC.) Stapf. (*Andropogon citratus* DC.). Poaceae.

A large, coarse grass with long, narrow leaves 4 or 5 feet in length, native to eastern Asia. The oil from this and a number of related species is the citronella oil of commerce, used in perfumes and as a mosquito deterrent.

For previous introduction, see No. 35132.

65298 to 65308—Continued.

65303. *MEIBOMIA STIPULACEA* (DC.) Kuntze
(*Desmodium stipulaceum* DC.). Fabaceae.

An erect leguminous plant, 2 to 3 feet high, with oval-oblong leaflets and simple racemes of small pale-blue flowers. Native to tropical America.

65304. *PENNISETUM ORIENTALE TRIFLORUM*
(Nees) Stapf. Poaceae.

A perennial erect or ascending grass, 2 to 6 feet high, with a stout, creeping rootstock, and very narrow leaves 1 to 2 feet long. Native to the Himalayas.

For previous introduction, see No. 54553.

65305. *RHAPHS PARVIFLORA* (R. Br.) Chase. Poaceae.

A tall-growing coarse grass, about 3 feet high, with deep roots. The narrow, long-pointed leaves are 6 to 12 inches long. Native to India and distributed throughout eastern Asia; found also in Australia and South Africa.

65306. *SESBANIA PAULENSIS* Barb.-Rodr. Fabaceae.

A leguminous shrub described by Rodrigues (Plantas Novas Cultivadas Jardim Botânico do Rio de Janeiro, vol. 2, p. 13) as of erect habit, about 10 feet high, with narrow, angular branches, finely pinnate leaves, and handsome yellow flowers in few-flowered racemes.

65307. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceae. Soy bean.

Locally grown seeds.

65309. *VIGNA MEMBRANACEA* A. Rich. Fabaceae.

An Abyssinian relative of the cowpea described by A. Richard (Tentamen Florae Abyssinicae, vol. 1, p. 219) as having a herbaceous stem, membranous leaflets, and violet flowers. According to Richard, it grows in humid places, and the native Abyssinian name is *ent-esterot*.

65309. *COLOCASIA ESCULENTA* (L.) Schott. Araceae. Dasheen.

From Harbin, Manchuria. Tubers collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received November 20, 1925.

No. 4446. October 5, 1925. Procured in the market where they were shipped in from Cheff. They are medium-sized and rather attractive in appearance. (Dorsett.)

65310 to 65313.

From Tangar, Kansu, China. Seeds collected by J. F. Rock, Arnold Arboretum, Jamaica Plain, Mass. Received November 19, 1925. Notes by Mr. Rock.

65310. *BETULA* sp. Betulaceae. Birch.

No. 13283. Kokonor. September 29, 1925. A tree 20 to 30 feet in height, found with willows, spruces, etc., on the rocky valley slopes, and forming about 30 per cent of all the vegetation in the Rako Gorge, at an altitude of 11,000 feet. The bark, silvery gray to bluish, is curled in bands 4 inches in width, the branches are ascending, and the crown is oblong pointed. The deltoid leaves 1 inch broad and long are irregularly serrate.

65311. *PICEA* sp. Pinaceae. Spruce

No. 13281. September 29, 1925. A tree, 50 to 80 feet in height, with long, descending branches, often assuming the shape of a wind-swept Monterey cypress, and sometimes branching from the base. It is a handsome tree with its deep-green needles, the cones being 3 to 4 inches long, an inch in diameter, and greenish drab

65310 to 65313—Continued.

colored. This species occurs singly in the ravines of the Kokonor Mountains, at altitudes of 11,000 to 12,000 feet, or associated together with *Betula* sp., No. 13283 [No. 65310].

65312. *PICEA* sp. Pinaceae. Spruce.

No. 13282. September, 1925. A tree 40 to 50 feet high, which occurs in pure stands near Bamba, southeast of the Kokonor, at an altitude of 8,500 feet. The trunk of this tree is straight, the bark gray and scaly, resembling that of *Picea meyeri*, and the needles are glaucous. No large trees were observed, as they are rapidly cut down.

65313. *RHODODENDRON* sp. Ericaceae. Rhododendron.

No. 13278. Rako Gorge, Kokonor. September 28, 1925. A shrub 5 to 8 feet in height, which occurs in remote valleys of the Kokonor region, at an altitude from 10,000 to 11,000 feet. The leaves are oval, pale fawn-colored beneath, and 3 to 4 inches long; the flowers are whitish to pink.

65314. *ABELIA SCHUMANNII* (Graebn.) Rehder. Caprifoliaceae.

From Jamaica Plain, Mass. Plant presented by Dr. C. S. Sargent, Arnold Arboretum. Received November 24, 1925.

This handsome Chinese bush is described in The Garden (vol. 89, p. 596) as follows: It is evergreen, of somewhat spreading habit, and the young branches are pendulous with the weight of the flowers. The latter resemble small pentstemon flowers, and are a beautiful pale mauve with a white throat, a pale orange blotch, and are about an inch long. In England the flowering period commences in June and lasts for several weeks.

65315 to 65320.

From Buitenzorg, Java. Seeds presented by Dr. W. M. Docters Van Leeuwen, Director, Botanic Garden. Received November 11, 1925.

65315. *BRADBURYA PUBESCENS* (Benth.) Kuntze
(*Centrosema pubescens* Benth.). Fabaceae.

A slender leguminous vine, up to about 6 feet in length, with trifoliate leaves and oval leaflets, the latter about 2 inches long, and white or yellowish small flowers. Native to tropical America.

For previous introduction, see No. 32780.

65316. *CENCRUS VIRIDIS* Spreng. Poaceae. Grass.

An erect or ascending tropical American grass, usually about 2 feet high, branched or simple, with flat leaves up to 15 inches long. The spikes, usually dense and cylindrical, are 3 or 4 inches long.

65317. *LEPTOCHLOA CHINENSIS* (L.) Nees. Grass.

An erect or ascending annual grass, 2 to 4 feet high, with leaves sometimes a foot and a half long. Native to eastern Asia and found also in Australia.

65318. *LEPTOCHLOA FUSCA* (L.) Kunth. Poaceae. Grass.

A tall, perennial, tufted grass, 3 to 5 feet tall, with long, narrow leaves. Although native to India, it is found also in Egypt and Australia (in the last-named country in low wet ground).

65319. *LIMNOCHARIS FLAVA* (L.) Buch. Alismaceae.

A perennial aquatic plant, native to the West Indies and South America, with erect, angled stems over a foot high in the flowering period; narrowly oval or broadly oval leaves, and yellow flowers in umbellike clusters.

65315 to 65320—Continued.65320. *SMITHIA JAVANICA* Benth. Fabaceae.

An East Indian leguminous plant, described by Bentham (Miquel, *Plantae Junghuhnianae*, p. 211) as a prostrate or diffuse herb, with compound leaves having five to seven pairs of oblong leaflets about half an inch long and small yellow flowers.

65321 to 65330. ORYZA SATIVA L. Poaceae. Rice.

From Assam, India. Seeds presented by M. Ganguli, botanical assistant, Karimganj Farm. Received November 16, 1925.

Locally grown strains.

65321. A 1, *Lal Ans*.65322. A 2, *Kasuloth*.65323. A 3, *Basmati*.65324. A 10, *Katakata*.65325. A 23/1, *C. P. Ans*.65326. A 24/1, *Basanta Bahar*.65327. D 138/2, *Tepi Durmai*.65328. D 138/6, *Tepi Dumai*.65329. M 36/30, *Baurash Hurali*.65330. M 142, *Koi Hurali*.**65331 and 65332. CROTALARIA spp. Fabaceae.**

From Kisantu, Belgian Congo. Seeds presented by Frère J. Gillet, Jardin d'Essais de Kisantu. Received November 16, 1925.

65331. *CROTALARIA CYLINDROCARPA* DC.

A tropical African leguminous plant described by J. G. Baker (Oliver, *Flora of Tropical Africa*, vol. 2, p. 40) as an erect, subscrubby herb about 2 feet high, with pale-green elliptic leaflets and medium-sized flowers.

65332. *CROTALARIA HILDEBRANDTH* Vatke.

As described by W. Vatke (*Oesterreichische Botanische Zeitschrift*, vol. 29, p. 220) this is a densely bushy perennial, with broadly oval leaflets. Native to the Belgian Congo.

65333. VIBURNUM LOBOPHYLLUM Graebn. Caprifoliaceae.

From Kew, England. Seeds presented by Dr. A. W. Hill, Director, Royal Botanic Gardens. Received November 18, 1925.

An ornamental shrub from western China with coarsely toothed, rounded leaves, white flowers, and round bright-red berries about a third of an inch in diameter. George M. Darrow, of the Bureau of Plant Industry, states in his letter of October 12, 1925, that this is the only large-fruited species, so far as he knows, which has acid fruit without bitterness.

For previous introduction, see No. 53748.

65334 and 65335. CARISSA CARANDAS L. Apocynaceae. Karanda.

From the Philippine Islands. Seeds presented by P. J. Wester, Ballston, Va. Received November 24, 1925.

65334. *Karanda*. An evergreen spiny shrub or small tree, with dark-green spiny-tipped leaves, fragrant white flowers in small clusters, and reddish acid fruits about an inch in diameter. In India, where the plant is native, and also in the Philippines, where it has recently been introduced, the fruits are used as pickles when green and for jelly when ripe.

65334 and 65335—Continued

65335. *Perunkila*. A form with sweeter fruits than the *Karanda*, cultivated in the Philippines. According to Mr. Wester, it is one of the best small fruits introduced into the Philippines.

65336. GARCINIA VENULOSA (Blanco) Choisy. Clusiaceae.

From Manila, Philippine Islands. Seeds presented by S. Youngberg, acting director, Bureau of Agriculture. Received November 28, 1925.

A wild Philippine relative of the mangosteen (*Garcinia mangostana*), which, as described by P. J. Wester (*Food Plants of the Philippines*, p. 105), is a tree about 45 feet high, with large, oblong, leathery leaves and roundish, flattened, green fruits about 2 inches in diameter, with acid flesh inclosing several flat seeds. The Filipinos eat the fruits with fish, and Mr. Wester believes that they would probably make good preserves.

For previous introduction, see No. 32264.

65337 to 65436. SOJA MAX (L.) Piper (Glycine hispida Maxim.). Fabaceae. Soy bean.

From Harbin, Manchuria. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received November 27, 1925.

October 13, 1925. Seeds sent in the pods with a portion of the vine attached. These varieties were grown at the botanical garden of the Manchurian Agricultural Research Society of Harbin, and were obtained largely through the courtesy of B. W. Skvortzow and N. Glowkhoff, the superintendent. The botanical-garden number is given for each variety.

65337. No. 4465. No. 3. A large, creamy yellow, almost round bean with a rather large, black eye.

65338. No. 4466. No. 4. A small, creamy yellow, brown-eyed bean.

65339. No. 4467. No. 5. A deep-green, black-eyed bean which is oblong and slightly flattened one way.

65340. No. 4468. No. 6. A large bean, flattened one way, which is creamy yellow with a pale-yellow eye.

65341. No. 4469. No. 6a. This creamy yellow bean, nearly round, is of good size and has a reddish-brown eye.

65342. No. 4470. No. 8. A brown-eyed, creamy yellow bean which is of average size, oblong, and slightly flattened one way.

65343. No. 4471. No. 8a. A small, almost round, creamy yellow bean with a tinge of green.

65344. No. 4472. No. 9. An almost round bean which is a clear creamy yellow. The rather large eye is very dark brown.

65345. No. 4473. No. 10. A dark-brown oblong bean, somewhat flattened one way, with a reddish-brown eye.

65346. No. 4474. No. 11. A clear creamy yellow, rather round bean. The eye is reddish brown with a white center.

65347. No. 4475. No. 12. An oblong, dark-brown bean, somewhat flattened one way with a slightly reddish-brown eye.

65348. No. 4476. No. 14. A small, flattened, brown bean with a reddish-brown eye.

65349. No. 4477. No. 15. A shiny black oblong bean, having a dull black eye.

65350. No. 4478. No. 16. A pale-yellow bean which is slightly oblong and rather flattened one way. The eye is a rich creamy yellow.

65337 to 65436—Continued.

65337. No. 4475. No. 12. An oblong dark-brown bean flattened one way with a reddish-brown eye.

65338. No. 4480. No. 17. A small almost round bean which is creamy yellow toward the green. The eye is reddish-brown.

65339. No. 4481. No. 18. A large oblong dark-green bean flattened one way. The reddish-brown eye is very conspicuous.

65340. No. 4482. No. 19. A roundish oblong bean with a dark brown eye.

65341. No. 4483. No. 19. An oblong reddish-brown bean flattened one way with a dark reddish-brown eye.

65342. No. 4484. No. 20. An attractive oval bean flattened one way. The eye is which is dark reddish-brown.

65343. No. 4485. No. 21. A large oval creamy-yellow bean flattened one way. The eye is dark reddish-brown.

65344. No. 4486. No. 22. A brown bean flattened one way with a reddish-brown eye.

65345. No. 4487. No. 23. An almost round creamy-yellow bean with a reddish-brown eye.

65346. No. 4488. No. 24. An oval greenish-yellow bean flattened one way with an inconspicuous eye.

65347. No. 4489. No. 27. An oblong creamy-yellow bean rounded with a shade of green having a large reddish-brown eye.

65348. No. 4490. No. 30. A small oblong creamy-yellow bean with a shade of green having a large reddish-brown eye.

65349. No. 4491. No. 31. A brown bean almost round with a reddish-brown inconspicuous eye.

65350. No. 4492. No. 32. An oblong light-green bean flattened one way with a white eye.

65351. No. 4493. No. 33. A large oblong light-green bean flattened one way with a light-brown eye.

65352. No. 4494. No. 34. A large creamy yellow bean flattened one way with a large dark reddish-brown eye.

65353. No. 4495. No. 37. A large oblong flattened green bean having a large reddish-brown eye.

65354. No. 4496. No. 38. A long flat greenish-brown bean with a reddish-brown eye.

65355. No. 4497. No. 39. A large oblong bean with a yellow with a dark brown eye. The eye is large and reddish-brown.

65356. No. 4498. No. 38. An almost round light-green bean with a light-brown eye.

65357. No. 4499. No. 40. A large oblong flattened brown bean with a light-brown eye.

65358. No. 4500. No. 41. A good-sized bright-yellow bean with a strong and has a light reddish-brown eye.

65359. No. 4501. No. 42. A small shiny black oblong bean with a dull-black eye.

65360. No. 4502. No. 43. A rather large oblong shiny black bean with a dull-black eye.

65361. No. 4503. No. 47. A light-brown oblong bean of fair size with a rather small reddish-brown eye.

65362. No. 4504. No. 48. A greenish yellow almost round bean with a slightly protruding reddish-brown eye.

65363. No. 4505. No. 50. An almost round shiny black bean of fair size with a dull-black eye.

65337 to 65436—Continued.

65364. No. 4506. No. 51. A clear creamy yellow oblong bean slightly flattened and of fair size. The eye is whitish with a peculiar light-brown blotch at one end.

65365. No. 4507. No. 52. A greenish yellow, oblong nearly round bean of average size. The eye is dark reddish-brown.

65366. No. 4508. No. 53. A reddish brown, rather large bean. The eye is a dark reddish brown with a white slit in it.

65367. No. 4507. No. 54. A fairly good-sized oblong creamy yellow bean with a shade of green and a dark gray eye.

65368. No. 4508. No. 54. A rather large, creamy yellow somewhat wrinkled bean with a light-brown inconspicuous eye.

65369. No. 4509. No. 55. A nearly round, light-green or drab-colored bean with a dark green eye.

65370. No. 4510. No. 56. An almost round, greenish yellow bean of medium size, with a dark reddish-brown eye.

65371. No. 4511. No. 57. An oblong reddish-brown bean with a dark reddish-brown eye.

65372. No. 4512. No. 58. An oblong greenish yellow bean with a reddish-brown eye which has a light-brown blotch under it.

65373. No. 4513. No. 59. A large, oblong, rather dark-brown bean with a long reddish-brown eye.

65374. No. 4514. No. 59a. A small brown bean, flattened one way, with a reddish-brown eye.

65375. No. 4515. No. 60. An attractive-looking oblong brown bean with a reddish-brown eye.

65376. No. 4516. No. 60a. A good-sized greenish yellow oblong bean having a large reddish-brown eye.

65377. No. 4517. No. 61. A medium-sized oblong brown bean with a reddish-brown eye.

65378. No. 4518. No. 62. A drab or olive-green oblong bean which is blotched dark green around the nearly black eye.

65379. No. 4519. No. 63. An oblong, rather shiny black bean with a dull-black eye.

65380. No. 4520. No. 65. A pale-yellow, large, almost round bean having a reddish-brown eye.

65381. No. 4521. No. 66. A large, rather round, brown bean with a dark-brown eye.

65382. No. 4522. No. 67. An oblong, flattened, drab or olive-green bean with a reddish-brown eye.

65383. No. 4523. No. 67a. An almost round, shiny black bean of good size, with a dull-black eye.

65384. No. 4524. No. 68. A light-green oblong good-sized bean with a dark-green eye.

65385. No. 4525. No. 69. An oval, light greenish yellow bean with a light reddish-brown eye.

65386. No. 4526. No. 70. A large oblong bean, creamy yellow tinged with green. The eye is a reddish brown.

65387. No. 4527. No. 71. A shiny greenish brown oblong bean with an inconspicuous eye which has a brown blotch under one end.

65388. No. 4528. No. 72. A small, almost round, light-brown bean with a band of darker brown.

65389. No. 4529. No. 73. An oblong brown bean with a dark reddish-brown eye.

65337 to 65436—Continued.

65404. No. 4530. No. 73a. A good-sized oval yellowish green bean with a long reddish-brown eye.
65405. No. 4531. No. 74. A small oblong dull brownish black bean having the appearance of a wild soy bean.
65406. No. 4532. No. 76. A long flat brown bean having a reddish-brown eye.
65407. No. 4533. No. 77. A large, clear creamy yellow bean with a large, reddish-brown eye.
65408. No. 4534. No. 77a. An oblong good-sized bean of a light olive green. The eye is dull black.
65409. No. 4535. No. 78. A small brown bean which is almost round. The dark-brown eye is blotched a greenish brown.
65410. No. 4536. No. 79. An almost round, olive-green bean with a fairly dark brownish eye.
65411. No. 4537. No. 80. A medium-sized oblong brown bean having a reddish-brown eye with a light slit.
65412. No. 4538. No. 81. A rather small, almost round bean which is creamy yellow tinged with green. The eye is reddish brown.
65413. No. 4539. No. 82. An almost round, shiny black bean with a dull-black eye.
65414. No. 4540. No. 83. An attractive, large, creamy yellow bean with a large, black eye.
65415. No. 4541. No. 85. A very good-sized, almost round bean which is creamy yellow with a faint tinge of green. The eye is large and reddish brown.
65416. No. 4542. No. 86. A large oblong bean with peculiar markings of black and brown and a dull-black eye.
65417. No. 4543. No. 87. A medium-sized, almost round clear brown bean having a very narrow reddish-brown eye in which there is a light-colored slit.
65418. No. 4544. No. 87a. An oblong, flattened, wrinkled bean which is a greenish brown. The eye is long and reddish brown.
65419. No. 4545. No. 88. An oblong flattened bean with shiny and dull-brown blotches and with a long reddish-brown eye.
65420. No. 4546. No. 89. An almost round, creamy yellow bean with a large, reddish-brown eye.
65421. No. 4547. No. 90. An oblong, rather small, black bean with a dull-black eye.
65422. No. 4548. No. 91. A large, almost round, shiny black bean with a dull-black eye.
65423. No. 4548a. No. 91a. A large, almost round bean which is brown with a dull-black eye.
65424. No. 4549. No. 92. An attractive, clear creamy yellow, almost round bean with a large, black eye.
65425. No. 4550. No. 93. An oblong, rather light-brown bean with a reddish-brown eye.
65426. No. 4551. No. 94. An oblong, creamy yellow bean with a rich-yellow inconspicuous eye.
65427. No. 4552. No. 95. A small, oblong, creamy yellow bean with a rather small reddish-brown eye.
65428. No. 4553. No. 96. An oblong creamy green bean with a rather small, reddish-brown eye.

65337 to 65436—Continued.

65429. No. 4554. No. 97. A large oblong greenish yellow bean with a fairly large reddish-brown eye.
65430. No. 4555. No. 98. A large, attractive, almost round creamy yellow bean with a large, black eye.
65431. No. 4556. No. 99. A large, almost round, creamy yellow bean with a light reddish-brown eye.
65432. No. 4557. A large oblong flattened bean which is dark brown. The eye is small and reddish brown.
65433. No. 4558. A good-sized, creamy yellow, almost round bean. The inconspicuous eye is light yellow and blotched at one end with a deeper shade of yellow.
65434. No. 4559. A medium-sized oblong brown bean which is flattened. The small eye is reddish brown.
65435. No. 4560. A small, oblong, rather dull black bean with a dull-black eye.
65436. No. 4561. An almost round, creamy yellow bean with a slight greenish tinge and a small light-colored eye.

65437 and 65438. Rosa spp. Rosaceae. Rose.

From Nogent sur Vernisson, Loiret, France. Plants presented by L. Pardé, Directeur des Ecoles Forestières des Barres. Received December 3, 1925.

65437. ROSA ROXRURGHII X RUGOSA.

65438. ROSA MULTIFLORA Thunb.

5907 *Semis* 5124 M. V. Sent from China by M. Levaille, in 1907, through P. Cavalerie. (Letter of David Fairchild, January 51, 1925.)

65439. DAVIDIA INVOLUCRATA Baill. Cornaceae.

From Paris, France. Seeds presented by A. Gerard. Received November 23, 1925.

The Chinese dove tree, as this is sometimes called, is a native of the mountain forests of central and western China. In its native home it becomes a tree 75 feet tall, with a shapely pyramidal crown. When in bloom the tree is unusually striking because of the two or three large snow-white bracts which subtend each flower. These bracts are of unequal size, the largest being 4 to 8 inches long and 2 to 4 inches broad. The bright-green, oval, sharply toothed leaves are 3 to 6 inches long.

For previous introduction, see No. 62007.

65440 to 65443. CITRUS AURANTIUM L. Rutaceae. Sour orange.

From Cadiz, Spain. Bud wood presented by O. W. Barrett, agricultural adviser, Department of Agriculture and Labor, San Juan, Porto Rico. Received November 21, 1925.

65440. No. 2. *Seville*. From Cordoba.

65441. No. 3. *Regular Seville*. From Seville.

65442. No. 4. *Small Seville*. From Seville.

65443. No. 5. *Spineless Seville*. From Seville.

65444 to 65449. SOLANUM spp. Solanaceae. Wild potato.

From Angol, Chile. Tubers presented by Elbert Reed, Instituto Agrícola Bunster. Received November 20, 1925. Notes by Mr. Reed.

A collection of wild potatoes of possible value to plant breeders.

65444 to 65449—Continued.

65444. *SOLANUM* sp.

This plant is found on the west coast of the island of Chiloe, between 12 and 15 miles south of Quilan, the same locality where W. F. Wight, of the Bureau of Plant Industry, collected the wild potato seven or eight years ago.

65445. *SOLANUM* sp.

Seedling of a wild potato. These tubers were given to me by the family living at Quilan.

65446. *SOLANUM* sp.

These tubers were given to me at Puntra, the halfway station between Ancud and Castro, near Quilan, by a man who said he had found this potato about six years before on the west coast of the island. Since that time it has been cultivated in this man's garden and has been kept pure.

65447 to 65449. These tubers were given to me at Puntra.

65447. *SOLANUM* sp.

Red progeny of wild seed.

65448. *SOLANUM* sp.

White progeny of wild seed.

65449. *SOLANUM* sp.

Yellow progeny of wild seed.

65450. *CASTANEA HENRYI* (Skan) Rehd. and Wils. *Fagaceae*.

From Jamaica Plain, Mass. Scions presented by Dr. C. S. Sargent, Arnold Arboretum. Received December 7, 1925.

A Chinese chestnut which, as described in *Plantae Wilsonianae* (vol. 3, p. 196), is a deciduous tree 25 to 90 feet tall, with oblong, lanceolate, long-acuminate leaves, green on both sides. The burrs are either solitary or two or three in a bunch, and contain usually but one nut.

65451. *SACCHARUM OFFICINARUM* L. *Poaceae*. Sugar cane.

From Santiago de las Vegas, Cuba. Cuttings presented by Gonzalo M. Fortun, Director, Estación Experimental Agronómica. Received December 7, 1925.

Cuba No. 653. A new seedling cane variety introduced for trial in Louisiana.

65452. *SACCHARUM OFFICINARUM* L. *Poaceae*. Sugar cane.

From Rio Piedras, Porto Rico. Cuttings presented by Francisco Lopez Dominguez, Director, Insular Experiment Station. Received December 8, 1925.

Variety *B-11569*. Introduced as a new and promising variety for testing in comparison with the standard varieties now in use.

65453 to 65464. *ORYZA SATIVA* L. *Poaceae*. Rice.

From Rangoon, India. Seeds presented by R. Watson, Deputy Director of Agriculture, Southern Circle. Received November 23, 1925. Notes by Mr. Watson.

65453. *Emata A 16-34*. Grown in Prome and the northern parts of the Tharrawaddy districts of Lower Burma, where the annual rainfall ranges from 47 to 67 inches. It is an early-maturing variety and is grown on an area of about 300,000 acres. This rice is very popular among the wealthier people of Burma, being classed as a fancy table variety. It does not mill well, and for this reason the

65453 to 65464—Continued.

bulk of the crop goes through a process of soaking and steaming before being put through the mill. The resulting product, known commercially as "Milchar," is exported to southern India.

65454. *Letpuezin B 15-1*. The districts of Tharrawaddy, Insein, and to some extent Pegu are the main tracts in which this variety is grown. The rainfall ranges from 87 to 100 inches annually. The grain is neither so slender nor so long as that of *Emata* [No. 65453], and it is translucent and hard. It matures early and is planted on high ground where water does not lie long enough for late-maturing varieties to mature successfully.

65455 to 65458. These varieties, commonly known in England as "Burma rice," cover probably the major area in Burma and are also the varieties exported in the largest quantity. They give both a heavy crop and a high output in milling, and keep well when stored after being milled. The grain is short, plump, translucent, hard, and polishes well. The main defect is the presence of red-skinned grains which detract from its appearance when milled. The annual rainfall in Lower Burma, where the largest areas under rice are situated, ranges from 100 to 130 inches.

65455. *Ngasein 8 C 14-8*.

65456. *Ngachima C 14-31*.

65457. *Ngasein 10 C 15-10*.

65458. *Early Ngasein C 19-26*.

65459. *Kamakyi Nedon D 17-88*. Like *Ngasein*, this variety covers a large portion of Lower Burma, but it is confined chiefly to the districts where the rainfall is heavy, requiring about 100 inches. It is generally late in maturing. The grain, which is short, plump, and soft, gives a high output in milling, but does not stand storage well. Locally it is preferred to *Ngasein*, being softer, more palatable, and easily digested. The main defect in this rice is the presence of awns which reduce the weight of a measure of grain.

65460. *Byat E 19-23*. This rice is grown chiefly in the district of Amherst, where the rainfall is from 150 to 200 inches. The grain is very large and broad, but the kernel is soft and opaque. This is one of the largest grained rices known. It matures late and requires a heavy rainfall, about 200 inches.

65461 and 65462. These two varieties supply the glutinous rice of Upper and Lower Burma. They are used chiefly for making sweet cakes and other confections and when boiled or steamed turn into a sticky mass and may be used for puddings.

65461. *Kaukhnyin Ngacheik* (black).

65462. *Kaukhnyin* (white).

65463. *Sabanet*. This is a subvariety of *Medon*, having a grayish black mark, which is highly esteemed for local consumption. The grains become very long and slender when cooked. This rice is usually late maturing, and like *Medon* it mills well, but has the same defect of awns.

65464. *Hoito*. Of Japanese origin.

65465. *LALLEMANTIA IBERICA* (Bieb.) Fisch. and Mey. *Menthaceae*.

From Paris, France. Seeds presented by Vilmorin-Andrieux & Co. Received November 27, 1925.

A blue-flowered, herbaceous perennial, native to semiarid regions in Asia Minor and Syria, whose seeds yield an oil said to be a high-grade drying oil.

For previous introduction, see No. 35594.

65466. CANAVALLA MARITIMA (Aubl.) Thouars. Fabaceae.

From Haina, Dominican Republic. Seeds presented by Dr. R. Ciferri, Director, Estacion Agronómica de Haina. Received November 28, 1925.

This plant is adapted perfectly to the seashore, in some places completely covering the sand, in others forming large, green islands of vegetation. It may be valuable for sandy areas with its stoloniferous roots and numerous root tubercles. (Ciferri.)

For previous introduction, see No. 43331.

65467. ARGANIA SPINOSA (L.) Skeels (A. sideroxylon Roem. and Schult.). Sapotaceae.

From Mogador, Morocco. Seeds presented by Louis Beachamp, Inspecteur-Adjoint des Eaux et Forêts. Received December 1, 1925.

The argan tree of western Morocco is very limited in its range, occurring only in that part of the African Continent. It grows to a large size and bears an abundance of light-yellow fruits somewhat resembling small plums in shape. Cattle and goats are said to feed upon these fruits, which are exceedingly acrid to the taste. The seeds are very thick walled and contain an oil which is used as a food and also for illuminating purposes. Apparently the tree is not injured by considerable frost and it may thrive wherever the hardy citrus grows. (David Fairchild.)

65468. PRUNUS SERRULATA Lindl. Amygdalaceae. Flowering cherry.

From Yokohama, Japan. Seeds purchased from the Yokohama Nursery Co. Received December 2, 1925.

Obtained for use as stock for horticultural varieties of flowering cherries.

65469. CYTISUS BATTANDIERI Maire. Fabaceae.

From Algiers, Algeria, Africa. Seeds presented by Dr. René Maire, University of Algiers. Received December 3, 1925.

As described by Dr. René Maire (Bulletin de la Station de Recherches Forestières du Nord de l'Afrique, vol. 1, p. 72), this is a handsome unarmed shrub, with large, rounded, silvery leaflets and elongated clusters of golden yellow flowers. It is native to northern Morocco, and, in the opinion of Doctor Maire, merits cultivation as an ornamental.

65470. PERSEA INDICA (L.) Spreng. Lauraceae.

From Orotava, Tenerife, Canary Islands. Seeds presented by Juan Bolinaga, Directeur du Jardin de Acclimatation. Received December 9, 1925.

A handsome tree, with oblong acute leaves 3 to 8 inches long and small white flowers in panicles 3 to 6 inches long. Native to the Canary Islands, Madeira, and the Azores.

For previous introduction, see No. 65031.

65471 to 65476. BERBERIS spp. Barberry. Berberidaceae.

From Nogent sur Vernisson, Loiret, France. Seeds presented by L. Pardé, Directeur des Ecoles Forestières des Barres. Received December 3, 1925.

65471. BERBERIS CANADENSIS Mill.

Received as *Berberis angulizans*, which is now referred to *B. canadensis*. French-grown seeds of the common barberry of the eastern United States.

For previous introduction, see No. 49055.

65471 to 65476—Continued.**65472. BERBERIS DICTYOPHYLLA Franch.**

Variety *albicaulis*. A form with the lower surface of the leaves intensely white and the young shoots very glaucous. The typical form is a shrub 6 feet high, native to western China, with oblong-oval, sometimes spiny leaves, pale-yellow solitary flowers, and ovoid red berries.

65473. BERBERIS MORRISONENSIS Hayata.

A barberry closely resembling *Berberis dictyophylla*; as described by B. Hayata (Journal of the College of Science, Imperial University, Tokyo, vol. 30, p. 25), it is an erect, densely branched shrub, with three-parted spines and fascicled leathery oval leaves. Unlike *B. dictyophylla*, the berries are in fascicles and are more nearly round.

65474. BERBERIS UMBELLATA Wall.

A hardy subevergreen Himalayan shrub about 3 feet high, with narrow leaves slightly glaucous beneath and umbellike racemes of yellow flowers.

For previous introduction, see No. 53645.

65475. BERBERIS sp.

M. V. 4775.

65476. BERBERIS sp.

Farrer 555.

65477 and 65478. ROSA spp. Rose. Rose.

From Nogent sur Vernisson, Loiret, France. Seeds presented by L. Pardé, Directeur des Ecoles Forestières des Barres. Received December 3, 1925.

65477. ROSA MULTIFLORA Thunb.

5907 *Semis 5124 M. V.* Sent from China by M. Leveille, in 1907, through P. Cavalerie. (Letter of David Fairchild, January 31, 1925.)

Plants received under No. 65438.

65478. ROSA ROXBURGHII × RUGOSA.

Plants received under No. 65437.

65479. AGROSTIS STOLONIFERA L. Poaceae. Creeping bent grass.

From Hamburg, Germany. Seeds presented by F. Splechtner, Botanisches Staatsinstitut. Received December 3, 1925.

Locally grown seeds.

65480 to 65516.

From Manchuria. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received November 11, 1925.

65480. ACER MANDSHURICUM Maxim. Aceraceae. Maple.

No. 4155. Mefun. September 11, 1925. A Manchurian maple found on the mountain side.

65481. ACER TEGMENTOSUM Maxim. Aceraceae. Maple.

No. 4154. Mefun. September 11, 1925. An interesting green-barked maple with seeds in long racemes, found on the mountain side.

65482. ACONITUM sp. Ranunculaceae. Aconite.

No. 4210. Mefun. September 13, 1925. An attractive blue-flowered vine of a peculiar shape.

65483. ACTAEA SPICATA L. Ranunculaceae.

No. 4166. Mefun. September 11, 1925. A fairly high-growing herbaceous plant with a long spike of purple or black fruits, resembling that of the pokeberry (*Phytolacca dicandra*).

65480 to 65516—Continued.

65484. *ACTINIDIA ARGUTA* (Sieb. and Zucc.) Planch. Dilleniaceae.

No. 4156. Mefun. September 11, 1925. A variety from the mountain side, with larger and better flavored fruits than No. 4086 [No. 65177]. Not only is it a good ornamental but also a good-fruited vine, as the vine from which we collected the fruits was bearing a heavy crop. The fruits are eaten fresh or made into jam.

For previous introduction, see No. 45241.

65485. *ACTINIDIA POLYGAMA* (Sieb. and Zucc.) Planch. Dilleniaceae.

No. 4157. Mefun. September 11, 1925. The berries, orange-yellow when ripe, are about the same diameter as those of *Actinidia arguta*, but longer and more pointed. The plant is a vigorous grower.

65486. *ARALIA ELATA* (Miquel) Seem. Araliaceae.

No. 4205. Mefun. September 12, 1925. The plumlike seeds and the fruiting sprays containing small, black seeds make this a very handsome variety.

For previous introduction, see No. 44378.

65487. *BETULA COSTATA* Trautv. Betulaceae. Birch.

No. 4209. Mefun. September 13, 1925. A brown or yellow birch growing on the mountain side. We saw trees 2 to 3 feet in diameter and 75 to 100 feet in height.

65488. *CONVALLARIA MAJALIS* L. Convallariaceae. Lily of the valley.

No. 4141. Mefun. September 11, 1925. A large-flowered, wild Manchurian variety which is abundant on the mountain sides and foothills.

65489. *EUONYMUS ALATUS SURTRIFLORUS* (Blume) Franch. and Sav. Celastraceae.

No. 4206. Mefun. September 12, 1925. A small shrub which has bright-red fruits with an outer coating of creamy white. It makes a very handsome appearance with its prettily colored pink and red foliage against a background of green.

65490. *EUONYMUS MACROPTERUS* Rupr. Celastraceae.

No. 4211. Mefun. September 13, 1925. The handsomest euonymus I have seen; the pink and red fruits resemble miniature Japanese lanterns. The square receptacles are sometimes an inch and a half in diameter.

65491. *EUONYMUS* sp. Celastraceae.

No. 4247. Harbin. September 18, 1925. A small-leaved variety found in the Russian cemetery. The red or pink-coated seeds are in pendulous, pink fruits. This is an attractive and really good variety, but not as fine as No. 4211 [No. 65490].

65492. *IRIS* sp. Iridaceae.

No. 4123. New Russian cemetery, Harbin. September 3, 1925. A rather tall-growing, lavender-flowered variety which is quite common in this section.

65493. *LESPEDEZA DAURICA* (Laxm.) Schindler. Fabaceae.

No. 3842. Harbin. September 15, 1925. A tall plant with white pealike flowers.

65494. *LESPEDEZA BICOLOR* Turcz. Fabaceae.

No. 4218. Mefun. September 13, 1925. A purple or red-flowered shrubby variety, about 6 feet high, growing near the tops of high mountains.

65480 to 65516—Continued.

65495. *LILIUM* sp. Liliaceae. Lily.

No. 4143. Mefun. September 13, 1925. Plants growing on the western and northwestern slopes of mountains. The leaves of this variety are in whorls, and there are one to five or more seed pods to the plant.

65496. *LILIUM* sp. Liliaceae. Lily.

No. 4144. Mefun. September 13, 1925. From plants growing at the top of one of the highest mountains. The leaves are similar to those of *Lilium longiflorum* *etivium*.

65497. *LONICERA CHRYSANTHA* Turcz. Caprifoliaceae. Coraline honeysuckle.

No. 4203. Mefun. September 12, 1925. A very attractive shrubby honeysuckle bearing large red berries.

For previous introduction, see No. 42315.

65498. *LYCHNIS* sp. Silenaceae.

No. 4212. Mefun. September 13, 1925. A bright red-flowered herbaceous plant.

65499. *MALUS* sp. Malaceae. Crab apple.

No. 4228. En route from Mefun to Harbin, at a station east of Ertsingientze. September 14, 1925. A small red-fruited variety.

65500. *ACTINOSTEMMA LORATUM* Maxim. Cucurbitaceae.

No. 4213. Mefun. September 13, 1925. A very interesting small plant found climbing over plants on the mountain side.

65501. *PINUS KORAIENSIS* Sieb. and Zucc. Pinaceae.

No. 4219. Mefun. September 13, 1925. Known here as Manchurian cedar, but to us it is the five-needle pine. The large trees grow near the tops of the mountains, while the smaller trees are found at lower levels.

For previous introduction, see No. 35615.

65502. *RHAMNUS DAVURICA* Pall. Rhamnaceae.

No. 4202. Mefun. September 12, 1925. The tree from which this material was obtained was 15 feet high.

For previous introduction, see No. 62230.

65503. *RHODODENDRON DAURICUM* L. Ericaceae.

No. 4215. Mefun. September 13, 1925. Obtained from the top of a high mountain.

For previous introduction, see No. 38413.

65504. *RIRES MANSHURICUM* (Maxim.) Komarov. Grossulariaceae. Currant.

No. 4159. Mefun. September 13, 1925. A fine red-fruited variety found on the mountain side. The fruits, produced in bunches of good size, are large and of good quality.

For previous introduction, see No. 40460.

65505. *ROSA* sp. Rosaceae. Rose.

No. 4164. Mefun. September 11, 1925. These hips are from the mountain side.

65506. *SAMBUCUS RACEMOSA* L. Caprifoliaceae. Red elder.

No. 4162. Mefun. September 11, 1925. A variety, producing small red fruits, found on the mountain side.

For previous introduction, see No. 36744.

65507 and 65508. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceae. Soy bean.

65480 to 65516—Continued.

65507. No. 4151. Mefun. September 11, 1925. A wild soy bean growing abundantly over wide areas. It varies considerably in the size of the leaves and perhaps in other ways.

65508. No. 4231. Ertsingtientze. September 16, 1925. A wild soy bean from the mountain side.

65509. *SYRINGA AMURENSIS* Rupr. Oleaceae. Lilac.

No. 4230. Harbin. September 15, 1925. Obtained from plants in the new Russian cemetery. We do not know whether this lilac is a white, purple, or lavender-flowered variety.

For previous introduction, see No. 57344.

65510. *VAGNERA* sp. Convallariaceae.

No. 4165. Mefun. September 11, 1925. A low-growing herbaceous plant with small bright-red fruits. It bears a spray of small, white fragrant flowers.

65511. *VIRURNUM BUREJAETICUM* Regel and Herd. Caprifoliaceae.

No. 4204. Mefun. September 12, 1925. An attractive shrub with dense clusters of red oblong berries which turn black when fully ripe.

For previous introduction, see No. 58807.

65512. *VIRURNUM SARGENTI* Koehne. Caprifoliaceae.

No. 4201. Mefun. September 12, 1925. A strong-growing shrub up to 12 or 15 feet high, with large clusters of bright-red fruits which are very showy. We do not recall having seen the flowers.

For previous introduction, see No. 43734.

65513. *VICIA* sp. Fabaceae. Vetch.

No. 3840. Harbin. A common leguminous plant found all over the cemetery and in many places in the country where we have been.

65514. *VICIA* sp. Fabaceae. Vetch.

No. 4152. Mefun. September 11, 1925. A small-leaved legume growing over brush 3 to 4 feet high, with pods like peas.

65515. *VITIS AMURENSIS* Rupr. Vitaceae. Amur grape.

No. 4153. Mefun. September 11, 1925. A local wild variety which is the best we have ever seen. The vine is a very strong grower; the bunches are large and some of them very compact. The deep-blue or black grapes are of good size, but contain large seeds and very little flesh, though there is considerable well-flavored juice which is made into wine.

For previous introduction, see No. 57367.

65516. *ZEA MAYS* L. Poaceae. Corn.

No. 4158. Mefun. September 11, 1925. A yellow dent corn from a field on a mountain side near the railway station.

65517 to 65552.

From Manchuria. Collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received November, 1925.

65517. *AMPELOPSIS* sp. Vitaceae.

No. 4279. From the Hai Yuan Kuan Temple (Sea Cloud Temple) which is commonly known as the Ta Lu Hua Temple, located in the Taluhua Mountains. September 24, 1925. Seeds of a hard-wooded vine with greenish yellow fruits. This might prove useful as an ornamental.

65517 to 65552—Continued.

65518. *AMYGDALUS PERSICA* L. (*Prunus persica* Stokes). Amygdalaceae. Peach.

No. 4276. Seeds from fruits obtained at the South Temple compound of the Ta Lu Hua Temple. September 24, 1925. Called *mao tao* (hairy peach) because of the fuzz on the fruit. A small, round, green peach which is a freestone; the flesh is greenish white and the quality very good.

65519. *CHAETOCLOA ITALICA* (L.) Scribn. (*Setaria italica* Beauv.). Poaceae. Millet.

No. 4268. September 23, 1925. A few seed heads of an ordinary millet obtained near Koupangtze.

65520. *CORYLUS SIEBOLDIANA* MANDSHURICA (Maxim.) C. Schneid. Betulaceae. Hazelnut.

No. 4454. Harbin. October 9, 1925. Seeds obtained at the market in Fuchia Tien, the Chinese section.

For previous introduction, see No. 36727.

65521. *DIOSCOREA* sp. Dioscoreaceae. Yam.

No. 4455. October 11, 1925. Air tubers of the yam grown by the Chinese gardeners here at Harbin and vicinity.

65522. *DOLICHOS LABLAB* L. Fabaceae. Hyacinth bean.

No. 4272. These seeds of *yang chiao tou* (goat-horn bean) were obtained at the South Temple compound of the Ta Lu Hua Temple, September 24, 1925. The green pods are used as a fresh vegetable or are sliced up and made into pickles.

65523. *FRAXINUS* sp. Oleaceae. Ash

No. 4277. September 24, 1925. Seeds from small trees along the trail between the Central Temple compound and the East Temple compound.

65524. *GOSSYPIMUM NANKING* Meyen. Malvaceae. Cotton.

No. 4270. September 23, 1925. Seeds gathered en route from Koupangtze to Kuangming.

For previous introduction, see No. 62595.

65525. *HEMEROCALLIS* sp. Liliaceae.

No. 4280. Ta Lu Hua Temple. Seeds collected September 24, 1925.

65526. *IRIS DICHOTOMA* Pall. Iridaceae.

No. 4275. September 24, 1925. Seeds obtained along the trail from the South Temple compound to the Central Temple compound, about 1,500 to 2,000 feet altitude. Perhaps this is the attractive purple iris seen in other places, but it may prove to be a lavender one.

For previous introduction, see No. 62178.

65527. *JUGLANS MANDSHURICA* Maxim. Juglandaceae.

No. 4441. September 30, 1925. *Shan ho t'ao* (wild mountain walnut). Seeds were obtained at Hsiaoliu.

For previous introduction, see No. 62611.

65528. *LESPEDEZA* sp. Fabaceae.

No. 4453. Harbin. October 9, 1925. Seeds of a rather tall-growing plant with numerous very attractive pea-shaped purple flowers, obtained in the new Russian cemetery. Some of the plants are very pendulous.

65529. *LILUM* sp. Liliaceae. Lily.

No. 4274. Seeds collected along the trail from the South Temple compound to the Central compound, September 24, 1925.

65517 to 65552—Continued.

65530. *MAACKIA AMURENSIS* Rupr. Fabaceae.

No. 4438. A variety with rather inconspicuous white flowers. These seeds were obtained at Hsiaoliu, September 30, 1925.

For previous introduction, see No. 57301.

65531. *MALUS* sp. Malaceae. Crab apple.

No. 4350. Ertshintentze. Seeds collected September 25, 1925. A wild Chinese crab apple from the mountains. This is a fine ornamental and may prove valuable as a stock and in connection with plant-breeding experiments.

65532. *CYNANCHUM AURICULATUM* Royle. Asclepiadaceae.

No. 3841. Harbin. September 15, 1925. Seeds of a large-leaved, pink-flowered, fragrant vine. It has a milky juice, and the seed pod is similar to that of the milkweed.

65533 to 65535. *ORYZA SATIVA* L. Poaceae. Rice.

65533. No. 4348. A few seed heads of an upland rice obtained en route from the Ta Lu Hua Temple to Koupangtze, September 25, 1925.

65534. No. 4580. A water rice, bearded, with a white hull, grown a few miles west of Harbin in the Sungari River bottom.

65535. No. 4581. Harbin. October 13, 1925. Seed heads of a red-hulled bearded water rice which is called *pukado* (?) and which is supposed to be a Japanese variety.

65536. *PHYSALIS ALKEKENGI* L. Solanaceae.

No. 4439. Purchased en route from Hsiaoliu to Harbin. Fruits orange scarlet, of fine quality.

65537 to 65542. *PYRUS* spp. Malaceae. Pear.

65537. *PYRUS* sp.

No. 4253. Koupangtze. September 22, 1925. Seeds of the *pa li hsiang li* (eight-li fragrant pear). F. C. Reimer, Talent, Oreg., says that this is the most important Chinese pear.

65538. *PYRUS* sp.

No. 4254. Koupangtze. September 22, 1925. Seeds of the *hsiang shui li* (fragrant water pear).

65539. *PYRUS* sp.

No. 4255. Seeds of a variety, which, according to Professor Reimer, is one of the four most important Chinese pears for stock. Obtained at the Ta Lu Hua Temple, September 22, 1925.

65540. *PYRUS* sp.

No. 4269. September 24, 1925. *Tu li* (wild pear). Seeds obtained from trees growing near the Ta Lu Hua Temple. The natives use this pear as stock for all the cultivated varieties.

65541. *PYRUS* sp.

No. 4416. September 26, 1925. *Chien pa li* (pointed bottom pear). Seeds purchased at Hsiungyaoching.

65542. *PYRUS* sp.

No. 4417. Hsiungyaoching. September 26, 1925. Seeds of the *man yuan hsiang li* (fragrant-in-the-whole-orchard pear), used in the manufacture of brandy.

65543. *RICINUS COMMUNIS* L. Euphorbiaceae. Castor bean.

No. 4582. Harbin. October 14, 1925. Seeds of a variety free from awns on the seed pods, obtained from the botanical garden of the Manchurian Agricultural Research Society.

65517 to 65552—Continued.

65544 and 65545. *SALIX* spp. Salicaceae. Willow.

Cuttings from the Sungari River bottom, October 15, 1925. These two forms should make good basket stock, as the growth is long and slender and about 8 feet in length. These willows are said to be cut off every year for fuel.

65544. *SALIX* sp.

No. 4590. A yellow-bark willow.

65545. *SALIX* sp.

No. 4591. A red-bark willow.

65546 to 65549. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceae. Soy bean.

65546. No. 4273. Seeds of a large-fruited, green soy bean, obtained at the Ta Lu Hua Temple, September 24, 1925.

65547. No. 4437. September 30, 1925. Wild soy bean. These seeds were obtained by Peter Liu at Hsiaoliu.

65548. No. 4448. October 5, 1925. A wild soy bean presented by B. W. Skvortzow. These seeds were obtained in the Sungari River bottom.

65549. No. 4583. October 14 and 15, 1925. Seeds of a wild soy bean from the Sungari River bottom.

65550. *SPIRAEA* sp. Rosaceae. Spirea.

No. 4278. September 24, 1925. Seeds from plants growing near the Ta Lu Hua Temple. Apparently the plants had bloomed profusely. This may prove valuable as an ornamental.

65551. *TILIA AMURENSIS* Rupr. Tiliaceae. Linden.

No. 4271. Seeds of a small-leaved Manchurian linden growing along the trail from the South Temple compound to the Central Temple compound.

65552. *TRIFOLIUM REPENS* L. Fabaceae. White clover.

No. 4440. September 30, 1925. Seeds of a white clover obtained at Hsiaoliu, along the railroad. This variety is apparently an introduction.

65553. *EUCALYPTUS LEHMANNI* (Schauer) Preiss. Myrtaceae.

From Hobart, Tasmania. Seeds presented by L. A. Evans, Secretary of Agriculture, Agricultural and Stock Department. Received November 27, 1925.

In a note published under No. 28849, Alwin Berger, of La Mortola, Ventimiglia, Italy, states that this is a large shrub or small tree with rough reddish bark peeling off in irregular sheets. The greenish yellow flowers open from July to September. It is native to Western Australia, and Mr. Berger believes it to be a valuable ornamental.

65554 to 65558.

From Kharkof, Ukraine, Russia. Seeds presented by L. P. Bordakoff, All-Ukrainian Seed-Producing Association, through F. A. Coffman, Bureau of Plant Industry. Received November 30, 1925. Notes by Mr. Bordakoff.

65554. *AVENA SATIVA* L. Poaceae. Oats.

Schatilovsci (mutica). From the Schatilov Experiment Station.

65555 to 65557. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceae. Common wheat.

Varieties of spring wheat from the Saratov Experiment Station.

65555. No. 62 (*lutescens*). For humid dry regions.

65554 to 65558—Continued.

65556. No. 604 (*albidum*). To be used in dry regions.

65557. No. 721 (*albidum*). For dry regions.

65558. *TRITICUM DURUM* Desf. Poaceae.
Durum wheat.

No. 05 (*hordeiforme*). From the Ekaterinoslav Experiment Station. Suited to dry regions.

65559. TRITICUM TURGIDUM L. Poaceae. Poulard wheat.

From Vannes, Brittany, France. Seeds collected by John Ashton, Columbia, Mo., and presented through C. E. Leighty, Bureau of Plant Industry. Received November 30, 1925.

This variety, collected in June, 1925, is said to yield a very heavy crop. It is not yet known by seedsmen. (*Ashton*.)

65560 to 65564.

From Italy. Seeds collected by John Ashton, Columbia, Mo., and presented through C. E. Leighty, Bureau of Plant Industry. Received November 30, 1925. Notes by Mr. Ashton.

65560. *ORYZA SATIVA L.* Poaceae. Rice.

No. 5. An excellent variety known as *Riso Maratella* (*Maratella rice*), collected in Pavia, Lombardy, May 1, 1925. It is a little earlier than other varieties found there.

65561. *TRITICUM AESTIVUM L. (T. vulgare Vill.)*. Poaceae. Common wheat.

No. 1. Var. *Gentil Rosso*. From Asti.

65562. *TRITICUM TURGIDUM L.* Poaceae.
Poulard wheat.

No. 2. Var. *Civitella*. From Asti.

65563. *TRITICUM* sp. Poaceae. Wheat.

No. 3. Sometimes called *Padovano* but more commonly known as *Cologna Veneto*. From Asti.

65564. *TRITICUM* sp. Poaceae. Wheat.

No. 4. *Cologna Veneto*. From Pavia, Lombardy. May, 1925.

65565 to 65572. TRITICUM AESTIVUM L. (T. vulgare Vill.) Poaceae. Common wheat.

From Kharkof, Ukraina, Russia. Seeds presented by L. P. Bordakoff, All-Ukrainian Seed-Producing Association, through F. A. Coffman, Bureau of Plant Industry. Received November 30, 1925. Notes by Mr. Bordakoff.

65565 to 65572. Varieties of winter wheat.

65565. No. 117. (*ferrugineum*). From the Kharkof Experiment Station. For dry regions.

65566. *Hour Councours (ferrugineum)*. For humid regions.

65567. *Triumf Podolian (ferrugineum)*. For humid regions.

65568. *Kooperatorca (erythrospermum)*. From the Odessa Experiment Station. This variety, which has very good baking qualities, is especially suited for dry regions.

65569. *Semka (erythrospermum)*. From the Odessa Experiment Station. For humid regions.

65570. *Ukrainka (erythrospermum)*. From the Mironof Experiment Station. For humid regions.

65571. No. 120 (*millitum*). From the Kharkof Experiment Station. For dry regions.

65565 to 65572—Continued.

65572. No. 0274. "*Girca*" (*millitum*). From the Odessa Experiment Station. For dry regions.

65573. GOSSYPIMUM HIRSUTUM L. Malvaceae. Cotton.

From Pretoria, Transvaal, Union of South Africa. Seeds presented by C. P. Lounsbury, chief, division of entomology, Department of Agriculture. Received December 1, 1925.

Cambodia. Seeds originally from Mr. Hilson, cotton specialist, Coimbatore, India.

65574. ORYZA SATIVA L. Poaceae. Rice.

From Taihoku, Formosa, Japan. Seeds presented by Dr. Kintaro Oshima, Director, Government Research Institute. Received December 4, 1925.

Commonly known as "toa tsu" in Taiwan. (*Oshima*.)

65575. DIPLORHYNCHUS MOSSAMBICENSIS Benth. Apocynaceae.

From Tjolotjo, Southern Rhodesia. Seeds received through H. L. Shantz, Bureau of Plant Industry. Received December 7, 1925.

This variety grows in dry regions and becomes a rather handsome tree. (*Shantz*.)

In a note published under No. 48248, J. Burt-Davy states that this is a small Rhodesian tree yielding a rubber in quantity, which, however, is of doubtful quality.

65576. EUCALYPTUS URNIGERA Hook. f. Myrtaceae.

From Hobart, Tasmania. Seeds presented by L. A. Evans, Secretary of Agriculture, Agricultural and Stock Department. Received December 4, 1925.

A tall shapely tree, native to the mountains of Tasmania, and said to be one of the hardest of the eucalypts. The pale-yellow flowers, in clusters of three, are followed by urn-shaped capsules.

For previous introduction, see No. 50210.

65577. GOSSYPIMUM HIRSUTUM L. Malvaceae. Cotton.

From Manila, Philippine Islands. Seeds presented by S. Youngberg, acting director, Bureau of Agriculture. Received December 4, 1925.

A white variety of cotton grown in the Philippines.

65578 to 65583. DIOSPYROS KAKI L. f. Diospyraceae. Kaki.

From Canton, China. Bud wood collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received December 15, 1925. Notes by Mr. McClure.

Numbers 65578 to 65581 (October 23, 1925) are from the village of Pakshan, Honam Island, about 6 miles east of the Canton Christian College.

65578. No. 173. *Taii paat sin tsz*. A few-seeded variety with very attractive bright-red fruits which are globular, medium sized, and of good flavor, obtained from Mok Fai T'ong. The fruits are usually ripened by the banyan-leaf method. The season extends from the last of August until the early part of October. The shipping quality of this variety is not quite so good as that of No. 174 [No. 65579].

65579. No. 174. *Kai sam tsz*. Obtained from a tree belonging to Mok Hang. This is a seedless strain of the small-fruited variety

65578 to 65583—Continued.

known as "chicken-heart persimmon." There seem to be a number of subvarieties falling under this group, varying somewhat in size, shape of fruit, and in number of seeds. The fruits are oblong, sometimes nearly square in cross section, and with a slight, sharp projection at the apex. The season for this variety or group extends from the last of August to the last of October, the longest of any variety known to me. As with other varieties of persimmons here, this variety is harvested when the skin has turned yellow, but while the flesh is still firm. The fruits are ripened by what is known as the banyan-leaf method; they are kept in earthenware jars between layers of fresh banyan leaves for two to four days to remove the pucker. The flavor is excellent, suggesting the rich, sweet, aromatic flavor of well-ripened fruits of *Diospyros virginiana*. This is one of the most prolific varieties cultivated here.

65580. No. 175. *Taai tsz*. From a tree with unusually large leaves, belonging to Mok Pan. A large, red-fruited, seedless variety of excellent quality and flavor. The season is from late August until early October.

65581. No. 176. *Sai paat sin tsz*. A rather small red-fruited variety with few seeds, obtained from Mok Oo. The fruits are larger and more nearly globose than those of No. 174 [No. 65579]. This variety seems to be distinguished from No. 173 [No. 65578] simply by the smaller average size of its leaves and fruits.

65582. No. 177. Toichung, Honam Island. October 26, 1925. *Shui tsz*, *Ma'tai yeung tsz*. Obtained from Chue Tung. The fruits are 4 to 5 centimeters in diameter, globose, light yellow, rather seedy, and have firm flesh.

65583. No. 178. Toichung, Honam Island. October 26, 1925. *Taai shui tsz*. From a tree belonging to Chue Tung. A grafted tree bearing large, nearly seedless fruits with firm, mellow flesh, which should be ripened by the lime-water method.

65584 and 65585.

From Santa Cruz, Palma, Canary Islands. Seeds purchased by David Fairchild, agricultural explorer, Bureau of Plant Industry, Allison V. Armour expedition, through Aboucher & Co. Received December 7, 1925.

65584. *CYTISUS PALMENSIS* (Christ) Hutchinson. Fabaceae. Tagasaste.

A stout leguminous shrub, up to 12 feet high, of rather lax habit, with long slender branches and green trifoliate leaves with silky pubescent lower surfaces. The white flowers are in axillary clusters among the branches. It is native to the Canary Islands, where it is considered an excellent drought-resistant forage plant.

For previous introduction, see No. 28827.

65585. *PSORALEA BITUMINOSA* L. Fabaceae.

The *Tedera* is a herbaceous perennial about 3 feet high which is found everywhere along the roads and trails throughout the barrancos of the islands and on some of the terraces, where the soil is too shallow and dry for alfalfa; it is cultivated for its hay. It is said to be a splendid milk producer. (Fairchild.)

For previous introduction, see No. 64970.

65586. *MONTEZUMA SPECIOSISSIMA* DC. Bombacaceae.

From San Juan, Porto Rico. Seeds presented by C. A. Figueroa, assistant agricultural adviser, Department of Agriculture and Labor. Received December 3, 1925.

A Porto Rican tree, which, as described by N. L. Britton and Percy Wilson (Scientific Survey of Porto Rico, vol. 5, p. 565), is up to 50 feet in height with a trunk sometimes a foot in diameter. The papery, rounded-oval leaves are 2 to 8 inches long, and the tree is commonly planted for shade in Porto Rico because of its showy flowers, which are deep pink shading to crimson within, with yellow anthers. The hard, valuable, durable wood, brown in color, is used for cabinetwork and for general construction.

65587. *MEIBOMIA GANGETICA* (L.) Kuntze (*Desmodium gangeticum* DC.). Fabaceae.

From Dehra Dun, United Provinces, India. Seeds presented by R. N. Parker, forest botanist. Received December 15, 1925.

As described by J. G. Baker (Hooker, Flora of British India, vol. 2, p. 108), this is a woody herbaceous plant, more or less erect and 3 to 4 feet high, with oblong leaflets 3 to 6 inches long and copious lateral and terminal flower clusters. Native to the Himalayas, and distributed throughout the East Indies and tropical Africa. Introduced for trial as a forage plant and for use in soil improvement in the Southern States.

For previous introduction, see No. 30874.

65588 to 65590.

From Kew, Surrey, England. Seeds presented by Dr. S. D. Cotton, keeper of the herbarium, Royal Botanic Gardens. Received December 15, 1925. Notes by Doctor Cotton.

65588 and 65589. *BETA VULGARIS* L. Chenopodiaceae. Wild beet.

65588. Collected in North Somerset by I. M. Roper.

65589. Collected in Lymington by Miss S. J. Chandler.

65590. *BRASSICA OLERACEA* L. Brassicaceae. Wild cabbage.

Collected in a remote part of Dorsetshire.

65591 to 65610. *BERBERIS* spp. Berberidaceae. Barberry.

From Paris, France. Seeds presented by Vilmorin-Andrieux & Co. Received December 15, 1925.

65591. *BERBERIS ACUMINATA* Franch.

A Chinese barberry, which, as described by W. J. Bean (Trees and Shrubs Hardy in the British Isles, vol. 1, p. 234), is an evergreen shrub of open spreading habit, with bright-red young growth and stout three-parted spines 3 to 6 inches long. The brownish yellow flowers, three-fourths of an inch broad, are in clusters of four to eight in the axils of the previous year's shoots. The oblong, black fruits are half an inch long. Native to central China.

For previous introduction, see No. 58088.

65592. *BERBERIS AGGREGATA* PRATT C. Schneid.

As described in Curtis's Botanical Magazine (pl. 8549), this is a hardy shrub 6 to 10 feet high, with slender three-parted spines, oval leaves,

65591 to 65610—Continued.

narrow panicles of yellow flowers, and egg-shaped salmon-red fruits about one-fourth of an inch long. It is a native of western China and grows very freely under cultivation at Kew, England.

For previous introduction, see No. 58136.

65593. *BERBERIS CANADENSIS* Mill.

Received as *Berberis angulizans*, which is now referred to *B. canadensis*. This is the common barberry of the eastern United States, and seeds are now introduced for the use of horticulturists studying the genus *Berberis*.

For previous introduction, see No. 49055.

65594. *BERBERIS CANDIDULA* C. Schneid.

A prostrate evergreen shrub with yellowish branchlets, elliptic leaves, white beneath, and violet-black fruits. Native to central China.

65595. *BERBERIS DICTYOPHYLLA* Franch.

A graceful bushy barberry, about 6 feet high, native to southwestern China, with small tufts of oblong leaves, glaucous beneath, solitary yellow flowers, and ovoid red berries.

For previous introduction, see No. 59003.

65596. *BERBERIS DIELSIANA* Fedde.

A spreading, loosely branched, Chinese shrub often 10 feet high, with elliptic leaves that are whitish beneath. The beauty of the red fruits is accentuated by the bronzy color of the leaves in the fall.

For previous introduction, see No. 58103.

65597. *BERBERIS FRANCISCI-FERDINANDI* C. Schneid.

For previous introduction and description, see No. 65230.

65598. *BERBERIS GAGNEPAINI* C. Schneid.

An evergreen Chinese shrub 3 to 6 feet high, with leathery leaves, spiny on the margins, and delicate yellow flowers on red pedicels. The ellipsoid berries are dark purple.

For previous introduction, see No. 61974.

65599. *BERBERIS JULIANAE* C. Schneid.

A shrubby barberry, up to 7 feet high, native to western China. It has thick three-cleft spines about 1½ inches long, narrowly oval leathery leaves, and small, yellow flowers.

For previous introduction, see No. 63336.

65600. *BERBERIS LEVIS* Franch.

An evergreen shrub up to 5 feet high, usually with long spines, with narrow-linear leaves, and small purplish fruits. Native to western China.

For previous introduction, see No. 34553.

65601. *BERBERIS MORRISONENSIS* Hayata.

For previous introduction and description, see No. 65473.

65602. *BERBERIS RURROSTILLA* Hort.

"An elegant seedling barberry of unrecorded parentage, but probably a hybrid between *Berberis wilsonae* and *B. concinna*. It has the habit of the latter, but has large, pendent, rich coral-red fruits. It is a very useful addition to our fruiting shrubs." (*Gardeners' Magazine*, vol. 59, p. 449.)

For previous introduction, see No. 47300.

65591 to 65610—Continued.

65603. *BERBERIS SURCAULIALATA* C. Schneid.

A thickly branched shrub from Tibet, up to 4½ feet high, with spines up to an inch in length, thick lance-shaped leaves about an inch long, and globular, reddish yellow fruits one-fourth of an inch in diameter.

For previous introduction, see No. 58143.

65604. *BERBERIS WILSONAE* Hemsl.

A handsome, sometimes partially evergreen shrub, 2 to 4 feet high, with abundant roundish coral-red berries, somewhat translucent. The leaves assume brilliant tints in the fall. Native to western China.

For previous introduction, see No. 60419.

65605. *BERBERIS* sp.

Farrer No. 355.

65606. *BERBERIS* sp.

M. V. No. 2768.

65607. *BERBERIS* sp.

Vilmorin No. 117/15.

65608. *BERBERIS* sp.

Wilson No. 1180.

65609. *BERBERIS* sp.

M. V. No. 7509.

65610. *BERBERIS* sp.

Labeled *Berberis morrisonensis* (?) No. 10912 Wilson; fruits not like *B. morrisonensis*.

65611. *SENECIO GRISEBACHII* Baker.
Asteraceae.

From Orotava, Teneriffe, Canary Islands. Seeds presented by Juan Bolinaga, Directeur du Jardin de Acclimatation. Received December 9, 1925.

A Brazilian composite which, as described by Martius (*Flora Brasiliensis*, vol. 6, pt. 3, p. 313), is either a biennial or perennial herb, with sessile linear leaves 3 to 4 inches long, white pubescent beneath, and lax panicles of small yellow flowers.

65612 to 65684.

From Manchuria. Collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received December, 1925.

65612. *ACTINIDIA KOLOMIKTA* (Maxim.) Rupr.
Dilleniaceae.

No. 4576. Ertsingtiente. October 26, 1925. Cuttings of an extremely ornamental vine with many of the leaves blotched white.

For previous introduction, see No. 58153.

65613. *AMETHYSTEA CAERULEA* L. Menthaceae.

No. 4568. October 25, 1925. Seeds presented by L. B. Smearnoff, of Echo. Seeds eaten by birds. A fragrant hardy annual about a foot high.

65614. *AMPELOPSIS RRVIPEDUNCULATA* (Maxim.) Koehne. Vitaceae.

No. 4633. Harbin. October 30, 1925. Cuttings of a variety producing yellowish green fruit, from the Russian cemetery. Seeds were sent in under No. 3723 [No. 65178].

For previous introduction, see No. 63332.

65612 to 65684—Continued.

65615. ASPARAGUS sp. Convallariaceae.

No. 4573. Ertshintz. October 26, 1925. Seeds of a wild asparagus found on the mountain side. This may prove useful as an ornamental or in connection with breeding experiments.

65616 and 65617. BETULA spp. Betulaceae. Birch

October 25, 1925. Seeds from trees growing in exposed places in the grounds of L. B. Smearnoff, of Echo.

65616. BETULA sp.

No. 4569. A white-barked birch.

65617. BETULA sp.

No. 4570. A yellow-barked birch.

65618. CANNABIS SATIVA L. Moraceae. Hemp.

No. 4571. October 25, 1925. Seeds obtained from L. B. Smearnoff, of Echo. This is a large-seeded hemp with a stronger odor than the average. The birds, especially the sparrows, are fond of the seeds.

65619 and 65620. CASTANEA MOLLISSIMA Blume. Fagaceae.

October 29, 1925. Scions obtained by J. H. Dorsett at the Fa Hua Ssu Temple, near Peking.

65619. No. 4687. *Ta chao li tze* (tiger-paw chestnut). This chestnut is about 1 inch in size and ripens in September.

65620. No. 4688. *Pai lu li tze* (white dew chestnut). The diameter of this variety is less than 1 inch; it ripens in early September.

65621 and 65622. CORYLUS HETEROPHYLLA Fisch. Betulaceae. Hazelnut.

Ertshintz. October 25, 1925. The Manchurian hazel, found on the mountain side to the north of the Chinese Eastern Railway.

For previous introduction, see No. 36726.

65621. No. 4578. Rooted plants.

65622. No. 4579. Scions.

65623. IRIS ENSATA Thunb. Iridaceae.

No. 4564. Echo. October 26, 1925. Seeds of a cluster iris which is very abundant in this region. The flowers are said to be lavender.

65624. LESPEDeza sp. Fabaceae.

No. 4566. Echo. October 26, 1925. Seeds.

65625. LINUM USITATISSIMUM L. Linaceae. Flax.

No. 4565. October 26, 1925. Seeds obtained through L. B. Smearnoff, of Echo.

65626 to 65633. MALUS spp. Malaceae. Crab apple.

65626. MALUS sp.

No. 4630. Harbin. October 29, 1925. Scions of a small-fruited, wild Manchurian crab apple. These trees were growing on sand dunes. They might be useful for stock and breeding work and may be ornamental.

65627. MALUS sp.

No. 4638. Harbin. October 30, 1925. Seeds from the Chinese Eastern Railway nursery. The fruit is small, one-half to three-fourths of an inch in diameter, and yellow. It is an attractive ornamental and a good grower and is used here as a stock especially for the same variety.

65612 to 65684—Continued.

65628. MALUS sp.

No. 4641. Harbin. October 30, 1925. Scions of a yellow-fruited crab apple presented by the superintendent of the Chinese Eastern Railway nursery. The fruits are rather small, one-half to three-fourths of an inch in diameter. This variety is grown here quite extensively, for the fruit and as an ornamental.

65629. MALUS sp.

No. 4643. Harbin. October 30, 1925. Scions presented by the superintendent of the Chinese Eastern Railway nursery. This variety, which is their best early red crab apple, may prove valuable as a stock.

65630. MALUS sp.

No. 4673. October 29, 1925. *Hung ping kou*. Scions obtained at the Fa Hua Ssu Temple, near Peking. The fruits are red, 3½ inches in diameter, and ripen in August.

65631. MALUS sp.

No. 4674. October 29, 1925. *Hung hsiang kou*. Scions obtained at the Fa Hua Ssu Temple, near Peking. The fruits of this fragrant crab apple, 2½ to 3 inches in diameter, are half red and half green, ripening in August.

65632. MALUS sp.

No. 4675. October 29, 1925. *Hung sha kou*. Scions obtained at the Fa Hua Ssu Temple, near Peking. This crab apple produces fruits which are 1½ to 2 inches in diameter and half green and half red. They ripen in August.

65633. MALUS sp.

No. 4676. October 29, 1925. *Cha hua sha kou*. Scions of a crab apple, collected at the Fa Hua Ssu Temple, near Peking. The fruits, 1 to 2 inches in diameter, are spotted red, ripening late in August.

65634. MORUS ALBA L. Moraceae.

White mulberry.

No. 4628. October 29, 1925. Scions from several trees on the sand dunes across the Sungari River to the north of Harbin.

65635 and 65636. PAEONIA spp. Ranunculaceae. Peony.

Harbin. October 27, 1925. These roots were presented by the botanical garden of the Manchurian Research Society.

65635. PAEONIA sp.

No. 4589. The wild Manchurian peony reported to be a double pink form. This plant was originally sent to Harbin from Mefun.

65636. PAEONIA sp.

No. 4596. Originally from Mongolia. The flowers are red and the foliage deep green to reddish.

65637. PAPAVER SOMNIFERUM L. Papaveraceae. Opium poppy.

No. 4573. Seeds presented by L. G. Smearnoff, of Echo. October 25, 1925.

65638. PHELLODENDRON AMURENSE Rupr. Rutaceae.

No. 4662. Seeds collected in New Town, Harbin. November 1, 1925. This is a common Manchurian tree which may be useful as a hardy shade tree, although the small, black, juicy berries might be objectionable under foot. The tree is said to be rich in tannin.

65612 to 65684—Continued.

65639. *PICEA* sp. Pinaceae. Spruce.

No. 4637. October 30, 1925. Seeds from a young tree, 12 to 18 feet high, growing in the Russian cemetery.

65640. *POLYGONUM ORIENTALE* L. Polygonaceae. Prince's plume.

No. 4567. Echo. October 26, 1925. Seeds presented by L. B. Smearoff, who says that this variety is a tall-growing ornamental plant.

65641 to 65645. *POPULUS* spp. Salicaceae. Poplar.65641. *POPULUS* sp.

No. 4562. October 25, 1925. Cuttings of a poplar, appearing to be a large-leaved variety, found southeast of Echo, in a region which is barren except for the few trees that have been planted there.

65642. *POPULUS* sp.

No. 4627. October 29, 1925. Scions of a small-leaved poplar which is the only tree of this kind we recall having seen here at Harbin. It is on the Chinese Eastern Railway embankment across the Sungari River to the north of Harbin.

65643. *POPULUS* sp.

No. 4632. Harbin. October 30, 1925. Cuttings of an almost round, wavy margined-leaved poplar, with grayish white bark, which is not very common here.

65644. *POPULUS* sp.

No. 4634. October 30, 1925. The ordinary large-leaved poplar found most commonly in the vicinity of Harbin. These cuttings were obtained from trees in the new Russian cemetery, in a dry exposed situation.

65645. *POPULUS* sp.

No. 4635. New Russian cemetery, Harbin. October 30, 1925. Cuttings of a rather long-pointed leaved poplar which is common in his region. The under surface of the leaves is inclined to be white tomentose.

65646 to 65665. *PRUNUS* spp. Amygdalaceae.65646 to 65648. *PRUNUS ARMENIACA* L. Apricot.

65646. No. 4604. Botanical Garden No. 3. October 27, 1925. Scions of a large yellow-leaved apricot, considered a very good variety, presented by the botanical garden of the Manchurian Research Society, Harbin.

65647. No. 4605. Botanical Garden No. 20. October 27, 1925. Scions presented by the botanical garden of the Manchurian Research Society, Harbin. This is considered their largest, earliest, and best apricot.

65648. No. 4672. October 29, 1925. *Ta pai lao yieh* (large, white god-faced apricot). Scions obtained at the Fa Hua Ssu Temple, near Peking. The freestone fruits, $1\frac{1}{2}$ to 2 inches in diameter, white with a pink blush, ripen in June.

65649. *PRUNUS MANDSHURICA* (Maxim.) Koehne.

No. 4574. Ertsingtientze. October 25, 1925. Scions of the wild Manchurian apricot which is, by far, the finest specimen we have seen. It might make a hardy ornamental or be useful in plant breeding.

65612 to 65684—Continued.

65650 to 65652. *PRUNUS TOMENTOSA* Thunb. Manchu cherry.

65650. No. 4599. October 27, 1925. Scions of a red-fruited Manchurian cherry, about five-eighths of an inch in diameter, presented by the botanical garden of the Manchurian Research Society, Harbin.

65651. No. 4639. October 30, 1925. Scions presented by the superintendent of the Chinese Eastern Railway nursery, Harbin. This cherry is not very common here.

65652. No. 4640. October 30, 1925. Seeds of a Manchurian cherry presented by the superintendent of the Chinese Eastern Railway nursery, Harbin. We assume that they saved these seeds from their own planting.

Numbers 65653 to 65660. October 27, 1925. This material was presented by the botanical garden of the Manchurian Research Society, Harbin.

65653. *PRUNUS* sp. Plum.

No. 4592. Botanical garden No. 2. A rooted sucker of a red plum of very good quality and a good fruiter.

65654. *PRUNUS* sp. Plum.

No. 4593. Scions from the same tree as No. 4592 [No. 65653].

65655. *PRUNUS* sp. Plum.

No. 4594. Botanical garden No. 28. Scions of a large yellow plum of very good quality.

65656. *PRUNUS* sp. Plum.

No. 4598. Scions of a fairly large yellow plum of very good quality.

65657. *PRUNUS* sp. Plum.

No. 4600. Scions of a rather large red plum which ripens early in August. The flesh is yellow, fragrant, and sweet, but slightly bitter near the stone.

65658. *PRUNUS* sp. Plum.

No. 4601. Botanical garden No. 55. Scions of a fairly good-sized purple or blue plum which is the heaviest bearing variety at the garden.

65659. *PRUNUS* sp. Plum.

No. 4602. Botanical garden No. 9. Scions of a purple or blue plum used in making very good preserves. The fruits dry well, and this past season some of these plums dried on the tree. This is the only tree in the collection on which any of the plums dried in this way.

65660. *PRUNUS* sp. Plum.

No. 4603. Botanical garden No. 16. Scions of a green plum with a pinkish tinge which ripens about the first of August. The fruits are not especially large, but they are fragrant and very sweet.

65661. *PRUNUS* sp. Plum.

No. 4642. October 30, 1925. Scions of a yellow plum presented by the superintendent of the nursery of the Chinese Eastern Railway, Harbin. These scions are small, but they are from the best fruit-producing plum at the nursery.

65612 to 65684—Continued.

65662. *PRUNUS* sp. Plum.

No. 4678. *Hung chuan chiao li tze* (red string). Scions obtained at the Fa Hua Ssu Temple, near Peking, October 29, 1925. The red fruits are 1 inch in diameter and ripen in July.

65663. *PRUNUS* sp. Plum.

No. 4679. October 29, 1925. *Chang bo hung lo tze* (red long-handled plum). Scions collected at the Fa Hua Ssu Temple, near Peking. The red fruits, 1½ inches in diameter, ripen in July.

65664. *PRUNUS* sp. Plum.

No. 4595. October 27, 1925. Plants of a hardwood variety, found among rocks, presented by the botanical garden of the Manchurian Research Society, Harbin. This Siberian or Mongolian bush apricot, recently collected by N. Glowkhoff in Mongolia, bears good crops. The fruits are small. It may prove useful in breeding work.

65665. *PRUNUS* sp. Cherry.

No. 4686. October 29, 1925. *Hung shan tou ying tao* (red bean cherry). Scions obtained at the Fa Hua Ssu Temple, near Peking. The small red fruits ripen in June.

65666 to 65675. *PYRUS* spp. Malaceae. Pear.65666. *PYRUS* sp.

No. 4581a. October 26, 1925. Scions of a young tree growing wild on the mountain side, near the Chinese Eastern Railway station, Ertshintientze.

65667. *PYRUS* sp.

No. 4591. October 27, 1925. Seedling trees of the wild Manchurian pear from seed collected by N. E. Hansen, of Brookings, S. Dak., a year ago at Hsiaolin. These trees were presented by the botanical garden of the Manchurian Research Society, Harbin.

65668 to 65675. Collected at the Fa Hua Ssu Temple, near Peking, October 29, 1925.

65668. *PYRUS* sp.

No. 4671. *Ya li*. Scions of a yellow pear 3 inches in diameter, which ripens the middle of September.

65669. *PYRUS* sp.

No. 4677. *Pai li* (white pear). Scions of a creamy white pear with a delicate pink blush, 2 inches in diameter. The fruits ripen about the end of September.

65670. *PYRUS* sp.

No. 4680. Scions of a large sugar pear 3 inches in diameter. The fruits are brown dotted with white.

65671. *PYRUS* sp.

No. 4681. *Tatutze li* (big-stomach pear). The yellow fruits, 3 inches in diameter, ripen in September.

65672. *PYRUS* sp.

No. 4682. Scions of the *chin chin pa li* (autumn golden handle pear). The fruits are yellow, 2 to 3 inches in diameter, and ripen in September.

65673. *PYRUS* sp.

No. 4683. The "summer golden handle pear," 2 to 3 inches in diameter, is yellow and ripens in August.

65674. *PYRUS* sp.

No. 4684. *Suan li* (sour pear). The red fruits are 1½ inches in diameter and ripen the end of September.

65612 to 65684—Continued.

65675. *PYRUS* sp.

No. 4685. *Chuh li* (festival pear). The fruits are 1½ to 2 inches in diameter, yellow, and ripen in September.

65676. *QUERCUS MONGOLICA* Fisch. Fagaceae. Oak.

No. 4577. *Ertshintientze*. October 26, 1925. Scions from young Manchurian oaks growing on the mountains.

65677. *RHAMNUS DAVURICA* Pall. Rhamnaceae.

No. 4631. October 29, 1925. Seeds from a small tree on the sand dunes across the Sungari River to the north of Harbin. The berries are black and the deep-yellow juice is sticky and of a bad flavor. This might be of ornamental value in dry exposed situations.

For previous introduction, see No. 62230.

65678. *ROSA DAVURICA* Pall. Rosaceae. Rose.

No. 4636. Harbin. October 30, 1925. Cuttings of a wild, single red rose obtained in the new Russian cemetery. We sent in hips under No. 3862 [No. 64447].

For previous introduction, see No. 57313.

65679. *ROSA RUGOSA* Thunb. Rosaceae. Rose.

No. 4590a. October 27, 1925. Plants of what is said to be a double-flowered, wild Manchurian rose, presented by the botanical garden of the Manchurian Research Society. Originally from Mefun.

65680. *RUBUS CRATAEGIFOLIUS* Bunge. Rosaceae. Siberian raspberry.

No. 4580. October 26, 1925. Plants of a variety found on the mountain side to the north of the Chinese Eastern Railway station, Ertshintientze.

65681. *SALIX* sp. Salicaceae. Willow.

No. 4563. October 25, 1925. Cuttings of a medium-sized willow growing along the Chinese Eastern Railway right of way, Echo. This may prove hardy, but it will probably need a rather moist situation.

65682. *SAMBUCUS* sp. Caprifoliaceae. Elder.

No. 4629. Harbin. October 29, 1925. Cuttings obtained from a plant on sand dunes across the Sungari River, north of Harbin; perhaps the red-berried form.

65683. *SORBUS* sp. Malaceae. Mountain ash.

No. 4572. October 25, 1925. Seeds presented by L. B. Smernoff, Echo. This *Sorbus* is said to be grown all over Siberia and Russia. After a frost it is used for making preserves which are a little bitter, but not objectionably so.

65684. *TILIA* sp. Tiliaceae. Linden.

No. 4575. October 26, 1925. Scions of what is said to be the broad-leaved Manchurian linden, obtained from young plants from the mountain top across from the Chinese Eastern Railway station, Ertshintientze. This is one of the best honey plants in northern Manchuria.

65685. *SOLANUM TUBEROSUM* L. Solanaceae. Potato.

From Reading, England. Tubers presented by Sutton & Sons, through E. L. Schultz, Bureau of Plant Industry. Received December 21, 1925.

Var. *Arran Comrade*. A variety of potato reported to be immune to the wart disease.

65686. *AMYGDALUS PEDUNCULATA* Pall. (*Prunus pedunculata* Maxim.). Amygdalaceae.

From the Gobi Desert, Mongolia. Seeds collected by Dr. Charles P. Berkey, Palisade, N. J. Received December 18, 1925.

The fruit of this wild plum is of no consequence as found in the Desert of Gobi, but the shrub is evidently exceedingly hardy. The seeds were collected at the eastern extremity of the Altai Mountains, along drainage courses, at an altitude of about 4,000 feet. (Berkey.)

Introduced for trial as a hardy stock for stone fruits.

65687 and 65688. SACCHARUM OFFICINARUM L. Poaceae. Sugar cane.

From Fajardo, Porto Rico. Cuttings presented by the experiment station of the Fajardo Sugar Co., through E. W. Brandes, Bureau of Plant Industry. Received December 23, 1925.

Early-maturing varieties especially recommended for trial in Louisiana by the Fajardo Sugar Co. (Brandes.)

65687. *F. C. 305.*

65688. *F. C. 426.*

65689 to 65692. PICEA spp. Pinaceae. Spruce.

From Kanchow, Kansu, China. Seeds collected by J. F. Rock, Arnold Arboretum, Jamaica Plain, Mass. Received December 22, 1925.

65689. *PICEA* sp.

No. 13304. October, 1925. This species, forming pure stands, ranges from 9,500 to 11,000 feet altitude at Komangssu, northeast of Tankar, northwestern Kansu. The tree, 80 to 120 feet in height and 2 to 3 feet in diameter, has pinkish gray, flaky bark. The needles are glaucous, the branchlets yellow, and the cones long and slender. The branches usually descend to the ground, but in dense forests the branches are very short and drooping.

65690. *PICEA* sp.

No. 13307. October, 1925. This tree occurs in forests of pure stands in a gorge on the northern slope of the North Kokonor barrier range, at altitudes from 9,500 to 11,000 feet. The tree is 90 to 100 feet or more tall, with a straight, gray-barked trunk. The curved, glaucous needles are large, long, and stiff, and the cones are large, oblong, and straight.

65691. *PICEA* sp.

No. 13309. October, 1925. A tree 100 to 120 feet tall and 3 to 4 feet in diameter, with large glaucous needles and large cones. It forms pure stands on Ngusiu, a mountain 18,000 feet high, rising from the North Kokonor barrier range toward the Richthofen Range, and is the only species of *Picea* in this whole region, being found up to an altitude of 11,500 feet.

65692. *PICEA* sp.

No. 13310. October, 1925. A tree 20 to 30 feet tall and 1 foot in diameter, with glaucous, whitish blue needles. This tree is only found in the Hungshiri K'ou Gorge, at an altitude of 8,500 to 9,500 feet, located on the northern slope of the Nanshan of the Richthofen Range. Unlike the *Picea* from Ngusiu, this species occurs in dry rocky situations.

65693. SORBUS ALNIFOLIA (Sieb. and Zucc.) Koch (Pyrus alnifolia Franch.). Malaceae.

From Mefun, Manchuria. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received December 23, 1925.

No. 4739. November 12, 1925. From a small tree growing on the top of one of the mountains.

For previous introduction, see No. 37582.

65694. CUCUMIS METULIFERUS E. Mey. Cucurbitaceae.

From Cape Town, South Africa. Seeds received through H. L. Shantz, Bureau of Plant Industry. Received December 21, 1925.

This South African "wild cucumber" is native to the Kalahari Desert and the Belgian Congo, where, according to I. B. Pole Evans (see No. 60368), the fruit is considered excellent for eating. The plant is an annual creeper, much branched, and covered with bristly hairs. The dark-green leaves are similar to those of the ordinary cucumber, and the flowers are yellow. The gourdlike fruit, oblong in shape, varies from greenish yellow to red when ripe, is about 5 inches long, and is covered with short hard spines. It is eaten in the same way as the ordinary cucumber.

65695. CITRUS NOBILIS DELICIOSA (Ten.) Swingle. Rutaceae.

Mandarin orange.

From Cadiz, Spain. Bud wood presented by O. W. Barrett, agricultural adviser, Department of Agriculture and Labor, San Juan, Porto Rico. Received November 24, 1925.

No. 6. *Mandarin*. A locally developed variety.

65696. CITRUS AURANTIUM L. Rutaceae. Sour orange.

From Spain. Seeds presented by O. W. Barrett, agricultural adviser, Department of Agriculture and Labor, San Juan, Porto Rico. Received December 2, 1925.

Seville.

65697 to 65701.

From Buitenzorg, Java. Seeds presented by Dr. W. M. Docters Van Leeuwen, Director, Botanic Garden. Received December 19, 1925.

65697. ANDROPOGON AMBOINICUS (L.) Merr. Poaceae. Grass.

A tall perennial East Indian grass, about 4 feet high, with narrowly linear leaves up to 20 inches in length.

65698. CROTALARIA ALBIDA Heyne. Fabaceae.

According to Hooker (Flora of British India, vol. 2, p. 71) this tropical Indian shrub is 1 or 2 feet high, with numerous slender silky pubescent branches, firm narrow leaves, pale-yellow flowers in short racemes, and oblong pods about half an inch long.

65699. CROTALARIA FULVA Roxb. Fabaceae.

An eastern Asiatic leguminous shrub which as described in Hooker's Flora of British India (vol. 2, p. 81) is stiffly erect, 3 to 5 feet high, with numerous paniculate branches. The silky, narrow leaves are about 4 inches long, and the flowers, in panicles, are about an inch long.

65700. CYMBOPOGON MARTINI (Roxb.) Stapf. (Andropogon martini Roxb.). Poaceae. Rusa-oil grass.

A stout perennial grass, native to northern India, which grows to a height of about 6 feet and has long, very smooth leaves of a rich green color and delicate texture. The perfume known commercially as Rusa oil is obtained from this plant.

For previous introduction, see No. 62802.

65701. PENNISETUM MACROSTACHYUM (Brongn.) Trin. Poaceae. Grass.

As described by Duperrey (Voyage Autour du Monde, Botanique, vol. 2, p. 104), this East Indian grass has ascending stems 2 to 3 feet high, with linear lax leaves 3 inches long, and nodding dense spikes 6 to 8 inches in length.

65702 to 65704. GOSSYPIUM NANKING Meyen. Malvaceae. Cotton.

From Nishigahara, Tokyo, Japan. Seeds presented by H. Ando, director, Imperial Agricultural Experiment Station. Received December 23, 1925.

65702 to 65704—Continued.

65702. *Aoki Wata.* 65704. *Shiso Wata.*
65703. *Cha Wata.*

65705. DIOSCOREA ALATA L. Dioscoreaceae. Greater yam.

From Tongatabu, Tonga Islands. Tubers presented by C. E. Wood, Director of Agriculture, Government of Tonga, at the request of H. A. Cowan, British consul. Received November 7, 1925.

Tubers of a yellow-fleshed yam, introduced for trial in the Gulf States.

65706 and 65707.

From Haiti. Seeds obtained through O. F. Cook, Bureau of Plant Industry. Received December 16, 1925.

65706. CRYPTOSTEGIA sp. Asclepiadaceae.

A tropical climber, with opposite leaves and large, showy reddish flowers. Introduced from Gonaives for testing as a source of rubber.

65707. HEVEA BRASILIENSIS (H. B. K.) Muell. Arg. Euphorbiaceae.

From Bayeux. The "Para" rubber tree, native to Brazil, and now extensively cultivated in the East Indies, has always ranked as the principal and most important rubber-producing tree in the world.

For previous introduction, see No. 64542.

INTRODUCTORY STATEMENT

NEARLY a thousand introductions are included in the present inventory, representing practically all classes of economic plants and drawn from nearly every corner of the globe.

From the cold region of Manchuria in northeastern China quantities of interesting plant material have continued to come in as the result of agricultural explorations of that Province by P. H. Dorsett. As in the preceding inventory, this material includes locally developed types of practically all of the well-known fruits, vegetables, and cereals, and should be of unusual value to crop specialists and plant breeders in the northernmost parts of the United States.

In the subtropical Province of Kwangtung, southeastern China, F. A. McClure has continued his explorations. Among his collections are seeds of *Eremochloa ophiuroides* (No. 65839), a deep-green, medium coarse, low-growing grass considered to be the best lawn grass for that region. It becomes 3 to 4 inches high, has smooth soft blades, and propagates easily by runners. Previous introductions of this grass have done well in the Gulf coast area and promise well for pasture and lawn purposes. Further introductions are for the purposes of getting a more hardy strain which will continue green throughout the winter period and thus afford a better lawn grass, and also to get more vigorous strains for use in pasture lands.

Material of two local varieties of the Chinese hairy chestnut (*Castanea mollissima*, Nos. 65805 and 65806) was also obtained by Mr. McClure; these will be of special interest for the use of plant breeders who are attempting to find blight-resistant chestnut strains for the United States. Other chestnut introductions included in this inventory will also be of interest for the same reason. Four samples of *Castanea* were sent in from Nanking, China—*C. henryi* (Nos. 65715 and 66036), *C. mollissima* (No. 66037), and *C. sequinii* (No. 66038).

Seeds of an evergreen chinquapin (*Castanopsis hystrix*, No. 65759) were presented by the Lloyd Botanic Garden, Darjiling, India. This is a tall tree with small nuts. Its chief value is as a timber tree for subtropical regions.

Forage-crop specialists will be interested in a number of introductions from Morocco and the Canary Islands which were sent in by David Fairchild during his visits to those countries. Four local strains of vetch (*Vicia sativa*, Nos. 66016 to 66019) were collected in different parts of Morocco. From the same country a number of grasses were obtained, including *Avena barbata* and *A. sterilis* (Nos. 66004 and 66005), *Hypparrhenia hirta* (No. 66008), and *Triticum ovatum* (No. 66015). *Calopogonium mucunoides* (No. 66085), which is being used successfully

in Sumatra and the Malay States as a ground cover and green-manure plant, has already shown, from a previous introduction, its probable value for these purposes in southern Florida. It makes a dense matted growth and thrives under Florida conditions. It needs to be extensively tested in the Gulf States and studied from the standpoint of varietal differences and adaptation.

The Palmyra palm (*Borassus flabellifer*, No. 66649) of India and Ceylon is a most interesting and useful plant. Whether or not it will succeed in the continental United States is yet to be determined, but it is possible that it can be grown in southern Florida and perhaps in other places. The many uses to which it is put in its native habitat make it seem indispensable to the native population. It furnishes food, drink, and fiber, the products in each form being numerous.

Another palm, *Hyphaene thebaica* (No. 66656), known as the Doum palm, is interesting from the fact that it is a most beautiful plant and the only branching palm known.

An unusual series of cotton varieties (*Gossypium* spp., Nos. 66020 to 66026) was received from Italian Somaliland through the director of their agricultural department. These are mostly local varieties developed by the Somaliland natives, and should be of special value for semiarid regions of the Southwest.

Although the Amur grape (*Vitis amurensis*, No. 65960) with its brilliant autumnal coloring is usually considered from the standpoint of an exceptionally hardy ornamental vine, it should be worth the attention of grape growers desiring to obtain vigorous hardy varieties for the northernmost parts of the United States and Alaska.

An Ecuadorian highland relative of the papaya (*Carica candamarcensis*, No. 66651) is reported to have small, acid-flavored fruits used for jams and preserves. This will suggest to subtropical fruit breeders the possibility of hybridization with the idea of varying the flavor and extending the growing area of the common papaya.

Three species and one variety of *Magnolia* (Nos. 66077 to 66080), all native to western China, were received from Léon Chénault, Orleans, France. All of these are practically unknown in American horticulture and promise to be desirable additions to a very popular group of ornamental trees.

As a subtropical ornamental climbing shrub, *Bauhinia galpini* (No. 66148) appears to have considerable merit. It attains a height of 10 or more feet under favorable conditions, and the brick-red flowers appear continuously from spring till fall.

A number of species of the so-called butterfly bushes have become popular ornamentals in those parts of the country not having severe winters. One of the handsomest of the genus (*Buddleia colvilei*, No. 65758), native to the Himalayas, has large loose clusters of crimson flowers. It is practically unknown in American horticulture and should be tested in southern California and the Gulf States.

The botanical determinations of these introductions have been made and the nomenclature determined by H. C. Skeels, and the descriptive matter has been prepared under the direction of Paul Russell, who has had general supervision of this inventory.

ROLAND MCKEE,
Acting Senior Agricultural Explorer in Charge.

OFFICE OF FOREIGN PLANT INTRODUCTION,
Washington, D. C., September 17, 1927.

INVENTORY¹

65708. HICORIA CATHAYENSIS (Sarg.) Chun. Juglandaceae. Hickory.

From Nanking, China. Seeds presented by W. Young Chun, Chinese Nurseries. Received February 25, 1926.

This is reported to be the only hickory found in China. As described by Sargent (*Plantae Wilsonianae*, vol. 3, p. 187), it is a tree 40 to 75 feet high, with a gray-barked trunk 1 to 2 feet in diameter and compound leaves about a foot long composed of five to seven pairs of narrowly oval leaflets, pale green above and rusty brown beneath. The thick-shelled nuts, about an inch long, are collected by the Chinese for sale; they are eaten as a sweetmeat, and a clear yellow oil is extracted from them for use in fancy pastry. The tough, strong wood is used for tool handles. The tree grows wild in the mountains of Chekiang, where the native name is Shan-gho-to.

For previous introduction see No. 43952.

65709. PYRUS CALLERYANA Decaisne. Malaceae. Pear.

From Nanking, China. Seeds presented by Prof. J. H. Reisner, College of Agriculture and Forestry, University of Nanking. Received February 25, 1926.

For trial as a stock for cultivated apple and pear varieties.

65710 to 65714. RUBUS spp. Rosa- ceae. Raspberry.

From St. Jean le Blanc, near Orleans, Loiret, France. Plants presented by Edmond Versin. Received March 4, 1926. Notes from Bunyard's Catalog of Fruit Trees, 1924-25.

65710. RUBUS sp.

Heytor.

65711. RUBUS sp.

Lloyd George. This variety is perpetual in habit and keeps a supply of fruit from the earliest season till late autumn. It is vigorous and productive and is in all respects a sterling novelty. Introduced by Mr. Kettle, violet specialist of Corfe Castle.

For previous introduction see No. 62387.

65712. RUBUS sp.

Park Lane. This is the most delicious of all raspberries, and although unexcelled for dessert use it is too soft for market culture. The fruit is round and the drupes large. Introduced by Mr. Payne.

¹ It should be understood that the names of horticultural varieties of fruits, vegetables, cereals, and other plants used in this inventory are those under which the material was received when introduced by the Office of Foreign Plant Introduction, and, further, that the printing of such names here does not constitute their official publication and adoption in this country. As the different varieties are studied, their entrance into the American trade forecast, and the use of varietal names for them in American literature becomes necessary, the foreign varietal designations appearing in this inventory will be subject to change with a view to bringing the forms of the names into harmony with recognized horticultural nomenclature.

It is a well-known fact that botanical descriptions, both technical and economic, seldom mention the seeds at all and rarely describe them in such a way as to make possible identification from the seeds alone. Many of the unusual plants listed in these inventories are appearing in this country for the first time, and there are no seed samples or herbarium specimens with ripe seeds with which the new arrivals may be compared. The only identification possible is to see that the sample received resembles seeds of other species of the same genus or of related genera. The responsibility for the identifications therefore must necessarily often rest with the person sending the material. If there is any question regarding the correctness of the identification of any plant received from this office, herbarium specimens of leaves and flowers should be sent in so that definite identification can be made.

65710 to 65714—Continued.

65713. RUBUS sp.

Pyne's Royal. The enormous fruits are borne on short trusses, conical in shape, solid, and of good flavor; the canes are very stout and vigorous. This is in our opinion the largest raspberry in cultivation; it was raised by Mr. Pyne and first fruited in 1908. Introduced in 1913.

For previous introduction see No. 52491.

65714. RUBUS sp.

Red Cross. The very early fruits are large and of good flavor, and the canes stout and upright. This new and promising variety was raised by Mr. Pyne.

65715. CASTANEA HENRYI (Skan) Rehd. and Wils. Fagaceae.

From Nanking, China. Seeds presented by W. Young Chun, Chinese Nurseries. Received March 2, 1926.

A Chinese chestnut which, as described in *Plantae Wilsonianae* (vol. 3, p. 196), is a deciduous tree 25 to 90 feet tall, with oblong-lanceolate, long-acuminate leaves, green on both sides. The burs are either solitary or two or three in a bunch and contain usually but one nut.

For previous introduction see No. 65450.

65716. FICUS CARICA L. Moraceae. Fig.

From Beirut, Syria. Cuttings purchased from Dr. A. E. Day, American University of Beirut. Received March 3, 1926.

Kazzi fig. From the district of the Murah, north of Batrun. This fig is said to be rather large, red inside and green without, and to ripen early. (*Day.*)

65717 to 65719.

From Richmond, Victoria, Australia. Seeds presented by F. H. Baker. Received February 27, 1926.

65717 and 65718. ACACIA spp. Mimosaceae.

65717. ACACIA DISCOLOR Willd.

A tall, unarmed shrub or small tree, native to southeastern Australia and Tasmania, which bears, in autumn, terminal and axillary clusters of yellow flowers.

For previous introduction see No. 62960.

65717 to 65719—Continued.

65718. *ACACIA PENNINERVIS* Sieber.

The bark of this Australian acacia contains 18 per cent of tannic acid, according to Maiden (Useful Native Plants of Australia), and is said to endure comparatively low temperatures. The same authority states that it is a tall shrub or tree with narrow sickle-shaped phyllodia and short racemes of pale-yellow flowers.

For previous introduction see No. 62961.

65719. *HAKEA LAURINA* R. Br. Proteaceae.

A tall Australian shrub, 30 feet or less high, remarkable for its showy crimson flowers. These are in globular heads, about 2 inches in diameter, from which numerous golden yellow styles protrude an inch or so in all directions.

For previous introduction see No. 64483.

65720. *LILIUM SUTCHUENENSE* Franch. Lily.

From Kew, England. Seeds presented by the Royal Botanic Garden, through Prof. E. B. Babcock, University of California, Berkeley. Received March 1, 1926.

A lily from Szechwan, western China, with a stem 3 to 5 feet high, the underground portion running along horizontally before coming to the surface. The thickly scattered leaves are linear and deep green, and the pendulous flowers, up to 20 in number, have reflexed orange-red segments spotted purplish-black and red anthers.

For previous introduction see No. 55609.

65721. *CARICA PAPAYA* L. Papaya.

From Pakse, Laos, Indo China. Seeds presented by G. Ricau. Received March 2, 1926.

Papaya de Ceylon. Introduced for testing in the warm parts of the United States.

65722 to 65730. *ABIES* spp. Pinaceae.

From Kansu, China. Seeds collected by J. F. Rock, Arnold Arboretum, Jamaica Plain, Mass. Received March 2, 1926. Notes by Mr. Rock.

65722. *ABIES* sp.

No. 13423. October, 1925. A tree 40 to 50 feet high, with ascending branches, found in the Maerhku Valley, northern slopes of the Minshan. The needles are glossy on both sides.

65723. *ABIES* sp.

No. 13425. A tree 60 to 80 feet high, found in the Maerhku Valley, northern slopes of the Minshan, at an altitude of 10,000 feet, October, 1925. The needles are long, wiry, and glaucous, the cones 2 inches long, and the scales broad and purplish black.

65724. *ABIES* sp.

No. 13429. From the Maerhku Valley, northern slopes of the Minshan, at an altitude of 10,600 feet, November, 1925. A tree 80 feet high, with long leaves, glossy on both sides; cones 2½ inches or more long, and broad purplish black scales.

65725. *ABIES* sp.

No. 13436. Djrakana, Tebbu country, November, 1925. A tree 80 feet high, growing at an altitude of 10,000 feet. The long needles are glossy whitish beneath, the cones 2¼ inches long, and the scales broad with a short protruding mucro.

65722 to 65730—Continued.

65726. *ABIES* sp.

No. 13447. November, 1925. A tree 40 to 50 feet high, found on Mount Koangka, North Tebbu country, at an altitude of 12,000 feet. The curved, emarginate leaves, glaucous beneath, are very large; the cones are 3 inches in length and the scales broad, with a remarkably large foliaceous mucro.

65727. *ABIES* sp.

No. 13448. November, 1925. A tree 40 feet high, growing at an altitude of 11,000 feet on Mount Koangka, North Tebbu country. The needles and cones are smaller than my No. 13447 [No. 65726], but the scales are similar.

65728. *ABIES* sp.

No. 13451. A tree 60 to 80 feet high, found at Djrakana, Tebbu country, at an altitude of 11,000 feet, November, 1925. The leaves are thick, broadly sessile or slightly petiolate, and the cones are 2 inches or more long.

65729. *ABIES* sp.

No. 13454. A tree 80 feet high, found at Djrakana, Tebbu country, at an altitude of 11,000 feet, November, 1925. The large thick leaves are glaucous above and dull green beneath, and the purplish black cones, 1¾ inches long, are mucronate.

65730. *ABIES* sp.

No. 13466. A tree 100 to 150 feet high, growing on Lienhoa Mountain, central Kansu, at an altitude of 12,500 feet, October, 1925. The large blunt leaves are glaucous beneath, and the cones, 2 inches or more long, are purplish black.

65731. *HYDNOCARPUS ANTHELMINTHICA* Pierre. Flacourtiaceae.

From Dalat, Anam, Indo-China. Seeds presented by R. Isl. Received March 2, 1926.

The maikrabao, as this species is called in Siam, where it is native, is a vigorous, graceful tree 30 to 60 feet high, with large leathery leaves up to a foot in length, pale yellowish above and shining green below. The rose or purplish flowers are in few-flowered racemes, and the large round fruits, about 3 inches in diameter, contain each about 80 oval seeds from which a fatty oil is expressed. In its physical characteristics and chemical composition this oil closely resembles chaulmoogra oil, which is used with great success in the treatment of leprosy. Like the true chaulmoogra oil (obtained from *Taraktogenos kurzi* King), this consists to a large extent of the glyceryl esters of chaulmoogric and hydnocarpic acids, and it may therefore be inferred that it possesses similar medicinal value.

For previous introduction see No. 58592.

65732. *CASSIA NODOSA* Buch.-Ham. Caesalpiniaceae.

From Assam, India. Seeds presented by Mrs. S. A. D. Boggs, Louisville, Ky., through F. L. Mulford, Bureau of Plant Industry. Received March 1, 1926.

Pink and white shower. This magnificent flowering tree is one of the most commonly cultivated ornamental plants in Honolulu, where it is much used for street planting. It is a moderate-sized deciduous tree, with long drooping branches and glossy leaves; during May and June it bears a profusion of beautiful bright-pink rose-scented flowers which are in dense clusters on long stalks. It is native from the eastern Himalayas to the Malay Islands and the Philippines.

For previous introduction see No. 54984.

65733 to 65744. ORYZA SATIVA L.
Poaceae. Rice.

From Cawnpore, United Provinces, India. Seeds presented by the economic botanist to the Government. Received March 1, 1926.

Locally developed Indian varieties.

65733. A-1. An early variety of fine quality.

65734. A-2. An early variety of fine quality.

65735. B-4. An early variety of medium quality.

65736. A-57. A late short round variety.

65737. A-74. A late vigorous variety of fine quality.

65738. A-99. A late variety of coarse quality.

65739. A-110. A late vigorous variety of fine quality.

65740. A-111. A late vigorous variety of fine quality.

65741. A-112. A late variety of coarse quality.

65742. C-15. A late variety of medium quality.

65743. F-4. A late variety of coarse quality.

65744. U-13. A late variety of coarse quality.

65745. TRIFOLIUM PRATENSE L. Faba-
ceae. Red clover.

From Paris, France. Seeds obtained from N. Cherot, through A. J. Pieters, Bureau of Plant Industry. Received March 3, 1926.

A locally developed French strain.

65746 to 65748. LESPEDeza spp. Fa-
baceae.

From Fukuoka, Japan. Seeds presented by Dr. Mitsunaga Fujioka, Kyushu Imperial University. Received March 3, 1926.

65746. LESPEDeza BICOLOR Turcz.

A bushy herbaceous Japanese perennial which flowers in early fall, bearing a profusion of rosy purple flowers which practically cover its drooping branches. These branches are sometimes 6 feet long.

For previous introduction see No. 62382.

65747. LESPEDeza BICOLOR INTERMEDIA Maxim.

A variety of the preceding, differing in minor botanical characters.

For previous introduction see No. 62862.

65748. LESPEDeza CYRTBOTRYA Miquel.

A shrub about 6 feet high, resembling *Lespedeza bicolor* in habit, with oval-oblong leaflets and dense clusters of purple flowers. Native to Japan.

For previous introduction see No. 62863.

65749. MELILOTUS ALBA Desr. Faba-
ceae. White sweet clover.

From Moosejaw, Saskatchewan, Canada. Seeds obtained from the Saskatchewan Registered Seed Growers, through A. J. Pieters, Bureau of Plant Industry. Received March 5, 1926.

Canadian-grown seed.

65750. GOSSYPIMUM sp. Malvaceae.
Cotton.

From Dar es Salaam, Tanganyika Territory, Africa. Seeds presented by T. H. Marshall, Tanganyika Department of Agriculture. Received March 1, 1926.

A kidney cotton, received as *Gossypium kirkii*, but the seeds do not agree with the description of that species.

65751 to 65759.

From Darjiling, India. Seeds presented by G. H. Cave, Curator, Lloyd Botanic Garden. Received March 4, 1926.

65751. ABIES SPECTABILIS Lambert (A. webbi-
ana Lindl.). Pinaceae. Fir.

An Asiatic fir which, as described by W. J. Bean (Trees and Shrubs Hardy in the British Isles, vol. 1, p. 128), is a tree sometimes 150 feet high in its native home in the Himalayas. The dark-green leaves are arranged in two opposite series so as to leave a V-shaped opening along the top; the individual leaves are 1 to 2 inches long. The cones, about 5 inches long, are violet-purple at first, becoming brown.

For previous introduction see No. 64289.

65752. ACER CAUDATUM Wall. Aceraceae.
Maple.

A large tree with dark-gray bark and five-lobed red-stemmed leaves $2\frac{1}{2}$ to 5 inches long. The shiny, compact, moderately hard wood is white with a faint pink tinge. This maple is found in the temperate Himalayas at altitudes of 7,000 to 11,000 feet.

For previous introduction see No. 56453.

65753. ACER SIKKIMENSE Miquel. Aceraceae.
Maple.

A small tree with thin gray bark, native to the eastern temperate Himalayas at altitudes of 7,000 to 9,000 feet. The leaves are undivided and up to 6 inches in length. The wood is a shining gray with distinct annual rings and numerous fine medullary rays.

For previous introduction see No. 56456.

65754 to 65756. BERBERIS spp. Berberidaceae.
Barberry.**65754. BERBERIS CONCINNA Hook. f.**

A low bushy barberry which was discovered in the mountains of Sikkim, India, at an altitude of about 12,000 feet. It is of compact habit, with obovate leaves shining green above and white beneath. The deep-yellow flowers are about one-half inch across, and the red oblong berries are a little more than half an inch long.

For previous introduction see No. 58101.

65755. BERBERIS UMBELLATA Wall.

A hardy subevergreen Himalayan shrub about 3 feet high, with narrow leaves slightly glaucous beneath and umbellike racemes of yellow flowers.

For previous introduction see No. 53645.

65756. BERBERIS WALLICHIANA DC.

A narrow-leaved evergreen barberry from temperate regions in the Himalayas, where it ascends to about 10,000 feet. The shining black-purple berries are produced in dense clusters.

For previous introduction see No. 60639.

65757. BETULA UTILIS Don (B. bhojpatra Wall.).
Betulaceae. Birch.

A tree 40 to 60 feet high, with reddish brown trunk and branches and bark which peels off in papery flakes. It is native to subtropical regions of the Himalayas. The oval, coarsely toothed, sharp-pointed leaves are dark green above and paler beneath, and are 3 inches long. In winter the orange-chocolate color of the twigs is very striking.

For previous introduction see No. 56400.

65751 to 65759—Continued.

65758. *BUDDLEIA COLVILEI* Hook. f. Loganiaceae.

With its large loose terminal clusters of crimson flowers and smooth dark-green leaves this Himalayan relative of the well-known butterfly bush has been called by some authorities the handsomest of the genus. It is a shrub or small tree, 30 to 40 feet high, and has proved hardy in some parts of England and Scotland.

For previous introduction see No. 58904.

65759. *CASTANOPSIS HYSTRIX* A. DC. Fagaceae.
Evergreen chinquapin.

"A lofty tree 80 to 100 feet tall, with trunks 3 feet in diameter, found in pine forests in south-western China, at an altitude of 6,000 feet. The smooth fawn-colored bark is flaky, and the straight ascending branches give the tree an oblong appearance. The burs are in long densely packed spikes, and the involucre are covered with long soft green spines. The small nuts are borne singly or in twos. This is one of the finest forest trees of the region. According to the natives, the wood is very durable and never attacked by insects." (J. F. Rock, under No. 56768.)

65760 to 65765. *ORYZA SATIVA* L.
Poaceae. Rice.

From Vercelli, Italy. Seeds presented by Professor Novelli, director, Stazione Sperimentale di Riscicoltura, through Asher Hobson, American delegate, International Institute of Agriculture, Rome. Received March 5, 1926.

65760. *Bertone.*65761. *Chinese Originario.*65762. *Nero Vialone.*65763. *Precoce Vittoria.*65764. *Sancino.*65765. *P-6.*

65766 to 65775.

From Nogent sur Vernisson, Loiret, France. Seeds presented by L. Pardé, directeur des Ecoles des Barres. Received March 5, 1926.

65766. *CHIONANTHUS RETUSA* Lindl. Oleaceae.
Chinese fringe-tree.

A beautiful deciduous hardy ornamental tree bearing in spring a multitude of white deliciously fragrant flowers with handsome fringed petals, followed in the fall by masses of blue berries resembling wild grapes. It is superior to the Virginia fringe tree (*Chionanthus virginica*) because of the whiteness and fragrance of its flowers and its more graceful habit.

For previous introduction see No. 41259.

65767. *CORNUS WALTERI* Wangerin. Cornaceae.
Dogwood.

A Chinese dogwood which, as described by Sargent (*Plantae Wilsonianae*, vol. 2, p. 576) is a tree 40 feet high, with white flowers and blue-black fruits, growing in woodlands at 900 to 2,000 feet altitude in western Hupeh, China.

For previous introduction see No. 52702.

65768. *CORYLOPSIS WILLMOTTIAE* Rehd. and Wils. Hamamelidaceae.

A deciduous shrub, up to 12 feet high, native to central China. The leaves, 1 to 3 inches long, are oval or somewhat heart-shaped with sinuate margins, and the yellow fragrant flowers, which appear in early spring, are in racemes about 3 inches long.

For previous introduction see No. 34591.

65766 to 65775—Continued.

65769. *EXOCHORDA GIRALDI* WILSONII Rehder. Rosaceae.

A slender spreading shrub about 10 feet high, native to central China. The leaves are oblong-elliptic, occasionally serrate, and the pure-white flowers, 2 inches across, are in 6-flowered to 10-flowered racemes.

65770. *LIGUSTRUM ACUTISSIMUM* Koehne. Oleaceae.
Privet.

A much-branched shrub, 10 feet or less in height, with spreading and curving branches and very narrow sharp-pointed leaves about 2 inches long. The white flowers are borne in dense nodding panicles about an inch long. This privet is native to Japan and China.

For previous introduction see No. 43852.

65771. *LONICERA FERDINANDI* Franch. Caprifoliaceae.
Honeysuckle.

A robust deciduous free-flowering shrub, of spreading, open habit, attaining ultimately a height of 8 or 9 feet. The oval dull-green leaves, up to 4 inches long, are hairy on both sides. The yellow flowers are produced in pairs during June, and the fruit is red. The shrub is native to Mongolia.

For previous introduction see No. 43696.

65772. *LONICERA KOEHEANE* Rehder. Caprifoliaceae.
Honeysuckle.

A western Chinese honeysuckle, generally similar to the Manchurian species (*Lonicera maackii*), but readily distinguished by the slender and much longer yellow flowers. The western species is a vigorous grower, with diamond-shaped leaves 3 or 4 inches long.

65773. *RHAMNUS* sp. Rhamnaceae.

M. V. 6909.

65774. *ROSA BEGGERIANA* Schrenk. Rosaceae.
Rose.

A bush 4 to 8 feet tall with prickly, pinnate leaves; the leaflets, usually seven to nine, are elliptic to oblong, smooth and deep green above, generally thickly hairy and bluish green below. The inflorescences are 1 to nearly 50 flowered; the flowers are white, cream colored, or more rarely red. The fruits are very dark red.

For previous introduction see No. 52458.

65775. *SOPHORA DAVIDII* (Franch.) Komarov (*S. viciifolia* Hance). Fabaceae.

A Chinese shrub about 6 feet high, of light and graceful habit, bearing clusters of white and blue flowers. It appears to do well in limestone soil. (Note by David Fairchild, under No. 63382.)

65776 and 65777. *MEDICAGO SATIVA* L. Fabaceae.
Alfalfa.

From Pretoria, Union of South Africa. Seeds presented by R. W. Thornton, secretary for agriculture. Received March 5, 1926. Notes by Mr. Thornton.

65776. No. 1. A standard South African variety, typical of what we are now exporting to the United States, Australia, and New Zealand. It is generally known as Cape Provence, being a variety of common lucern developed in the Cape Province and originating from seed of the Provence variety imported from France.

65777. No. 2. *Grootfontein Chinese*, a variety which, though still in the experimental stage, has given very promising results and may in some cases replace Cape Provence, which is the variety at present commonly grown here.

65778 to 65780. AMYGDALUS PERSICA NECTARINA Ait. Amygdalaceae.**Nectarine.**

From Maidstone, England. Plants purchased from George Bunyard & Co., The Royal Nurseries. Received March 11, 1926. Notes from Catalog of Royal Nurseries, 1924-25.

65778. Darwin. Fruit large, deep orange with red flush; flesh orange, with rich flavor. Matures in September.

65779. Humboldt. Fruit large, bright yellow with a dark-crimson flush and mottlings; flesh orange, very tender and juicy. Matures in August.

65780. Pineapple. Fruit large, deep orange with a rich-crimson cheek; flesh yellow, with a delicious pineapple flavor. Matures in early September.

65781. CYNOMETRA CAULIFLORA L. Caesalpiniaceae.

From Kandy, Ceylon. Seeds obtained by David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition. Received March 12, 1926.

No. 384. Presented by Dr. A. Nell, February 3, 1926.

As described by Van Nooten (Fleurs et Fruits de Java, pt. 6, 1863), this is a medium-sized tree, with a very irregular, knotty trunk, covered with thick brown bark, marked with numerous grayish and whitish spots. The alternate compound leaves are smooth and light green when mature, but when young are red or pink, or, in some varieties, yellow. From the trunk and branches appear the corymbs of small pink or white flowers. The flattened, roundish, light-brown pods have a fleshy portion which is very palatable when stewed. The tree is a native of Java.

For previous introduction see No. 44895.

65782 to 65784. SOJA MAX (L.) Piper (Glycine hispida Maxim.). Fabaceae. Soy bean.

From Matania el Saff, Egypt. Seeds presented by Alfred Bircher, Middle Egypt Botanic Station. Received March 9, 1926.

65782. A large flattened brown bean.

65783. A large flattened creamy-yellow bean.

65784. A small round light-green bean.

65785 to 65788.

From Koslov, Government of Tambov, Russia. Seeds presented by W. M. Konstantinov. Received March 9, 1926. Notes by Mr. Konstantinov.

65785. AMYGDALUS PILOSA Turcz. Amygdalaceae.

A hardy shrub, about 10 feet in height, with pinkish flowers. Native of Mongolia.

65786. CUCUMIS MELO L. Cucurbitaceae. Melon.

Kulenkamp's Selection. From Rjasan, Mongolia. Matures in about 120 days.

65787. NICOTIANA TABACUM L. Solanaceae. Tobacco.

Mitchurin. A yellow tobacco resembling Mahorca.

65788. ZEA MAYS L. Poaceae. Corn.

Kulenkamp's Selection. A sugar corn which thrives here in the open.

65789 and 65790.

From Pretoria, Union of South Africa. Seeds presented by I. B. Pole Evans, chief, division of botany, Department of Agriculture, through W. T. Swingle, Bureau of Plant Industry. Received March 6, 1926.

65789. ALOE STRIATA Haw. Liliaceae.

A low, fleshy plant with a dense rosette of thick, narrowly oblong leaves 1 or 2 feet long, obscurely spotted, and bright-red flowers, about an inch long, in 20 or more heads borne on a stout branched peduncle. Native to South Africa.

65790. HOODIA MACRANTHA Hort. Asclepiadaceae.

A stout fleshy perennial bushy plant, with large showy flowers. Native to South Africa.

65791 and 65792.

From Lamac, Limay, Bataan, Philippine Islands. Seeds presented by the Lamac Experiment Station, through W. T. Swingle, Bureau of Plant Industry. Received March 11, 1926. Notes by P. J. Wester in Food Plants of the Philippines, Bulletin 39, Philippine Bureau of Agriculture.

65791. ANTIDESMA BUNIUS (L.) Spreng. Euphorbiaceae. Banauac.

"A small, attractive, dark-green, dioecious tree, attaining a height of 10 meters, with dark-green, thick, pointed leaves, and small, dark-red, subacid, well-flavored fruits in racemes like a currant. May be eaten raw and also makes a fair jelly. Widely distributed at low and medium elevations and under varying climatic conditions. Rare in cultivation." (P. 43.)

For previous introduction see No. 47204.

65792. COFFEA LIBERICA Bull. Rubiaceae. Coffee.

"A small tree of upright growth, native to Africa, blight resistant; adapted to elevations at and below 350 meters, succeeding well even on rather heavy, clayey soils. Average yield approximately 565 pounds to the acre. Requires artificial drying. Properly prepared, the coffee is of good quality and commands a good price." (P. 63.)

For previous introduction see No. 53497.

65793 and 65794. BELOU MARMELOS (L.) Lyons (Aegle marmelos Correa). Rutaceae. Bel.

From Colombo, Ceylon. Seeds collected by David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition. Received March 12, 1926.

For previous introduction see No. 61762.

65793. No. 330. Obtained at the market, January 23, 1926. A variety with large spherica fruits containing many seeds. In quality this fruit is not so good as the small one with abortive seeds, No. 336 [No. 66338], but it is a good flavor. It is eaten as a tonic for break fast by the people of Ceylon.

65794. No. 331. Obtained at the market, January 23, 1926. A variety with flat fruits, 3½ inches in diameter, containing many seeds. The flavor is good but not so good as No. 336 [No. 66338]. It is eaten with palm sugar as a tonic.

65795. RHAMNUS CRENATA Sieb. and Zucc. **Rhamnaceae.** **Buckthorn.**

From Nogent sur Vernisson, Loiret, France. Seeds presented by L. Pardé, directeur des Ecoles des Barres. Received March 5, 1926.

A hardy shrub, 10 feet or less in height, native from Japan to central China. The leaves are narrowly oblong or oval, sometimes long-acuminate, and the small globular berries, a third of an inch in diameter, change from red to purplish black.

65796. PINUS SYLVESTRIS L. **Pinaceae.** **Scotch pine.**

From Moscow, Russia. Seeds presented by the director, Institute of Applied Botany and New Cultures. Received March 18, 1926.

A Russian variety of Scotch pine.

65797 to 65799. COFFEA spp. **Rubiaceae.** **Coffee.**

From Mayaguez, Porto Rico. Seeds presented by the director, Agricultural Experiment Station. Received January 21, 1926. Notes taken from an article on Coffees of the Dutch Indies (*Tea and Coffee Trade Journal*, vol. 55, p. 417).

65797. COFFEA CANEPHORA Pierre.

The branches of this species are more slender than those of *Coffea robusta* and spread horizontally in the young plant. The leaves are dark green, narrower than in *C. robusta*, and reddish when young. The unripe berries are purple, the ripe berries are bright red and narrowly oblong. This stands drought better than *C. robusta* and is better fitted for higher altitudes.

For previous introduction see No. 53455.

65798. COFFEA QUILLOU P. J. S. Cramer.

Introduced into the East Indies from Libreville, French Congo, in 1901, this was found to be distinct from *Coffea robusta*. The leaves are narrower and brighter green, and the young trees are pyramidal in habit. The berries are bright red, not dark crimson, and oblong. The crop matures later than that of *C. robusta* and under favorable circumstances is larger than that of any other coffee. Under less favorable conditions *C. robusta* is more productive.

For previous introduction see No. 61486.

65799. COFFEA UGANDAE P. J. S. Cramer.

This resembles *Coffea canephora* in many respects, but the smaller, narrower leaves are brighter green and more curled and ribbed. The bean is smaller in size and shape, but shows a purplish tinge and is not sharply striped. The flavor of the coffee is said to be better than that of *C. robusta*.

65800 and 65801. SACCHARUM OFFICINARUM L. **Poaceae.** **Sugar cane.**

From Ensenada, Porto Rico. Cuttings presented by the South Porto Rico Sugar Co., through E. W. Brandes, Bureau of Plant Industry. Received January 2, 1926.

Locally grown varieties.

65800. *G. C. 1480.*

65801. *Ba. 6082.*

65802 and 65803.

From Ronda, Spain. Seeds presented by Mrs. N. Low, at the request of David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received January 2, 1926.

65802 and 65803—Continued.

65802. GENISTA MONOSPERMA (L.) Lam. **Fabaceae.**

An ornamental leguminous shrub, native to Spain, about 10 feet high, with slender grayish branches and small, very narrow leaves. The fragrant white flowers are in short lateral racemes.

For previous introduction see No. 64923.

65803. QUERCUS ILEX L. **Fagaceae.** **Oak.**

The *Ballota* is only a seedling variation of *Quercus ilex* which, in the Balearic Islands, is so much appreciated because of its large sweet acorns that it is grafted on the bitter acorn-bearing form as a stock. In southern Spain I was assured that acorns from a sweet *Ballota* tree would produce sweet acorns. (Fairchild.)

For previous introduction see No. 54659.

65804. AMYGDALUS PERSICA L. (*Prunus persica* Stokes). **Amygdalaceae.** **Peach.**

From Tunbridge Wells, England. Plants obtained from Arthur Charlton & Sons. Received January 8, 1926.

Royal George. Fruit large, pale yellow flushed with blood red; flesh yellow, rich and sweet; matures early in September. (Arthur Charlton & Sons' Catalogue.)

65805 and 65806. CASTANEA MOLLISSIMA Blume. **Fagaceae.** **Chestnut.**

From Canton, China. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received January 4, 1925. Numbered January, 1926.

65805. No. 185. Obtained at Chukkouen, Loh-kongtung, October 30, 1925. *Fung lut* and *hong lut*. The fruits of this variety are distinguished by their gray color, which is due to an almost complete covering of adpressed hairs. This is said to be the most common variety, the most prolific bearer, and the most durable in storage.

65806. No. 186. Obtained at Chukkouen, Loh-kongtung, October 30, 1925. *Fung lut* and *yau lut*. The fruits of this variety are distinguished by their deep brownish red color and their almost complete freedom from the covering of gray hairs which characterizes McClure's No. 185 [No. 65805]. This variety is said to be less common than No. 185 and to bring a slightly better price on the market because of its better appearance, but it is less durable in storage.

65807. SACCHARUM OFFICINARIUM L. **Poaceae.** **Sugar cane.**

From Dal Carmen, Pampanga, Philippine Islands. Cuttings presented by H. B. Ross, through E. W. Brandes, Bureau of Plant Industry. Received January 11, 1926.

A locally grown variety.

65808 to 65816. ZEA MAYS L. **Poaceae.** **Corn.**

From Leningrad, Russia. Seeds presented by the Institute of Applied Botany, through G. N. Collins, Bureau of Plant Industry. Received January 5, 1926.

Locally grown varieties.

65817. CITRUS GRANDIS (L.) Osbeck
(*C. decumana* Murr.). Rutaceae.
Grapefruit.

From Los Banos, Philippine Islands. Bud wood presented by J. E. Higgins, College of Agriculture, through W. T. Swingle, Bureau of Plant Industry. Received January 2, 1926.

Better pummelo C. A. 1427.

65818. CITRUS GRANDIS (L.) Osbeck
(*C. decumana* Murr.). Rutaceae.
Grapefruit.

From Bangkok, Siam. Seeds presented by Yai S. Sanitwongse. Received January 2, 1926.

Seeds of a variety of pummelo called Thongdie, considered by many the best in Siam. It has a thin skin and does not keep as long as the commercial Siamese varieties. (*Sanitwongse*.)

65819 to 65853.

From Kwangtung, China, and the Philippine Islands. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received January 4, 1926. Notes by Mr. McClure.

65819 to 65822. AMYGDALUS PERSICA L. (*Prunus persica* Stokes). Amygdalaceae.

These seeds were obtained from trees on the Canton Christian College farm, July, 1925.

65819. No. 231. *Tim tao*. A comparatively late, single-flowered variety of edible peach. The round white-skinned fruits have sweet white flesh.

65820. No. 232. *Suen tao*. A single-flowered variety of edible, though very sour, fruits. It is the earliest variety known here, ordinarily.

65821. No. 233. *Shau thai tao*. This peach bears medium-sized fruit which the Chinese say is good to eat, but the chief value of this variety is its large double pink fragrant flowers, which make it an exquisite ornamental.

65822. No. 234. *Laan faan tao*. A very early single-flowered variety. The yellow-skinned fruits are the largest of any variety native here, but they are also the sourest. The yellow flesh is dark red near the seed.

65823. ANEMONE VITIFOLIA Buch-Ham. Ranunculaceae.

No. 239. A very pretty ornamental found in the wild on Santo Tomas (St. Thomas) Mountain, Luzon, Philippine Islands, at an altitude of over 2,000 meters, September, 1925. It is an annual, reaching a height of about 1 meter, much branched, with large, deeply divided leaves and open corymbs of beautiful flowers which are tinted cream and pale pink. These are followed by round fruits which, when ripe, burst forth in abundant seed-bearing cotton.

For previous introduction see No. 49615.

65824. ARTOCARPUS HYPARGYREA Hance. Moraceae.

No. 182. From a tree located at Taishaan, Lohkongtung, Kwangtung Province, belonging to Chung Pooi Chue. *Paak kwai muk: paak kau long*. A beautiful ornamental tree, attaining a height of 10 to 15 meters, with a dense covering of large, soft-textured, dull-green leaves. The curious yellow fruit is about the size of a large orange, irregular in shape and very soft when ripe. In fact, the skin is so very tender and easily broken that the fruit is never shipped fresh. The skin, like that of No. 1 [No. 62009], is covered with a fine stiff short pubescence which is very unpleasant when eating. When an unripe fruit is bruised or the skin is broken it exudes a very sticky white latex. The struc-

65819 to 65853—Continued.

ture of the fruit is typical of the genus, the segments being arranged radically. The texture of the deep orange-yellow flesh is very fine and tender, and the flavor is pleasant, subacid to acid. The fruit is used by the Chinese as follows: Fresh, pickled in salt as an appetizer, and as a drug when dried. The tree is grown from seeds, which are considerably larger than those of No. 1, and it is not grafted.

65825. BOEHMERIA NIVEA (L.) Gaud. Urticaceae. **Ramie.**

No. 223. Obtained from the Linchow District, Kwangtung Province, October, 1925. *Pak chue ma*. An erect, branched monoecious shrubby perennial, 1 to 2 meters high, with hairy branches and petioles, which is propagated here, as a rule, by means of rooted suckers springing up from the base of the plant. It is cultivated in Kwangtung for the excellent fibers which its stem yields, and the well-known Chinese grass cloth is said to be made from the selected fibers.

For previous introduction see No. 63790.

65826 to 65828. CANARIUM ALBUM (Lour.) DC. Balsameaceae.

These seeds were obtained October 31, 1925, from a tree near Chukkouen, Lohkongtung, belonging to Chung Ch'iu Chue.

For previous introduction see No. 61761.

65826. No. 216. *Paak laam; Shaan tau paak laam*. The fruits are subelliptical in longitudinal section and nearly round in cross section. This variety is considered by the Chinese to be the best *paak laam* in point of flavor and quality, and it is consumed fresh to a greater extent than any other. It is multiplied only by grafting.

65827. No. 217. *Paak laam; saam fong paak laam*. The fruits are subovate in longitudinal section, distinctly triangular in cross section. This variety is considered by the Chinese to rank next to No. 216 [No. 65826] in quality and flavor. The crop is used almost entirely for pickling. Multiplied only by grafting.

65828. No. 218. *Paak laam; wongtsai*. This variety is very similar to No. 216 [No. 65826] in general appearance, but turns yellow sooner. It is considered by the Chinese to be decidedly inferior to No. 216 in flavor and quality. It is not eaten fresh to any great extent, but is used for pickling. Multiplied only by grafting.

65829 to 65834. CANARIUM PIMELA Koen. Balsameaceae.

From a tree belonging to Chung Ch'iu Chue, at Chukkouen, Lohkongtung. October 31, 1925.

65829. No. 209. *Oo laam; heung laam*. The medium-sized fruits, 4.5 centimeters long, are irregularly oblong and stand at the top of the list in flavor and quality. They resemble No. 210 [No. 65830], but are distinguished from these fruits by the less triangular and more pointed shape of the seeds. This variety is propagated only by grafting.

65830. No. 210. *Oo laam; saam fong laam*. A black olive with excellent flavor and quality, no fiber, and a rather tough skin. The fruit is bluntly oblong in shape and somewhat triangular in cross section. This olive, next to No. 209 [No. 65829], is the most highly esteemed by the Chinese. Propagated only by grafting.

65831. No. 211. *Oo laam; taai tsung paak*. This variety, propagated only by grafting, is distinguished from No. 210 [No. 65830] by its more abundant resin and more tender skin.

65819 to 65853—Continued.

65832. No. 212. *Oo laam; shaan laam*. A seedling tree which through neglect was never grafted. All ungrafted trees of this species are known as *shaan laam* (mountain olive). The fruits are long and semipointed, and the seeds are comparatively long and tapering at the end. The resin and oil content seem to be higher than in the other varieties, and the quality is fair.

65833. No. 213. *Oo laam; ah paak oo laam*. This variety, propagated only by grafting, is similar in shape to No. 212 [No. 65832] but slightly larger on the average. The quality is medium, the flavor poor, and the skin is very tough. The seed is long pointed but not so long as that of No. 212.

65834. No. 214. *Oo laam; ngoh ko oo laam*. This is the thickest fleshed variety, but also the most coarse grained and fibrous. The fruits are subovate and the seed very long pointed. Propagated only by grafting.

65835. *DIANELLA CAERULEA* Sims. Liliaceae.

No. 238. From the wild in the pine woods at Baguio, Luzon, Philippine Islands, at an altitude of about 1,500 meters, September, 1925. A herbaceous perennial, 1 to 2 meters high, with its two-ranked linear leaves in distichous arrangement. The under surface of the leaves is scantily covered with a white powdery bloom; the pale blue flowers, with yellow stamens, are borne in terminal corymbs; the fruits are produced rather abundantly, soon turning black and soft, falling to the ground. Spreads by creeping rootstocks.

65836 to 65838. *DIOSPYROS KAKI* L. f. Diospyraceae. Kaki.

65836. No. 179. From a tree belonging to Chue Tung, at T'oi chung, Honam Island, Kwangtung Province. October 26, 1925. *Shui tsz; ma tai yeung tsz*. The globose, light-yellow fruits, 4 to 5 centimeters in diameter, are rather seedy and have firm flesh.

For introduction of bud wood see No. 65582.

65837. No. 180. *Sai' paat sin tsz*. A large prolific tree found just outside of Pakshaan, Honam Island, Kwangtung Province. October 26, 1925.

65838. No. 195. From a tree, near Lohfungtsz (Monastery), Lohkongtung, Kwangtung Province, belonging to Chung Ch'iu Chue, October 30, 1925. *Sz man chuen tsz*. This variety is considered very prolific, and the tree is about 20 feet high and has a spread of about 20 feet. The fruits, the size of a goose egg, are subglobular and characterized by a depression which forms a "collar" just below the calyx. This is a rather seedy variety, some fruits having four or five seeds, but seedless ones are often found on this tree. The most striking thing about the fruits is that it is not necessary to ripen them artificially in order to remove the astringency. Ch'iu Chue says that this is the only tree he knows that produces nonastringent fruits.

65839. *EREMOCHLOA OPHIUROIDES* (Munro) Hack. Poaceae. Grass.

No. 220. From the island of Honam, Kwangtung Province. This variety was growing on rolling land not under cultivation, but constantly pastured and cut over by hunters of fuel. This grass has never been grown artificially here by means of seed, but it can doubtless be grown by following the usual practices observed in sowing lawn grasses.

For previous introduction see No. 58389.

65819 to 65853—Continued.

65840. *FICUS* sp. Moraceae.

Fig.

No. 237. A much-branched shrub up to 4 or 5 meters in height, found growing in a sink hole in a limestone formation in the wild near Baguio, Luzon, Philippine Islands, at an altitude of about 5,000 feet, September, 1925. The fruits are small, up to 2 centimeters in diameter, rich purple when ripe, sweet, and of very pleasant flavor. Owing to the tenderness of the skin and its freedom from the roughness which makes the ordinary fig a little difficult for some persons to eat, this fruit may be eaten fresh, in which state it was pronounced delicious by all those who sampled it. The leaves are mostly entire, oblong to lanceolate, acute, with a roughness to the touch which is due to a sparse covering of short, bristly scalelike excrescences. This is probably not of promise as a commercial fig, owing to the smallness of the fruits, the tenderness of the skin, and the scant fecundity; but it may have possibilities as a stock or for breeding purposes.

65841. *GLYPTOSTROBUS PENSILIS* (Staunton) Koch (*Taxodium heterophyllum* Brongn.). Pinaceae.

No. 222. From Honam Island, Kwangtung Province. October 1925. *Shui tsung*. A beautiful ornamental which is planted along water-courses and ponds in many parts of the Canton delta because of its supposed beneficent geomantic influence. The lumber is considered to be very durable even when exposed to moisture, as it requires more than average moisture in order to thrive, and is therefore used in the construction of boats at Canton, particularly as heavy timbers. This tree is of scientific interest in that it is known only in cultivation. Its native home is supposed to be somewhere in southern China, since it is not known elsewhere. It can be grown as a seedling if not allowed to become too dry.

65842. *IXORA CHINENSIS* Lam. Rubiaceae.

No. 187. Obtained in the wild at Kotasaitamshaan, Lohkongtung, Kwangtung Province, October 31, 1925. *Lung shuen fa*. A small, ornamental bush with abundant dense terminal umbels of attractive flame-colored flowers. The leaves are large, shiny, and pale green.

65843. *MELASTOMA SANGUINEUM* Roxb. Melastomaceae.

No. 188. From the wild at Kotasaitamshaan, Lohkongtung, Kwangtung Province, November 1, 1925. *Mo nim*. A fine ornamental shrub, attaining a height of 1 to 2 meters, with large shiny red-nerved leaves and large single deep-pink flowers with conspicuous yellow stamens.

65844 to 65845. *PRUNUS SALICINA* Lindl. Amygdalaceae. Japanese plum.

Obtained at Pakshaan, Honam Island, Kwangtung Province, June, 1925, from Mok Tai T'ong.

65844. No. 226. Contrary to the vernacular name, *hung fa lei* (red-flowered plum), this and all the other varieties known here have white flowers. The fruits, however, when ripe are deep red, almost black, with deep-red flesh and comparatively small seeds to which the flesh adheres very tightly. While very attractive in appearance and good shippers, these fruits are quite sour. This variety is said to be propagated almost entirely by means of root sprouts.

65845. No. 227. The flowers of this variety are white. The fruits are dark red, mottled with fine yellow dots; suture shallow, marked with darker red; apex often with slightly raised appendage; flesh firm, juicy, red, flavor fair. Propagated by grafting. The seedlings of any variety

65819 to 65853—Continued.

of the species used without preference; peach stock tried with success by Mok Tai T'ong.

65846. No. 228. *Foo yan lei*. The fruits are pale yellowish red, mottled with yellow or greenish yellow, subglobular, usually with a slight ridge on one side of the suture which is marked by a line of red deeper than that of the rest of the fruit. The skin is smooth and the flesh bright-red, firm and juicy, acid, clinging tightly to the seed. The two halves of the fruit are usually unequal in size.

65847. No. 229. *Taai oo lei*. Fruits dark red, mottled with greenish yellow; globular in shape; suture slightly raised and marked with a darker red line; flesh firm, juicy, subacid, dark red; seed a cling, rather large in proportion to fruit. Propagated by grafting on seedlings of any variety of this species.

65848. No. 230. *Nooh Ko lei*. Fruits relatively large, oblong; halves often unequal; suture not deep, marked with a thin solid red line; skin smooth, golden yellow, mottled with red; flesh firm, juicy, lemon-yellow when ripe. Propagated by grafting on seedlings of any variety of this species.

65849. *RHODOMYRTUS TOMENTOSA* (Ait.) Wight. Myrtaceae.

No. 202. From the wild at Kotaaitamshaan, Lohkongtung, Kwangtung Province, November 1, 1925. *Nim tsai*. A pretty little shrub bearing abundant pale-pink flowers followed by delicious purplish fruits the size of a gooseberry. The fruits, as well as the under side of the leaves, are covered with fine gray hairs.

For previous introduction see No. 48583.

65850. *RUBUS ELMERI* Focke. Rosaceae.

No. 235. Found in disintegrated limestone residual at Baguio, Luzon, Philippine Islands, at an altitude of 5,000 feet, September, 1925. A very pretty, low, creeping bramble, with dark-green, rugose foliage, bearing its white flowers and yellowish fruits singly in the axils of the leaves at or near the tips of the branches. The stems, buds, petioles, and under surface of the leaves are covered with dense brownish tomentum. The fruits are medium sized, yellowish, very juicy, and somewhat sweet, with a good flavor. The long styles remain attached to the drupels as with our yellow raspberry in the United States. This berry is gathered from the wild and served at some of the boarding places in this region.

65851. *RUBUS FRAXINIFOLIUS* Poir. Rosaceae.

No. 236. Found in disintegrated limestone soil at Baguio, Luzon, Philippine Islands, at an altitude of 5,000 feet, September, 1925. A sturdy, upright, little-branched bramble, with a stiff stem up to 3 or 4 meters high and 2 to 3 centimeters in diameter under favorable conditions. The stems and branches are red, armed with short, sharp, recurved hooks. The white flowers are followed by large, attractive bright-red fruits, borne in large clusters. The drupels are small and numerous, resulting in a rather seedy, comparatively dry fruit.

For previous introduction see No. 56273.

65852 and 65853. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceae. Soy bean.

65852. No. 224. From Nodoo, Hainan Island, China. *Tung tau; siu tau*. A small black bean usually planted in December and grown during the winter months.

65853. No. 225. From Nodoo, Hainan Island, China. *Ch'un tau; tai tau* (spring bean; big bean). A spring variety planted in May.

65854 to 65859.

From Harbin, Manchuria. Seeds obtained by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received January 4, 1926.

65854. *ABUTILON THEOPHRASTI* Medic. (*A. avicennae* Gaertn.). Malvaceae.

No. 4692. November 8, 1925. Seeds from plants growing in the wild. This variety is generally known here as "Manchurian jute" and is found both wild and cultivated.

For previous introduction see No. 54748.

65855. *AMYGDALUS DAVIDIANA* (Carr.) Zabel (*Prunus davidiana* Franch.). Amygdalaceae.

No. 4670. Obtained at the Fa Hua Ssu Temple, near Peking, October 29, 1925. May prove valuable as stock.

65856 and 65857. *AMYGDALUS PERSICA* L. (*Prunus persica* Stokes). Amygdalaceae. Peach.

Obtained at the Fa Hua Ssu Temple, near Peking, October 29, 1925.

65856. No. 4663. "Red Flowering peach," a freestone variety which ripens the middle of September and is said to fruit in pairs.

65857. No. 4670. This peach may prove valuable as a stock.

65858 and 65859. *CASTANEA MOLLISSIMA* Blume. Fagaceae. Chestnut.

65858. No. 4666. Obtained at the Fa Hua Ssu Temple, near Peking, October 29, 1925. *Pai luli tze* (white dew chestnut). The diameter of the nuts is less than an inch; they mature early in September.

For previous introduction see No. 65620.

65859. Nos. 4667 and 4668. Mixed seeds of *erh luli tze* (second-crop chestnut) and *han luli tze* (cold-dew chestnut) obtained at the Fa Hua Tze Temple near Peking, October 29, 1925. Ripen the last of September.

65860. *ILEX CORNUTA* Lindl. and Paxt. Aquifoliaceae. Chinese holly.

From Ichang, China. Seeds presented by Rev. A. S. Cooper, American Church Mission. Received May 22, 1923. Numbered January, 1926.

A holly with spiny, dark-green, glossy leaves, which in winter is loaded with clusters of scarlet berries. While it does not make as symmetrical a crown as does the native Christmas holly, *Ilex opaca*, its attractive foliage and bright-colored fruits render it a fine winter ornamental for the southern half of the United States.

For previous introduction see No. 32945.

65861 to 65880.

From Harbin, Manchuria. Seeds obtained by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received January 4, 1926. Notes by Mr. Dorsett. Chestnut.

65861. *CASTANEA MOLLISSIMA* Blume. Fagaceae.

No. 4669. From the Fa Hua Ssu Temple, near Peking. *Hu chao li tze* (tiger-paw chestnut). Seeds of this same chestnut were sent in under No. 790 [No. 61834], and scions under No. 1677 [No. 62257].

65862. *CHAETOCLOA ITALICA* (L.) Scribn. (*Setaria italica* Beauv.). Poaceae. Millet.

No. 4697. November 8, 1925. Obtained at Echo.

65863. *CUCURBITA MAXIMA* Duchesne. Cucurbitaceae.

No. 4705. November 8, 1925. A good-sized, dark-red variety with yellow flesh.

65861 to 65880—Continued.

65864. *ELSHOLTZIA PATRINII* (Lepechin) Garcke
(*E. cristata* Willd.). Menthaceae.

No. 4700. November 8, 1925. From Echo.

For previous introduction see No. 29928.

65865. *EVONYMUS* sp. Celastraceae.

No. 4690. From Echo, October 8, 1925.
This may prove of value as an ornamental.

65866. *FRAXINUS* sp. Oleaceae. Ash.

No. 4730. November 10, 1925. From the Ta
Lu Hua Temple, Taluhua Mountains.

65867. *GLEDITSIA HETEROPHYLLA* Blume. Cae-
salpiniaceae.

No. 4708. November 8, 1925. Collected in
the Western Hills, northwest of Peking. This
may be the same as No. 653 [No. 61922].

65868. *GLYCRRHIZA* sp. Fabaceae.

No. 4698. November 8, 1925. A rank-grow-
ing plant with heavy seed pods and spiny cap-
sules, found in Echo.

65869 and 65870. *JUGLANS REGIA* L. Juglan-
daceae. Walnut.

From the Fa Hua Ssu Temple, near Peking,
October 29, 1925.

65869. No. 4664. *Chiu tze ho tao* (ornament
walnut). A very hard-shelled, irregular-
shaped variety which ripens at the end of
August.

65870. No. 4665. A thin-shelled variety
which ripens at the end of August.

65871. *LESPEDEZA* sp. Fabaceae.

No. 4691. November 8, 1925. A herbaceous
plant from Echo.

65872. *LESPEDEZA* sp. Fabaceae.

No. 4701. November 8, 1925. From Echo.

65873. *NICOTIANA* sp. Solanaceae. Tobacco.

No. 4695. November 8, 1925. Chinese cul-
tivated tobacco grown in the vicinity of Echo.

65874. *PERILLA FRUTESCENS* (L.) Britton (*P.*
ocymoides L.). Menthaceae. Perilla.

No. 4703. November 8, 1925. From Echo.

For previous introduction see No. 62187.

65875. *PINUS KORAIENSIS* Sieb. and Zucc.
Pinaceae. Pine.

No. 4706. Seeds obtained at the market,
Harbin, November 8, 1925, where they had been
shipped in from the mountains of the surround-
ing region.

For previous introduction see No. 65501.

65876. *POLYGONUM DIVARICATUM* L. Poly-
gonaceae.

No. 4696. November 8, 1925. From Echo.

65877. *PRUNUS* sp. Amygdalaceae. Plum.

No. 4670½. A variety which may be valuable
for stock; good fruiting types also may appear.
From the Fa Hua Ssu Temple, near Peking.

65878. *PYRUS BETULAEFOLIA* Bunge. Malaceae.
Pear.

No. 4723. Nung Lo Tomb. October 18, 1925.
From the same tree as the seeds sent in under
No. 865 [No. 62195]. This tree is a considerable
distance from any other pear tree, which perhaps
accounts for so few seeds in the fruit.

65861 to 65880—Continued.

65879. *PYRUS* sp. Malaceae.

Pear.

No. 4724. Wild pears obtained in the Peking
market, October 21, 1925, where they had been
shipped in from Shaho, north of Peking. They
may prove of interest as stock.

65880. *SORBUS* sp. Malaceae. Mountain ash.

No. 4689. November 3, 1925. An ornamental
red-fruited tree growing near Achihe station of
the Chinese Eastern Railway. The berries are
borne in clusters similar to elderberries and after
frost may be made into jam. Seeds were sent in
under No. 4572 [No. 65683].

65881 to 65899. *ORYZA SATIVA* L.
Poaceae. Rice.

From Leningrad, Russia. Seeds presented by
A. Kol, chief of bureau of introduction and
information, Institute of Applied Botany and
New Cultures, through C. E. Chambliss,
Bureau of Plant Industry. Received January 5,
1926. Locality notes by Mr. Kol.

65881. No. 1. *Tchal'tyk*. From Armenia.

65882. No. 3. *Tchal'tyk*. From Aserbejdshan,
Nuchimsky District.

65883. No. 4. *Andabru*. From Aserbejdshan,
Baku Government, Lenkoransky District.

65884. No. 7. *Styk*. From Aserbejdshan, Baku
Government, Lenkoransky District.

65885. No. 8. *Shala*. From Turkestan, Dusety
Su District.

65886. No. 20. *Shala*. From Samarkand Dis-
trict.

65887. No. 21. *Shala*. From Samarkand Dis-
trict.

65888. No. 22. *Shala*. From Samarkand Dis-
trict.

65889. No. 37. *Shala* (China). From Turke-
stan.

65890. No. 101. From Turkestan.

65891. No. 103. *Shala*. From Turkestan,
Dsheti-Su.

65892. No. 105. *Shala*. From Turkestan,
Samarkand District.

65893. No. 110. *Shala*. From Turkestan.

65894. No. 113. *Gidej*. From Aserbejdshan,
Lenkoransky District.

65895. No. 116. *Andabru*. From Aserbejdshan,
Lenkoransky District.

65896. No. 262. *Arna Shala*. From Turkestan,
Samarkand District.

65897. No. 467. *Shaly*. From Turkestan, Sam-
arkand District.

65898. No. 506. *Berindsh*. From Estate Kara-
kar, near Erivan, Armenia.

65899. No. 508. From Estate Karakar, near
Erivan, Armenia.

65900 and 65901. *GOSSYPIUM NAN-
KING* Meyen. Malvaceae. Cotton.

From Kunchuling, Manchuria. Seeds presented
by Dr. K. Kanda, director, Kunchuling
Agricultural Experiment Station. Received
January 6, 1926. Notes by Doctor Kanda.

Local strains produced in 1925 at the Hsiung-
yaocheng Agricultural Experiment Branch Station
of the South Manchuria Railroad Co., near Liao-
yang, Manchuria.

65900 and 65901—Continued.

65900. *Kuro tane* (Manchurian black seed).65901. *Shiro tane* (Manchurian white seed).65902. *CARICA PAPAYA* L. **Papaya-
ceae.**

From Vera Cruz, Mexico. Seeds presented by C. A. Purpus. Received January 7, 1926.

The papaya from Monserrate is an excellent variety, grown in sandy soil. It is monoecious, not dioecious. The fruit is orange red inside and very sweet. (*Purpus*.)

65903 and 65904. *LESPEDA* spp.
Fabaceae.

From Fukuoka, Japan. Seeds presented by Dr. Mitsunaga Fujioka, Kyushu Imperial University. Received January 9, 1926.

65903. *LESPEDA JUNCIA SERICEA* (Miquel) Forbes and Hemsli.

Medohagi. A Japanese bush clover which develops into a shrubby plant about 3 feet high, with dense foliage and white flowers.

For previous introduction see No. 59378.

65904. *LESPEDA STRIATA* (Thunb.) Hook. and Arn.

Yahazuso. A locally developed Japanese strain.

For previous introduction see No. 62383.

65905. *COFFEA QUILLOU* P. J. S. Cramer.
Rubiaceae. Coffee.

From Manila, Philippine Islands. Seeds presented by S. Youngberg, director, Bureau of Agriculture. Received January 9, 1926.

For previous introduction and description see No. 65798.

65906 to 65961.

From Harbin, Manchuria. Seeds obtained by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received January 8, 1926.

65906. *ABIES HOLOPHYLLA* Maxim. **Pinaceae.**
Manchurian fir.

No. 4758. November 21, 1925. A tall, handsome Manchurian fir, eventually 100 feet or more in height, with stout spreading or ascending branches and dark-green foliage.

65907. *ACANTHOPANAX SENTICOSUM* (Rupr.) Harms. **Araliaceae.**

No. 4756. November 21, 1925. A very spiny shrub bearing palmate-divided leaves and having at the end of its long shoots small umbels of black berries. Grows generally in dense shade, and may be of use as a park or garden shrub or as an undergrowth beneath tall trees. (*Frank N. Meyer, under No. 57274.*)

65908. *ACANTHOPANAX SESSILIFLORUM* (Rupr. and Maxim.) Seem. **Araliaceae.**

No. 4767. November 21, 1925. A vigorous deciduous shrub which forms a large spreading bush 10 feet high, with three-lobed or five-lobed, irregularly toothed leaves. The flowers, brownish purple with yellow protruding stamens, are packed closely in a spherical almost stalkless cluster about an inch in diameter and appear in July. The inky black berries are in round clusters about an inch thick. This is one of the hardest shrubs introduced from northern China, where it is native.

For previous introduction see No. 58603.

65909 to 65911. *ACER* spp. **Aceraceae. Maple.**

November 21, 1926.

65906 to 65961—Continued.

65909. *ACER BARBINERVE* Maxim.

No. 4757. A shrubby maple, native to Manchuria, with coarsely toothed five-lobed leaves.

65910. *ACER GINNALA* Maxim.

No. 4751. A small tree or large shrub of bushy habit, with three-lobed, slightly heart-shaped leaves and very fragrant white flowers in short panicles, appearing in May. This maple is nearly allied to *Acer tataricum*, but differs markedly in shape of leaf. The foliage turns a beautiful red before falling, the species being one of the best for autumn coloring. It is native to China, Manchuria, and Japan.

For previous introduction see No. 42310.

65911. *ACER UKURUNDENSE* Trautv. and Meyer (*A. spicatum* Lam.).

No. 4762. A small Manchurian tree with coarsely toothed, five-lobed or seven-lobed leaves.

For previous introduction see No. 30845.

65912. *ALNUS HIRSUTA* Turcz. **Betulaceae.**
Alder.

No. 4752. November 21, 1925. A rather handsome medium-sized tree, native to Japan and Manchuria, with rounded-elliptic, slightly lobed leaves, hairy beneath.

65913. *ABALIA CHINENSIS MANDSHURICA* (Rupr.) Rehd. **Araliaceae.**

No. 4763. November 21, 1925. This is a small, hardy Manchurian tree resembling *Aralia spinosa* (Hercules club), but more treelike, with few spines. It does not form many branches, but the large bipinnate leaves cast a good shade. The greenish white flowers are borne in large panicles, and the berries are dark red when ripe, producing a very pleasing effect.

For previous introduction see No. 45573.

65914 to 65916. *AVENA SATIVA* L. **Poaceae.**
Oats.

From the Agricultural Experiment Station, Harbin, November 22, 1925.

65914. No. 4805. *Dreger yellow*, No. 37.65915. No. 4806. *Dreger white*, No. 36.65916. No. 4807. *Strube*, No. 40.65917. *BETULA FRUTICOSA* Pall. **Betulaceae.**
Birch.

No. 4815. November 21, 1925. A shrub, about 15 feet high, with oval-elliptic leaves 2 inches long. Native to Manchuria and Siberia.

For previous introduction see No. 37007.

65918. *BETULA PLATYPHYLLA* Sukaczew. **Betulaceae.**
Birch.

No. 4753. November 21, 1925. A Siberian birch with broadly ovate, acuminate leaves 2 inches wide and long.

65919. *CANNABIS SATIVA* L. **Moraceae. Hemp.**

No. 4802. November 22, 1925. A local variety, No. 2, from the Agricultural Experiment Station, Harbin.

65920. *CARPINUS CORDATA* Blume. **Betulaceae.**
Hornbeam.

No. 4755. November 21, 1925. A handsome hardy tree 40 feet or less in height, with oval-oblong, acuminate leaves 3 to 6 inches long. Native to Japan and Manchuria.

65921. *CAULOPHYLLUM ROBUSTUM* Maxim. **Berberidaceae.**

65906 to 65961—Continued.

No. 4759. November 21, 1925. An ornamental perennial herb, native to eastern Asia, with panicles of small yellow-green flowers, succeeded by blue berries.

65922. *CELASTRUS FLAGELLARIS* Rupr. Celastraceae.

No. 4772. November 21, 1925. A shrubby Chinese vine, quite hardy, with persistent spiny stipules, small oval leaves, and small axillary fruits with crimson arils.

For previous introduction see No. 63345.

65923 and 65924. *CHAETOCHELOA ITALICA* (L.) Scribn. (*Saana italica* Beauv.). Poaceae. Millet.

November 22, 1925. From the Agricultural Experiment Station, Harbin.

65925. No. 4800. A small yellow-seeded variety.

65924. No. 4801. A small shiny yellow variety.

65925. *CLEMATIS BREVICAUDA* DC. Ranunculaceae.

No. 4774. November 21, 1925. A vigorous climbing vine, native to China, with pinnate or bipinnate, coarsely toothed leaves and axillary panicles of white flowers.

65926. *EVONYMUS ALATUS* (Thunb.) Rupr. Celastraceae.

No. 4764. November 21, 1925. A spreading shrub about 8 feet high native to China and Japan. The sharply toothed elliptic leaves are about 2 inches long, and the yellowish flowers are in small clusters. The capsules are purplish.

For previous introduction see No. 37479.

65927. *PAGOPHYRUM VULGARE* Hill (*P. esculentum* Moench). Polygonaceae. Buckwheat.

No. 4804. From the Agricultural Experiment Station, Harbin, November 22, 1925.

65928 to 65934. *HORDEUM* spp. Poaceae. Barley.

From the Agricultural Experiment Station, Harbin, November 21, 1925.

65928 and 65929. *HORDEUM DISTICHON* PALMELLA Harlan. Two-rowed barley.

65928. No. 4778. *Moravia*, No. 57.

65929. No. 4781. *Tschermak*, No. 53.

65930. *HORDEUM VULGARE* NIGRUM (Willd.) Beaven. Six-rowed barley.

No. 4783. *Mukden* black barley, No. 15.

65931 to 65934. *HORDEUM VULGARE* PALLEDUM Siering. Six-rowed barley.

65931. No. 4779. *Ganazay HIV*, No. 40.

65932. No. 4780. *Imperial*, No. 56.

65933. No. 4782. *Vladimirov*, No. 12.

65934. No. 4784. *San toku*, No. 13.

65935 and 65936. *LINUM USITATISSIMUM* L. Linaceae. Flax.

From the Agricultural Experiment Station, Harbin, November 22, 1925.

65935. No. 4798. *Belgium*, No. 11.

65936. No. 4799. *Russian*, No. 7.

65937. *LONICERA MAACKII* (Rupr.) Herd. Caprifoliaceae. Honeysuckle.

No. 4766. November 21, 1925. A bush honeysuckle, native to northeastern China, becoming about 10 feet high with widely spreading branches and dark-green leaves which are downy on both surfaces. The pure-white

65906 to 65961—Continued.

flowers, an inch in diameter, are produced in pairs on the upper side of the branches. The fruits are red.

For previous introduction see No. 57900.

65938. *LONICERA BUTRECHTIANA* Regel. Caprifoliaceae. Honeysuckle.

No. 4770. November 21, 1925. A Manchurian shrub, 12 feet high, with dark-green leaves, grayish pubescent beneath, and pure white flowers followed by red or yellow fruits.

For previous introduction see No. 53715.

65939. *MAACKIA AMURENSIS* Rupr. Fabaceae.

No. 4754. November 21, 1925. A small tree, native to eastern Asia, with orange-brown bark, dull-green compound leaves, and short erect clusters of small yellowish white flowers.

For previous introduction see No. 57301.

65940 and 65941. *ORYZA SATIVA* L. Poaceae. Rice.

Upland rice from the Agricultural Experiment Station, Harbin, November 21, 1925.

65940. No. 4785. *Kon tou*, No. 4.

65941. No. 4786. *Tieh ling*, No. 16.

65942. *PICEA JEZOENSIS* (Sieb. and Zucc.) Carr. Pinaceae. Spruce.

No. 4773. November 21, 1925. A tall Siberian spruce, up to 100 feet in height, with slender horizontally spreading branches, dark-gray bark, and silvery white leaves, dark green below.

For previous introduction see No. 52653.

65943. *RHAMNUS DAURICA* Pall. Rhamnaceae. Daurian buckthorn.

No. 4768. November 21, 1925. A shrub or small tree up to 30 feet in height, with more or less arching branches which are often thornless. The oblong or oval leaves are slender pointed and finely toothed. The black fruits, in dense clusters, are about one-fourth of an inch in diameter. This species is native to northeastern China and Siberia and is of value for rough shrubberies.

For previous introduction see No. 57311.

65944. *ROSA DAURICA* Pall. Rosaceae. Rose.

No. 4771. November 21, 1925. A Manchurian shrub closely related to the cinnamon rose, with straight slender prickles, smaller double serrate leaflets, purple flowers, and ovate scarlet fruits. (*H. C. Sheld.*, under No. 5433.)

65945 to 65955. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceae. Soy bean.

November, 1925. From the Agricultural Experiment Station, Harbin.

65945. No. 4787. *Huang tou*, No. 6. An attractive yellow bean of good size.

65946. No. 4788. *Tai hoi ichi Huang tou*, No. 20. A fine large yellow bean, practically round, with a large black eye.

65947. No. 4789. *Scheun Huang tou*, No. 60. An almost round bean of good size, with a reddish brown eye.

65948. No. 4790. *Tai hoi tou*, No. 123. A good-sized, almost round, black bean.

65949. No. 4791. *Sao hoi tcher Huang tou*, No. 40. A medium-sized, almost round, yellow bean with a dark-brown eye.

65950. No. 4792. *Thyanno dam tao*, No. 74. An almost round yellow bean with a deeper colored eye.

65906 to 65961—Continued.

65951. No. 4793. *Dichou lau tou*, No. 180. An almost round black and brown bean, of good size.

65952. No. 4794. *Lw tuiang tou*, No. 100. A large green roundish bean.

65953. No. 4795. *Pheo litchin tou*, No. 104. A medium-sized dark-green, almost round bean with a black eye.

65954. No. 4796. *Tha lau za tou*, No. 143. A medium-sized brown bean, almost round, with a lighter colored eye.

65955. No. 4797. *Tchali tcher huang tou*, No. 80. An oblong yellow bean of good size, with a brown eye.

65956 to 65958. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceae. Common wheat.

November 21, 1925. From the Agricultural Experiment Station, Harbin.

65956. No. 4775. *Sapporo*, No. 80. An attractive hard wheat.

65957. No. 4776. *Tafogin*, No. 81.

65958. No. 4777. *Muriya* × *Khapli*.

65959. *VIBURNUM BUREJAETICUM* Regel and Herd. Caprifoliaceae.

No. 4765. November 21, 1925. A northern Chinese species allied to the Wayfaring tree (*Viburnum lantana*); the flowers are produced in dense cymes 2 inches across, and the fruits are ovoid and bluish black.

For previous introduction see No. 58807.

65960. *VITIS AMURENSIS* Rupr. Vitaceae. Amur grape.

No. 4750. November 21, 1925. A strong-growing deciduous vine somewhat similar in habit to *Vitis vinifera*. It is worth growing as an ornamental for its vigorous habit and for the fine crimson and purple autumn hues of its foliage. It is native to Chosen (Korea) and northeastern China.

For previous introduction see No. 57367.

65961. *ZEA MAYS* L. Poaceae. Corn.

No. 4803. November 22, 1925. A hard red flint corn, with a yellow tip, from the Agricultural Experiment Station, Harbin.

65962. *GENISTA SPHAEROCARPA* Lam. Fabaceae.

From Demnat, Morocco. Seeds presented by Sergeant Prot, Bureau des Renseignements, at the request of David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received January 12, 1926.

A charming, drooping, desert shrub covered with delicate, brilliant yellow flowers somewhat resembling small orchids.

For previous introduction see No. 64927.

65963. *PHYTOLACCA DIOICA* L. Phytolaccaceae. Ombu.

From Santa Barbara, Calif. Seeds presented by E. O. Orpet, superintendent of parks. Received January 14, 1926.

An evergreen tree, native to South America, which develops eventually a thick trunk and a large crown. The slender-stemmed leaves are elliptic to oval, and the small, greenish white, inconspicuous flowers are in pendulous racemes. The chief value of this tree is as an ornamental and for shade; in its native country it is called *bella sombra* (handsome shade). It has proved hardy at Santa Barbara, Calif., not even losing its leaves in cold weather.

For previous introduction see No. 48975.

65964. *ORYZA LATIFOLIA* Desv. Poaceae. Rice.

From Assam, India. Seeds obtained from the director of agriculture, Assam, through Rai Sahib L. Jai Chand Luthra, officiating economic botanist to the Punjab Government, Lyallpur. Received January 16, 1926.

A perennial wild rice distributed through parts of tropical Asia, Africa, and America. The tufted stems become 6 to 8 feet high, and the plant is said to flower and produce seeds throughout the year. The smooth leaves are 1 or 2 feet long and about an inch wide, and the erect spike is 2 to 4 inches long.

For previous introduction see No. 50491.

65965. *TRIFOLIUM PRATENSE* L. Fabaceae. Red clover.

From Warsaw, Poland. Seeds purchased through R. Y. Jarvis, American consul. Received January 16, 1926.

Locally produced seeds from Poland.

65966 to 65970.

From Spain. Seeds collected by M. Sharpe, Vacaville, Calif. Received January 13, 1926.

Locally developed strains, collected along the Andarax River in the Province of Almería.

65966. *AMYGDALUS COMMUNIS* L. (*Prunus amygdalus* Stokes). Amygdalaceae. Almond.

65967. *CASSIA* sp. Caesalpiniaceae.

65968. *CUCUMIS MELO* L. Cucurbitaceae. Melon.

A winter melon.

65969. *DAUCUS CAROTA* L. Apiaceae. Carrot.

A black carrot.

65970. *RAPHANUS SATIVUS* L. Brassicaceae. Radish.

A huge radish of fine quality.

65971. *LILIUM CENTIFOLIUM* Stapf. Liliaceae. Lily.

From Ardgowan, Inverkip, Renfrewshire, Scotland. Bulb presented by Lady Alice Shaw Stewart. Received January 21, 1926.

This Chinese lily was originally discovered by Reginald Farrer in a little garden at Siku, Kansu, in 1914, according to the Botanical Magazine (pl. 8960). It is described as follows: The stem, densely leafy and somewhat glaucous, is up to 7 or 8 feet high, arising from a slightly depressed bulb about 3 inches in diameter. The numerous leaves are dark green above and paler below, linear or linear-lanceolate, and up to 18 inches long. The sweet-scented flowers, 6 to 18 in number, are arranged in a short almost umbellike raceme. The individual flowers are 6 inches long and about 4 inches across the mouth. Within, the perianth is pure white, blending into lemon yellow in the throat; the outer segments are richly flushed with dark purple, while the broader inner segments are greenish with deep brownish purple midribs. The anthers are rusty red.

For previous introduction see No. 61748.

65972 to 66001.

From Saonara, Padova, Italy. Plants purchased from Fratelli Sgaravatti. Received January 21, 1926. Notes from Fratelli Sgaravatti's catalogue.

65972 to 65979. *AMYGDALUS PERSICA* NECTARINA Ait. Amygdalaceae. Nectarine.

65972. *Lord Napier*. Large, red and green, with juicy greenish subacid flesh of first quality. Ripens in July and August.

65973. *Bianca*. Medium sized, white or sometimes pinkish; flesh white, melting, sugary, aromatic. Ripens in August.

65972 to 66001—Continued.

65974. *De Coosa*. Very large, red; flesh white; an excellent variety. Ripens in July.
65975. *Fertile del Poitou*. Very large, yellow mottled with purple, pink on exposed side; flesh white, fine, juicy, sweet, aromatic; pit small. Ripens in August.
65976. *Galopin*. Medium sized, waxy white, sometimes pink; flesh greenish white, sweet, and especially aromatic. Ripens in September.
65977. *Gialla di Padova*. Medium sized, yellow; flesh firm, yellow, aromatic, with an apricotlike flavor; quality excellent. Ripens in June.
65978. *Regina Vittoria*. Large, violet-carmine, flesh white, sugary, acidulous. Ripens in July.
65979. *Vineuse Henri Monicourt*. Medium sized, with smooth, shining, reddish violet skin; flesh blood red, whitish near pit, sugary, juicy, aromatic.
- 65980 to 66001. *PRUNUS ARMENIACA* L. Amygdalaceae. Apricot.
65980. *A mondorla dulce*. Medium sized, pale yellow, marked with red; flesh moderately tender, sweet. Ripens in July.
65981. *Angoumis*. Large, orange-yellow shaded with carmine, spotted with brown; flesh pinkish, juicy, aromatic. Ripens in July and August.
65982. *Bianco de Carpentras*. Large; flesh orange-yellow, of exquisite flavor. Ripens in July.
65983. *D'Alessandria*. Medium sized, sometimes large, orange-yellow shaded pink and marked with carmine; flesh firm, juicy, aromatic; of first quality. Ripens in June.
65984. *Di Breda*. Medium sized, pale yellow shaded with bright pink. Ripens in July.
65985. *Di Sant'Ambrogio*. Very large, skin firm, pale, yellow shaded with pink; flesh very sweet and with a delicate aroma. Ripens in July.
65986. *Di Versailles*. Very large, pale yellow, carmine on exposed cheek; flesh yellow, melting, aromatic. Ripens in July.
65987. *Gloire d'Auvergne*. A robust and prolific variety, excellent for preserving. Ripens in July.
65988. *Grosso Blanco presose d'Auvergne*.
[Large, white, early maturing.]
65989. *Lever du Soleil* [Sunrise]. Large, of good quality, and early maturing.
65990. *Liaband*. Large, pale yellow; flesh transparent, juicy, and aromatic. Ripens in July.
65991. *Particolare*. Large, yellow shaded with pink; flesh yellow, sweet. Ripens in July.
65992. *Paviot*. Rather large; skin orange-yellow and carmine; flesh fine, melting, aromatic. Ripens in July and August.
65993. *Persicina*. Large, orange-yellow; flesh yellow-red, fine, of exceptional flavor. Ripens in July.
65994. *Pesca di Nancy*. Large, orange-yellow and pale carmine; flesh yellow, tender, very sweet. Ripens in July and August.
65995. *Precoce di Bourbon*. Large, with fine, buttery flesh. Ripens in July.

65972 to 66001—Continued.

65996. *Precoce d'Italia*. Small, yellow shaded with orange; flesh whitish, fine, sweet, slightly aromatic. Ripens in June.
65997. *Reale*. Medium sized, downy, yellowish white, orange on exposed cheek; flesh melting, very fine. Ripens in June and July.
65998. *Rosseggiante*. Rather large, carmine-yellow; flesh fine and aromatic. Ripens in July.
65999. *Rosso grosso*. Large, reddish; flesh melting. Ripens in June and July.
66000. *Souvenir d'Amic*. Large, yellow shaded with brown; flesh melting, of excellent flavor. Ripens in June.
66001. *Zuccherino di Holub*. Large, oblong, reddish yellow; flesh fine, very sweet. Ripens in July.

66002 to 66019.

From the Mediterranean region. Seeds collected by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received January 13, 1926.

66002. *ACACIA GUMMIFERA* Willd. Mimosaceae.

Found near Amismiz, Morocco, May 19, 1925. A small spiny tree, about 30 feet high, native to northern Africa. It yields the Morocco gum of commerce.

66003. *ACHYRANTHES ASPERA* L. Amaranthaceae.

From Barranco Ruis, Orotava, Teneriffe, Canary Islands, July 11, 1925. According to Juan Bollnaga, director del Jardin de Aclimatación, Orotava, this is a good forage plant which has become naturalized in the barrancos of Teneriffe. It is a low shrubby West Indian herb, with very small greenish flowers.

66004. *AVENA BARBATA* Brot. Poaceae. Grass.

Found on the roadside between Rabat and Casa Blanca, Morocco, May 8, 1925.

For previous introduction see No. 42734.

66005. *AVENA STERILIS* L. Poaceae. Oats.

Collected between Casa Blanca and Fedhala, Morocco, May 10, 1925.

66006. *CERATONIA SILIQUA* L. Caesalpinaceae. Carob.

Collected near San Antonio, Iviza, Balearic Islands, August 14, 1925. Variety *Vera*. A variety extensively grown in Iviza which I think must have perfect flowers.

66007. *EPHEDRA ALTISSIMA* Desf. Gnetaceae.

Collected in an Arab cemetery beyond Amismiz, south of Marrakesh, in the Grand Atlas Mountains, Morocco, May 29, 1925. A handsome woody climber, 20 feet or less in height, with minute green leaves, and especially striking when covered with its ovoid scarlet berries. Native to northern Africa.

For previous introduction see No. 57930.

66008. *HYPARRHENIA HIRTA* (L.) Stapf. Poaceae. Grass.

From a roadside between Rabat and Casa Blanca, Morocco, May 8, 1925. A perennial grass about 3 feet high, native to tropical and northern Africa.

For previous introduction see No. 39490.

66009. *LAGURUS OVATUS* L. Poaceae. Grass.

Found near Casa Blanca, Morocco, May 24, 1925, in rocky dry soil. A hardy annual grass, native to the Mediterranean region. The small white flower heads are used for dry bouquets.

66002 to 66019—Continued.

66010. *ONONIS SALZMANNIANA* Boiss. and Reut. Fabaceae.

Collected near Algeciras, Spain, June 27, 1925. An annual, erect, herbaceous, leguminous plant, with simple or trifoliate light-green leaves and dense spikes of pink flowers.

66011. *PERIPLOCA LAEVIGATA* Ait. Asclepiadaceae.

Collected north of Mogador, Morocco, June 3, 1925. An attractive evergreen shrub, native to the Canary Islands, with glossy dark-green foliage and dull-colored fragrant flowers.

66012. *RUMEX LUNARIA* L. Polygonaceae.

From Barranco de las Augustias, above the town of Los Llanos, Palma, Canary Islands, July 16, 1925. This perennial herb seems to be common on rocky places all over the island and is said to form goat forage of considerable importance.

66013. *THAPSIA GARGANICA* L. Apiaceae.

From an Arab cemetery beyond Amismiz, south of Marrakesh, in the Great Atlas Mountains, Morocco, May 29, 1925. A yellow-flowered herbaceous perennial, native to southern Europe. The fleshy root is said to have medicinal virtues.

66014. *TRICHOLAENA ROSEA* Nees. Poaceae.

Natal grass.

Obtained from Juan Bolinaga, director del Jardin de Aclimatación, Orotava, Tenerife, Canary Islands, July 12, 1925. According to Mr. Bolinaga, this variety is thought to be indigenous. It is a very important forage crop in Tenerife and makes a remarkable growth.

For previous introduction see No. 61692.

66015. *TRITICUM OVATUM* (L.) Rasp. Poaceae.
Grass.

From a roadside between Casa Blanca and Marrakesh, Morocco, May 13, 1925. An annual densely branched grass, with ascending stems about a foot long. Native to dry places in the Mediterranean region.

For previous introduction see No. 56520.

66016 to 66019. *VICIA SATIVA* L. Fabaceae.
Vetch.

66016. Collected at Piste, near Amismiz, Morocco, May 19, 1925.

66017. Collected along an oued or stream, near the Pont des Espagnols, on the road between Casa Blanca and Foukhala, Morocco.

66018. From Piste, beyond Amismiz, Morocco, May 19, 1925.

66019. Collected on the road to Mogador, near Marrakesh, Morocco, May 17, 1925.

66020 to 66026. *Gossypium* spp.
Malvaceae. Cotton.

From Villaggio Duca Abruzzi, Italian Somaliland, Africa. Seeds presented by the direttore. Agrario e Zootecnico della Sais. Received January 18, 1926.

Cotton varieties of native origin or introduced, which have become acclimated in Italian Somaliland.

66020. *Gossypium BARBADENSE* L.

No. 4. Var. *Sakellaridis*.

66021. *Gossypium HERBACEUM* L.

No. 7. Var. *Somala di Uaressk*.

66020 to 66026—Continued.

66022 to 66025. *Gossypium HIRSUTUM* L.

66022. No. 1. Var. *Durango*; Australian.

66023. No. 2. Var. *Russell big boll*; Australian.

66024. No. 3. Var. *Uganda*.

66025. No. 5. Var. *Agordat*; Eritrea.

66026. *Gossypium* sp.

No. 6. Var. *Somala di Audégle*.

66027. *Gossypium* sp. Malvaceae.
Cotton.

From Buitenzorg, Java. Seeds presented by Dr. P. J. S. Cramer, director, general experiment station, Department of Agriculture, Industry, and Commerce. Received January 12, 1926.

A native cotton from Sumatra.

66028. *Ilex* sp. Aquifoliaceae. Holly.

From Nanking, China. Seeds presented by M. L. Hancock, University of Nanking. Received January 19, 1926.

A "red evergreen privet" which is a species of *Ilex* with shiny spineless evergreen leaves and red berries. Collected at Nanking. (Hancock.)

66029 to 66035. *Trifolium PRATENSE* L. Fabaceae. Red clover.

From Aberystwyth, Wales. Seeds presented by R. G. Stapledon, director, Welsh Plant Breeding Station. Received January 23, 1926. Notes by Mr. Stapledon.

Locally grown varieties.

66029 to 66031. From Leightons Ltd., Newcastle.

66029. Station No. 1212. (Cambridge No. 92.)

66030. Station No. 1210. (Dorsett No. 194.)

66031. Station No. 1211. (Hertfordshire No. 85.)

66032. Station No. 1206. *Dorsett Marlglass clover*, from H. H. Dunn, Dunns Farm Seeds (Ltd.), Salisbury.

66033 to 66035. From Leightons Ltd., Newcastle.

66033. Station No. 1208. (Oxfordshire No. 49.)

66034. Station No. 1209. (Oxfordshire No. 180.)

66035. Station No. 1207. (Shropshire No. 118.)

66036 to 66038. *Castanea* spp. Fagaceae. Chestnut.

From Nanking, China. Seeds purchased from Prof. J. H. Reisner, College of Agriculture and Forestry, University of Nanking. Received at the United States Plant Introduction Garden, Chico, Calif., January 22, 1926.

66036. *CASTANEA HENRYI* (Skan) Rehd. and Wils.

A Chinese chestnut which, as described in *Plantae Wilsonianae* (vol. 3, p. 196), is a deciduous tree 25 to 90 feet tall, with oblong-lanceolate, long-acuminate leaves, green on both sides. The burs are either solitary or two or three in a bunch and contain usually but one nut.

For previous introduction see No. 65450.

66036 to 66038—Continued.

66037. *CASTANEA MOLLISSIMA* Blume.

In the endeavor to relieve the situation caused by the rapid disappearance of our native chestnut, due to the ravages of the blight fungus, the Chinese hairy chestnut is being introduced into this country in considerable quantity. The size and quality of the nuts compare rather favorably with that of our native chestnut, although neither the size of the tree nor the tanning content measure up to those of our native species.

For previous introduction see No. 58602.

66038. *CASTANEA SEGUINI* Dode.

A Chinese chestnut, native to east-central China, which is usually a bush or low tree, but occasionally a shapely tree up to 40 feet in height, with deep-green leaves, paler beneath, and small nuts of sweet agreeable flavor.

66039 to 66042. *CROTALARIA* spp. Fabaceae.

From Nairobi, Kenya Colony, British East Africa. Seeds presented by J. McDonald, Scott Agricultural Laboratories. Received January 22, 1926.

66039. *CROTALARIA AGATIFLORA* Schweinf. f.

No. 6. A tropical African leguminous herb, which, as described by Engler (Hoehnel, Zum Rudolf See, Appendix 1892, p. 13), has large yellow flowers about 2 inches long and 1 inch across and sword-shaped pods about 3 inches long, containing 15 to 20 seeds.

66040. *CROTALARIA* sp.

No. 8.

66041. *CROTALARIA* sp.

No. 10.

66042. *CROTALARIA* sp.

No. 11.

66043 to 66045. *GOSSYPIUM NANKING* Meyen. Malvaceae. Cotton.

From Buitenzorg, Java. Seeds presented by Dr. P. J. S. Cramer, director, general experiment station, Department of Agriculture, Industry, and Commerce. Received January 19, 1926.

The "Chinese" cotton of commerce is, according to Watt (Wild and Cultivated Cottons of the World), an annual or perennial bush, with delicate, sparsely branched stems and imperfectly cordate leaves. The irregular-shaped seeds are densely coated with rufous velvet and bear a silky floss, which, in all the better varieties, is white, but often shows a tendency to become reddish or khaki. This cotton is cultivated throughout tropical Asia.

For previous introduction see No. 62595.

66043. From Demak, a place in central Java, east of Semarang.

66044. No. 1. From Palembang.

66045. No. 2. From Palembang.

66046 to 66050. *SACCHARUM OFFICINARUM* L. Poaceae. Sugar cane.

From Muzaffarpur, Bengal, India. Cuttings presented by Noel Deerr, superintendent of factories, through E. W. Brandes, Bureau of Plant Industry. Received February 1, 1926. Notes by Mr. Deerr.

66046. *Haruki*. From Purtabtore, District of Saras.66047. *Hatooni* (otherwise known as *Chemal* and *Baruk*). From Riwa Ghat, District of Muzaffarpur. This cane seems to be very close to *Sewali*.66048. *Nagori*. A slender cane from Samastipur, District of Darbhanga.

66046 to 66050—Continued.

66049. *Turi*. A thick green cane.66050. *Samari* or *Sewali*. From Ryam, District of Darbhanga. This cane seems to be very close to *Hatooni*.66051. *HERNANDIA SONORA* L. Hernandiaceae.

From Port of Spain, Trinidad, British West Indies. Seeds presented by W. G. Freeman, director of agriculture. Received January 27, 1926.

A handsome evergreen West Indian tree, sometimes 60 feet high, with oval-oblong papery leaves 7 to 12 inches long and loose terminal clusters of small yellowish flowers. The juice of this tree is said to be a painless depilatory.

66052 to 66055. *TRIFOLIUM PRATENSE* L. Fabaceae. Red clover.

From Valence sur Rhone, France. Seeds purchased from Tizier Frères. Received February 2, 1926.

Locally grown varieties.

66052. Department of Ardeche.

66053. Department of Aveyron.

66054. Nimes.

66055. Valence and Lyon.

66056 to 66058.

From Cairo, Egypt. Seeds presented by W. Carlton McQuiston, the American University at Cairo. Received January 26, 1926. Notes by Mr. McQuiston.

66056. *CUCUMIS MELO* L. Cucurbitaceae. Melon.

A long-type muskmelon, known here as the *Sheman*.

66057 and 66058. *TRITICUM* spp. Poaceae.

Wheat varieties originated by the Royal Agricultural Society of Egypt.

66057. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Common wheat.

Hindi wheat. A variety from India. At present it is the best yielder in the Delta.

66058. *TRITICUM TURGIDUM* L. Poulard wheat.

A selected strain of *Beladi*.

66059. *GOSSYPIUM* sp. Malvaceae. Kidney cotton.

From Bangkok, Siam. Seeds presented by Dr. A. Kerr, director, botanical section, Ministry of Commerce. Received January 21, 1926.

A perennial cotton cultivated in this region. It is not grown as a regular crop, and the floss is used only for making string. (*Kerr*.)

66060. *GOSSYPIUM* sp. Malvaceae. Cotton.

From Caracas, Venezuela. Seeds presented by H. Pittier, Ministerio de Relaciones Exteriores, Museo Comercial. Received January 22, 1926.

Seeds collected in the State of Portuguesa. I believe them to be of one of the indigenous species. (*Pittier*.)

66061. *MACADAMIA INTEGRIFOLIA* Maiden and Betcher. Proteaceae.

From Dundas, New South Wales, Australia. Seeds presented by Herbert J. Rumsey. Received January 29, 1926.

As described by J. H. Maiden (Proceedings of the Linnean Society of New South Wales, vol. 21, p. 624), this close relative of the Queensland nut (*Macadamia ternifolia*) is a small bushy tree, with entire, narrowly oblong leaves, about 6 inches long, in irregular whorls of three. The globular fruits, about three-fourths of an inch in diameter, have a leathery exocarp and a hard endocarp. Native to New South Wales.

66062 to 66076.

From Canton, China. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received January 25, 1926. Notes by Mr. McClure.

66062 to 66064. ALEURITES MONTANA (Lour.) Wilson. Euphorbiaceae.

Baptist Mission compound, Wuchow, Kwangsi. November 18, 1925. Trees growing at the foot of a terrace, in yellow clay granitic subsoil, with their roots partly in filled soil of the same composition, but naturally looser in texture.

66062. No. 240. Tree No. 1. This tree, which appears to be the most prolific of the collection at the mission compound, is about 12 meters high and 25 centimeters in diameter at chest height. It bears the largest clusters of fruits, 11 to 13 to a cluster.

66063. No. 241. Tree No. 2. This tree is second only to tree No. 1 [No. 66062] in prolificness.

66064. No. 242. From trees of average yield.

66065 to 66067. BENINCASA HISPIDA (Thunb.) Cogn. Cucurbitaceae. Wax gourd.

66065. No. 245. Purchased in Yungui, Kwangsi, November 20, 1926. *Paak shik kwa.* The fruits are long and slender, the largest ones being 65 centimeters long and 36 centimeters in circumference, and are slightly constricted in the middle. They are thickly covered, when mature, with a white flourlike powder. The skin is pale green, thin, with a sparse outgrowth of hairs 2 or 3 millimeters in length. The flesh, 2 to 3 centimeters in thickness, is greenish for a half inch inward from the skin, otherwise white, and is tender, but has little flavor. The Chinese usually cook the fruits with pork and often use them in soup.

66066. No. 273. *Tsit kwa.* Purchased at Takhing, Kwangtung Province, November 27, 1925. This variety seems very similar to No. 245 [No. 66065], differing only in being straight and not depressed in the middle.

66067. No. 276. *Tung kwa.* Purchased in Takhing, Kwangtung Province, November 27, 1925. A short, thick variety, depressed at both ends, which is somewhat triangular in cross section. It is light green and thickly covered with a flourlike bloom when mature.

66068. CITRULLUS VULGARIS Schrad. Cucurbitaceae. Watermelon.

No. 251. *Hung kwa tsz* and *sai kwa tsz.* Purchased in Wuchow, Kwangsi, November 23, 1925. This variety is said to be cultivated for the seeds only, and the flesh is said to be worthless. The seeds are commonly served between courses at Chinese feasts.

66069. CRATAEGUS PINNATIFIDA Bunge. Malaceae. Chinese hawthorn.

No. 252. Obtained at Wuchow, Kwangsi, November 23, 1925, where they had been shipped in from Tientsin, in a dried sliced condition. *Shaan cha.* The seeds are thick walled. A thin red circular waterlike confection is made from the flesh by adding a red coloring matter and sugar.

66062 to 66076—Continued.

66070] and 66071. CUCURBITA MOSCHATA Duchesne. Cucurbitaceae. Cushaw.

Purchased at Takhing, Kwangtung Province, November 27, 1925. Used as food only by the poorer classes and is, therefore, commonly cultivated by them.

66070. No. 274. *Naam kwa.* A variety with the skin mottled green and yellow and the flesh deep yellow.

66071. No. 275. *Hop kwa.* An orange-yellow skinned variety, smaller than No. 274 [No. 66070], which is slightly paled by the presence of a scant gray bloom.

66072. ELEUSINE CORACANA (L.) Gaertn. Poaceae. Ragi.

No. 278. Purchased November 27, at Takhing, Kwangtung Province. *Aap keuk suk.* This variety is commonly cultivated in Kwangtung, but on a small scale. It is boiled and eaten with sugar.

66073. PHASEOLUS CALCARATUS Roxb. Fabaceae. Rice bean.

No. 277. Purchased at Takhing, Kwangtung Province, November 27, 1925. *Chik siu tau.* This variety, said to be grown locally in the silty soil of the annually denuded river flood plain, yields two crops a year. It is eaten after being boiled.

66074. PYRUS sp. Malaceae. Pear.

No. 244. Purchased at Yungui, Kwangsi, November 20, 1925, and is said to have come from the region north of Wuchow, on the Foo River. It is said to occur also generally in the region east of Wuchow, north of the West River in Kwangtung, and it is also seen in the markets of Takhing, Kwangtung. The fruits are oblate to subglobular, the stem long, 1.5 to 2.5 centimeters, slender, attached in a small, shallow depression; the apex of the fruit has a slight depression or none; the skin is olive green, thin but tough, and smooth; the flesh is fine grained, but very firm, and somewhat astringent when fresh; the seeds are large, 5 to 10 in number; and the seed section is surrounded by a thick yellow "shell" of hard granular material. The fruits are usually placed in hot water for a time before they are eaten. Another way of preparing them is to pickle them in vinegar. This variety may serve as a stock for pears or apples, but, so far as I know, it is not used for this purpose by the Chinese.

66075. PYRUS sp. Malaceae. Pear.

No. 254. From fruits purchased November 23, 1925, in Wuchow, Kwangsi. *Tona lei tsai.* A small round red-brown to russet fruit, thickly punctate with tiny light-brown dots. The fruits are few seeded; the flesh, mellow when ripe, is somewhat granular, like that of pears, especially in the zone which divides the pome portion from the ovary portion of the fruit. The fruits are not eaten fresh, but are prepared for consumption by pickling in vinegar. This plant serves exclusively as stock for pears in southern China, so far as I have been informed. It is said to grow only in the wild or half-cultivated state, except as stock for pears, and is widely distributed in Kwangtung and Kwangsi.

66076. SESAMUM ORIENTALE L. Pedaliaceae. Sesame.

No. 253. Purchased November 23, 1925, in Wuchow, Kwangsi. *Paak chi ma.* A herbaceous annual said to be grown in the Foo River District, Kwangsi. The seeds are used in confections, often as a covering for cakes and candies, and the oil expressed from the seeds is used by the Chinese in cooking.

66077 to 66080. MAGNOLIA spp. Magnoliaceae. Magnolia.

From Orleans, France. Plants presented by Leon Chenault. Received February 4, 1926.

66077 to 66080—Continued

All of these magnolias are growing at the Arnold Arboretum. The following notes are adapted from Sargent, *Plantae Wilsonianae*, vol. 1, pp. 394-399.

66077. *MAGNOLIA DAWSONIANA* Rehd. and Wils.

A tree 25 to 40 feet high, originally collected in western Szechwan, China, where it grows at an altitude of about 7,000 feet. It is readily distinguished from related magnolias by its leathery, shining-green obovate leaves, which are 3 to 5 inches long. The flowers are unknown.

66078. *MAGNOLIA NICHOLSONIANA* Rehd. and Wils.

A deciduous shrub or small tree, 20 feet or less in height, closely allied to *Magnolia wilsonii*, from which it is distinguished by its vinous-red bark, shorter petioles, and oblong-obovate leaves with densely hairy undersurfaces. The cup-shaped flowers, appearing with the leaves, are white with red pistils and about 4 inches across. This magnolia is native to western China.

66079. *MAGNOLIA SARGENTIANA* Rehd. and Wils.

A tall tree, up to 75 feet in height, the largest magnolia found in western China, where it is native. The branches are very numerous, forming a massive flattened crown. The deciduous, leathery leaves, pubescent beneath, are 4 to 7 inches long, and, according to the natives of western China, the flowers are rosy red and 8 inches wide.

66080. *MAGNOLIA SARGENTIANA ROBUSTA* Rehd. and Wils.

This variety differs from the type in having longer and narrower leaves and larger fruits.

66081 to 66083.

From British Honduras. Seeds collected by S. J. Record, School of Forestry, Yale University, New Haven, Conn. Received February 2, 1926.

66081. *GEONOMA* sp. *Phoenicaceae*. Palm.

The members of this tropical American genus are slender spineless palms with ringed, reedlike stems.

66082. *PLETIS* sp. *Phoenicaceae*. Palm.

Mountain cabbage. (*Record*.)

The palms of this Guatemalan genus have a very tall, slender, tapering trunk and short-stemmed leaves with very numerous linear pinnae.

66083. *SYNECHANTHUS FIBROSUS* Wendl. *Phoenicaceae*. Palm.

Common monkey-tail palm. (*Record*.)

An unarmed Central American palm with a slender, green, ringed trunk about 4 feet high and a cluster of terminal spreading leaves about 4 feet long with numerous narrow leaflets a foot or so in length. The orange-red, ellipsoid fruit is one-seeded.

66084. *DISSOTIS IRVINGIANA* Hook. *Melastomaceae*.

From Aburi, Gold Coast, Africa. Seeds presented by F. N. Howes, Government botanist, Department of Agriculture. Received February 2, 1926.

An ornamental annual plant, 1 to 3 feet high, from tropical Africa. The leaves are opposite, narrow, and acute, and the reddish purple flowers are about an inch across.

66085. *CALOPOGONIUM MUCUNOIDES* Desv. *Fabaceae*.

From Kuala Lumpur, Federated Malay States. Seeds presented by B. Bunting, agriculturist, Department of Agriculture. Received March 19, 1926.

A tropical American plant which is said to be popular as a cover plant in Sumatra, according to J. N. Milsum and E. A. Curtler (*Malayan Agricultural Journal*, vol. 13, No. 8, August, 1925, pp. 271-272). These authorities state that a fair cover is obtained after three months from sowing, when flowering commences. The plant is a vigorous creeping herb which forms a mat of foliage 1½ feet or so in thickness over the soil. The stems, 3 to 10 feet long, form roots at each node. The pale-blue flowers are in racemes 1 to 4 inches long.

66086. (Undetermined.) *Poaceae*. Bamboo.

From Slidell, La. Plants presented by J. L. Gelis. Received March 19, 1926.

A bamboo obtained in 1909 from a nursery in Fresno, Calif. It grows well here and becomes 10 to 18 feet high with stems about an inch in diameter. (*Gelis*.)

66087. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). *Poaceae*.

Common wheat.

From Rome, Italy. Seeds obtained through Rev. Walter Lowrie, of the Rectory of St. Paul's, by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received March 12, 1926.

No. 340. Var. *Piccolo rosso degli Alpi*. A selected variety, 50 to 60 centimeters high, from Pragelato, Italy, at an altitude of 1,800 meters, and is adapted to 2,000 meters altitude. It is planted in June and harvested in July of the following year.

66088. *RUBUS PROBUS* Bailey. *Rosaceae*. Raspberry.

From Rio Piedras, P. R. Plants presented by A. Lopez Dominguez, director, Insular Experiment Station. Received February 2, 1926.

The so-called "Queensland" raspberry, which, as described by L. H. Bailey (*Gentes Herbarum*, vol. 1, p. 150), is related to *Rubus roseifolius*, but is less thorny and has glabrous leaves and pedicels, with usually seven leaflets which are relatively broader than in the above-mentioned species. The seedy red berries have a flattened appearance. The plant is upright, about 8 feet high, and the canes are not perennial. This is a cultivated plant in Porto Rico, where it has been grown for some years, and is probably originally from Queensland.

66089 to 66092. *LILIUM* spp. *Liliaceae*. Lily.

From Orleans, Loiret, France. Seeds presented by E. Debras. Received February 5, 1926.

Locally grown seed.

66089. *LILIUM HENRII* Baker.

The Henry lily, native to central China, has a stem 4 to 8 feet high, deep green, tinged and spotted with brown; the leaves, 60 to 100 in number, are horizontal and 3 to 6 inches long. The flowers, bright orange-yellow, with orange-red anthers, are about 3 inches in diameter.

66090. *LILIUM HUMBOLDTI* Roetz and Leichtl.

Var. *magnificum*. A form of the Humboldt lily which is more robust and larger, often 8 feet high, with larger and more richly colored flowers, frequently tinged with reddish purple.

66091. *LILIUM REGALE* Wilson. Regal lily.

Seeds of the regal (or royal) lily.

66092. *LILIUM SARGENTIAE* Wilson.

The Sargent lily, originally from western China, has a stout stem 4 to 8 feet high, green tinged with purple, and a hundred or more thickly scattered horizontal leaves 2 to 4 inches long. The fragrant flowers are waxy white inside, tinged yellow near the throat, and reddish purple outside.

66093 to 66095. AMYGDALUS PERSICA L.
(*Prunus persica* Stokes). Amygdalaceae. Peach.

From Orleans, France. Trees purchased from Grandes Roseraies du Val de la Loire. Received February 10, 1926. Notes from catalogue of Grandes Roseraies du Val de la Loire.

66093. Admirable jaune. Fruit large, golden yellow, spotted with red; matures in late September.

66094. Galande. Fruit large purplish, very good quality; matures in late August.

66095. Madeleine de Courson. Fruit very large, red, very good quality; matures in late September.

66096. NOTHOSCORDUM FRAGRANS
(Vent.) Kunth. Liliaceae.

From Orleans, Loiret, France. Seeds presented by E. Debras. Received February 5, 1926.

A tropical American bulbous plant closely related to the onion; the bulb is round and yellowish white, and the linear obtuse leaves are 8 to 12 inches long. The fragrant flowers, white flushed with pink, with purplish stamens and anthers, are borne on a scape 20 inches high.

66097. ANOPTERUS GLANDULOSUS Labill. Escalloniaceae.

From Cradle Mountain, Tasmania. Seeds presented by G. Weinderfer, through George B. Sudworth, Forest Service. Received February 6, 1926.

A handsome evergreen Tasmanian shrub, sometimes a small tree 40 feet high in its native country. The thick narrow leaves, mostly at the ends of the branches, are 4 to 8 inches long, and the white flowers are in drooping terminal racemes. It is suitable for greenhouse culture, blooming in the spring.

For previous introduction see No. 61324.

66098 to 66106. BETA VULGARIS L.
Chenopodiaceae. Beet.

From Kew, England. Seeds presented by Dr. A. D. Cotton, Royal Botanic Gardens. Received February 6, 1926.

Var. *maritima*. Wild beet seeds collected in different parts of England.

66098. From Clevedon, Somerset.

66099. From Par Harbour, Cornwall.

66100. From Par Sands, Cornwall.

66101. From Pentewan, Cornwall.

66102. From Polperro, Cornwall.

66103. From St. Helens Spit, Isle of Wight.

66104. From Charlestown, South Cornwall.

66105. From Trenarnen, South Cornwall.

66106. From Seaton, Devonshire.

66107. VACCINIUM VITIS-IDAEA L.
Vacciniaceae. Lingonberry.

From Helsingfors, Finland. Seeds presented by the director of the Botanic Garden. Received February 6, 1926.

The fruits of the European form of this evergreen bush are larger than those of the mountain cranberry (*Vaccinium vitis-idaea minus*) found in the northeastern United States.

66108 to 66115. BRASSICA OLERACEA
BOTRYTIS L. Brassicaceae. Broccoli.

From Reading, England. Seeds purchased from Sutton & Sons. Received February 6, 1926. Notes from Sutton & Sons' catalogue.

Varieties not in the American trade.

66108. Autumn Protecting. Equal to Michaelmas White in quality, but matures later. Heads well protected.

66109. Superb Early White. Heads pure white, perfectly protected.

66110. Michaelmas White. Heads very large, well formed, delicate, white, firm, quickly maturing. Excellent for early autumn use.

66111. Safeguard Protecting. Heads pure white, medium sized, often enduring severe winters uninjured.

66112. Satisfaction. A variety for use in April and May.

66113. Snow White. Heads of uniform size and shape; for spring use.

66114. Whitsuntide. Somewhat similar to Late Queen, but of larger size and later maturing. Heads pure white, large, firm, of finest quality. Has survived 22° of frost uninjured.

66115. Winter Mammoth. Immense white heads, excellent in texture and quality, for use in midwinter.

66116 to 66123. TRIFOLIUM PRATENSE
L. Fabaceae. Red clover.

From Reading, England. Seeds presented by Martin H. Sutton, The Royal Seed Establishment. Received February 8, 1926.

66116 to 66119. Early-flowering varieties.

66116. Dorset Marl.

66117. English.

66118. Giant Hybrid.

66119. Welsh.

66120 to 66123. Late-flowering varieties.

66120. Cornish Marl.

66121. English.

66122. Montgomeryshire.

66123. Wild red clover.

66124. BAUHINIA HETEROPHYLLA
Kunth. Caesalpiniaceae.

From Little River, Fla. Plant presented by John Soar, through Charles T. Simpson, collaborator, Bureau of Plant Industry. Received February 12, 1926.

This plant is from seeds collected in the Organ Mountains of western Cuba. (Simpson.)

This is called bejuco tortuga (turtle vine) because of the characteristic turtle-shaped swellings in the older parts of the vine. It grows in low, sandy places, chiefly on the edges of lagoons and marshes in western Cuba, where it climbs over trees and shrubs. The clusters of yellowish white flowers appear in December. The young vine is used by the natives for making rough baskets and rope. (Note by Dr. Mario Calvino under No. 58824.)

66125. CITRUS sp. Rutaceae.

From Miyazaki, Japan. Seeds presented by Dr. T. Tanaka, through W. T. Swingle, Bureau of Plant Industry. Received March 30, 1926.

Seeds from locally grown fruits.

66126 and 66127. TRIFOLIUM PRATENSE
L. Fabaceae. Red clover.

From Valence sur Rhone, France. Seeds purchased from Tézier Frères. Received February 10, 1926. Notes by Tézier Frères.

Local varieties.

66126. From Loire.

66127. Seeds from plants grown in dry calcareous soil in the neighborhood of Forcalquier in the Department of Basses-Alpes, at an altitude of 2,000 feet. In our opinion this strain is more winter hardy than the strains from southern France.

66128 and 66129. JUGLANS REGIA L.
Juglandaceae. Walnut.

From Ainsdale, Southport, England. Seeds presented by Howard Spence, The Red House. Received February 13, 1926.

Seeds from trees growing in the vicinity of Ranikhet, Kumaon, United Provinces, India. The nuts are very thick shelled and of little value, but I believe the trees may be of value as stocks. (Spence.)

66128. No. 1.

66129. No. 2.

66130. CITRUS GRANDIS (L.) Osbeck
(*C. decumana* Murr.). Rutaceae. Grapefruit.

From Singapore, Straits Settlements. Seeds presented by O. H. Reinking, Botanic Gardens. Received February 13, 1926.

Seeds of the *Thong Dee Siamese Pummelo*.

66131. PYRUS sp. Malaceae. Pear.

From Arlington Experiment Farm, Rosslyn, Va. A hybrid seedling pear originated by M. B. Waite, Bureau of Plant Industry, at the Arlington farm. Numbered February, 1926, for convenience in distribution.

Kieffer Cross 38-12. (A cross made several years ago between Kieffer and a European variety of unknown parentage.) Tree moderately vigorous, erect to spreading. Fruit pyriform, 3 to 4 inches long by 2 to 2½ inches wide, yellow, fairly smooth, with numerous small gray or yellowish lenticels. Flesh white, tender, not quite so buttery in texture as Bartlett, but with few stone cells. Rather highly flavored, mildly acid, apparently well suited to cooking and canning purposes as well as for dessert use. Appears to possess good handling and keeping qualities, not breaking down at the core. (Waite.)

66132. ARTABOTRYS UNCINATUS (Lam.)
Merr. (*A. odoratissimus* R. Br.). Annonaceae.

From Canton, China. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received February 18, 1926.

No. 318. Near Uenpui, December 25, 1925. *Ying chaaü ja; ying chaaü laan*. A half-scandent shrub with long, slender, drooping branches and greenish flowers. The fruits are ovoid with a pointed, slightly curved apex and yellowish when ripe. This plant is very highly esteemed by the Chinese because of the rich fragrance of the flowers and fruits. It is commonly cultivated in monasteries.

66133. SACCHARUM OFFICINARUM L.
Poaceae. Sugar cane.

From Herradura, Cuba. Cuttings presented by F. S. Earle, through E. W. Brandes, Bureau of Plant Industry. Received February 12, 1926.

B. 208.

66134. VACCINIUM VITIS-IDAEA L.
Vacciniaceae.

From Stockholm, Sweden. Seeds presented by Dr. Robert E. Fries, director, Botanic Garden. Received February 13, 1926.

For previous introduction and description see No. 66107.

66135 to 66141.

From Rabat, Morocco. Seeds collected by David Fairchild, agricultural explorer, Bureau of Plant Industry. Received February 11, 1926.

66135. CYTISUS LINIFOLIUS (L.) Lam. Fabaceae.
Broom.

From the Forest of Mamora, near Rabat. April 19, 1925. A low shrub, 3 feet or less high, with erect, silky hairy branches and very narrow shining-green leaflets with silvery lower surfaces. The bright-yellow flowers are in short compact clusters. Native to the Mediterranean countries.

66136. LOTUS sp. Fabaceae.

From a roadside near the seed-selection station, Rabat, April 17, 1925.

66137. MEDICAGO sp. Fabaceae.

Collected near the seed-selection station, Rabat, April 17, 1925.

66138. MEDICAGO sp. Fabaceae.

Found on a roadside between Meknes and Rabat, April 7, 1925.

66139. MEDICAGO sp. Fabaceae.

Collected on the road between Kenitra and Ouezzan, April 25, 1925.

66140. ORNITHOPUS ISTHOCARPUS Coss. Fabaceae.

Collected in sandy land north of Kenitra on the road to Ouezzan, April 25, 1925. A slender annual leguminous herb, about 2 feet high, with small hairy pinnate leaves, pinkish flowers, and narrow, constricted pods about an inch long. Native to the Mediterranean region.

66141. VICIA ERVILIA (L.) Willd. Fabaceae.
Vetch.

Collected April 29, 1925. Cultivated by E. Miegé at the experiment station in Rabat, Morocco.

66142 to 66147. HEDYSARUM spp. Fabaceae.

From Oran, Algeria. Seeds presented by Herbiere A. Faure, through David Fairchild, agricultural explorer, Bureau of Plant Industry. Received February 11, 1926.

66142 and 66143. HEDYSARUM CAPITATUM Desf.

An annual, ascending leguminous plant, with purple flowers. Native to the Mediterranean countries.

For previous introduction see No. 64553.

66142. A. 66143. B.

66144. HEDYSARUM HUMILE L.

A decumbent perennial leguminous plant, about a foot and a half high. Native to the Mediterranean countries.

66145 and 66146. HEDYSARUM PALLIDUM Desf.

A perennial procumbent leguminous plant, native to northern Africa, where it thrives on steep hillsides.

For previous introduction see No. 64554.

66145. A. 66146. B.

66142 to 66147—Continued.

66147. *HEDYSARUM SPINOSISSIMUM* L.

An annual decumbent leguminous herb with pale-pink flower clusters. Native to the Mediterranean countries.

66148 to 66158.

From Bangalore, India. Seeds presented by the director of the botanic gardens. Received February 12, 1925.

66148 to 66150. *BAUHINIA* spp. *Caesalpiniaceae*.66148. *BAUHINIA GALPINI* N. E. Brown.

A climbing shrub, 5 to 10 feet high, native to tropical Africa. The leaves, two lobed at the apex from one-fifth to one-half their length, are 1 to 3 inches long, and the brick-red flowers are borne continuously from spring to late fall.

66149. *BAUHINIA HOOKERI* F. Muell.

A large spreading tree, native to Australia, with broad obtuse leaflets and short terminal racemes of white flowers edged with crimson.

For previous introduction see No. 37135.

66150. *BAUHINIA TOMENTOSA* L.

An erect shrub or small tree with leathery leaves, broader than long and with obtuse lobes, and few-flowered clusters of pale golden-yellow flowers, with the upper petals marked by deep-purple blotches. Native to India.

For previous introduction see No. 38651.

66151. *COLVILLEA RACEMOSA* Boj. *Caesalpiniaceae*.

A tall, handsome tree, believed to be indigenous to East Africa, which is related to the Royal poinciana (*Delonix regia*). It is said to reach 40 or 50 feet in height. The pinnate leaves are 3 feet long, and the curiously shaped, brilliant scarlet flowers are borne in drooping racemes more than a foot long. The tree was named for Sir Charles Colville, Governor of Mauritius; it was discovered in 1824 on the west coast of Madagascar, where it flowers in April or May. In all probability it will stand no more frost than the poinciana. Like most other leguminous trees, it is readily propagated from seeds.

For previous introduction see No. 59676.

66152. *PONGAM PINNATUM* (L.) W. F. Wight. *Fabaceae*.

A tall, erect tree, or sometimes a climbing shrub, with compound leaves composed of five to seven pairs of oblong leaflets and simple racemes of white flowers. The woody pods are about a quarter of an inch thick and an inch and a half long. Native to tropical Asia. Because of its bright, handsome foliage this tree has been recommended as an ornamental for mild-wintered regions.

For previous introduction see No. 43662.

66153. *SANTALUM ALBUM* L. *Santalaceae*. Sandalwood.

A small evergreen tree, native to the drier regions of southern India, and cultivated in northern India for the sake of the white or citron-colored wood, which, when dried, is sweet scented and esteemed as a perfume.

For previous introduction see No. 40782.

66154. *SARACA INDICA* L. *Caesalpiniaceae*.

One of the handsomest of Indian ornamental trees, producing large heads of the most brilliant scarlet flowers imaginable. While restricted to the tropical sections of India, it may be sufficiently hardy to succeed in southern Florida. (Note by Wilson Popenoe, Bureau of Plant Industry, under No. 56092.)

66148 to 66158—Continued.

66155. *TECTONA GRANDIS* L. f. *Verbenaceae*. Teak.

The common teak is a native of southern and central India. The young branches are quadrangular, the leaves opposite and elliptical or egg-shaped, and the white flowers are borne in terminal panicles. The wood is highly prized by shipbuilders because of its great strength and durability.

For previous introduction see No. 49563.

66156 to 66158. *TERMINALIA* spp. *Combretaceae*.66156. *TERMINALIA ARJUNA* (Roxb.) Wight and Arn.

Arjan. A very large tree with smooth green or whitish bark, found on river banks throughout central and southern India. The leaves are narrowly oblong, about 9 inches long, and the flowers, which appear in April and May, are borne in terminal panicles. This tree yields the transparent gum which is used as a drug in northern India; the bark is used for tanning, and the wood is used for carts and agricultural implements.

For previous introduction see No. 49565.

66157. *TERMINALIA CHEBULA* Retz.

A large deciduous tree, native to northern India, Burma, and Ceylon, with oval-elliptic leaves about 5 inches long and terminal racemes of white flowers. The ovoid, leathery fruits form the black myrobalan of commerce, which is one of the most valuable tanning materials of India.

For previous introduction see No. 63645.

66158. *TERMINALIA TOMENTOSA* (Roxb.) Wight and Arn.

The tropical almond (*Terminalia catappa*) is one of the most popular trees in southern Florida, where it is extensively planted as an ornamental shade tree. This closely related Asiatic species, found in many parts of India, is described by Brandis (Forest Flora of India) as a large tree, 80 to 100 feet tall, with hard, leathery leaves 5 to 9 inches long and erect terminal racemes of dull-yellow flowers. The tree appears to thrive best in India in heavy, binding soils, and the dark-brown wood is valued for general construction purposes.

For previous introduction see No. 61624.

66159 to 66162.

From British Honduras. Seeds collected by S. J. Record, School of Forestry, Yale University, New Haven, Conn. Received February 11, 1926.

66159. *ACANTHORIZA* sp. *Phoenicaceae*. Palm.

A tropical American palm of medium height, with palmate leaves clustered at the end of the trunk.

66160. *CHAMAEDOREA* sp. *Phoenicaceae*. Palm.

A spineless palm, with pinnate leaves, native to tropical North America.

66161. *DESMONCUS* sp. *Phoenicaceae*. Palm.

A slender climbing palm, with leaves scattered along the stem. Native to tropical and subtropical America.

66162. *PYRENOGLYPHIS* sp. *Phoenicaceae*. Palm.

A tropical American palm which is usually low and often has a spiny trunk.

66163. SOLANUM TUBEROSUM L. Solanaceae. Potato.

From Reading, England. Tubers obtained from Sutton & Sons, by F. W. Keay, Wolverhampton, and presented through C. F. Clark, Bureau of Plant Industry. Received February 18, 1926.

This variety is said to be *Paterson's Victoria*, but it is not the old Paterson's Victoria bred by William Paterson. (Keay.)

66164. IPOMOEA REPTANS (L.) Poir. (I. aquatica Forsk.). Convolvulaceae.

From Canton, China. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received February 3, 1926.

No. 305. Obtained on Honam Island, December 15, 1925. *Ung taoi; paak hook ung taoi*. This is one of the most widely cultivated vegetables among the Chinese. It is easy to grow, yields many crops, and appeals generally to the Chinese palate. It may be grown either as a dry-land vegetable or as a water crop. The tips of the branches are eaten, together with the leaves. (McClure.)

For previous introduction see No. 54409.

66165 to 66167. PYRUS spp. Malaceae. Pear.

From Algiers, Algeria. Scions presented by Dr. L. Trabut, Government botanist. Received February 11, 1926. Notes by Doctor Trabut.

66165. PYRUS GHARBIANA Trabut.

This is near to *Pyrus longipes*, but sufficiently characterized by the form of the leaves and the fruit. This pear grows on the tufas in the region of Lamoriciere, Daya. It is called gharbiana from the name of the region which formed part of the ancient kingdom of Gharb (of the west) at the time of Arab domination.

For previous introduction see No. 30031.

66166. PYRUS LONGIPES Coss. and Dur.

A rare Algerian wild variety of botanical interest, which forms a tall tree with few spines. It occurs in the mountains of Serif, Anini, and L'Aures, where it reaches its highest development. The leaves are small, rounded, oval, and suborbicular; the fruits are small, about the size of a cherry, and have a stalk three times their length.

For previous introduction see No. 34602.

66167. PYRUS MAMORENSIS Trabut.

A Moroccan pear growing in the cork-oak forest of Mamora. The vigorous tree, very resistant to dryness in the sandy noncalcareous soils, will probably form a good stock. The fruits are rather large and the seeds very large.

For previous introduction see No. 45612.

66168. CEIBA ACUMINATA (S. Wats.) Rose. Bombacaceae. Pochote.

From Cajenne, Sonora, Mexico. Seeds presented by Walter Thompson, through L. H. Dewey, Bureau of Plant Industry. Received February 16, 1926.

This close relative of the silk-cotton tree (*Ceiba pentandra*) is described by P. C. Standley (Contributions from the United States National Herbarium, vol. 23, pt. 3) as a large or medium-sized tree with a greenish, spiny trunk, compound leaves, and hard, oblong fruits about 7 inches long which contain brownish "cotton" used for stuffing pillows and for making candlewicks. It is native to western and southern Mexico.

For previous introduction see No. 39389.

66169. ARACHIS NAMBYQUARAE Hoehne. Fabaceae.

From Sao Paulo, Brazil. Seeds presented by the Secretaria do Interior do Estado de Sao Paulo, through Arthur G. Parsloe, American vice consul in charge, Santos. Received February 16, 1926.

A Brazilian relative of the peanut, which, according to Hoehne (Historia Natural Botanica, Matto Grosso, Brazil, pt. 12), is a rather shrubby, much-branched prostrate or ascending plant. The pod is 2 to 3 inches long, with usually two seeds, which are edible and very oily. Cultivated by the Nambyquara Indians in Rondonia, Matto Grosso.

For previous introduction see No. 62099.

66170. COFFEA QUILLOU P. J. S. Cramer. Rubiaceae. Coffee.

From Manila, Philippine Islands. Seeds presented by S. Youngberg, director, Bureau of Agriculture. Received February 16, 1926.

Introduced into the East Indies from Libreville, French Congo, in 1901, this was found to be distinct from *Coffea robusta*. The leaves are narrower and brighter green, and the young trees are pyramidal in habit. The berries are bright red, not dark crimson, and oblong. The crop matures later than that of *C. robusta* and under favorable circumstances is larger than that of any other coffee. Under less favorable conditions *C. robusta* is more productive. (*Tea and Coffee Trade Journal*, vol. 85, p. 417.)

For previous introduction see No. 65798.

66171. GOSSYPIUM spp. Malvaceae. Cotton.

From Rio de Janeiro, Brazil. Seeds obtained through A. Gaylin, American consul general. Received February 18, 1926.

Mocó (tree type) cotton, a locally grown variety.

66172 to 66175. TRIFOLIUM PRATENSE L. Fabaceae. Red clover.

From Aberystwyth, Wales. Seeds presented by R. G. Stapledon, director, Welsh Plant-Breeding Station. Received February 19, 1926.

Locally developed varieties.

66172. Sta. No. Aa-1214.

66173. Sta. No. Aa-1215.

66174. Sta. No. Aa-1216.

66175. Montgomery late-flowering clover.

66176. ELAEOCARPUS LANCEAFOLIUS Roxb. Elaeocarpaceae.

From Algiers, Algeria. Seeds presented by Dr. L. Trabut, Government botanist. Received February 19, 1926.

A handsome white-flowered tree from the Himalayas, which, according to J. D. Hooker (Flora of British India, vol. 1, p. 402), has serrulate, lanceolate leaves up to 6 inches in length and 2 inches in width, and flowers half an inch across, borne in racemes.

66177 to 66179. GOSSYPIUM spp. Malvaceae. Cotton.

From the island of Cyprus. Seeds presented by the director of agriculture. Received February 19, 1926.

66177. GOSSYPIUM HERBACEUM L.

66178 and 66179. GOSSYPIUM HIRSUTUM L.

66178. *Triumph*.

66179. Derived from *Sea Island*, New Orleans, *Triumph*, and other varieties.

66180. TRITICUM AESTIVUM L. (T. vulgare Vill.). Poaceae.**Common wheat.**

From Piacenza, Italy. Seeds presented by Federazione Italiana dei Consorzi Agrari. Received February 20, 1926.

Ardito. A new Italian wheat variety.

66181 and 66182.

From Rio Piedras, Porto Rico. Seeds presented by W. P. Kramer, chief, Porto Rico Forest Service. Received February 17, 1926.

66181. BAUHINIA KURZII Prain. Caesalpinia-ceae.

As described by J. G. Baker (Hooker, Flora of British India, vol. 2, p. 280), this is a climbing shrub, with papery, rounded-cordate leaves about 4 inches long, which are slit down about one-third of their length. The flowers are borne in terminal racemes. Native to Martaban, Burma.

For previous introduction see No. 33558.

66182. CAESALPINIA SAPPAU L. Caesalpinia-ceae.

A shrubby leguminous tree, native to India and Malaysia, which bears showy yellow flowers. The wood, known to commerce as sappan wood, yields a red dye, and the bark is used for tanning. It is said to be an excellent hedge plant and to endure rather poor dry soils.

66183. CITRUS NOBILIS DELICIOSA (Ten.) Swingle. Rutaceae.**Mandarin orange.**

From Manila, Philippine Islands. Seeds presented by S. Youngberg, director, Bureau of Agriculture. Received February 20, 1926.

P. I. No. 1267. *Szinkom mandarin*. Grown at the experiment station in Tanauan, Batangas. (Youngberg.)

66184 to 66188. CYNARA SCOLYMUS L. Asteraceae. Artichoke.

From Paris, France. Offshoots purchased from Vilmorin-Andrieux & Co. Received February 27, 1926.

Artichoke varieties not known in the American trade.

66184. Early Purple Globe.

66185. Green Globe or Provence.

66186. Large Flat Brittany.

66187. Large Globe or Paris Improved Large Green.

66188. Perpetual.

66189 and 66190. COFFEA spp. Rubiaceae. Coffee.

From Tananarive, Madagascar. Seeds presented by the director of agriculture. Received February 15, 1926.

66189. COFFEA sp.

No. 1.

66190. COFFEA sp.

No. 2.

66191. SACCCHARUM OFFICINARUM L. Poaceae. Sugar cane.

From Herradura, Cuba. Cuttings presented by F. S. Earle, through E. W. Brandes, Bureau of Plant Industry. Received March 1, 1926.

Co. 281. A locally grown variety.

66192 and 66193.

From the island of Mytilene, Greece. Scions purchased through P. D. Caldis, University Farm, Davis, Calif. Received March 1, 1926. Notes by Mr. Caldis.

66192. CYDONIA OBLONGA Mill. (Pyrus cydonia L.). Malaceae. Quince.

A variety formerly quite famous in Asia Minor. The fruit is large and fragrant and is eaten fresh like an apple.

66193. OLEA EUROPAEA L. Oleaceae. Olive.

Ropades. A variety commonly grown in the island of Mytilene which is said to lack the bitter flavor of other varieties.

66194 to 66247.

From Peradeniya, Ceylon. Seeds obtained by David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition. Received February 26, 1926.

Unless otherwise stated, the following seeds were collected at the Royal Botanic Gardens, Peradeniya.

66194. ADENANTHERA BICOLOR Moon. Mimosaceae.

No. 296. January 2, 1926. The beans of this tropical tree, unlike those of its relative, *Adenantha pavoniana*, are half red and half black like those of the *Abrus precatorius*. These seeds are very attractive for bead work, and the tree might be grown for the purpose of producing these seeds. Native to Ceylon.

66195. AGATI GRANDIFLORA (L.) Desv. (Sesbania grandiflora Poir.). Fabaceae.

No. 311. January 11, 1926. A small, rapid-growing, soft-wooded tree, 15 to 20 feet in height, with pinnate leaves and large pendulous white flowers, followed by long sickle-shaped pods. The fleshy petals are used in curries and soups in the Indian Archipelago, where this tree is native. The leaves and young shoots are sometimes used as fodder.

For previous introduction see No. 61778.

66196. AMOMUM HEMISPHERICUM (Blume) Schum. Zinziberaceae.

No. 282. January 3, 1926. A very striking and handsome species from Java, with great pinnate leaves rising from the ground to a height of 12 feet and having leaflets 2 feet long. Underneath, these leaves are the loveliest bronze-claret color, making the plant, when seen against the sunlight, a wonderful thing. Propagated usually by rhizome cuttings.

66197. ANODENDRON PANICULATUM (Roxb.) A. DC. Apocynaceae.

No. 294. January 2, 1926. The dul of Ceylon climbs to the tops of the tallest trees and forms an immense snakelike stem several inches through. It bears big pods with seeds having a long white silky coma.

66198 to 66201. ARECA CATECHU L. Phoeniceae. Palm.

This superb little palm grows everywhere in the oriental Tropics, and nobody knows whence it came; it is one of the most striking features of the landscapes here, and deserves to be thoroughly established in the western Tropics. There are at least four distinct varieties of the Areca palm in Ceylon.

For previous introduction see No. 51803.

66198. No. 313. Variety A.

66199. No. 314. Variety B.

66194 to 66247—Continued.

66200. No. 315. Variety *C*. The yellow fruit of the variety "Rata-puwak" is said to be larger than the others and is esteemed to be the best.

66201. No. 316. Variety *D*.

66202. *ARISTOLOCHIA RIDICULA* N. E. Brown. Aristolochiaceae.

No. 300. January 8, 1926. A Brazilian plant most interesting because of its fascinating fly-trapping character. The flowers hold captive the flies which fall into them for 27 hours or until other flowers are ready to receive them as they come out well dusted with pollen. Adapted for cross-pollination. It will cover a fence, forming a mass of light-green foliage.

66203. *BARYXYLUM INERME* (Roxb.) Pierre (*Peltophorum ferrugineum* Benth.). Caesalpinaceae.

No. 264. January 2, 1926. A beautiful large forest tree used extensively as a street tree in Ceylon because of its yellow flowers which are produced in early spring.

For previous introduction see No. 51810.

66204. *BROWNEA ARIZA* Benth. Caesalpinaceae.

No. 268. January 2, 1926. A small spreading leguminous tree from tropical America, with pinnate leaves which droop in a striking, limp way when young. It bears large dense round clusters of bright-scarlet blossoms.

For previous introduction see No. 42856.

66205. *CAESALPINIA BICOLOR* C. H. Wright. Caesalpinaceae.

No. 292. January 2, 1926. A tropical American flowering shrub with beautiful, orange, pendent blossoms of delicate form.

66206. *CANARIUM BENGALENSE* Roxb. Balsameaceae.

No. 267. January 2, 1926. A tall, handsome shade tree from Sylhet, British India, producing large nuts similar to those of *Canarium commune*.

66207. *CANARIUM INDICUM* Stickm. Balsameaceae.

No. 270. January 2, 1926. A forest tree from the Molukkas which, like *Canarium commune*, produces edible nuts. It is also a fine avenue tree.

66208. *CANARIUM ZEYLANICUM* (Retz.) Blume. Balsameaceae.

No. 241. January 1, 1926. The "malamekuna." A large magnificent avenue tree which is said to exude copiously a fragrant gum resin from the stem.

66209. *CASSIA GRANDIS* L. f. Caesalpinaceae.

No. 291. January 5, 1926. This leguminous tree produces masses of pale-pink flowers during February and March, at which time it is leafless. It should be very attractive for park and garden work in southern Florida where *Cassia fistula* and others of the genus have done well.

For previous introduction see No. 54706.

66210. *CHLOROXYLON SWIETENIA* DC. Meliaceae.

No. 238. January 1, 1926. The "Ceylon satin wood" tree, which was at one time exported in large quantities from Ceylon. A moderate-sized tree, growing in the so-called dry zone of Ceylon, which furnishes a very hard, heavy, fine-grained timber for turners. The "flowered wood" is said to bring a high price in London. It is also worth growing as a shade tree.

66194 to 66247—Continued.

66211. *CUCUMIS SATIVUS* L. Cucurbitaceae.
Cucumber.

No. 360. January 10, 1926. A long, rather large, russet cucumber obtained in a country market west of Kandy. The flesh is white, crisp, and of good quality.

66212. *CUCURBITA MOSCHATA* Duchesne. Cucurbitaceae.
Cushaw.

No. 359. January 10, 1926. A large oblong yellow variety obtained in a country market near Kandy. The flesh is about 1½ inches thick and of a creamy yellow color.

66213. *DILLENIA BURBIDGEI* (Hook. f.) Gilg. Dilleniaceae.

No. 295. January 5, 1926. A small ornamental tree from Borneo, with large leaves and very beautiful bright-yellow flowers 2 inches across.

For previous introduction see No. 60438.

66214. *ELAEOCARPUS SERRATUS* L. Elaeocarpaceae.

No. 277. January 3, 1926. The "wild olive" of Ceylon. A moderate-sized attractive tree which bears an abundance of small olive-shaped fruits. When ripe these fruits are good to eat, having a mild acid flavor and good texture. In Ceylon they are pickled somewhat as olives are, and they are said to be very good.

For previous introduction see No. 32098.

66215. *ELAEOCARPUS* sp. Elaeocarpaceae.

No. 229. January 1, 1926. A forest tree of extremely attractive appearance, used as an avenue tree in the Royal Botanic Gardens. The leaves turn a beautiful scarlet as they fall, and the large, rather attractive green fruits are egg-shaped and a little sour, but not bad for eating.

66216. *ELETTARIA CARDAMOMUM MAJOR* (Smith) Trimmen. Zinziberaceae.

No. 309. January 11, 1926. Var. *majus*. The wild species of Ceylon which does not furnish the commercial cardamoms, but is being used here as an ornamental in the herbaceous perennial borders with stunning effects. It would be excellent for use around houses to produce tropical effects in southern Florida.

66217. *ERYTHRINA* sp. Fabaceae.

No. 289. Collected on the Gompala Road, Kandy, January 6, 1926. The dadap tree is used as a shade for the tea all over Ceylon. It is a rapid grower and during the spring, when in flower, is attractive with its bright-scarlet flowers.

66218. *EUTERPE EDULIS* Mart. Phoenicaceae.
Palm.

No. 255. January 1, 1926. The Assai palm of tropical America. A very beautiful, slender-stemmed palm whose pinnate leaves, borne at the tips of the graceful stems, are waved by the slightest breeze.

For previous introduction see No. 56463.

66219. *FLACOURTIA INERMIS* Roxb. Flacourtiaceae.

No. 250. January 1, 1926. The lovi-lovi tree of Malaya is cultivated everywhere in the private gardens of Ceylon. The very acid, brilliant-red fruits are produced in immense quantities and are said to make excellent preserves. Judging from the taste of the sour fruits they would resemble cranberry preserves.

66194 to 66247—Continued.

66220. *HARPULLIA CUPANIODES* Roxb. Sapindaceae.

No. 299. January 3, 1926. The na-imbul tree of the Singhalese, who are said to use the fruits for washing purposes. Since saponin has become more valuable, it may be worth testing for its saponin content. It is suitable furthermore for avenue and shade-tree purposes.

For previous introduction see No. 39419.

66221 and 66222. *HIBISCUS SABDARIFFA* L. Malvaceae.

66221. No. 287. January 4, 1926. A deep-crimson fruited roselle, of the spreading type, which may prove superior to the variety growing in America.

66222. No. 288. Attempts to grow this variety in Ceylon for fiber have met with only partial success. It grows upright like hemp and is about as tall. Perhaps this tall-growing variety may succeed in Florida.

66223 and 66224. *LAGERSTROEMIA SPECIOSA* (Muenchh.) Pers. (*L. flos-reginae* Retz.). Lythraceae. **Crape myrtle.**

For previous introduction see No. 59315.

66223. No. 307. Collected in front of the Nursing Home, Kandy. This variety, the leaves of which fall in January, is not so showy as No. 308 [No. 66224], nevertheless it is worthy of cultivation as a street tree. It is called in Ceylon Pride of India or Queen's flower.

66224. No. 308. Collected near Kandy, January 9, 1926. Around the lake here at Kandy many of these trees have been planted, and already they are beginning to open their superb clusters of bright-pink flowers. This variety also is called in Ceylon Pride of India or Queen's flower.

66225. *LICUALA GRACILIS* Blume. Phoenicaceae. **Palm.**

No. 252. January 1, 1926. A small fan palm from Java, 5 to 7 feet high, clusters of which would grace any private garden in the Tropics.

66226. *LICUALA SPINOSA* Thunb. Phoenicaceae. **Palm.**

No. 306. January 1, 1926. A beautiful fan palm, native to Singapore and Java, with graceful stems produced in clusters 20 to 25 feet tall.

For previous introduction see No. 62104.

66227. *LYSIDICE RHODOSTEGIA* Hance. Caesalpiniaceae.

No. 290. January 3, 1926. A handsome leguminous tree from southern China which was introduced into Ceylon in 1882. It bears loose panicles of rose-purple flowers with pale-pink bracts and is very attractive.

66228. *MUSSAENDA LUTEOLA* Delile. Rubiaceae.

No. 266. January 2, 1926. A dwarf species of Rubiaceae, with small yellow flowers and large white bractlike sepals which are very showy. It reminds one slightly of our northern dogwood.

66229. *ONCOBA SPINOSA* Forsk. Flacourtiaceae.

No. 240. January 1, 1926. A relative of *Oncoeba echinata* whose seeds contain an oil having chaulmoogric acid in it. This species, native to Arabia, forms a small bushy tree bearing large scented white flowers and fruits the size of small apples which are reported to be edible.

For previous introduction see No. 49469.

66194 to 66247—Continued.

66230. *ONCOSPERMA FASCICULATUM* Thwaites. Phoenicaceae. **Palm.**

No. 235. January 1, 1926. The Katu-kitul palm of Indo-Malaya is one of the graceful cluster palms which make magnificent groups, 40 to 60 feet high, in the Peradeniya Gardens. The stems are spiny and therefore not suitable for small gardens, but rather for parks, to increase the tropical effect.

For previous introduction see No. 45961.

66231. *ONCOSPERMA FILAMENTOSUM* Blume. Phoenicaceae. **Palm.**

No. 275. January 3, 1926. The nibung palm of Java. A cluster palm of great beauty which rises to 50 feet and waves its pinnate leaves in the slightest breeze. Like its relative, *Oncosperma fasciculatum*, it is a spiny palm and therefore not suited for small garden uses but to parks. The great clusters of this palm are wonderfully effective.

For previous introduction see No. 51726.

66232. *ORMOSIA MONOSPERMA* (Swartz) Urban. Fabaceae.

No. 302. January 9, 1926. The so-called "necklace" tree because its beans are the size of large beads, three-fourths of an inch long, and of brilliant scarlet blotched with the deepest brown. They are among the most strikingly colored seeds I have ever seen and are sold in Kandy to tourists for high prices. The tree comes from tropical South America and fruits during the winter months.

For previous introduction see No. 37876.

66233. *PAYENA LEERII* (T. and B.) Kurz. Sapotaceae.

No. 297. January 2, 1926. The gutta sundek tree of the Malay Peninsula, of possible value as a source of gutta-percha.

66234. *PHOENIX FARINIFERA* Roxb. Phoenicaceae. **Palm.**

No. 260. January 1, 1926. A pinnate-leaved palm, native to India and Ceylon. Like most of the species of Phoenix, this will probably grow well in southern Florida.

For previous introduction see No. 41507.

66235. *PITTIOSPORUM TIMORENSE* Blume. Pittosporaceae.

No. 265. January 2, 1926. A tropical forest tree from the island of Timor in the Dutch East Indies. This may prove valuable as a street tree.

66236. *PTEROCARPUS ERINACEUS* Lam. Fabaceae.

No. 253. January 1, 1926. A very ornamental leguminous forest tree from the Philippine Islands, which is related to the species furnishing the kino gum. It bears clusters of pale-orange flowers during April. Introduced because of its suitability as an avenue tree.

For previous introduction see No. 52912.

66237. *PTYCHOSPERMA ANGUSTIFOLIA* Blume. Phoenicaceae. **Palm.**

No. 257. January 1, 1926. A tropical Australian pinnate palm which grows in great clusters. When young it is suited for pot culture, but it should be tried out in the open in southern Florida in private gardens. The small slender stems make it especially adapted for small gardens.

66238. *SABAL GLAUDESCENS* Lodd. Phoenicaceae.

No. 247. January 1, 1926. A handsome fan-leaved palm from Trinidad which grows to 40 or 50 feet high; it is suitable for parks.

66194 to 66247—Continued.

66239. *SIDEROXYLON* sp. Sapotaceae.

No. 310. January 11, 1926. A small-leaved variety with golden-yellow mealy flesh; in general appearance and flavor the fruits resemble those of the canistel (*Lucuma nervosa*).

66240. *STRAX BENZOIN* Dryander. Stryacaceae.

No. 237. January 1, 1926. A medium-sized tree, native to Malaya, which might prove interesting as a park tree. It yields the gum benzoin which is used as incense in churches.

For previous introduction see No. 51807.

66241. *TALINUM TRIANGULARE* (Jacq.) Willd. Portulacaceae.

No. 317. Obtained at Kandy, January 12, 1926. A low herb, with somewhat fleshy leaves and pink flowers, which is cultivated in beds in the small market gardens around Kandy. It is used in the hotels and by the Singhalese as a "spinach" or potherb, and I must say it makes a very good one.

For previous introduction see No. 59292.

66242. *TECTONA GRANDIS* L. f. Verbenaceae. Teak.

No. 283. January 4, 1926. The teak tree of India furnishes one of the most valuable timbers in the world. It is said to do best in calcareous soil.

For previous introduction see No. 49562.

66243. *TERMINALIA TOMENTOSA* (Roxb.) Wight and Arn. Combretaceae.

No. 236. January 1, 1926. The kumbuk of the Singhalese. An immense tree which sometimes grows to 45 feet in circumference around its base in the beds of rivers in the so-called dry region of Ceylon. The bark is remarkable for the amount of pure calcium carbonate which it contains, and it is burnt to obtain this pure lime, which is an ingredient of the mixture known as betel-nut quid, chewed by millions throughout the oriental Tropics.

For previous introduction see No. 61624.

66244. *TOLUIFERA BALSAMUM* L. (*Myroxylon toluiferum* H. B. K.). Fabaceae. Tolu.

No. 286. January 3, 1926. A leguminous tree of South America which, in the Peradeniya Gardens, makes a beautiful park tree. It is said to thrive in dry districts as well as moist ones, and I imagine would prove a good avenue tree.

For previous introduction see No. 42720.

66245. *TOLUIFERA PEREIRAE* (Klotzsch) Baill. (*Myroxylon pereirae* Klotzsch). Fabaceae.

No. 272. January 2, 1926. Balsam of Peru is obtained from the base of this tropical American leguminous tree. It is probably a good street tree.

For previous introduction see No. 38977.

66246. *TRACHYLOBUM VERRUCOSUM* (Gaertn.) Oliver. Caesalpinaceae.

No. 231. January 1, 1926. A tall and very attractive forest tree from East Africa which would make an excellent avenue tree, and whose copal resin may prove to have special value. The curious fruits are covered with pustules filled with inflammable gum, which, if lighted, will burn.

For previous introduction see No. 60323.

66247. *TRICHOSANTHES* sp. Cucurbitaceae.

No. 305. January 8, 1926. A vine with very showy scarlet fruits, 2 inches in diameter, which are extremely ornamental but poisonous.

66248 to 66256.

From Ceylon, India. Seeds collected by David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition. Received March 4, 1926.

66248 to 66254. From the agricultural experiment station near the villages of Gangoruwa and Yatinalagal, in the district of Kandy, January 23, 1926.

66249. *BRADBURYA PUBESCENS* (Benth.) Kuntze (*Centrosema pubescens* Benth.). Fabaceae.

No. 371. A creeping leguminous vine used as a cover crop in a rubber plantation here.

For previous introduction see No. 32780.

66249. *CRACCA CANDIDA* (DC.) Kuntze (*Tephrosia candida* DC.). Fabaceae.

No. 366. A white-flowered shrubby perennial, 4 to 7 feet high, which yields four cuttings a year or 58 tons of green manure per acre.

For previous introduction see No. 60642.

66250. *CRACCA VOGELII* (Hook. f.) Kuntz (*Tephrosia vogelii* Hook. f.). Fabaceae.

No. 374. A very strong-growing cover crop with velvety brown pods.

For previous introduction see No. 49995.

66251. *CROTALARIA ANAGYROIDES* H. B. K. Fabaceae.

No. 368. A very strong rank grower with large clusters of yellow flowers.

66252. *CROTALARIA USARAMOENSIS* Baker f. Fabaceae.

No. 365. A very strong grower, 8 feet or more in height, with long spikes of yellow flowers which are tinged with bronze. This green-manure crop is being used extensively.

For previous introduction see No. 57831.

66253. *INDIGOFERA ENDECAPHYLLA* Jacq. Fabaceae.

No. 369. An annual or biennial leguminous plant which has become popular as a cover plant in Ceylon, according to the Tropical Agriculturist (vol. 63, October, 1924). The trailing stems are 1 to 2 feet long and the violet-purple flowers are in dense racemes.

For previous introduction see No. 63605.

66254. *MEIBOMIA GYROIDES* (DC.) Kuntze (*Desmodium gyroides* DC.). Fabaceae.

No. 370. A shrubby leguminous plant, 8 to 10 feet high, from the warmer parts of the central and eastern Himalayas. It has hairy leaves and terminal clusters of reddish purple flowers.

For previous introduction see No. 61613.

66255. *OXYLON INDICUM* (L.) Vent. Bignoniaceae.

No. 362. Kandy, January 21, 1926. A tropical Asiatic ornamental tree, sometimes 40 feet high, with glossy compound leaves 2 to 4 feet across and terminal panicles of white to purple flowers. The large flat pods, up to 3 feet long, contain winged seeds.

For previous introduction see No. 35415.

66256. *PUERARIA PHASEOLOIDES* (Roxb.) Benth. Fabaceae.

No. 372. From the agricultural experiment station near the villages of Gangoruwa and Yatinalagal, in the district of Kandy, January 23, 1926. A twining, semishrubby plant densely covered with brown hairs, which is native to the tropical regions of the eastern Himalayas. The leaflets are green above and densely matted with gray hairs beneath. The reddish flowers are borne in copious long-stemmed racemes.

66257 to 66259.

From Keijyo, Chosen, Japan. Seeds presented by Dr. M. Tozawa, director, Forest Experiment Station. Received March 9, 1926.

66257. *ABIES HOLOPHYLLA* Maxim. Pinaceae.
Manchurian fir.

Collected at Potschonkjongdo. A tall, handsome Manchurian fir, eventually 100 feet or more in height, with stout spreading or ascending branches and dark-green foliage.

For previous introduction see No. 65906.

66258. *FRAXINUS CHINENSIS RHYNCHOPHYLLA* (Hance) Hemsl. Oleaceae. Ash.

Collected at Anpjon, Sudhamgjongdo. A rather small ash, 40 feet or less in height, with dark-green leaves, lighter beneath, consisting of five to seven narrowly oblong, irregularly toothed leaflets 2 to 5 inches long.

66259. *SYRINGA DILATATA* Nakai. Oleaceae.
Lilac.

Collected at Hwanghaido. A hardy compact shrub about 12 feet high, with heart-shaped, bright-green leaves and dense panicles of pale-lilac flowers. Native to Chosen.

66260 to 66266.

From Ceylon and Italy. Seeds obtained by David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition. Received March 12, 1926.

66260. *AMOMUM MAGNIFICUM* (Roscoe) Benth. and Hook. Zinziberaceae.

No. 363. From the Peradeniya Botanic Garden, Kandy, Ceylon, January 21, 1926. A variety with large pink flower heads on erect stalks, $2\frac{1}{2}$ to 3 inches or more high.

66261. *ARBUTUS CANARIENSIS* Duham. Ericaceae.

No. 228. These seeds were presented by Professor Cavara, director, Naples Botanic Garden, November 14, 1925. A beautiful tree with smooth bark and evergreen leaves, resembling our California *Arbutus menziesii*. It is a rather rare tree in the Canary Islands.

For previous introduction see No. 56529.

66262. *ARISTEA ECKLONI* Baker. Iridaceae.

No. 380. Collected near Hakgalla Garden, in the region of Kandy, Ceylon, January 27, 1926. An iridaceous plant from South Africa which has become naturalized in the high altitudes of Ceylon. Though rather small, it is very pretty with its brilliant blue flowers.

66263. *BOTOR TETRAGONOLOBA* (L.) Kuntze (*Psophocarpus tetragonolobus* DC.). Fabaceae. Goa bean.

No. 341. From Peradeniya, Ceylon, February 1, 1926. A bean with winged pods, much used in curries by the Singhalese. The wings are torn off before cooking.

For previous introduction see No. 51765.

66264. *ELAEOCARPUS SPHAERICUS* (Gaertn.) Schum. (*E. ganitrus* Roxb.). Elaeocarpaceae.

No. 385. From the Botanical Gardens, Peradeniya, February 3, 1926. A good-sized ornamental tree which bears small blue fruits about the size of a plum. The seeds are rough and attractive and when dry may be used as hat pin heads.

For previous introduction see No. 50696.

66260 to 66266—Continued.

66265. *HIBISCUS SABDARIFFA* L. Malvaceae.

No. 332. Presented by the director of the Peradeniya Experiment Station, Ceylon, January 29, 1926. A tall straight-growing variety which furnishes an excellent fiber for the manufacture of bags.

For previous introduction see No. 66222.

66266. *PRUNUS ARMENIACA* L. Amygdalaceae.
Apricot.

No. 342. Kandy, Ceylon, January 29, 1926. This variety is from the upper hill country of India. The fruits are dried with the seed in them and are never cut open or halved. When stewed they have a delicious flavor.

66267 to 66269.

From China. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received March 12, 1926. Notes by Mr. Dorsett.

66267. *EVODIA* sp. Rutaceae.

No. 4814. Dairen, Manchuria. November 28, 1925. A good-sized tree, 10 inches in diameter and 25 to 30 feet high, with smooth grayish bark, which was growing in a playground park between the Yamato Hotel and the water front. The shiny black seeds have a spicy odor.

66268. *GLEDITSIA* sp. Caesalpiniaceae.
Honey locust.

No. 4817. Dairen, Manchuria. November 28, 1925. This tree was also growing in a playground park. It is a small tree and has large thorns which are more or less flattened.

66269. *PINUS* sp. Pinaceae. Pine.

No. 4818. Tsingtao, China. December 1, 1925. The small trees were growing in an exposed situation in poor gravelly clay soil.

66270 to 66324.

From Elstree, Herts, England. Plants presented by Edwin Beckett, superintendent, Aldenham House Gardens. Received March 19, 1926.

66270 to 66278. *ASTER* spp. Asteraceae. Aster.66270. *ASTER* sp.

Dainty. A very delicate semidouble pink variety.

66271. *ASTER* sp.

Grace Sweet. One of the finest deep blues yet raised.

66272. *ASTER* sp.

Gray Lady. A large semidouble opal-gray flowered variety which is very distinct and lovely.

66273. *ASTER* sp.

Moonbeams. A pale-mauve variety with large flowers which is especially pretty.

66274. *ASTER* sp.

Pink Perfection. A very true bright-pink variety.

66275. *ASTER* sp.

Queen of the Lilacs. A variety with large, glorious pale lilac-blue flowers.

66276. *ASTER* sp.

Snowdrift. A semidouble snow-white flowered variety of attractive branching pyramidal habit.

66270 to 66324—Continued.

66277. *ASTER* sp.

Sunset. A very pretty variety with single pink flowers.

66278. *ASTER* sp.

Wedgewood. The flowers of this variety are a lovely shade of porcelain blue.

66279. *BERBERIS ARISTATA* DC. Berberidaceae.
Barberry.

An almost evergreen form, native to the Himalayas, which has a fine coloring in the fall. The flowers, produced freely about July, are in racemes 2 to 3 inches long. The fruits are long and red, covered with a bluish white bloom.

For previous introduction see No. 60378.

66280. *BUDDLEIA FALLOWIANA* Balf. f. and W. W. Smith. Loganiaceae.

A white-flowered variety with very white woolly leaves.

66281. *BUDDLEIA DAVIDII* Franch. Loganiaceae.

Var. *nanhoensis*. A Chinese variety of spreading habit, which produces an abundance of bright rosy mauve flowers.

66282. *SIMMONDSIA CHINENSIS* (Link) C. Schneid. (*S. californica* Nutt.). Buxaceae.

A much-branched evergreen shrub, 5 to 15 feet high, with small, narrow-oblong, leathery leaves. Native to southwestern California and western Mexico.

66283. *COROKIA COTONEASTER* Raoul. Cornaceae.

An evergreen shrub, native to New Zealand, with curiously interlacing branches and small yellow flowers.

66284. *CORLYUS* sp. Betulaceae. Hazel.

This is probably the Tibetan hazel. It makes a fine and interesting tree.

66285 and 66286. *CHAMAECYPARIS LAWSONIANA* (Murray) Parl. Pinaceae. Lawson cypress.

For previous introduction see No. 62706.

66285. Var. *nana*. A dwarfish plant, generally broader than high, and of rounded habit.66286. Var. *nana glauca*. A low-growing dwarf form with glaucous leaves, which is suitable for rock gardens.66287. *CHAMAECYPARIS OBUTSA* (Sieb. and Zucc.) Endl. Pinaceae.

Var. *pygmaea*. A dwarf form of rounded habit, which makes an excellent conifer for the rock garden.

66288. *DEUTZIA SCABRA* Thunb. Hydrangeaceae.

Var. *latiflora*. A tall-growing, very floriferous variety with big panicles of large white flowers which are sometimes tinged with pink on the outer side of the petals.

66289. *DEUTZIA WILSONI* Duthie. Hydrangeaceae.

A very handsome Chinese shrub with reddish-brown bark, soon peeling, and scabrous oblanceolate leaves 3 to 4½ inches long. The white flowers, nearly 1 inch across, are in open corymbs, and the petal margins are wavy and hooded.

For previous introduction see No. 49946.

66270 to 66324—Continued.

66290. *DIERVILLA FLORIBUNDA* Sieb. and Zucc. Caprifoliaceae. Crimson weigela.

Var. *Aldenham Glow*. A choice deep-scarlet flowered form resembling *Eva Rathke*.

66291. *FORSYTHIA INTERMEDIA* Zabel. Oleaceae.

Var. *spectabilis*. A wonderful golden-yellow flowered hybrid variety.

66292. *HEUCHERA* sp. Saxifragaceae.

A plant 3 feet high with beautiful soft-rose flowers.

66293. *JASMINUM HETEROPHYLLUM* Roxb. Oleaceae.

Var. *glabricymosum*. A strong-growing bush jasmine introduced from China by G. Forrest, which bears an abundance of golden-yellow blossoms.

66294. *LESPEDEZA CYRTBOTRYA* Miquel. Fabaceae. Bush clover.

A small, deciduous bush clover, native to Japan and Chosen, which produces during August racemes of rosy purple pea-shaped flowers.

For previous introduction see No. 62863.

66295. *LIGUSTRUM CONFUSUM* Decaisne. Oleaceae. Privet.

A small tree, up to 40 feet in height, which is one of the tropical relatives of the California privet (*Ligustrum ovalifolium*). The leathery, obtuse leaves are about 3 inches long, and the small white flowers are in panicles 1 to 5 inches long.

For previous introduction see No. 60651.

66296. *LIGUSTRUM CORIACEUM* Carr. Oleaceae.

A quaint, glossy, leathery-leaved evergreen, native to Japan.

66297. *LONICERA CHAETOCARPA* Rehder. Caprifoliaceae. Honeysuckle.

This was originally collected in Kansu, western China, by E. H. Wilson. It is described (Curtis's Botanical Magazine, pl. 8804) as a shrub of compact habit, about 5 feet in height. The oblong leaves are bright green and more or less hairy, and the flowers, an inch or more in length, open in early June and are a pleasing primrose yellow.

For previous introduction see No. 62391.

66298. *MALUS SYLVESTRIS* Mill. (*Pyrus malus* L.). Malaceae. Apple.

Var. *Excellenz Thiel*. A very graceful weeping tree of German origin, having narrow leaves. The boughs hang down close to the trunk.

66299. *MORUS ACIDOSA* Griffith. Moraceae. Acid mulberry.

As described by Sargent (Plantae Wilsonianae, vol. 2, p. 300), this is usually a broad shrub from 3 to 16 feet in height, but occasionally it is a tree 25 feet tall. It is found in the Provinces of Hupeh and Szechwan, China. The leaves are very variable in size and shape and are not used for feeding silkworms. The fruits are dark red or shining black and are quite palatable.

For previous introduction see No. 46532.

66300. *MYRTUS COMMUNIS TARENTINA* L. Myrtaceae.

The Tarentum myrtle. A small-leaved variety, especially fine for walls, bearing small white fragrant flowers.

66270 to 66324—Continued.

66301. *ONONIS FRUTICOSA* L. Fabaceae.

A spreading deciduous European shrub, with almost stalkless trifoliate leaves, and pink flowers which are produced during July and August.

66302. *ONONIS ROTUNDIFOLIA* L. Fabaceae.

A hardy shrubby plant, about a foot high, with trifoliate leaves and bright-pink pealike flowers produced freely throughout the summer. Native to southern Europe.

66303 and 66304. *PHILADELPHUS LEMOINEI* Lemoine. Hydrangeaceae.

66303. Var. *purpureo-maculatus*. A very pretty and fragrant variety, producing flowers well expanded with round white petals which carry a deep-pink blotch at the base.

66304. *Sylwaine*. A variety producing large well-opened flowers with broad petals which are white tinged with pink in the center.

66305. *PICEA LAXA* (Ehrh.) Sarg. Pinaceae.
White spruce.

Var. *albertiana*. A pretty slow-growing conifer of very compact habit and glaucous tone.

66306. *RHAMNUS RUPESTRIS* Scop. Rhamnaceae.

A low-spreading European shrub with fruits that are first red, then black.

66307. *RIBES LAURIFOLIUM* Jancz. Grossulariaceae.

A very fine and distinct Chinese evergreen with beautiful leaf buds during the dormant period; the flowers are greenish yellow in long racemes.

For previous introduction see No. 56061.

66308. *RIBES VICARI* Hort. Grossulariaceae.

An evergreen of trailing habit, very distinct, with highly aromatic leaves and dull-pink flowers.

66309. *RUBUS IRENAEUS* Focke. Rosaceae.

An evergreen creeping shrub, native to western China, with simple, nearly round leaves, white flowers half an inch across, and yellow fruits.

For previous introduction see No. 44401.

66310. *RUBUS* sp. Rosaceae.

Hers. 2706. A new species with soft hairy leaves, three-leaved, at times five, or divided into two small leaflets at the base, with a larger one at the apex of the leaf.

66311. *RUSCUS ACULEATUS* L. Convallariaceae.
Butcher's-broom.

Var. *hermaphroditus*. A superior form of the butcher's-broom, more handsome in foliage and fruit, and bearing an abundance of red berries which are retained for a very long time.

For previous introduction see No. 26882.

66312. *STRANVAESIA DAVIDIANA UNDULATA* (Decaisne) Rehd. and Wils. Malaceae.

A low spreading evergreen shrub, or occasionally a small tree, native to western China. The leathery narrowly oval leaves are glossy green and 1 to 3 inches long, and the white flowers, about half an inch across, appear in terminal clusters. Its greatest charm as an ornamental is the abundant crop of bright-red fruits.

For previous introduction see No. 61993.

66313 to 66315. *SYRINGA* spp. Oleaceae Lilac.

66270 to 66324—Continued.

66313. *SYRINGA VILLOSA* × *JOSIKAEAE*.

Var. *lutece*. The enormous panicles of deep-violet flowers, which are very fine in the bud, are produced abundantly during May.

66314. *SYRINGA PALIBINIANA* Nakai.

A very pretty lilac from China, with stiff panicles of red-purple flowers and small dark foliage.

66315. *SYRINGA YUNNANENSIS* Franch.

A handsome species related to *Syringa wilsonii* but with pale pink flowers in big panicles. The downy leaves have a distinct red midrib, the color being continued through the leaf stalk.

66316. *TRITOMA* sp. Liliaceae.

Var. *Lord Roberts*. A very fine variety with effective spikes of bright coral red.

66317. *VERONICA GAUNTLETTII* Hort. Scrophulariaceae.

A very beautiful hybrid form with 6-inch spikes of salmon-pink flowers.

66318. *VERONICA SPICATA* L. Scrophulariaceae.

Var. *rosea*. The spikes, 1 foot in length, of pink flowers are very attractive.

66319 to 66324. *VIBURNUM* spp. Caprifoliaceae.66319. *VIBURNUM FRAGRANS* Bunge.

A very early-flowering species introduced from China by Farrer. The flowers are deliciously fragrant and are shaded with rose.

For previous introduction see No. 62741.

66320. *VIBURNUM HARRYANUM* Rehd.

An evergreen which is very distinct, with small round quaint leaves and long black fruits.

For previous introduction see No. 62742.

66321. *VIBURNUM ODORATISSIMUM* Ker.

An exceptionally fine evergreen with shining leathery leaves up to 8 inches long. The fragrant white flowers are produced in large broad panicles and are followed by red fruit which turns black as it ripens.

66322. *VIBURNUM PROPINQUUM* Hemsl.

A distinct evergreen shrub from China, with greenish white flowers produced in good-sized cymes which are followed by blue-black fruit.

For previous introduction see No. 62744.

66323. *VIBURNUM UTILE* Hemsl.

A handsome hardy evergreen shrub of rather open habit with dark glossy green leathery leaves and pure white flowers produced in dense terminal rounded trusses in May. These are succeeded by oval blue-black berries. The shrub is native to western China, where it is said to grow on limestone soils.

For previous introduction see No. 63688.

66324. *VIBURNUM* sp.

In appearance this resembles *Viburnum venosum*, but is very early flowering. A native of China.

66325 to 66335. *ORYZA SATIVA* L.
Poaceae. Rice.

From Assam, India. Seeds presented by P. M. Ganguli, botanical assistant, Karimganj Farm. Received March 17, 1926.

Indian varieties.

66325 to 66335—Continued.

66325. *Ar. 1. Badal.*
 66326. *Ar. 28. Birbak.*
 66327. *S. 14. Ilati.*
 66328. *S. 15. Tulshijoha.*

 66332. *S. 156. Nagra.*
 66333. *S. 161. Dhepi.*
 66334. *S. 233. Basantabhar.*
 66335. Mixed seeds of *S. 154 George* and *S. 156 Nagra.*

66336 and 66337. TRIFOLIUM PRATENSE L. Fabaceae. Red clover.

From Copenhagen, Denmark. Seeds presented by L. P. M. Larsen, Danish Royal Agricultural Society. Received March 18, 1926.

66336. *Tystofte No. 40.* An early red clover.
 66337. *Hersnap.* A late red clover; a good yielder.

66338. BELOU MARMELOS (L.) Lyons (Aegle marmelos Correa). Rutaceae. Bel.

From Kandy, Ceylon. Scions collected by David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition. Received March 12, 1926.

No. 336. From a tree near the home of Ratwatte Disawa, grandson of the former King of Kandy. A variety with abortive seeds and of excellent quality though rather small. The disawa told us that he eats one of these fruits for breakfast every morning, and that his father practically lived on them during the latter years of his life.

For previous introduction see Nos. 65793 and 65794.

66339. CANNA EDULIS Ker. Cannaceae. Edible canna.

From San Juan, Porto Rico. Rhizomes presented by O. W. Barrett, agricultural director, Department of Agriculture and Labor. Received March 23, 1926.

A close relative of the ornamental cannas, cultivated for its edible tubers, which contain a large percentage of starch. The plant is very vigorous and often becomes 9 feet high, with handsome bronze-green leaves and scarlet flowers. When properly cooked the tubers are very palatable; according to F. G. Krauss, of the Hawaii Agricultural Experiment Station, they should be boiled for 30 minutes and then mashed like boiled potatoes. Prepared thus they are comparable to potatoes in taste and in Hawaii the yield is more than twice as great. As much as 60 pounds of tubers have been obtained from a single hill. The tops can be used as forage for cattle and swine.

It is as a commercial source of starch, however, that the edible canna is most promising. In Australia it is grown for this purpose in preference to the Bermuda arrowroot (*Maranta arundinacea*), because of its much higher yield. A deep rich well-drained soil and moderate rainfall are necessary for the successful cultivation of this plant. In the United States it will probably have to be grown as an annual, except in the warmest parts of Florida.

For previous introduction see No. 46313.

66340. ATALANTIA MISSIONIS (Wight) Oliver. Rutaceae.

From Jaffna, Ceylon. Scions collected by David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition. Received March 26, 1926.

Mr. Fairchild's No. 345. The pamburu of the Singhalese and kuruntu of the Tamils. A native Ceylon tree with white flowers and very sweet fruits which are like small, dark oranges. Native to the dry district of Ceylon.

66341 to 66419.

From Tielingho, Kirin Province, Manchuria. Seeds presented by A. D. Woeikoff, director, Experimental Farm, Echo. Received March, 1926.

66341. AGROPYRON STRIGOSUM (Bieb.) Boiss. Poaceae. Grass.

No. 2. A perennial cespitose grass, native to Turkestan, with long narrow panicles and short narrow rigidly acuminate leaves.

66342. AGROPYRON sp. Poaceae. Grass. No. 5a.

66343. AMPELOPSIS BREVIPEDUNCULATA (Maxim.) Koehne. Vitaceae.

No. 74. A handsome strong-growing vine, native to eastern Asia, which is particularly attractive in autumn with its clusters of deep-blue berries; it is well adapted for covering trellises and low walls.

For previous introduction see No. 63332.

66344. ASPARAGUS SCHOBERIODES Kunth. Con-vallariaceae.

No. 57. An erect hardy herbaceous perennial asparagus, 3 feet or less in height, with red berries. Native to eastern Asia.

For previous introduction see No. 33309.

66345. CALAMAGROSTIS EPIGEIOS (L.) Roth. Poaceae. Grass.

No. 1. A stout perennial grass native to Manchuria.

For previous introduction see No. 57279.

66346. CALAMAGROSTIS sp. Poaceae. Grass.

No. 3a. A stout perennial Manchurian grass.

66347 to 66365. CHAETOCHLOA ITALICA (L.) Scribn. (Setaria italica Beauv.). Poaceae. Millet.

66347. No. 185. *Nien ku tsa* (yellow glutinous). Originally from Ninguta district, Kirin Province.

66348. No. 187. *P'ai fang ku* (white). Originally from Ninguta district, Kirin Province.

66349. No. 188. *Fang ku tsa*. Originally from Ninguta district, Kirin Province.

66350. No. 190. *Fang ku tsa* (light yellow). Originally from Ninguta district, Kirin Province.

66351. No. 193. *Fang ku tsa* (light yellow). From Ninguta district, Kirin Province.

66352. No. 194. *Fang ku tsa*. From Tung-pingshien district, Kirin Province.

66353. No. 197. *Fang ku tsa* (light yellow). From Tungpingshien district, Kirin Province.

66354. No. 199. *Fang ku tsa*. From Ninguta district, Kirin Province.

66341 to 66419—Continued.

66355. No. 201. *Hung ku tsu* (red). From Ninguta district, Kirin Province.
66356. No. 202. *Hung niang ku tsu* (red glutinous). From Ninguta district, Kirin Province.
66357. No. 205. *Hung nien ku tsu* (glutinous). From Ninguta district, Kirin Province.
66358. No. 918. *Hung niang* (glutinous). From Achiho district, Kirin Province.
66359. No. 924. *P'ai ku tsu* (white). From Ninguta district, Kirin Province.
66360. No. 925. *P'ai ku tsu* (white). From the Government Agricultural Experiment Station, Peking, China.
66361. No. 926. *Hung ku tsu*. From the Government Agricultural Experiment Station, Peking, China.
66362. No. 927. *Pah tah yil*. From the agricultural experiment station, Kungchuling, South Manchurian Railway, Mukden Province, Manchuria.
66363. No. 928. *Sui li chang*. From the agricultural experiment station, Kungchuling, South Manchurian Railway, Mukden Province, Manchuria.
66364. No. 929. *Pao pah chi*. From the agricultural experiment station, Kungchuling, South Manchurian Railway, Mukden Province, Manchuria.
66365. No. 930. *Pai sha*. From the agricultural experiment station, Kungchuling, South Manchurian Railway, Mukden Province, Manchuria.

66366. *EVONYMUS MAACKII* Rupr. Celastraceae.

No. 84. A large shrub or small tree with oval-oblong finely toothed leaves about 3 inches long and small pink 4-lobed fruits with orange-red arils. Native to northeastern Asia.

66367. *EVONYMUS MACROPTERUS* Rupr. Celastraceae.

No. 65. A shrub or small tree, about 20 feet high, with narrowly oval, wedge-shaped leaves, dense clusters of yellowish flowers, and pink fruits. Native to northeastern Asia.

66368 to 66393. *HOLCUS SORGHUM* L. (*Sorghum vulgare* Pers.). Poaceae. Sorghum.

66368. No. 163. *Nien kaoliang*. From Ninguta district, Kirin Province.
66369. No. 166. *Hung kaoliang* (red). From Ninguta district, Kirin Province.
66370. No. 167. *Hung kaoliang* (red). From Tungpinghsien district, Kirin Province.
66371. No. 171. *She jen* (snake eye). From Ninguta district, Kirin Province.
66372. No. 801. A yellow variety from the experiment farm, Chinese Eastern Railway, Harbin, Manchuria.
66373. No. 815. *Nien*. From the commercial agency of the Chinese Eastern Railway, Laoshakou, Kirin Province.
66374. No. 817. *Lao tou pai*. From the commercial agency of the Chinese Eastern Railway, Laoshakou, Kirin Province.
66375. No. 824. *Pai kaoliang*. From Ninguta district, Kirin Province.
66376. No. 834. *Dun a hsiang kaoliang*.
66377. No. 835. *Hung mao mung*. From the Government Agricultural Experiment Station, Peking, China.

66341 to 66419—Continued.

66378. No. 836. *Hei ko she jen hung*. From the agricultural experiment station, South Manchurian Railway, Kungchuling, Mukden Province, Manchuria.
66379. No. 838. *Huang ko chin sui*. From the agricultural experiment station, South Manchurian Railway, Kungchuling, Mukden Province, Manchuria.
66380. No. 839. *Huang ko san sui*. From the agricultural experiment station, South Manchurian Railway, Kungchuling, Mukden Province, Manchuria.
66381. No. 840. *Hei ko san sui*. From the agricultural experiment station, South Manchurian Railway, Kungchuling, Mukden Province, Manchuria.
66382. No. 841. *Hung ko san sui*. From the agricultural experiment station, South Manchurian Railway, Kungchuling, Mukden Province, Manchuria.
66383. No. 842. *Hsia tsu fang pai yen*. From the agricultural experiment station, South Manchurian Railway, Kungchuling, Mukden Province, Manchuria.
66384. No. 843. *Lao mu chu pu tai tou*. From the agricultural experiment station, South Manchurian Railway, Kungchuling, Mukden Province, Manchuria.
66385. No. 844. *Hei ko shuang sih pan*. From the agricultural experiment station, South Manchurian Railway, Kungchuling, Mukden Province, Manchuria.
66386. No. 846. *Hung ko tai she yen*. From the agricultural experiment station, South Manchurian Railway, Kungchuling, Mukden Province, Manchuria.
66387. No. 847. *Hei hsin pang*. From the agricultural experiment station, South Manchurian Railway, Kungchuling, Mukden Province, Manchuria.
66388. No. 848. *Ku po hsiang*. From the agricultural experiment station, South Manchurian Railway, Kungchuling, Mukden Province, Manchuria.
66389. No. 849. *Lao ku tsu*. From the agricultural experiment station, South Manchurian Railway, Kungchuling, Mukden Province, Manchuria.
66390. No. 850. *Huang jen peng*. From the agricultural experiment station, South Manchurian Railway, Kungchuling, Mukden Province, Manchuria.
66391. No. 851. *Hien*. From the agricultural experiment station, South Manchurian Railway, Kungchuling, Mukden Province, Manchuria.
66392. No. 852. *Huang nien*. From the agricultural experiment station, South Manchurian Railway, Kungchuling, Mukden Province, Manchuria.
66393. No. 853. *Pai kaoliang*. From the agricultural experiment station, South Manchurian Railway, Kungchuling, Mukden Province, Manchuria.

66394. *LILIUM HANSONI* Leichtl. Liliaceae.

Lily.

No. 72. A Japanese lily with smooth stems 3 to 5 feet high, horizontal leaves about 4 inches long, and 1 to 10 slightly fragrant golden-yellow flowers spotted with purplish brown.

66395. *MISCANTHUS SACCHARIFLORUS* (Maxim.) Hack. Poaceae. Grass.

No. 23. A tall perennial Chinese grass with large feathery fan-shaped panicles; related to sugar cane.

66341 to 66419—Continued.

66396. *PHILADELPHUS SCHRENBH* Rupr. Hydrangeaceae.

No. 108. An upright shrub closely related to the common "syringa" or mock orange; it has smaller flowers. Native to Manchuria.

66397. *PRUNUS MAXIMOWICZII* Rupr. Amygdalaceae. Korean cherry.

No. 125. A large handsome tree, about 50 feet high, with horizontally spreading branches, coarsely double-toothed leaves, white flowers about three-fourths of an inch across, and black fruits about the size of peas. Native to north-eastern Asia.

For previous introduction see No. 43867.

66398 to 66400. *RHAMNUS* spp. Rhamnaceae.

66398. *RHAMNUS DAURICA* Pall.

No. 82. A large spreading shrub, sometimes a tree 30 feet high, with stout thorny branches, oblong dark-green leaves 2 to 4 inches long, and clusters of black berries about a third of an inch in diameter. Native to eastern Asia.

For previous introduction see No. 62230.

66399. *RHAMNUS DAURICA NIPPONICA* Makino.

No. 88. A Japanese variety of the preceding [No. 66398] with narrower leaves, light green beneath, 2 to 6 inches long.

For previous introduction see No. 43873.

66400. *RHAMNUS PAVIFOLIA* Bunge.

No. 53. A *Rhamnus* of dense growth, having small foliage and bearing large jet-black berries. The shrub does not grow tall but assumes a well-rounded form when not mutilated. Of value as a garden and park shrub and as material for medium-sized hedges, especially for the drier sections of the United States. (Note by Frank N. Meyer under No. 38735.)

66401 to 66418. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceae. Soy bean.

66401. No. 277. *Huang tou tea*.

66402. No. 1153. A black variety from the experiment farm, Chinese Eastern Railway, Harbin, Manchuria.

66403. No. 1159. A black variety with gray pubescence. From the experiment farm, Chinese Eastern Railway, Harbin, Manchuria.

66404. No. 1237. *Hei tou*. From Ninguta district, Kirin Province.

66405. No. 1238. *Yuan tou* (yellow). From Ninguta district, Kirin Province.

66406. No. 1239. *Huang tou*. From Ninguta district, Kirin Province.

66407. No. 1248. *Kaiyuan pai hua*. From the agricultural experiment station, South Manchurian Railway, Kungchuling, Mukden Province, Manchuria.

66408. No. 1249. *Sepingchieh hei chi*. From the agricultural experiment station, South Manchurian Railway, Kungchuling, Mukden Province, Manchuria.

66409. No. 1250. *Kungchuling won sin hei shih*. From the agricultural experiment station, South Manchurian Railway, Kungchuling, Mukden Province, Manchuria.

66410. No. 1255. *Hsia er tai*. From the agricultural experiment station, South Manchurian Railway, Kungchuling, Mukden Province, Manchuria.

66341 to 66419—Continued.

66411. No. 1256. *Mukden hei chi*. From the agricultural experiment station, South Manchurian Railway, Kungchuling, Mukden Province, Manchuria.

66412. No. 1275. *Er shih li pao*. From the agricultural experiment station, South Manchurian Railway, Kungchuling, Mukden Province, Manchuria.

66413. No. 1259. *Hsiao hei chi*. From the agricultural experiment station, South Manchurian Railway, Kungchuling, Mukden Province, Manchuria.

66414. No. 1261. *Kuei tsu yen*. From the agricultural experiment station, South Manchurian Railway, Kungchuling, Mukden Province, Manchuria.

66415. No. 1263. *Ssu li huan improved* No. 4.

66416. No. 1270. *Ju shu tai*. From the agricultural experiment station, South Manchurian Railway, Kungchuling, Mukden Province, Manchuria.

66417. No. 1299. A yellow variety with a black brow. From the experiment farm, Chinese Eastern Railway, Harbin, Manchuria.

66418. No. 1802. *Kirin* (green). From the commercial agency of the Chinese Eastern Railway, Laoshakou, Kirin Province.

66419. *SPODIOPOGON SIBIRICUS* Trin. Poaceae. Grass.

No. 24. A perennial grass, 2 to 3 feet high, occurring on mountain slopes on decomposed porphyritic rock in partial shade. Possibly of forage value in the Rocky Mountain localities. (Note by Frank N. Meyer under No. 44283.)

66420 and 66421. *COCOS NUCIFERA* L. *Phoenixaceae*. Coconut.

From Jaffna, Ceylon. Seeds collected by David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition. Received March 26, 1926.

The two most valuable coconut varieties which are grown here. They are not good for copra production, but are good for drinking and household purposes.

66420. No. 337. February 1, 1926. The King coconut is the handsomest of the coconuts, having nuts of a golden yellow color and smooth texture at the stage when they are cut for drinking purposes. The trees and fruits are smaller than those of the ordinary varieties, but as a landscape tree it is by far the prettiest.

66421. No. 338. February 1, 1926. The Nawasi, though not beautiful, is a curiosity. The base of the husk is edible, refreshing, and sweet, and in texture it reminds one of a turnip. It is one of the best varieties for drinking purposes, and when the milk is at its maximum the fruit is still green in color.

66422 to 66481.

From Edinburgh, Scotland. Seeds presented by William Wright Smith, regius keeper, Royal Botanic Garden. Received March 10, 1926.

Locally grown seeds introduced for testing as vegetables and also as ornamentals.

66422 to 66435. *ALLIUM* spp. Liliaceae.

66422. *ALLIUM ASCALONICUM* L. Shallot.

For previous introduction see No. 52319.

66422 to 66481—Continued.

66423. *ALLIUM ASCHERSONIANUM* Barbey.
Onion.

A herbaceous perennial onion, with pink flowers. Native to Asia Minor.

66424. *ALLIUM BIDWILLIAE* S. Wats. Onion.

A pink-flowered onion about a foot high, native to the Sierra Madre Mountains, California.

66425. *ALLIUM CERNUUM* Roth.
Nodding onion.

The flowers of this onion are rose colored or white, produced in open, nodding umbels. Native to the eastern United States.

66426. *ALLIUM CYANEUM* Regel. Onion.

A rather dwarf plant, less than a foot high, with little pendulous bright-blue flower heads. Native to northern China.

66427. *ALLIUM FALLAX* Schult. f.

A perennial Austrian onion with lilac-purple flowers.

66428. *ALLIUM HYMENORRHIZUM* Ledeb.

A perennial moisture-loving Russian species with linear leaves and purplish violet flowers.

For previous introduction see No. 60227.

66429. *ALLIUM MACRANTHUM* Baker.

A handsome herbaceous perennial from the eastern Himalayas. The flat leaves are over a foot long, and the mauve-purple flowers are produced in clusters of 50 or more on scapes 2 feet high.

For previous introduction see No. 59975.

66430. *ALLIUM ORIENTALE* Boiss.

A perennial pink-flowered onion, native to Asia Minor.

66431. *ALLIUM PARADOXUM* (Bieb.) Don.

A perennial onion, a foot high, with white flowers. Native to Siberia.

66432. *ALLIUM SIKKIMENSE* Baker.

A compact, neat little perennial 6 inches high or more, with grasslike leaves and loose umbels of deep-blue flowers. Native to Sikkim, India.

For previous introduction see No. 58884.

66433. *ALLIUM URCEOLATUM* Regel.

An onion, native to Turkestan, with linear leaves and bright-blue flowers borne in a hemispherical head.

66434. *ALLIUM VICTORIALIS* L.

One of the most distinct species of European Alliums, with stems about a foot and a half high and leaves resembling those of the lily-of-the-valley. The white or greenish white flowers are produced in May.

For previous introduction see No. 59351.

66435. *ALLIUM WALLICHIANUM* Steud.

A tall, eastern Asiatic onion, with narrow flat leaves about 3 feet long and purple flower heads.

66436 to 66451. *ASTRAGALUS* spp. Fabaceae.
Milk vetch.

66436. *ASTRAGALUS ARMENIACUS* Boiss.

A perennial caespitose herbaceous plant, with ochre-yellow flowers. Native to Armenia.

66422 to 66481—Continued.

66437. *ASTRAGALUS ASPER* Jacq.

An erect herbaceous perennial with yellow flowers, native to southern Russia.

For previous introduction see No. 20645.

66438. *ASTRAGALUS CHLOROSTACHYS* Lindl.

A herbaceous perennial, native to the Himalayas, with greenish-yellow flowers.

66439. *ASTRAGALUS ECHINUS* DC.

A densely branched spiny shrub from the alpine regions of Syria.

66440. *ASTRAGALUS FALCATUS* Lam.

An erect herbaceous perennial with yellow flowers, native to southern Russia and western Siberia.

For previous introduction see No. 34992.

66441. *ASTRAGALUS GLYCYPHYLLOS* L.

A prostrate, spreading herbaceous perennial native to Asia Minor.

For previous introduction see No. 20739.

66442. *ASTRAGALUS GUMMIFER* Labill.

A densely branched spiny shrub native to dry mountain areas in Syria.

66443. *ASTRAGALUS HYPOGLOTTIS* L.

An ascending or diffuse herbaceous perennial with purple flowers, native to the Caucasus.

66444. *ASTRAGALUS PENTAGLOTTIS* L.

A spreading annual leguminous plant with purplish flowers. Native to the Mediterranean region.

66445. *ASTRAGALUS PODOCARPUS* Meyer.

An erect herbaceous perennial, 1 or 2 feet high, native to Asia Minor.

66446. *ASTRAGALUS PURPUREUS* Lam.

A low perennial trailing plant with purple flowers. Native to southern Europe.

66447. *ASTRAGALUS ROBBINSII* (Oakes) A. Gray.

An erect white-flowered perennial, native to the northeastern United States.

66448. *ASTRAGALUS SULCATUS* L.

An erect herbaceous perennial up to 4 feet high, with light-blue flowers. Native to Siberia.

66449. *ASTRAGALUS UTRIGER* Pall.

A low herbaceous perennial about 4 inches high, with yellow flowers. Native to Asia Minor.

66450. *ASTRAGALUS VERUS* Olivier.

A stout-branched hairy spiny shrub, native to western Persia.

66451. *ASTRAGALUS VICIODES* R. Grah.

A herbaceous perennial about 2 feet high, with yellow flowers. Native to the Himalayas.

66452. *BETA VULGARIS* L. Chenopodiaceae.
Chilean beet.

Var. *cicla*.

66453. *CAPNOIDES CHAEROPHYLLUM* (DC.) Kuntze (*Corydalis chaerophylla* DC.). Papaveraceae.

An upright herbaceous perennial, 2 to 4 feet high, with slender golden-yellow flowers.

66422 to 66481—Continued.

66454. *CAPNOIDES LUTEUM* (L.) Gaertn. (*Corydalis lutea* DC.). Papaveraceae.

An erect or spreading annual about 7 inches high, with delicate, pale-green, much-divided leaves and short racemes of pale-yellow flowers. Native to southern Europe.

66455. *CAPNOIDES SEMPERVIRENS* (L.) Borkh. (*Corydalis glauca* Pursh). Papaveraceae.

An annual, very glaucous plant, 1 or 2 feet high, with short terminal clusters of flowers which are pink or purple with yellow tops. Native to rocky places in the northern and western United States.

66456. *CORYDALIS THALICTRIFOLIA* Jameson. Papaveraceae.

A herbaceous perennial, native to China, with a woody rhizome, large rigid spreading leaves, and large racemes of showy yellow flowers.

66457. *CORYDALIS TOMENTOSA* N. E. Brown. Papaveraceae.

A low rock-loving perennial with a rosette of oblong hairy basal leaves and erect racemes of light-yellow flowers. Native to China.

66458. *CHIONODOXA LUCILIAE* Boiss. Liliaceae. *Glory-of-the-snow*.

Var. *gigantea*.

66459. *CRAMBE MARITIMA* L. Brassicaceae. *Common sea kale*.

66460. *CRAMBE PINNATIFIDA* Ait. Brassicaceae. *Sea kale*.

A herbaceous perennial, native to Siberia.

66461. *DEUTZIA LONGIFOLIA VEITCHII* (Veitch) Rehder. Hydrangeaceae.

A shrubby plant about 3 feet high, with roughly hairy leaves 3 inches or more in length, and bright-pink flowers an inch across, borne in terminal corymbs. Native to western China and considered one of the hardiest of the deutzias, although scarcely hardy north of Washington, D. C.

For previous introduction see No. 53693.

66462. *ERODIUM MANESCAVI* Coss. Geraniaceae. *Pyrenees heronbill*.

A perennial plant, belonging to the geranium family, about a foot and a half high, with narrow leaves 6 inches or more in length and rosy purple flowers about 2 inches across. It grows wild in the Pyrenees Mountains.

For previous introduction see No. 63985.

- 66463 to 66466. *IRIS* spp. Iridaceae.

66463. *IRIS BULLEYANA* Dykes. *Hollowstem iris*.

An iris from western China which, as described by Dykes (*The Genus Iris*, p. 30), resembles *Iris clarkei*, having a hollow unbranched stem. The narrow leaves are glossy above and glaucous beneath. The stem, 15 to 18 inches long, bears a single head of one to two flowers. The falls have a greenish-yellow oblong haft, veined and dotted with purple. On the obovate blade the coloring becomes clearer and consists of broken veins and blotches of bright blue-purple on a creamy ground. The extremity is a uniform blue-purple, paler at the edges. The oblanceolate, channeled standards are pale blue-purple with deeper veins and diverge at an angle of about 60°. The keeled, dark-purple styles are held high above the falls.

For previous introduction see No. 53703.

66422 to 66481—Continued.

66464. *IRIS CLARKEI* Baker. *Clarke iris*.

"A curiously local species native to a circumscribed area in the Sikkim and Bhutan region at a height of 6,000 to 11,000 feet in ground that is swampy half the year and hard frozen under snow during most of the remaining months. The narrow leaves, 2 feet long, droop at the tops; the upper surface is polished and shiny, the underside glaucouscent. The solid stem is 2 feet long and bears one or two lateral heads. The falls are blue-purple, blotched with white, and are reflexed laterally. The upper part of the haft is marked with yellow. The reddish purple, lanceolate standards are poised almost horizontally. The styles form the highest point of the flower; they are keeled, very convex, and 1½ inches long." (*Dykes, The Genus Iris*, p. 29.)

For previous introduction see No. 53704.

66465. *IRIS FORRESTII* Dykes. *Yunnan iris*.

"A most pleasing iris, like a dwarf *Iris wilsoni*, from which it differs in the less glaucous leaves, clearer yellow, unveined standards. The stem, 12 to 18 inches high, bears a single head of two flowers, although a lateral flowered branch sometimes develops. The short haft bears two central lines and broken lateral veins of brown-purple on a clear yellow ground. The oblong, ovate blade of the falls is often very long and drooping, of a clear, lemon yellow which becomes deeper around the end of the style branches and is there marked with brown-purple veins. The oblanceolate yellow blade of the standards narrows to a deeply channeled haft, yellow, shorter than the falls, and slightly divergent. The broad, short-keeled, deep-yellow styles, often discolored with purple, curve down onto the falls. Native to open mountain pastures on the eastern flank of the Likang Range in northwestern Yunnan, China, at an altitude of 12,000 to 13,000 feet." (*Dykes, The Genus Iris*, p. 27.)

For previous introduction see No. 53705.

66466. *IRIS SETOSA* Pall. *Arctic iris*.

This was originally described as an Asiatic plant, but forms that can not be separated from it are found in North America, according to W. R. Dykes (*Iris*, p. 64). At least half a dozen forms come true from seed. The peculiarity of this iris is that the standards have dwindled until they are only small points about half an inch long, but their disappearance is usually counterbalanced by the increased size of the falls. The color is usually blue, but some shades are so light as to be almost gray.

For previous introduction see No. 57297.

66467. *LEUCOJUM VERNUM* L. Amaryllidaceae. *Spring snowflake*.

A hardy bulbous plant, native to central Europe, with strap-shaped leaves, and a one-flowered scape up to a foot long, bearing a white flower tipped with green.

66468. *LIGUSTRUM DELAVAYANUM* Hariot. Oleaceae.

An evergreen shrub, about 6 feet high, with long graceful branches and dark shining-green oval leaves. The white flowers, borne in downy panicles, and the black fruits make the shrub very ornamental. It is native to the mountainous regions of Yunnan, China, and is probably suited for growing only in the southern United States.

For previous introduction see No. 58613.

66422 to 66481—Continued.

66469. *LILIUM GIGANTEUM* Wall. Liliaceae.
Giant lily.

"This majestic lily is common in the damp thick forests of the Himalayas. The bulb grows close to the surface, in rich black mold, at altitudes of 7,500 to 9,000 feet, where it is covered with snow from November to April. The smooth hollow stems are commonly from 6 to 9 feet high, and are used for musical pipes. The handsome cordate leaves, shining dark green above and paler below, are 10 to 12 inches long on petioles of equal length; both become smaller near the apex. In the large fragrant white flowers, 12 to a raceme, the perianth tube is slightly greenish and the inner surfaces of the segments are tinged with deep purple." (*Curtis's Botanical Magazine*, pl. 4673.)

For previous introduction see No. 49641.

66470. *LILIUM MARTAGON* L. Liliaceae.
Martagon lily.

Var. *dalmaticum*. A Dalmatian form of the Martagon lily which becomes 7 feet high, with five to seven whorls of leaves and 12 to 40 flowers of a deeper purple, almost black.

66471. *MUSCARI ARMENIACUM* Leichtl. Liliaceae.
Grape hyacinth.

A handsome hardy bulbous plant, native to Armenia, with many linear leaves overtopping the racemes of deep-violet flowers. One of the last of the grape hyacinths to flower.

66472. *NICOTIANA RUSTICA* L. Solanaceae.
Aztec tobacco.

For previous introduction see No. 56614.

66473. *ORNITHOGALUM SAUNDERSIAE* Baker. Liliaceae.

A South African bulbous plant with lanceolate leaves up to a foot long and white or yellow flowers borne in a dense raceme on a scape a foot or more high.

For previous introduction see No. 31854.

66474. *PISUM FORMOSUM* Alef. Fabaceae. Pea.

A low herbaceous perennial, with a slender creeping rhizome and rather large pink flowers. Native to Asia Minor.

66475. *PISUM JOMARDI* Schrank. Fabaceae. Pea.

A hardy annual white-flowered pea about 3 feet high, native to Egypt.

66476 to 66480. *RHODODENDRON* spp. Ericaceae.

66476. *RHODODENDRON PONTICUM* L.
Pontic rhododendron.

A shrub 10 feet high, with elliptic or oblong leaves 3 to 5 inches long and many-flowered clusters of purple flowers, spotted brownish within. Native to Asia Minor and Spain.

66477. *RHODODENDRON PSEUDO-YANTHINUM* Hort.

66478. *RHODODENDRON SMIRNOWI* Trautv.

A shrub or small tree, about 20 feet high, with dark-green leaves, grayish hairy beneath, and compact heads of rosy red flowers, each about 3 inches across. Native to the Caucasus.

66479. *RHODODENDRON YANTHINUM* Bur. and Franch.

A western Chinese shrub about 10 feet high, with oval-elliptic leaves and small clusters of purple, sometimes white, funnel-shaped flowers.

66422 to 66481—Continued.

66480. *RHODODENDRON YUNNANENSE* Franch.

A low shrub, 6 feet or less high, with narrowly elliptic, somewhat hairy leaves, and few-flowered clusters of broadly funnel-shaped flowers, white with the upper lobes spotted blood red. Native to Yunnan, China.

66481. *ROSA BANKSIOPSIS* Baker. Rosaceae.
False Banksian rose.

An erect shrubby rose, common in western Hupeh, China, where it is found on mountain slopes at altitudes of from 4,000 to 7,000 feet. The flowers are rose red, and the fruits are coral red.

For previous introduction see No. 50427.

66482 to 66485. *ORYZA SATIVA* L.
Poaceae. Rice.

From Valencia, Spain. Seeds presented by Rafael Font de Mora, director, Estación Arrocería de Sueca. Received March 19, 1926.

Spanish varieties of rice.

66482. *Amonquilli*. 66484. *Bomba*.

66483. *Benlloch*. 66485. *Sueca*.

66486 to 66503.

From Ayr, Scotland. Seeds purchased from McGill & Smith. Received March 22, 1926.

Locally grown seeds.

66486 to 66489. *AVENA SATIVA* L. Poaceae. Oats.

66486. *Castleton*.

66487. *Dala*.

66488. *Early Fellow*.

66489. *Tam Finlay*. A pure-line stock which we are putting out this year for the first time. (*McGill & Smith*.)

66490 to 66503. *TRIFOLIUM* spp. Fabaceae.

66490 to 66498. *TRIFOLIUM PRATENSE* L.
Red clover.

66490. *Alpine*.

66491. *Brittany broad-leaved*.

66492. *English broad-leaved early*.

66493. *English late-flowering*.

66494. *Montgomery*.

66495. *Mountain*.

66496. *Norwegian*. We found in our trials that this is possibly the best late-flowering red clover. (*McGill & Smith*.)

66497. *Swedish late "Hersnap"*.

66498. *Vale of Clwyd late-flowering*.

66499 to 66503. *TRIFOLIUM REPENS* L.
White clover.

66499. *Danish Morso*.

66500. *English*.

66501. *New Zealand*.

66502. *Wild New Zealand*.

66503. *Wild English* × *Thent*.

66504. *COLVILLEA RACEMOSA* Boj.
Caesalpiniaceae.

From Port of Spain, Trinidad, British West Indies. Seeds presented by W. G. Freeman, director of agriculture. Received March 23, 1926.

For previous introduction and description see No. 66151.

66505. CHENOPodium QUINOA Willd.
Chenopodiaceae. Quinoa.

From Lima, Peru. Seeds presented by A. H. Rosenfeld. Received March 24, 1926.

The native inhabitants of the highlands of western South America cultivate this plant for the sake of the seeds, which are creamy white and about three times as large as those of the common North American weed known as "goosefoot" (*Chenopodium album*). In pre-Columbian times this native cereal ranked in importance with the potato and corn. The plant is an abundant yielder and is harvested in early summer. The seeds are washed for about 24 hours in order to remove the bitter flavor, and the washed seeds are boiled and eaten in the same manner as rice.

For previous introduction see No. 55471.

66506. HIBISCUS DIVERSIFOLIUS Jacq.
Malvaceae.

From Wellington, New Zealand. Seeds presented by Llewelyn A. Jones. Received March 25, 1926.

A tall, hairy, rigidly upright, shrubby perennial with prickly stems, variable foliage, and yellow flowers with dark-red centers. Native to tropical Africa and the Pacific islands.

66507 to 66510. CITRUS spp. Rutaceae.

From Algiers, Algeria. Bud sticks presented by Dr. L. Trabut, government botanist. Received March, 1926. Notes by Doctor Trabut.

66507. CITRUS LIMONIA Osbeck. Lemon.

A seedless variety from Algeria.

66508 to 66510. CITRUS SINENSIS (L.) Osbeck. Sweet orange.

66508. Algiers navel. A handsome fruit of good quality.

66509. Matidja navel. A seedling of the Algiers navel.

66510. Zatima. A native variety. The tree is prolific, with several of the branches bearing navel oranges of good quality. Season late.

66511 and 66512. CANNA spp. Cannaceae.

From Haina, Dominican Republic. Seeds presented by Dr. R. Ciferri, director, Estación Agronómica de Haina. Received March 23, 1926. Notes by Doctor Ciferri.

Wild cannas.

66511. CANNA sp.

February 21, 1926. From El Limon, Dominican Republic. Found in sandy places.

66512. CANNA sp.

March 1, 1926. From Sanchez, Dominican Republic, where this canna is particularly abundant.

66513 to 66531.

From Stockholm, Sweden. Seeds presented by Dr. Robert E. Fries, director, botanic garden. Received March 30, 1926.

66513 to 66520. ASTRAGALUS spp. Fabaceae. Milk vetch.

66513. ASTRAGALUS ALPINUS L.

A perennial plant with ascending stems about 8 inches high. Native to the alpine regions of central Europe.

For previous introduction see No. 64617.

66513 to 66531—Continued.

66514. ASTRAGALUS BOETICUS L.

An upright, often stout annual, with compound leaves usually composed of 9 to 15 pairs of narrow leaflets and 6 to 15 pale-yellow flowers in a crowded raceme. Native to the Mediterranean countries.

For previous introduction see No. 64619.

66515. ASTRAGALUS CICER L.

A European astragalus said to be valuable for forage. It is a perennial with prostrate or ascending stems.

For previous introduction see No. 64620.

66516. ASTRAGALUS DANICUS Retz.

A perennial leguminous plant, native to central Europe, with a branching rhizome, ascending stems a foot or less long, and blue or violet flowers.

66517. ASTRAGALUS FALCATUS Lam.

An upright perennial, nearly 2 feet high, with yellowish flowers in an elongated cluster. Native to southern Russia and Asia Minor.

For previous introduction see No. 35237.

66518. ASTRAGALUS FRIGIDUS (L.) A. Gray.

A perennial upright or ascending plant, entirely unbranched or with very few branches. Native to alpine slopes throughout northern Europe and Asia.

For previous introduction see No. 63979.

66519. ASTRAGALUS GALEGIFORMIS L.

A perennial, upright, slightly hairy plant, 1 to 3 feet high, native to southeastern Europe and Asia Minor.

For previous introduction see No. 63980.

66520. ASTRAGALUS GLYCYPHYLLUS L.

For previous introduction and description see No. 66441.

66521 to 66524. CREPIS spp. Cichoriaceae.

Introduced for genetic studies of the genus Crepis.

66521. CREPIS BLATTARIOIDES (L.) Vill.

A hairy perennial with large flower heads; native to central and western Europe.

66522. CREPIS RUBRA L.

An annual composite about a foot high with solitary red flowers. Native to southern Europe.

66523. CREPIS SIBIRICA L.

A hairy perennial, 2 to 3 feet high, with a terminal cluster of bright-yellow flowers. Native to Asia Minor, Europe, and the Himalayas.

66524. CREPIS TECTORUM L.

An erect annual, native to dry places in southeastern Europe.

66525. INCARVILLEA COMPACTA Maxim. / Bigoniaceae.

A handsome hardy perennial, native to northwestern China, a foot or more high, with fleshy, mostly radical leaves and terminal clusters of purple flowers.

66526. LATHYRUS VERNUS FLACIDUS (Seringe) Arcang. Fabaceae. Spring bitter vetch.

A leguminous perennial 1 to 2 feet high, with limp, very narrow leaves, and blue-violet flowers. Native to central and southern Europe.

For previous introduction see No. 40323.

66513 to 66531—Continued.

66527. *PENTAGONIA PHYSALODES* (L.) Hiern.
(*Nicandra physalodes* Gaertn.). Solanaceae.
Apple of Peru.

A blue-flowered Peruvian annual with the fruit inclosed in a husk as in *Physalis*. The campanulate flowers, an inch or more in diameter, are light blue with a lighter throat; they are produced singly in the axils of the leaves.

For previous introduction see No. 58130.

66528. *NICOTIANA RUSTICA* L. Solanaceae.
Aztec tobacco.

66529. *ONOBRYCHIS CRISTA-GALLI* (L.) Lam.
Fabaceae.

An annual or biennial ascending plant, 8 to 20 inches high, with pinkish purple flowers. Native to dry places in the Mediterranean region.

For previous introduction see No. 33292.

66530. *TRIGONELLA CALLICERAS* Fisch. Fabaceae.

An erect leguminous annual with rather large yellow flowers; native to the Caucasus.

For previous introduction see No. 27294.

66531. *TRIGONELLA CAERULEA* (L.) Seringe.
Fabaceae.

An annual, upright plant, usually from 1 to 2 feet high, with bright-blue flowers having the same odor as the fenugreek (*Trigonella foenum-graecum*). Native to the Mediterranean region.

For previous introduction see No. 64646.

66532 to 66615.

From Kew, England. Seeds presented by Dr. A. W. Hill, director, Royal Botanic Gardens. Received March 23, 1926.

66532 to 66535. *ALLIUM* spp. Liliaceae. Onion.

66532. *ALLIUM KARATAVIENSE* Regel.

A herbaceous plant with very broad, ovate-oblong flat leaves and pink flowers borne in dense, convex umbels. The scapes are about 6 inches high. Native to Turkistan.

For previous introduction see No. 60228.

66533. *ALLIUM OSTROWSKIANUM* Regel.

This species, native to Turkistan, has rose-colored flowers produced freely in many-flowered umbels on scapes 6 inches high.

For previous introduction see No. 58880.

66534. *ALLIUM SIKKIMENSE* Baker.

A compact, neat little perennial 6 inches high or more with grasslike leaves and loose umbels of deep-blue flowers. Native to Sikkim, India.

For previous introduction see No. 58884.

66535. *ALLIUM YUNNANENSE* Diels.

A caespitose onion, native to southwestern China, with linear leaves about 6 inches long and pink or purplish flowers on a scape 4 to 16 inches long.

66536 to 66541. *ASTRAGALUS* spp. Fabaceae.
Milk vetch.

66536. *ASTRAGALUS ALOPECUROIDES* L.
Foxtail milk vetch.

An erect pubescent Siberian species 2 to 5 feet high with narrowly oval leaves and yellow flowers produced in thick oblong spikes.

For previous introduction see No. 58692.

66532 to 66615—Continued.

66537. *ASTRAGALUS ARISTATUS* L'Herit.

An alpine plant, native to southern Europe, where on dry, barren slopes it forms mats of spiny branches in which appear the little yellow flower heads among the minute leaves.

66538. *ASTRAGALUS BOETICUS* L.

An upright, often stout annual, with compound leaves usually composed of 9 to 15 pairs of very narrow leaflets, and 6 to 15 pale-yellow flowers in a crowded raceme. Native to the Mediterranean countries.

For previous introduction see No. 58693.

66539. *ASTRAGALUS CHINENSIS* L. f.

An erect, herbaceous plant, native to China, with smooth slender stems, elliptic-obtuse leaflets, and pendulous, few-flowered racemes.

For previous introduction see No. 59352.

66540. *ASTRAGALUS HAMOSUS* L.

An annual gray-green hairy plant, with prostrate or ascending stems 8 inches to a foot in length. Native to sunny places in the Mediterranean countries.

For previous introduction see No. 63982.

66541. *ASTRAGALUS ZINGERI* Korsh.

A somewhat shrubby perennial, with an erect or ascending stem 6 to 20 inches high, and spikelike clusters of white flowers. Native to rocky places on the Volga River.

66542 to 66544. *BERBERIS* spp. Berberidaceae.
Barberry.

66542. *BERBERIS ARISTATA* DC.

A handsome shrub of elegant, spreading habit, becoming at times 10 feet high. The spine-tipped leaves are often whitish beneath, and the numerous flowers are bright golden yellow. The spindle-shaped berries, about half an inch in length, are red, covered with a blue-white bloom. This is said to be one of the most vigorous of the Himalayan barberries; it is hardy at the Arnold Arboretum, Jamaica Plain, Mass.

For previous introduction see No. 60378.

66543. *BERBERIS TISCHLERI* C. Schneid.

A shrub from western China, 7 to 14 feet high, with spines in threes, papery spine-tipped leaves up to 2 inches in length, and yellow flowers in dense racemes. The somewhat pruinose egg-shaped red fruits ripen in October.

For previous introduction see No. 58123.

66544. *BERBERIS YUNNANENSIS* Franch.

A deciduous shrub, 3 to 6 feet high, with dense rounded spines and nearly circular leaves. The flowers are pale yellow, and the berries are bright red. Native to western China.

For previous introduction see No. 43826.

66545. *CLEMATIS REHDERIANA* Craib. Ranunculaceae.
Clematis.

A vigorous woody climber, native to southwestern China, which produces quantities of small, nodding, fragrant, primrose-yellow flowers in fall.

For previous introduction see No. 49937.

66546. *CORIARIA JAPONICA* A. Gray. Coriariaceae.
Japanese coriaria.

A Japanese shrub, 2 or 3 feet high, or occasionally more, with opposite, oval leaves and racemes of bright-red berrylike fruits which become violet black when thoroughly ripe.

66532 to 66615—Continued.

66547 to 66555. *CROCUS* spp. Iridaceae.66547. *CROCUS ASTURICUS* Herbert.

A Spanish crocus with flowers about 1½ inches long; the segments are lilac, the anthers bright yellow, and the style orange.

66548. *CROCUS ETRUSCUS* Parl.

The leaves of this Italian crocus, about three in number, are very narrow; the perianth segments are about an inch long, lilac, or the outer ones cream colored, and the throat yellow; the anthers and style are orange.

66549. *CROCUS IMPERATI* Tenore.

An Italian species with four to six very narrow leaves, exceeding the flowers, and lilac or white flowers with the outer segments buff and three striped, and yellow anthers.

66550. *CROCUS LAEVIGATUS* Bory and Chaub.

The leaves of this crocus, which is native to Greece, are three or four in a tuft, as high as the flowers and very narrow with reflexed margins and a white band. The flowers are pure white or with three to five lilac stripes on the outer segments, and the throat is yellow.

66551. *CROCUS MEDICUS* Balb.

A lilac-flowered crocus, native to France and Italy, with narrow leaves a foot or more high.

66552. *CROCUS SALZMANNI* J. Gay.

A Moroccan crocus, with about six very narrow leaves, not prominent at flowering time. The lilac flowers have yellowish anthers and throat.

66553. *CROCUS SPECIOSUS* Bieb.

The leaves of this crocus, which is native to Asia Minor, are usually three in number. They are very narrow, developing after the flowers and becoming a foot long. The flowers are lilac, with darker featherings, and the large anthers are bright orange.

66554. *CROCUS TOMMASINIANUS* Herbert.

A crocus native to Serbia and Dalmatia; the narrow leaves appear with the flowers, which are pale bluish red with pale orange anthers.

66555. *CROCUS ZONATUS* J. Gay.

The narrow-linear leaves of this Asia Minor species appear after the flowers. The rosy lilac flowers, 2 to 3 inches long, are purple veined and orange spotted within, and the throat is yellow and pubescent. The anthers are white.

66556 to 66559. *CYTISTUS* spp. Fabaceae.

Broom.

66556. *CYTISTUS GRANDIFLORUS* (Brot.) DC.

A spineless leguminous shrub with long rodlike branches, trifoliolate leaves, and large solitary yellow flowers. Native to Spain.

66557. *CYTISTUS BIFLORUS* L'Herit.

A leguminous shrub 3 feet high, with slender branches and leaflets with silky lower surfaces. The yellow flowers are single or in pairs. Native to Europe and western Asia.

66558. *CYTISTUS SESSILIFOLIUS* L.

Sessile broom.

A leguminous shrub, native to Greece, with trifoliolate leaves and erect racemes of yellow flowers.

66532 to 66615—Continued.

66559. *CYTISTUS SUPINUS* L.

Big-flower broom.

An erect shrub about 3 feet high, native to central and southern Europe. The oblong-oval leaflets, about an inch long, are hairy beneath, and the yellow flowers are nearly an inch long.

66560. *DEUTZIA LONGIFOLIA* VEITCHII (Veitch) Rehder. Hydrangeaceae. Long-leaf deutzia.

This deutzia, from Yunnan, China, which bears its large flowers in dense many-flowered corymbs, is one of the handsomest of the genus, but it has proved hardy only under protection at the Arnold Arboretum, Jamaica Plain, Mass.

For previous introduction see No. 53698.

66561 to 66569. *ERODIUM* spp. Geraniaceae.

Heronbill.

66561. *ERODIUM CARVIFOLIUM* Boiss. and Reut.

An attractive herbaceous perennial, native to Spain, with radical leaves about 6 inches long and purplish flowers on a scape about a foot long.

66562. *ERODIUM TRIFOLIUM* Cav. (*E. hymenodes* L'Herit.).

A half-hardy herbaceous perennial about 9 inches high, with pink flowers. Native to Algeria.

66563. *ERODIUM GLANDULOSUM* (Cav.) Willd. (*E. macradenum* L'Herit.).

A stemless herbaceous perennial, native to the Pyrenees Mountains, with long stout roots, hairy leaves 2 to 6 inches long, and light-purple flowers three-fourths of an inch across.

66564. *ERODIUM MANESCAVI* Coss.

Pyrenees heronbill.

A herbaceous perennial plant, belonging to the geranium family, about a foot and a half high, with narrow leaves 6 inches or more in length, and rosy purple flowers about 2 inches across. It grows wild in the Pyrenees Mountains.

For previous introduction see No. 63985.

66565. *ERODIUM PETRAEUM* (Gouan) Willd.

A herbaceous perennial, native to Asia Minor, with a vertical rhizome, numerous crowded basal leaves and violet or pink flowers.

66566. *ERODIUM SUPRACANUM* L'Herit.

A stemless herbaceous perennial with a vertical rhizome, numerous densely hairy leaves, and white, red-veined flowers. Native to the Pyrenees Mountains.

66567. *EUONYMUS MAACKII* Rupr. Celastraceae.

A large shrub or small tree, with narrowly oval leaves about 3 inches long, and small clusters of pink, four-lobed fruits with orange-red arils. Native to northeastern Asia.

66568. *EUONYMUS YEDOENSIS* Koehne. Celastraceae.

A large handsome Japanese shrub which bears dense clusters of pink, deeply four-lobed fruits with orange arils.

For previous introduction see No. 61982.

66569. *EVODIA HUPEHENSIS* Dode. Rutaceae.

A very common tree in the woodlands of western Hupeh, China, according to E. H. Wilson (*Plantae Wilsonianae*, vol. 2, pt. 1), where it grows to a height of 20 to 40 feet. It has smooth gray bark, spreading branches, and white flowers in large flat corymbs.

For previous introduction see No. 63357.

66532 to 66615—Continued.

66570. *GENISTA PILOSA* L. Fabaceae.
Silky-leaf broom.

A dwarf procumbent or ascending leguminous shrub with dark-green leaves, hairy beneath, and axillary yellow flowers. Native to Europe and western Asia.

66571. *HELIANTHEMUM FORMOSUM* (Curt.) Dunal. Cistaceae. Sun rose.

An upright spreading hairy shrub, about 3 feet high, with oval leaves, white-hairy when young, and small clusters of flowers which are yellow, spotted purple at the base, and 2 inches across. Native to Spain.

For previous introduction see No. 40181.

66572. *HEMEROCALLIS CITRINA* Baroni. Liliaceae. Citron day lily.

A tall growing, very fragrant bulbous plant with lemon-yellow flowers; native to China.

66573. *HEMEROCALLIS NANA* Forrest and Smith. Liliaceae. Day lily.

A perennial bulbous plant, native to southwest China, which grows in several-headed clumps 4 to 10 inches high. The green linear leaves are about 6 inches long, and the flowers, orange flushed with red, are borne singly or in pairs on a stem about 5 inches long.

66574. *HYACINTHUS AMETHYSTINUS* L. Liliaceae. Hyacinth.

A slender graceful Spanish hyacinth with short racemes of light-blue flowers 6 inches or less high.

- 66575 to 66578. *IRIS* spp. Iridaceae.

66575. *IRIS CHRYSOPHAGES* Dykes. Goldvein iris.

One of the handsomest of the Siberian irises; the velvety dark-purple flowers are brightened by golden reticulations at the throat.

66576. *IRIS FOETIDISSIMA* L. Gladwin iris.

An iris, native to the Mediterranean countries, with leaves a foot long, and bright-blue flowers borne on a stem about 2 feet high.

For previous introduction see No. 63410.

66577. *IRIS FORRESTII* Dykes. Yunnan iris.

For previous introduction and description see No. 63410.

66578. *IRIS MILESH* Baker. Himalayan iris.

A large Himalayan iris, with seven or eight leaves, 2 to 3 feet long, on the stem; the latter is branched and bears about four heads of bright-lilac flowers.

66579. *LATHYRUS VENOSUS* Muhl. Fabaceae.

A stout perennial, 2 to 3 feet high, with purple flowers; native to the eastern United States.

66580. *LIGUSTRUM INSULENSE* Decaisne (*L. insulare* Decaisne). Oleaceae. Privet.

A shrub, closely related to the common privet (*Ligustrum vulgare*), becoming 6 feet high, with yellowish green, often pendulous leaves and rather large flower panicles. Country of origin unknown.

66581. *LIGUSTRUM YUNNANENSE* L. Henry. Oleaceae. Privet.

A shrub 12 feet or less in height, with thick, narrowly oblong leaves 2 to 5 inches long. Native to Yunnan, China.

66532 to 66615—Continued.

66582. *LONICERA CHRYSANTHA* Turcz. Caprifoliaceae. Coralline honeysuckle.

A shrubby honeysuckle from Japan, up to 12 feet high, with upright stems, somewhat rhombic leaves 2 to 5 inches long, and yellowish white flowers three-fourths of an inch long. It is particularly handsome in autumn with its bright coral-red berries.

For previous introduction see No. 42315.

66583. *LONICERA TRICHOSANTHA* Bur. and Franch. Caprifoliaceae.

Slender honeysuckle.

A robust deciduous shrub 8 feet high, native to Szechwan, China. The whole plant has a rounded, dense, leafy habit and a pale grayish aspect. The dull gray-green leaves are paler beneath, and the pale-yellow flowers fade to a deeper shade. The berries are red.

For previous introduction see No. 53716.

66584. *MAGNOLIA PARVIFLORA* Sieb. and Zucc. Magnoliaceae. Oyama magnolia.

A small Japanese magnolia with oblong leaves 4 to 6 inches long and fragrant white cup-shaped flowers 3 to 4 inches across, with large pink sepals and crimson stamens.

- 66585 to 66589. *MUSCARI* spp. Liliaceae. Grape hyacinth.

66585. *MUSCARI ARGAEI* Hort.

Said to be an extra good variety resembling *M. neglectum* (No. 66589).

66586. *MUSCARI ARMENIACUM* Leichtl.

For previous introduction and description see No. 66471.

66587. *MUSCARI COMPACTUM* (Jord. and Four.) Baker.

A species of uncertain status, said to have flowers which are nearly black with whitish teeth.

66588. *MUSCARI MAWEANUM* Leichtl.

A hardy bulbous plant about 6 inches high, with pale-blue and white flowers. Native to Armenia.

66589. *MUSCARI NEGLECTUM* Guss.

A low bulbous plant, native to the Mediterranean countries, with numerous strap-shaped leaves up to a foot in length and fragrant dark-blue flowers.

66590. *NARCISSUS BULBOCODIUM* L. Amaryllidaceae. Petticoat daffodil.

A small slender plant with very slender leaves and one flower ascending or horizontal, usually bright yellow throughout. Native to southern France and Morocco.

66591. *NICOTIANA RUSTICA* L. Solanaceae. Aztec tobacco.

66592. *OSMANTHUS DELAVAYI* Baill. Oleaceae. Delavay osmanthus.

A beautiful evergreen shrub from southwestern China, with dense axillary clusters of pure white flowers. The dark-green, ovate leaves are an inch long and have serrate margins.

For previous introduction see No. 52685.

- 66593 to 66598. *PAEONIA* spp. Ranunculaceae. Peony.

66532 to 66615—Continued.

66593. *PAEONIA ANOMALA* L.

A strong-growing wild peony found on well-drained hill slopes, mostly between scrub. Flowers large and of a pale-rose color; foliage somewhat coarse. (Note by Frank N. Meyer under No. 32240.)

66594. *PAEONIA ARIETINA* Anders.

A European peony about 3 feet high, with solitary large, dark-red flowers.

66595. *PAEONIA HIRSUTA* Mill.

A peony of unknown origin, with large double red flowers. The lobes of the leaves are narrowly spear shaped.

66596. *PAEONIA LUTEA* Delavay.

Golden peony.

A shrubby Chinese peony, with a short woody stem 1 or 2 feet high and deep-green, leathery, three-parted leaves, white beneath, and about a foot in length. The golden yellow, single or slightly double flowers are $2\frac{1}{2}$ inches across.

For previous introduction see No. 62758.

66597. *PAEONIA PARADOXA* Anders.

One of the dwarfest of the peonies, with the leaves in a dense tuft and purple-red flowers. Native to southern Europe.

66598. *PAEONIA PEREGRINA* Mill.

A European peony about 2 feet high, with deep-green leaves, paler beneath, and dark-crimson flowers.

66599. *PETTERIA RAMENTACEA* (Sieber) Presl. Fabaceae.

An upright leguminous shrub, 6 feet or less high, with trifoliate leaves and dense upright racemes of fragrant yellow flowers. Native to southern Europe.

66600. *PRUNUS SERRULATA* Lindl. Amygdalaceae. Hitoye cherry.

Var. *Lannesiana*. A variety with the young foliage green or slightly reddish. The leaf margins are dentate, with the teeth long aristate.

66601. *PRUNUS MAXIMOWICZII* Rupr. Amygdalaceae. Korean cherry.

For previous introduction and description see No. 66397.

66602. *RHAMNUS SAXATILIS* Jacq. Rhamnaceae. Buckthorn.

A low, dense, very spiny shrub about 3 feet high, native to mountainous regions in central Europe and western Asia.

66603. *RHODODENDRON YANTHINUM* Bur. and Franch. Ericaceae. Rhododendron.

For previous introduction and description see No. 66479.

66604 to 66607. *RUBUS* spp. Rosaceae.66604. *RUBUS BIFLORUS* Buch.-Ham.

A rambling shrub, with large leaves, woolly beneath, and subacid yellow berries about the size of a thimble. Native to the Himalayas.

For previous introduction see No. 58967.

66605. *RUBUS FLOSCULOSUS* Focke.

A deciduous shrub which, as described by E. H. Wilson (A Naturalist in Western China, vol. 2, p. 31), is up to 12 feet in height with stout erect stems arching at the much-branched top. The pinnate leaves, 4 to 7 inches long, are smooth above and covered beneath with a close white felt. The small pink flowers, in narrow racemes 2 to 4 inches

66532 to 66615—Continued.

long, are succeeded by small, very dark-red or black edible fruits of agreeable flavor. Native to central and western China.

For previous introduction see No. 52943.

66606. *RUBUS INOERTUS* Focke.

A climbing shrub with stout stems and ovate green leaflets. The short-pedicelled flowers are either axillary or clustered at the tips of the branches. Native to south and central China at altitudes of 2,000 meters.

For previous introduction see No. 52945.

66607. *RUBUS LASIOSTYLUS* Focke.

Woolly raspberry.

A wild raspberry from western China, with bluish white bristly stems, small, pinnate leaves, silvery beneath, magenta flowers, and rose-colored woolly fruits which are sweet but said to be of little use for eating.

For previous introduction see No. 58896.

66608. *STYRAX WILSONII* Rehder. Styracaceae. Chinese snow bell.

A very attractive, compact little shrub 6 feet or less in height, which starts to bear its small clusters of white flowers when about 2 years old. The oval leaves are white tomentose beneath. The shrub is native to the mountains of western China and is hardy as far north as the Arnold Arboretum, Jamaica Plain, Mass.

For previous introduction see No. 62287.

66609 to 66613. *VIBURNUM* spp. Caprifoliaceae.66609. *VIBURNUM BETULIFOLIUM* Batal.

An upright shrub, ultimately about 10 feet high, with coarsely toothed oval leaves, white flowers in cymes 2 to 4 inches wide, and red fruits. Native to central and western China.

For previous introduction see No. 35199.

66610. *VIBURNUM BREVIPES* Rehder.

An erect shrub, 6 to 10 feet high, native to western China, with membranous oblong-oval leaves and ovoid red berries.

66611. *VIBURNUM BUREJATICUM* Regel and Herd. Manchurian viburnum.

A northern Chinese species allied to the wayfaring tree (*Viburnum lantana*); the flowers are produced in dense cymes 2 inches across, and the fruits are ovoid and bluish black.

For previous introduction see No. 58807.

66612. *VIBURNUM DAVIDI* Franch.

One of the handsomest small shrubs I have ever seen. The leaves have a grace of form, a texture, and color which is remarkable, and the bright-blue berries add a touch of style to the plant. This shrub, an introduction from Szechwan, China, made in 1910, grows well in the shade and requires plenty of moisture. (Note by David Fairchild under No. 62853.)

66613. *VIBURNUM HENYI* Hemsl.

A shrubby, evergreen viburnum 10 feet or more in height, with dark shining green, oblong leaves and stiff pyramidal panicles of white flowers. The oval fruits, one-third of an inch long, are at first red, becoming black, and give the shrub a decidedly ornamental appearance in autumn. Native to central China and hardy as far north as Massachusetts.

For previous introduction see No. 63686.

66614. (Undetermined.)

66532 to 66615—Continued.

66615. *VICIA PYRENAICA* Pourr. Fabaceae.
Vetch.

A perennial prostrate or ascending vetch, native to southwestern France, with stems up to a foot in length and large solitary purplish flowers.

66616 to 66622.

From Cluj, Rumania. Seeds presented by Dr. Al. Borza, director, botanic garden of the University of Cluj. Received March 27, 1926.

66616 to 66619. *CREPIS* spp. Cichoriaceae.

Introduced for genetic studies of the genus *Crepis*.

66616. *CREPIS BIENNIS* L.

A biennial composite with pinnately hastate leaves, native to southern Europe.

66617. *CREPIS RUBRA* L.

An annual red-flowered plant, native to southern Europe.

66618. *CREPIS SETOSA* Hall. f.

An erect annual herb, much branched, native to Asia Minor.

66619. *CREPIS TARAXACIFOLIA* Thuill.

A biennial, hairy, spreading composite with yellow flowers; native to France.

66620. *GLADIOLUS GANDAVENSIS* Van Houtte. Iridaceae.

A late-flowering hybrid gladiolus (*G. pisticinus* × *cardinalis*); the flowers, in long spikes, are red and reddish yellow, variously streaked and penciled.

66621. *NICOTIANA RUSTICA* L. Solanaceae.
Aztec tobacco.

66622. *TRIFOLIUM PRATENSE* L. Fabaceae.
Red clover.

66623 to 66646.

From Nancy, France. Seeds presented by Prof. Edmond Gain, director, botanic garden, Place Carnot. Received March 31, 1926.

66623 to 66625. *AGROSTIS* spp. Poaceae.

66623. *AGROSTIS PALUSTRIS* Huds. Redtop.

66624. *AGROSTIS MARITIMA* Lam. Bent grass.

66625. *AGROSTIS CAPILLARIS* L.
Rhode Island bent.

66626 to 66628. *CREPIS* spp. Cichoriaceae.

Introduced for genetic studies of the genus *Crepis*.

66626. *CREPIS BIENNIS* L.

For previous introduction and description see No. 66616.

66627. *CREPIS MONTANA* (Jacq.) Reichenb.

An alpine composite with a large head of yellow flowers, native to Switzerland.

66628. *CREPIS SIBIRICA* L.

A perennial composite, 2 to 3 feet high, covered with short rough hairs, bearing a terminal cluster of bright-yellow flowers. Native to Asia Minor and the Himalayas.

66629 to 66632. *LATHYRUS* spp. Fabaceae.

66629. *LATHYRUS CIRRHOSUS* Seringe.

A climbing annual 16 to 40 inches high, with a woody, straight-winged stem, leaves composed of two to three pairs of elliptic or oblong leaflets, and purple or pinkish

66623 to 66646—Continued.

flowers in three to eight flowered loose racemes. Native to the barren slopes of the Pyrenees Mountains.

For previous introduction see No. 44692.

66630. *LATHYRUS LATIFOLIUS* L.
Perennial pea.

For previous introduction see No. 42076.

66631. *LATHYRUS OCHRUS* (L.) DC.

A prostrate or ascending annual up to 2 feet long, with winged stems and yellow flowers. Native to the Mediterranean countries.

For previous introduction see No. 29941.

66632. *LATHYRUS SATIVUS* L. Bitter vetch.

An annual ascending or prostrate leguminous plant with whitish flowers. Native to the Mediterranean countries.

66633. *LUPINUS COCCINEUS* Hort. Fabaceae.
Lupine.

66634. *MEDICAGO TURBINATA OLIVAEFORMIS* (Guss.) Aschers. and Graebn. Fabaceae.

A leguminous annual, with prostrate stems about 2 feet long. Native to the Mediterranean countries.

66635. *MEDICAGO SATIVA VARIA* (Mart.) Urban. Fabaceae.

A hardy herbaceous European perennial.

66636. *MELILOTUS ALBA* Desr. Fabaceae.
White sweet clover.

66637. *MELILOTUS SPECIOSA* Durieu. Fabaceae.

An erect leguminous annual, native to northern Africa.

66638. *NICOTIANA TABACUM* L. Solanaceae.
Tobacco.

Var. *macrophylla*. A large-leaved form.

66639. *NICOTIANA RUSTICA* L. Solanaceae.
Aztec tobacco.

66640 to 66643. *TRIFOLIUM* spp. Fabaceae.
Clover.

66640. *TRIFOLIUM ALPESTRE* L.

A perennial clover, with long underground roots, found over almost all the mountainous parts of Europe, especially in calcareous soils, and ascending to a height of 16,000 feet. The narrowly oval leaflets are velvety hairy, and the flowers are pinkish purple.

For previous introduction see No. 56671.

66641. *TRIFOLIUM MEDIUM* Huds.
Mammoth clover.

A perennial clover with a wide-creeping rhizome, upright stems over a foot high, and bright-purple flowers. Native to southern Europe.

For previous introduction see No. 57855.

66642. *TRIFOLIUM MONTANUM* L.

A perennial white-flowered clover, native to southern Europe, with a woody rhizome giving rise to one or more clumps of upright stems up to 2 feet high.

For previous introduction see No. 35279.

66643. *TRIFOLIUM RUBENS* L.

A perennial clover with widely creeping rhizomes and upright glabrous stems 1 to 2 feet high. Native to rocky places and thickets in the Mediterranean region.

For previous introduction see No. 63994.

66623 to 66646—Continued.

66644. *TRIGONELLA CAERULEA* (L.) Seringe.
Fabaceae.

An upright annual, 2 feet or less high, with bright-blue flowers. Native to southeastern Europe.

For previous introduction see No. 33297.

66645. *TRIGONELLA STRIATA* L. f. Fabaceae.

An annual yellow-flowered leguminous plant, native to southeastern Europe and western Asia.

66646. *VICIA SATIVA* L. Fabaceae.

Common vetch.

66647. *LECYTHIS PISONIS* Cambess.
Lecythidaceae.

From Rio de Janeiro, Brazil. Seeds presented by Amazonas Torres, botanic garden. Received March 27, 1926.

A large Brazilian tree which, as described by St. Hilaire (Flora Brasiliæ Meridionalis, vol. 2, p. 377), has broadly ovate glossy green leaves 3 inches long and ellipsoidal woody fruits about the size of a child's head. These fruits open by a circular lid, and the edible seeds, the size of a cherry, have white flesh of good flavor.

66648 to 66660.

From Ceylon. Seeds and cuttings obtained by David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition. Received March 26, 1926.

66648. *ALBIZZIA ODORATISSIMA* (L. f.) Benth.
Mimosaceae.

No. 348. From the American Mission compound, Tellippalai, near Jaffna, February 6, 1926. A large shade tree, spreading in habit, with pure white sweet-scented flowers, which is called suriya mara by the Singhalese.

66649. *BORASSUS FLABELLIFER* L. Phœnicaceae.
Palmyra palm.

No. 350. Jaffna. February 6, 1926. The famous Palmyra palm of India and Ceylon which in the northern part of this island takes the place of the coconut palm. Though a slow grower, it is a very handsome palm when old. Inasmuch as it grows in the dry coastal regions of Ceylon, it is apparently able to withstand any amount of lime, and as it is said to have been used successfully as a binder for sand dunes, it should prove of real value in the calcareous soils of southern Florida. In the number of uses to which it is put here it rivals the coconut. A delicate sugar is made from the sap which flows in abundance from its inflorescence when cut. The seeds are germinated and the young subterranean hypocotyl is used as a vegetable. The leaves are used in many different ways. The fruit, half the size of a coconut, is very attractive in appearance and when ripe exhales a delicate fragrance. The hull is eaten by the Tamils of Ceylon.

66650. *CAESALPINIA CORIARIA* (Jacq.) Willd.
Caesalpinaceae.

No. 407. February 7, 1926. Seeds from a very beautiful tree growing in deep sandy soil in Regency Park, Jaffna. This tree, bearing sweet-scented flowers, may prove a success as a tannin-producing plant.

For previous introduction see No. 42271.

66651. *CARICA CANDAMARCENSIS* Hook. f. Papayaceae.

No. 401. From the Hakgala Botanic Gardens at an altitude of 6,000 feet. February 8, 1926. The mountain papaya of Ceylon. The fruits of this Ecuadorian species are entirely different from those of *Carica papaya*, being small and acid flavored and useful only for jam and preserves.

For previous introduction see No. 51389.

66648 to 66660—Continued.

66652. *CASUARINA MONTANA* Leschen. Casuarinaceae.

No. 408. From the Hakgala Botanic Gardens. January 28, 1926. A beautiful species with drooping branches growing in the cool rainy region of Hakgala.

66653. *CISSUS QUADRANGULA* L. (*Vitis quadrangularis* Wall.). Vitaceae.

No. 406. Cuttings collected on the north coast of Ceylon near Jaffna, February 6, 1926. A succulent plant with square fleshy stems of most interesting structure.

66654. *CYAMOPSIS TETRAGONOLOBA* (L.) Taub. (*C. psoraloides* DC.). Fabaceae. Guar.

No. 412. Jaffna Mission School, Batticotta. February 6, 1926. The guar or "cluster bean," whose young pods are eaten in curries, is commonly cultivated in India and occasionally in Ceylon. The plant may be useful as green manure.

For previous introduction see No. 57833.

66655. *EHRETIA MICROPHYLLA* Lam. Boraginaceae.

No. 344. From roadside thickets at Point Pedro, Jaffna. February 6, 1926. A dark-green glossy-leaved plant which makes an attractive shrub when grown on salty land near the seashore; suitable for hedges. The yellow fruits, about the size of a pea, are said to be edible.

For previous introduction see No. 43760.

66656. *HYPHAENE THEBAICA* (L.) Mart. Phœnicaceae.
Doom palm.

No. 349. From Residency Park, Jaffna. February 6, 1926. A palm 25 feet high, distributed from Upper Egypt to central Africa. The stems of old trees are sometimes forked three or four times. The beautiful yellowish brown fruits are borne in long clusters of 100 to 200. In Upper Egypt the poorer classes eat the fibrous mealy fruit husk, which tastes much like gingerbread but is rather hard and husky. The hard tough wood is used for domestic utensils.

For previous introduction see No. 53848.

66657. *INDIGOFERA ENDECAPHYLLA* Jacq. Fabaceae.

No. 391. From the agricultural experiment station in the district of Kandy, January 23, 1926.

For previous introduction and description see No. 66253.

66658. *PTYCHOSPERMA* sp. Phœnicaceae.
Palm.

No. 421. February 12, 1926. A pinnate-leaved palm with a smooth trunk.

66659. *SCHLEICHERA TRIJUGA* Willd. Sapindaceae.

No. 343. A very handsome sapindaceous tree, splendid for shade, growing in front of the Residency House at Jaffna. February 5, 1926. It resembles a European evergreen oak, but the small fruits are edible and slightly acid.

For previous introduction see No. 25848.

66660. *THUNBERGIA COCCINEA* Wall. Acanthaceae.

No. 387. From the Hakgala Botanic Garden. January 28, 1926. A beautiful red-flowered climber which is a very fine ornamental.

66661. *ANNONA* sp. Annonaceae.

From Homestead, Fla. Seeds presented by H. W. Johnston, through R. A. Young, Bureau of Plant Industry, Gainesville, Fla. Received March 30, 1926.

One fruit, picked July 11, 1925, weighed nearly one-half pound, was 3 inches long and thick, and of somewhat irregular shape. The flesh was pleasantly acid sweet, of fairly good flavor, but very granular, and contained about 100 seeds. (Young.)

66662 to 66673. LILIUM spp. Liliaceae.
Lily.

From London, England. Bulbs purchased from Barr & Sons, Covent Garden. Received March 29, 1926. Notes from Barr & Sons' catalogue.

66662 to 66666. LILIUM DAURICUM Ker. Candlestick lily.

For previous introduction see No. 63827.

66662. Var. fulgidum. A very distinct variety, 1 foot high, with handsome flowers of a rich dark crimson, shaded with deep orange and freely spotted.

66663. Var. incomparabile. A handsome showy variety, 2 feet high, which is an intense rich crimson-scarlet and is freely spotted.

66664. Var. Leonard Joerg. A very handsome showy lily, 20 to 23 inches high, bearing umbels of large flowers of good form, with broad petals. The flowers are glowing orange-scarlet, shading down to golden yellow, and freely spotted with dark crimson.

66665. Var. Sappho. A variety, 2 feet high, which is scarlet, shading to orange, and moderately spotted.

66666. Var. Splendidum. A fine showy variety of sturdy growth, 2 to 2½ feet high, producing a head of flowers, up to 12 in number, with slightly reflexed petals which are orange-scarlet, shading to glowing crimson-vermilion.

66667 to 66673. LILIUM ELEGANS Thunb. Japanese lily.

66667. Var. alutaceum, Prince of Orange. A showy dwarf lily, 1 foot high, with clear apricot-orange flowers which are spotted black. This is a valuable variety for flower beds, rock gardens, and massing in front borders.

66668. Var. bicolor. A variety, 1½ feet high, with beautiful large flowers which are apricot-orange flamed scarlet.

66669. Var. marmoratum aureum. A variety, 2½ feet high, producing broad open flowers which are golden-apricot, densely spotted with purple.

66670. Orange Queen. A handsome, strong robust grower, 15 to 18 inches high, which is very decorative in either pots or borders. During the midsummer it produces large orange-colored flowers spotted with black.

66671. Var. sanguineum. A variety, 1½ feet high, with rich-crimson flowers finely spotted with dark crimson.

66672. Star of Heusden. A very free-flowering variety 1½ feet high. The large beautiful flowers are soft chrome yellow with a dark-orange stripe on each petal and finely spotted.

66673. Var. venustum. A grand showy lily, 1½ feet high, which is late flowering. The flowers are glowing reddish orange.

66674. MUSCARI sp. Liliaceae.
Grape hyacinth.

From Morocco. Bulbs collected by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received September 8, 1925. Numbered January, 1926.

No. 102. From Ito Plateau, near Azrou. June 17, 1925. A species peculiar to the Middle Atlas Mountains, at an altitude of 1,300 meters. A spring-blooming bulbous plant with blue or white flowers in racemes or spikes.

For introduction of seeds see No. 64957.

66675. PERSEA AMERICANA Mill. (P. gratissima Gaertn. f.). Lauraceae.
Avocado.

Fruits from a seedling of No. 19080, *Collins*, grown at the United States Plant Introduction Garden, Miami, Fla., under the Garden number 1891. Received at Washington, D. C., January 21, 1926. Numbered March, 1926.

Collinami. A large pear-shaped fruit which is light green with light-colored dots over most of the surface. The skin, comparatively smooth, is medium thick and pliable, separating easily from the flesh, which is soft, buttery, and of excellent texture and flavor. The outer seed coat separates easily from the seed, but tends to cling to the flesh. The tree is a very upright grower, similar to the parent tree. The leaves are large and rather glossy.

66676. MANGIFERA INDICA L. Anacardiaceae.
Mango.

From Ceylon, India. Scions presented through David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition. Received March 26, 1926.

No. 347. February 6, 1926. Scions from a tree planted by Miss Eliza Agnew on the grounds of the Uduvil Girls' School, Chunnakan, Ceylon, and presented by Miss G. M. Vining. This mango is said to be of good quality, with a small seed, little fiber, and a scarlet blush which makes it very attractive.

66677 and 66678. GOSSYPIUM NANKING Meyn. Malvaceae. Cotton.

From French Indo China. Seeds received March 23, 1926.

66677. No. 1. A variety which grows wild.

66678. No. 2. A variety cultivated in the villages.

66679. CYNOMETRA CAULIFLORA L. Caesalpinniaceae.

From Ceylon. Seeds obtained by David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition. Received March 26, 1926.

No. 392. Obtained from the Veyangoda Farm, between Colombo and Kandy, February 12, 1926.

For previous introduction and description see No. 65781.

66680 to 66693. BERBERIS spp. Berberidaceae.
Barberry.

From Elstree, Herts, England. Plants presented by Edwin Beckett, superintendent, Aldenham House Gardens. Received February 12, 1926.

66680. BERBERIS BRACHYPODA Maxim.

Var. gibbsii. An attractive shrub from western China, 4 to 7 feet high, with ovate, serrate leaves, long slender panicles of yellow flowers, and scarlet fruits often half an inch in length.

For previous introduction see No. 61973.

66681. BERBERIS CANADENSIS Mil.

Received as *Berberis fischeri* which is now considered to be a form of *B. canadensis*. An ornamental of great decorative value. The showy fruits are very effective.

For previous introduction see No. 65471.

66680 to 66693—Continued.

66682. *BERBERIS CANDIDULA* C. Schneid.

A charming evergreen of compact growth, with leaves silvery on the underside. (*Beckett.*)

66683. *BERBERIS CONSIMILIS* C. Schneid.

A yellow-flowered shrub, of unknown origin, cultivated at the Arnold Arboretum, Jamaica Plain, Mass., since 1904. The spiny-dentate oval-oblong leaves are 2 centimeters long, and the ellipsoid fruits are purple.

66684. *BERBERIS GIRALDII* Hesse.

A species with large deciduous bronze foliage and compact bunches of scarlet berries. (*Beckett.*)

66685. *BERBERIS HOOKERI* Lem.

Var. *compacta*. A compact dwarf variety with bright evergreen leaves. (*Beckett.*)

66686. *BERBERIS JACOUNII* Hort.

A semievergreen, strong-growing barberry, with medium-sized, glaucous, finely serrated leaves and dark-red berries in small clusters. (*Beckett.*)

66687. *BERBERIS MORRISONENSIS* Hayata.

A barberry closely resembling *Berberis dictyophylla*. As described by B. Hayata (Journal of the College of Science, Imperial University, Tokyo, vol. 30, p. 25), it is an erect, densely branched shrub, with 3-parted spines and fasciated leathery oval leaves. Unlike *B. dictyophylla*, the berries are in fascicles and are more nearly round.

For previous introduction see No. 65473.

66688. *BERBERIS ORTHOBOTRYS* Bienert.

A semievergreen barberry with very large crimson berries. (*Beckett.*)

For previous introduction see No. 53637.

66689. *BERBERIS PARVIFOLIA* Sprague.

A low, half-evergreen shrub with small, narrow, usually entire leaves and terra-cotta colored fruits. Native to western China.

For previous introduction see No. 33022.

66690. *BERBERIS* sp.

Farrer No. 355.

66691. *BERBERIS* sp.

Forrest No. 20179.

66692. *BERBERIS* sp.

Forrest No. 20292.

66693. *BERBERIS* sp.

Purdum No. 543.

66694. *BROSIMUM ALICASTRUM* Swartz.
Moraceae.

From Merida, Yucatan, Mexico. Seeds presented by Julio Rendon. Received February 4, 1926.

Pamón. A large tropical American tree with shining green narrowly elliptic leaves and round yellow fruits about an inch in diameter. The fruit contains a single large seed, known as "bread-nut" in Jamaica; it is roasted and eaten in that country. The leaves are said to be good cattle feed.

For previous introduction see No. 53534.

66695. *ORCHIS PAPILIONACEA* L. Or-
chidaceae.

From Morocco. Bulbs collected by David Fairchild, agricultural explorer, Bureau of Plant Industry. Received September 8, 1925. Numbered January, 1926.

No. 38. Found in a Berber cemetery, near Amismiz, in the Great Atlas Mountains, south of Marrakesh, May 30, 1925. A terrestrial orchid, about 18 inches high, which grows in soil that bakes as hard as a brick before the last of May. This variety produces tubers the size of a pigeon's egg, and attractive red flowers.

For previous introduction see No. 64963.

66696 and 66697. *ARTOCARPUS INTEGRA*
(Thunb.) L. Moraceae. Jackfruit.

From Ceylon. Seeds obtained by David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition. Received February 26 and March 4, 1926.

66696. No. 324. Collected near Kandy, January 20, 1926. The "honey jackfruit" or peniwaraka of the Singhalese. The delicate sweet fruit pulp around each seed is excellent eating. It is quite unlike that of the ordinary jackfruit.

66697. No. 361. "Honey jackfruit", or peniwaraka. Seeds from a large fruit obtained from one of the hotel porters.

66698. *COLOCASIA ESCULENTA* (L.)
Schott. Araceae. Dasheen.

From China. Corms collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received February 18, 1926.

No. 330. *Kau chau oo*. Obtained at Chukouen, Lohkongtung, December 27, 1925. A dasheen cultivated to a limited extent in the region of Lohkongtung and elsewhere. This variety, rarely used as an esculent, is commonly dried and sold to drug shops. It is distinguished from the commonly cultivated varieties by having the offshoots closely adhering to the main corm so that a year's growth results in a large irregular mass rather than a number of nearly severed cormels. (*McClure.*)

ORGANIZATION OF THE UNITED STATES DEPARTMENT OF AGRICULTURE

July 25, 1928

<i>Secretary of Agriculture</i>	W. M. JARDINE.
<i>Assistant Secretary</i>	R. W. DUNLAP.
<i>Director of Scientific Work</i>	A. F. WOODS.
<i>Director of Regulatory Work</i>	WALTER G. CAMPBELL.
<i>Director of Extension</i>	C. W. WARBURTON.
<i>Director of Personnel and Business Administration.</i>	W. W. STOCKBERGER.
<i>Director of Information</i>	NELSON ANTRIM CRAWFORD.
<i>Solicitor</i>	R. W. WILLIAMS.
<i>Weather Bureau</i>	CHARLES F. MARVIN, <i>Chief.</i>
<i>Bureau of Animal Industry</i>	JOHN R. MOHLER, <i>Chief.</i>
<i>Bureau of Dairy Industry</i>	C. W. LARSON, <i>Chief.</i>
<i>Bureau of Plant Industry</i>	WILLIAM A. TAYLOR, <i>Chief.</i>
<i>Forest Service</i>	R. Y. STUART, <i>Chief.</i>
<i>Bureau of Chemistry and Soils</i>	H. G. KNIGHT, <i>Chief.</i>
<i>Bureau of Entomology</i>	C. L. MARLATT, <i>Chief.</i>
<i>Bureau of Biological Survey</i>	PAUL G. REDINGTON, <i>Chief.</i>
<i>Bureau of Public Roads</i>	THOMAS H. MACDONALD, <i>Chief.</i>
<i>Bureau of Agricultural Economics</i>	NILS A. OLSEN, <i>Chief.</i>
<i>Bureau of Home Economics</i>	LOUISE STANLEY, <i>Chief.</i>
<i>Plant Quarantine and Control Administration</i>	C. L. MARLATT, <i>Chief.</i>
<i>Grain Futures Administration</i>	J. W. T. DUVEL, <i>Chief.</i>
<i>Food, Drug, and Insecticide Administration</i>	WALTER G. CAMPBELL, <i>Director of Regulatory Work, in Charge.</i>
<i>Office of Experiment Stations</i>	E. W. ALLEN, <i>Chief.</i>
<i>Office of Cooperative Extension Work</i>	C. B. SMITH, <i>Chief.</i>
<i>Library</i>	CLARIBEL R. BARNETT, <i>Librarian.</i>

This inventory is a contribution from

Index of common and scientific names.....	49

INTRODUCTORY STATEMENT

THREE agricultural explorers were carrying on their investigations in foreign lands during the three-month period represented by this eighty-seventh inventory.

David Fairchild, in company with P. H. Dorsett, made an extended tour along the northern coast of Sumatra and also spent some time in Java and Ceylon. Their itinerary included the Sibolangit Botanic Garden, near Medan, Sumatra, and the Hakgala Botanic Garden, Newara Eliya, Ceylon. The material collected came from these botanic gardens, from the markets of the native villages visited, and from the wild. It consisted for the most part of fruit-bearing plants, ornamentals, and leguminous plants of possible value as cover crops for the warmer parts of the United States. Breeders of small fruits will be interested in the numerous species of *Rubus* (Nos. 67592 to 67604; 67728 to 67740) obtained mostly in Sumatra. Several species of *Ficus* (Nos. 67557 to 67570; 67696 to 67705) from Sumatra will be tested in southern Florida, where already a number of these wild figs have proved popular as shade trees.

F. A. McClure continued to work in the general vicinity of Canton, China, collecting plant material largely from the native markets of the neighboring villages. At one small place in the Lungtau Mountains he obtained seeds of the Faan kwa cushaw (*Cucurbita moschata*, No. 66735). A previous introduction (No. 54427), also from the vicinity of Canton, showed this to be an excellent variety of cushaw, producing large fruits of good quality and flavor. Mr. McClure also collected rhizomes of several bamboos, mostly belonging to the genus *Phyllostachys* (Nos. 66781 to 66789; 66900 to 66902; 667398, 67399), a number of which furnish edible young shoots.

Through the courtesy of the Institute of Applied Botany, **Lenin-**grad, Russia, the department received an interesting shipment of seeds of Russian plants (Nos. 67649 to 67668), consisting of locally developed varieties of cucurbitaceous vegetables from widely separated parts of the country.

From the little-known island of Tasmania were received seeds of several native ornamental shrubs and herbaceous perennials not previously introduced through this office (Nos. 67805 to 67834). Among these may be mentioned *Cyathodes divaricata* (No. 67812), a juniperlike shrub with rigid branches and leaves and white flowers on recurved stems; also three species of everlasting (*Elichrysum* spp.; Nos. 67814 to 67816), erect evergreen shrubs with very narrow leaves and showy flower clusters. Somewhat similar in nature to the Tasmanian shipment is a collection of shrubs sent in from South Australia (Nos. 67067 to 67087). Most of these are new to American horticulture. The collection includes 10 species of *Melaleuca* (Nos. 67077 to 67086); these are said to be drought resistant, and many have showy flowers.

The botanical determinations of these introductions have been made and the nomenclature determined by H. C. Skeels, and the descriptive matter has been prepared under the direction of Paul Russell, who has had general supervision of this inventory.

KNOWLES A. RYERSON,
Senior Horticulturist, in Charge.

OFFICE OF FOREIGN PLANT INTRODUCTION,
Washington, D. C., July 1, 1928.

INVENTORY¹

66699. DURIQ ZIBETHINUS Murr. Bombacaceae. Durian.

From Java. Seeds obtained by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received June 28, 1926.

No. 787. Seeds from a durian obtained at the market in Soerabaya, May 17, 1926. According to Macmillan (Handbook of Tropical Gardening and Planting), this is a very large, handsome pyramid-shaped tree, native to the Malay Archipelago, and commonly cultivated [in the Straits Settlements, Burma, Java, etc.], for the sake of its celebrated fruit. The latter, produced on the older branches, varies somewhat from round to oval in shape, and usually weighs from 5 to 7 pounds, though sometimes as much as 10 pounds. It is armed with thickly set formidable prickles about one-half inch long; when ripe it becomes slightly yellow and has an offensive odor. The cream-colored pulp surrounds the seed in the edible portion; this is most highly prized by the Malays and other oriental races and is also relished by the Europeans who acquire a taste for it. The large seeds may be roasted and eaten like chestnuts. Durian fruits are variable in size, shape, flavor, and quantity of pulp, according to variety. The trees also vary in productiveness, some varieties being almost barren. Selection and high cultivation should therefore be practiced, in order to obtain the best fruits. The tree is readily propagated by seed if sown fresh. The large fleshy seed is of short vitality and germinates in seven to eight days.

For previous introduction see No. 45179.

66700 and 66701. MEDICAGO SATIVA L. Fabaceae. Alfalfa.

From Sable, Sarthe, France. Seeds obtained from A. Coutard, through H. L. Westover, Bureau of Plant Industry. Received April 1, 1926.

French-grown varieties.

66700. From Provence.

66701. From Sarthe.

66702. CITRUS GRANDIS (L.) Osbeck (C. decumana Murr.). Rutaceae. Grapefruit.

From Los Banos, Philippine Islands. Seeds presented by J. D. Bagarino, through W. T. Swingle, Bureau of Plant Industry. Received April 1, 1926.

A Philippine variety.

66703. LILIUM sp. Liliaceae. Lily.

From Canton, China. Bulbs collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received April 2, 1926.

No. 343. These bulbs were obtained from the wild at the foot of the Lungtaushan, January 9, 1926. *Paak hop fa*. The white flowers are borne on stems 1 to 1.5 meters high.

66704. PASPALUM NOTATUM Fluegge. Poaceae. Grass.

From San Jose, Costa Rica. Seeds purchased from J. Alfredo Quiros. Received April 6, 1926.

A perennial grass which has shown promise as a pasture grass in the southern United States; now introduced for further testing in that region.

For previous introduction see No. 62049.

66705. SALPICHROA RHOMBOIDEA (Gill. and Hook.) Miers. Solanaceae.

From Buenos Aires, Argentina. Seeds presented by Dr. Carlos L. Thays, director, botanic garden. Received April 3, 1926.

An ornamental relative of the tomato, with white flowers and edible white transparent berries which resemble the pineapple in flavor. Because of its attractive appearance and creeping habit it is very effective for trellises and arbors. Native to Argentina.

For previous introduction see No. 55478.

¹ It should be understood that the names of horticultural varieties of fruits, vegetables, cereals, and other plants used in this inventory are those under which the material was received when introduced by the Office of Foreign Plant Introduction, and, further, that the printing of such names here does not constitute their official publication and adoption in this country. As the different varieties are studied, their entrance into the American trade forecast, and the use of varietal names for them in American literature becomes necessary, the foreign varietal designations appearing in this inventory will be subject to change with a view to bringing the forms of the names into harmony with recognized horticultural nomenclature.

It is a well-known fact that botanical descriptions, both technical and economic, seldom mention the seeds at all and rarely describe them in such a way as to make possible identification from the seeds alone. Many of the unusual plants listed in these inventories are appearing in this country for the first time, and there are no seed samples or herbarium specimens with ripe seeds with which the new arrivals may be compared. The only identification possible is to see that the sample received resembles seeds of other species of the same genus or of related genera. The responsibility for the specific identifications therefore must necessarily often rest with the person sending the material. If there is any question regarding the correctness of the identification of any plant received from this office, herbarium specimens of leaves and flowers should be sent in so that definite identification can be made.

66706. PISUM SATIVUM L. Fabaceae. Pea.

From Socorro, New Mexico. Seeds presented by B. R. Britton. Received April 3, 1926.

A variety originally imported from Sweden, larger than those now grown in the San Luis Valley, Colo. (Britton.)

66707 to 66713. ORYZA SATIVA L. Poaceae. Rice.

From Valencia, Spain. Seeds presented by Clemente Cerda. Received April 6, 1926.

66707. *Benlloc*. From Ribera Alta.

66708. *Benlloc*. From Ribera Baja.

66709. *Nano*. From Jativa.

66710. *Benlloc Pla*.

66711. *Muga*.

66712. *Mil Seiscientos*.

66713. *Bomba*.

66714. CANNA INDICA L. Cannaceae.

From Rio de Janeiro, Brazil. Seeds presented by Amazonas Torres, Jardín Botánico. Received April 3, 1926.

A low, slender-stemmed, tropical American canna, 3 to 5 feet high, with green oblong leaves about a foot long and simple lax racemes of small flowers. The latter have pale-green narrow petals, reddish yellow lip, and bright red upper stamens.

66715 to 66720.

From Kaunas, Lithuania. Seeds presented by Dr. C. Regel, director, botanic garden. Received April 1, 1926.

European-grown seeds.

66715. CAPSICUM FRUTESCENS BACCATUM (L.) Irish. Solanaceae. Bush red pepper.

An erect shrubby perennial about 3 feet high, with slender flexuose branches, small white flowers, and small red fruits about one-fourth of an inch in diameter. Native to tropical America.

66716. CAPSICUM ANNUUM L. Solanaceae. Red pepper.

Variety *pendulum*. A pendulous variety.

66717. CREPIS RUBRA L. Cichoriaceae.

An annual red-flowered composite, one-half to 1½ feet high, native to southern Europe.

66718. MELLLOTUS ALTISSIMA Thuill. Fabaceae. Sweet clover.

For previous introduction see No. 30242.

66719. NICOTIANA RUSTICA L. Solanaceae. Aztec tobacco.**66720. PISUM SATIVUM L. Fabaceae. Pea.****66721 to 66723. TRIFOLIUM PRATENSE L. Fabaceae. Red clover.**

From Norrköping, Sweden. Seeds presented by Algot Holmberg & Son, at the request of Dr. Hernfrid Witte, Swedish State Seed Testing Station, Stocksund. Received April 8, 1926.

Swedish strains.

66721. *Gotaklover*. From Algotsholms.

66722. *Lattjordstyp*.

66723. *Styrjardstypen*.

66724 to 66728.

From Pretoria, Union of South Africa. Cuttings presented by I. B. Pole Evans, chief, division of botany, Department of Agriculture, through Eugene May, Bureau of Plant Industry. Received April 12, 1926.

66724. CARALLUMA LEENDERTZIAE N. E. Brown. Asclepiadaceae.

A dwarf fleshy plant, native to South Africa, with thick stems about 4 inches high, and dark, purple flowers 2 inches wide in few-flowered umbels.

66725. HUERNIA LOESENERIANA Schlechter. Asclepiadaceae.

A dwarf fleshy perennial with square stems an inch or two long and bell-shaped, brownish purple flowers about an inch across, borne near the bases of the young stems. Native to dry regions in the Transvaal.

66726 to 66728. STAPELIA spp. Asclepiadaceae.**66726. STAPELIA GITTLEFFII R. Pott.**

A low, fleshy South African plant with erect four-angled stems 8 to 10 inches high and one to three greenish yellow and purple five-lobed flowers with lobes nearly 3 inches long.

66727. STAPELIA LEENDERTZIAE N. E. Brown.

A low erect succulent plant about 4 inches high, with angled stems toothed at the angles and one or two flowers. The flowers, about 3 inches long and 3 to 4 inches wide at the mouth, are dark brownish purple. Native to the Transvaal, South Africa.

66728. STAPELIA NOBILIS N. E. Brown.

A low, fleshy South African perennial, branching at the base, with four-angled erect softly hairy stems 3 to 5 inches long and light-yellow flowers about an inch across, marked with numerous irregular transverse crimson lines and thinly covered with long erect purple hairs.

66729. MEDICAGO SATIVA L. Fabaceae. Alfalfa.

From London, England. Seeds purchased from McMaster & Frankish. Received April 10, 1926.

A South African alfalfa.

66730 to 66766.

From Canton, China. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received April 2, 1926.

66730 to 66732. BRASSICA spp. Brassicaceae.**66730. BRASSICA sp.**

No. 342. *Kai tsoi*, *Heung ta tsoi*. A coarse, open-growing vegetable with crinkly leaves which tend to vary in the direction of frilled margins.

66731. BRASSICA sp.

No. 366. Obtained from a farmer at Yeunguk, Lungtau Mountains, January 13, 1926. *Yau tsoi*. The most commonly cultivated crop during the winter months when the rice terraces would otherwise be fallow. The oil expressed from the seeds of this vegetable is used both as an esculent and as an illuminant.

66732. BRASSICA sp.

No. 395. *Yau tsoi*. An oil-producing mustard obtained at Shiuchow, January 23, 1926.

66730 to 66766—Continued.

66733 and 66734. *CORCHORUS CAPSULARIS* L. Tiliaceae. Jute.

For previous introduction see Nos. 61226 to 61229.

66733. No. 368. Obtained at Tsangsheng, January 30, 1926. *Wong ma*. This plant is the common source of coarse fibers for the making of small rope and cord as well as sacking. It is planted rather closely in rows 6 to 8 inches apart in raised beds. The purpose of crowding the plants into close quarters is to make them grow tall without branching. The hemp is marketed in two forms—*Shaang ma*, which is removed without having been soaked, and *Shuk ma*, which is removed from the plants only after they have been soaked. The *Shuk ma* is also beaten and the outer bark removed before it is marketed.

66734. No. 383. January 13, 1926. *Wong ma*. A common hemp cultivated in the region of Yeunguk, Lungtau Mountains.

66735. *CUCURBITA MOSCHATA* Duchesne. Cucurbitaceae. Cushaw.

No. 345. *Faan kwa*. Obtained January 9, 1926, at Yeunguk, Lungtau Mountains, from a 20-pound pumpkin of excellent quality and flavor. The skin is golden buff mottled with yellow, and the flesh is golden yellow.

For previous introduction see No. 64154.

66736. *DIOSPYROS* sp. Diospyraceae. Persimmon.

No. 341. *Ye tsz tsai*, *Hau pei tsai*. A fruit obtained at Tsehaang ravine, Lungtau Mountains, January 8, 1926.

66737. *DIOSPYROS* sp. Diospyraceae. Persimmon.

No. 384. *Hau pei tsai*. Fruits obtained from wild trees near Miupukan, en route from Yeunguk to Fungwaan, January 14, 1926. These trees, dwarfed by the fact that they were growing on a steep, rocky cliff almost devoid of soil and by periodic chopping by wood hunters, were otherwise very much like the cultivated persimmons found farther south and in other parts of the Province. The fruits, which ripen in September and October, are small, globular and golden yellow to reddish yellow, and edible when thoroughly ripe.

66738. *ELEUSINE CORACANA* (L.) Gaertn. Poaceae.

No. 364. *Sai suk*. Obtained at Yeunguk, Lungtau Mountains, January 13, 1926.

For previous introduction see Nos. 60478 to 60480.

66739. *FAGOPYRUM VULGARE* Hill (*F. esculentum* Moench.). Polygonaceae. Buckwheat.

No. 397. *Saam kok maak*, *Fa maak*. A very small variety of buckwheat obtained at Shiuchow, January 24, 1926.

For previous introduction see No. 64367.

66740. *GOSYPIUM NANKING* Meyen. Malvaceae. Cotton.

No. 367. *Min fa*. A very small variety with infinitesimal bolls, the kind commonly cultivated for home use; obtained at Yeunguk, Lungtau Mountains, January 13, 1926.

For previous introduction see No. 63843.

66741. *HOLCUS SORGHUM* L. (*Sorghum vulgare* Pers.). Poaceae. Sorghum.

No. 365. *Ko leung suk*. Yeunguk, Lungtau Mountains, January 13, 1926. The seeds are used for human consumption and the threshed-out heads are bound into brooms.

66730 to 66766—Continued.

66742. *LILIUM* sp. Liliaceae. Lily.

No. 343. *Paak hop fa*. *Paak kung fa*. Obtained from the wild at the foot of the Lungtau Mountains, January 9, 1926. The white flowers are produced on stems 1 to 1.5 meters high.

66743 to 66757. *ORYZA SATIVA* L. Poaceae. Rice.

66743. No. 338. *Leng noh kuk*. Obtained from the Iu aborigines at Tsehaang, Lungtau Mountains, January 8, 1926. An upland glutinous rice, beardless, with dark-purple husks, which is planted in April or May and harvested in August or September.

66744. No. 339. *Leng chim kuk*. An upland variety of starchy rice obtained from the Iu aborigines at Tsehaang, Lungtau Mountains, January 8, 1926.

66745. No. 372. *Tso woh kuk*. An early variety of starchy rice obtained at Yeunguk, Lungtau Mountains, January 12, 1926.

66746. No. 373. *Yau chim kuk*. Obtained January 11, 1926, at Yeunguk, Lungtau Mountains.

66747. No. 374. *Fu kong chim*. "Foo River Starchy," a bearded variety obtained at Yeunguk, Lungtau Mountains, January 12, 1926.

66748. No. 375. *Kaang kuk*. A bearded variety obtained at Yeunguk, Lungtau Mountains, January 14, 1926.

66749. No. 376. A red variety obtained at Yeunguk, Lungtau Mountains, January 11, 1926.

66750. No. 377. *Sai fa hoh*. "Small-flowered glutinous" variety obtained at Yeunguk, Lungtau Mountains, January 13, 1926.

66751. No. 378. *Tso noh*. "Early glutinous" variety obtained at Yeunguk, Lungtau Mountains, January 13, 1926.

66752. No. 403. *Ha noh kuk*. Shiuchow. January 24, 1926.

66753. No. 404. *Paak chim*. A starchy variety obtained at Shiuchow, January 24, 1926.

66754. No. 405. *Yau chim*. A starchy variety obtained at Shiuchow, January 24, 1926.

66755. No. 406. *Chi kuk*. A late variety of starchy rice obtained at Shiuchow, January 24, 1926.

66756. No. 407. *Tso kuk*. An early variety of starchy rice obtained at Shiuchow, January 24, 1926.

66757. No. 408. *Hung kuk*. A red variety of starchy rice obtained at Shiuchow, January 24, 1926.

66758. *PYRUS* sp. Malaceae. Pear.

No. 340. *Tong lei tsi*. A small round wild pear obtained from a tree growing in granitic soil on the bank of the Tsehaang Creek, Lungtau Mountains, January 8, 1926, at an altitude of about 800 meters. The tree, 10 meters high, 25 centimeters in diameter, and of rather spreading habit, appeared very healthy and heavily laden with fruit. This variety may be a possible stock for cultivated pears.

66759 and 66760. *SESAMUM ORIENTALE* L. Pedaliaceae.

Obtained at Shiuchow, January 24, 1926.

For previous introduction see No. 60939.

66759. No. 401. *Paak chi ma*. White seeds.

66760. No. 402. *Haak chi ma*. Black seeds.

66730 to 66766--Continued.

66761 and 66762. SOJA MAX (L.) Piper (*Glycine hispida* Maxim.). Fabaceae. Soy bean.

Obtained at Yeunguk, Lungtau Mountains, January 11, 1926.

66761. No. 379. *Tai tsing tau*. A large, pale-green variety.

66762. No. 380. *Tsai wong tau*. A white to cream-colored variety.

66763. TRITICUM AESTIVUM L. (*T. vulgare* Vill.). Poaceae. Common wheat.

No. 400. *Min mak*. January 24, 1926. The commonly cultivated variety found in the vicinity of Shiuchow.

66764 and 66765. VIGNA SESQUIPEDALIS (L.) Fruwirth. Fabaceae. Yard Long bean.

Obtained at Yeunguk, Lungtau Mountains, January 13, 1926.

For previous introduction see No. 64339.

66764. No. 381. *Hung tau*. A red variety.

66765. No. 382. *Oo tau*. A black variety.

66766. TRACHYCARPUS EXCELSUS (Thunb.) Wendl. Phoenicaceae. Palm.

No. 369. *Tsung*. Obtained at Yeunguk, Lungtau Mountains, January 13, 1926. This palm is commonly cultivated on a small scale in the northern part of this Province for the fibers which it yields. The broad tough fibrous sheathing bases of the leaf petioles are sewed together to make rain capes, and the fibers are used to make small rope.

For previous introduction see No. 48280.

66767 and 66768.

From Bahia, Brazil. Seeds presented by Rev. Camillo Torrend, Collegio Antonio Vieira. Received April 8, 1926.

66767. CAMPOMANESIA MASCHALANTHA (Berg.) Kiaersk. Myrtaceae.

A large tree producing very sweet fruits which are greenish when ripe and commonly called *Guabiroba* in the southern and central parts of Brazil.

66768. CUPHEA BALSAMONA Cham. and Schlecht. Lythraceae.

According to an article published in *Chacaras E Quintaes* (vol. 31, p. 426, May 15, 1925) by Father Torrend, this plant has acquired an excellent reputation as forage in southern Brazil. Even when other fodder plants are abundant, cattle are said to consume with avidity this *Barba de San Pedro*, as it is called.

For previous introduction see No. 64537.

66769 and 66770.

From Summit, Canal Zone. Seeds presented by Holger Johansen, plant introduction garden. Received April 9, 1926.

66769. CALYCOPHYLLUM CANDIDISSIMUM (Vahl) DC. Rubiaceae.

This Central American timber tree, known commercially as the *Degame*, is described by S. J. Record (*Timbers of Tropical America*, p. 547) as being 40 to 65 feet high with a straight trunk free from limbs. The wood has the strength, toughness, and resilience of hickory and is used for making agricultural implements, tool handles, and similar articles.

For previous introduction see No. 63628.

66770. HELICONIA sp. Musaceae.

Bananalike plants, often with beautifully marked foliage. Native to tropical America.

66771. PRUNUS ARMENIACA L. Amygdalaceae. Apricot.

From Chihli, China. Scions collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received March 21, 1925. Numbered June 1926.

No. 2024. February 15, 1925. *Tsei pu pou hsing* (they will not steal). Found in decomposed granite soil in the foothill region of Tsanfengyung, west of Huailai, at an altitude of about 1,800 feet. The yellow-fleshed freestone fruits, 1 to 2 inches in diameter, ripen during the middle of June, becoming green.

66772 to 66777.

From Rabat, Morocco. Seeds presented by A. Pochon, Directeur, Jardin d'Essais de Rabat, at the request of David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received April 9, 1926.

66772. ACACIA CYCLOPS A. Cunn. Mimosaceae.

A low shrubby Australian acacia, used in Morocco with great success as a hedge plant and in South Africa as a sand binder on the seashore. The yellow flowers are in dense globular heads.

For previous introduction see No. 48041.

66773. ATRIPLEX HALIMUS L. Chenopodiaceae.

A low, spreading, North African shrub, with gray foliage, used extensively in Morocco as a hedge plant close to the sea.

66774. LOPEZIA BICOLOR Hort. Onagraceae.

A superb climbing plant from Mexico, with small pink flowers which make it a peculiarly delicate plant for walls and rockwork. (Note by David Fairchild in letter of May 2, 1925.)

66775. MESEMBRYANTHEMUM sp. Aizoaceae.

A low-growing succulent plant of possible value as an ornamental for the subtropical sections of the United States.

66776. PRUNUS ARMENIACA L. Amygdalaceae. Apricot.

Much earlier than the European varieties, maturing its fruits at the beginning of June. Its foliage is smaller than that of the European apricot and when young is of a characteristic red. Used here as a stock, and the ordinary apricot thrives splendidly on it. The trees, which grow to a very old age, produce enormous crops of fruits of small size but of good flavor. (Note by David Fairchild in letter of May 2, 1925.)

66777. VITTADINIA TRILOBA (Gaud.) DC. (*V. australis* A. Rich.). Asteraceae.

This little Australian composite makes a superb mass of rosy-white flowers here in Morocco. (Note by David Fairchild in letter of May 2, 1925.)

66778 and 66779. ZEA MAYS L. Poaceae. Corn.

From Canton, China. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received April 2, 1926.

66778. No. 336. Yellow Flint corn obtained from Iu aborigines at Tsehaang, Lungtau Mountains, January 7, 1926. *Chi paau suk*, *Tai woh paau*. Rather small, somewhat pointed ears.

66779. No. 337. White Flint corn obtained from Iu aborigines at Tsehaang, Lungtau Mountains, January 7, 1926. *Chi paau suk*, *Tai woh paau*. A yellowish white variety with larger and better shaped ears than No. 336 [No. 66778]. It is also a later variety, being planted here in May and June and harvested in September or October.

66780. GOSYPIUM NANKING Meyen.
Malvaceae. Cotton.

From Nanking, China. Seeds obtained from R. H. Porter, acting head of cotton department, Nanking University, through C. B. Doyle, Bureau of Plant Industry. Received April 15, 1926.

Million Dollar.

66781 to 66789.

From Canton, China. Rhizomes collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received April 7, 1926.

66781. ARUNDINARIA sp. Poaceae. Bamboo.

No. 334. January 7, 1926. *Tip mo chuk*. A wild bamboo found in a dense brake on the sandy flood plain of a little stream, Tsehaang, Lungtau Mountains. The rough culms, 1 to 4 meters high and three-fourths to 15 centimeters in diameter, have very long internodes and very small interior cavities; the branches are tufted, very upright, and stiff; the leaves are large and used to line bamboo hats.

66782 to 66788. PHYLLOSTACHYS spp. Poaceae. Bamboo.**66782. PHYLLOSTACHYS sp.**

No. 335. January 7, 1926. *Kam chuk*. A wild bamboo growing on the sandy flood plain of a little stream, Tsehaang, Lungtau Mountains. The young shoots are edible. The culms, up to 8 meters high and 2 or 2.5 centimeters in diameter, are pale green and rather thin-walled, and the branches are usually in pairs.

66783. PHYLLOSTACHYS sp.

No. 344. January 9, 1926. *Fu chuk*. From Lukchukhaang, at the foot of the Lungtau Mountains. A wild variety with culms up to 11 centimeters in diameter and 10 meters long, deep green, gradually turning yellow in old age and which are rather thin-walled. The leaves are very narrow, the branchlets slender, somewhat drooping, and the young shoots are edible but must be parboiled to remove a bitter principle which gives to the bamboo its name "bitter bamboo."

66784. PHYLLOSTACHYS sp.

No. 346. January 10, 1926. *Oo chuk*. From the wild in a ravine on Peng Mountain, Lungtau Mountains. The culms, which in this region have a height of about 5 meters and a diameter of 2 centimeters, are more or less completely covered with purplish dots, giving them a dark or black appearance from a distance, hence the name "black bamboo." These culms are of no special use excepting for pipes as curiosities. The young shoots, though edible, are not of special merit. The surface of the rhizomes is quite black.

66785. PHYLLOSTACHYS sp.

No. 348. Obtained from the wild near Yeunguk, Lungtau Mountains, January 10, 1926. A small bamboo with culms up to 4 meters high and 1.5 centimeters in diameter, which turn yellow early. The culm sheaths are said to be spotted with brown, hence the name *Fa hok chuk*. The young shoots are edible.

66786. PHYLLOSTACHYS sp.

No. 349. *Nai chuk*. From the wild, near Yeunguk, Lungtau Mountains, January 11, 1926. The culms are up to 4 meters high and 1.25 centimeters in diameter, with most of the upper portion solid, which makes them somewhat top-heavy and likely to be bent over by any unusual weight, such as the growth of vines. The young shoots are eaten.

66781 to 66789—Continued.**66787. PHYLLOSTACHYS sp.**

No. 387. *Kam chuk*. From the wild near Shekwohtsz, Chauen Mountains, January 17, 1926. This bamboo is scarcely distinguishable, upon first sight, from *Phyllostachys pubescens*, but upon careful examination, however, it is seen to differ in having, on the average, slightly larger leaves, slightly longer internodes, and a double ridge at the nodes instead of a single ridge; the culms have thinner walls and the rhizomes are rounder in cross section and smaller. The young shoots are highly esteemed by the Chinese. In these mountains, where it covers large areas, the shoots are dried in great quantities for the market.

66788. PHYLLOSTACHYS sp.

No. 388. *Woh tsz*. Obtained from the vicinity of Shekwohtsz, Chauen Mountains, January 18, 1926. Hills and valleys of these mountains are clad with this soft-green feathery bamboo which in former peaceful times supplied two great industries, paper making and the drying of young shoots. This is the most highly esteemed and in general the bamboo most widely adapted to the everyday needs of the people. Practically all of the paper manufactured in this Province is made of it. It is unusual in that it produces shoots during the winter months which serve as a table delicacy. The pale-green culms, especially adapted to the making of carrying poles, furniture, and household implements, are covered with a dense short stiff pubescence when young.

66789. (Undetermined.)

No. 399. *Ngau tsin chuk*. Obtained from the wild at Waichungpeng Pass, Chauen Mountains. It is a small bamboo with rather thin-walled culms up to 5 meters in height and 2 centimeters in diameter. The young shoots, though edible, are of no special merit.

66790 and 66791. CHAYOTA EDULIS Jacq. (Seschium edule Swartz). Cucurbitaceae. Chayote.

From Santiago de las Vegas, Cuba. Fruits presented by Dr. Gonzalo M. Fortun, Director, Estación Experimental Agronómica. Received April 15, 1926.

Cuban chayotes.

66790. A white variety.

66791. A green variety.

66792. COIX LACRYMA-JOBI MA-YUEN (Rom.) Stapf. Poaceae. Adlay.

From Impolutao, Bukidnon, Philippine Islands. Seeds presented by Ole Waloe, through P. J. Wester, Ballston, Va. Received April 3, 1926.

Adlay seeds introduced for testing in tropical America.

66793. TRIFOLIUM PRATENSE L. Fabaceae. Red clover.

From Leningrad, Russia. Seeds purchased from A. Kol, chief of the bureau of introduction, Institute of Applied Botany. Received April 20, 1926.

A central Russian variety from the Shatilov Experiment Station, Government of Orel.

66794. SPIRAEA sp. Rosaceae. Spirea.

From Lexington, Ky. Plant presented by Mrs. Harriet Williams Carter. Received April 21, 1926.

Variety *Enchantment*. Said to be superior to any of the spireas now in the American trade. (Mrs. Carter.)

66795 to 66817.

From Montevideo, Uruguay. Seeds presented by Luis Guillot, director tecnico, Dirección de Paseos Públicos. Received April 9, 1926.

66795. ALSTROEMERIA PULCHELLA L. f. *Am-aryllidaceae*. **Parrot alstroemeria.**

A tall slender tuberous-rooted plant, native to Brazil, with dark-red flowers in a simple umbel on a scape 2 or 3 feet high.

66796. BERBERIS GLAUDESCENS St. Hil. *Berberidaceae*. **Barberry.**

A shrubby Brazilian barberry with three-parted brownish spines, glaucescent leaves about an inch long, and black berries.

For previous introduction see No. 40208.

66797. CALYCOTOME SPINOSA (L.) Link. *Fabaceae*.

A low spiny shrub, about 5 feet high, with trifoliolate leaves, hairy beneath, and yellow flowers about three-fourths of an inch long. Native to the Mediterranean region.

66798. CORTADERIA SELLOANA (Schult.) Aschers. and Graebn. *Poaceae*. **Pampas grass.**

A tall reedlike Brazilian grass with numerous culms 3 to 10 feet high and large feathery silvery white panicles 1 to 3 feet high.

66799 to 66806. CREPIS spp. *Cichoriaceae*.

66799. CREPIS ALPINA L.

An annual composite, 2 feet or more high, with oval-oblong, dentate leaves and yellow flower heads. Native to eastern Asia and Asia Minor.

66800. CREPIS ASPERA L.

A tall prickly annual, native to Asia Minor, with rather coarsely toothed leaves and small yellow flower heads.

66801. CREPIS BIENNIS L.

A biennial composite, native to southern Europe, with pinnately hastate leaves.

For previous introduction see No. 66626.

66802. CREPIS BLATTARIOIDES (L.) Vill.

A hairy perennial, with large flower heads; native to central and western Europe.

For previous introduction see No. 66521.

66803. CREPIS DIOSCORIDIS L.

An annual, yellow-flowered plant, native to southern Europe.

66804. CREPIS FOETIDA L.

An annual, more or less bristly European plant up to 2 feet high, with one to four heads of yellow flowers.

66805. CREPIS RUBRA L.

An annual red-flowered plant, native to southern Europe.

For previous introduction see No. 66617.

66806. CREPIS VIRENS L.

An erect plant, native to the Caucasus, with narrowly oblong leaves and yellow flowers.

66807. DATURA INERMIS Jacq. *Solanaceae*.

A white-flowered annual, about 2 feet high, native to Africa.

66795 to 66817—Continued.

66808. INDIGOFERA ARTICULATA Gouan (*I. argentea* L., not Burm.). *Fabaceae*. **Indigo.**

An erect perennial, native to Egypt, with a long taproot, a woody, much-branched stem about 2 feet high, and silvery hairy leaves. The small purplish flowers are in axillary racemes.

For previous introduction see No. 41929.

66809. LESSERTIA BRACHYSTACHYA DC. *Fabaceae*.

A shrubby leguminous plant, with compound leaves composed of about 10 pairs of very narrow leaflets, and purplish flowers in axillary racemes. Native to South Africa.

66810. LONCHOCARPUS NEUROSCAPHA Benth. *Fabaceae*. **Lancepod.**

An evergreen tree, native to Uruguay, with alternate pinnate leaves and racemes of purplish, pealike flowers.

66811. LONICERA NERVOSA Maxim. *Caprifoliaceae*. **Honeysuckle.**

A hardy, graceful Chinese shrub, about 10 feet high, with slender, dark-purple branchlets, oval, purple-veined leaves, small pink flowers, and black berries.

66812. MESEMBRYANTHEMUM ADSCENDENS Haw. *Aizoaceae*.

A low stemless succulent, native to South Africa, with leaves about 2 inches long and white or reddish flowers.

66813. MESEMBRYANTHEMUM AURANTIACUM Haw. *Aizoaceae*.

A low fleshy South African plant, about a foot high, with smooth leaves an inch or less long and orange flowers about 1½ inches wide.

66814. NICOTIANA RUSTICA L. *Solanaceae*. **Aztec tobacco.**

For previous introduction see No. 56614.

66815. ORYZOPSIS MILLICEA (L.) Benth. *Poaceae*. **Grass.**

"*Smilo grass*." A perennial grass, native to the Mediterranean region and known in Australia as velt grass. In California it has been called "Smilo grass," "San Diego grass," "mountain rice," and "many-flowered millet." Under Californian conditions it has exhibited considerable promise. It has been generally introduced into Australia and New Zealand, where it possesses considerable merit. (Note by C. V. Piper under No. 48978.)

66816. PHYSALIS PERUVIANA L. *Solanaceae*. **Poha.**

For previous introduction see No. 56855.

66817. PHYTOLACCA DIOICA L. *Phytolaccaceae*. **Ombu.**

For previous introduction see No. 65963.

66818 to 66832. FRAGARIA spp. *Rosaceae*. **Strawberry.**

From Maidstone, England. Plants purchased from George Bunyard & Co., The Royal Nurseries. Received April 21, 1926. Notes from Bunyard's Catalog of Fruit Trees, 1924-25.

66818. FRAGARIA sp.

Aprikose. A variety producing fairly large, pinkish red berries, of remarkable apricot flavor, distinct from other varieties. Season medium.

66818 to 66832—Continued.**66819. FRAGARIA sp.**

Bedford Champion. A robust plant with fine foliage, producing large berries with a refreshing acid flavor; season medium.

66820. FRAGARIA sp.

British Queen. Pale-red berries of exquisite flavor. Season medium.

66821. FRAGARIA sp.

Countess. A late-seasoned variety producing handsome dark-crimson, wedge-shaped berries; only a moderate cropper, but in point of flavor first rate.

66822. FRAGARIA sp.

King George V. An improved, earlier and better flavored *Royal Sovereign*. The finest strawberry of the century for forcing and outdoor culture.

66823. FRAGARIA sp.

Laxton's Latest. A very fine late-seasoned variety of moderate growth; the shining, deep-crimson berries, fine flavored, are enormous in size, yet firm, approaching 2 ounces.

66824. FRAGARIA sp.

Laxtonian. Large, dark-crimson berries with firm flesh and good flavor which ripen about the same time as *Sir Joseph Paxton*. Season medium. One of the best of recent introduction.

66825. FRAGARIA sp.

Madame Kooi. A medium-seasoned variety, of Dutch origin, producing a large crop of enormous, white-fleshed berries which are hollow and of poor flavor.

66826. FRAGARIA sp.

President. A medium-seasoned variety which is one of the best all-round sorts in regard to quality and productiveness for main crop; it is fine for forcing, as it retains its flavor and bears well. The berries are handsome, of pale color, with a rich pine flavor.

66827. FRAGARIA sp.

Royal Sovereign. A very early, robust, hardy variety with grand foliage, which is a continuous cropper, producing very large berries of brisk luscious flavor, carrying well. This is the best variety where but one kind can be grown, and it is the finest for forcing, as proved at Wisley trials. Season early.

66828. FRAGARIA sp.

Sir Joseph Paxton. A medium-seasoned, hardy, prolific variety which is one of the best for the main crop. The bright glossy red berries are of excellent flavor when fully ripe; that is, when they reach a deep crimson.

66829. FRAGARIA sp.

The Duke. An earlier *Royal Sovereign* which is better in flavor and cropping and the best all-round variety. Season early.

66830. FRAGARIA sp.

Twentieth Century. A very vigorous variety producing an enormous quantity of large bright-red berries.

66831. FRAGARIA sp.

Utility. The finest late strawberry yet produced, which is good in all respects for color, size, and flavor.

66832. FRAGARIA sp.

Waterloo. A very large variety which withstands the heat well and is remarkable for its black mulberrylike appearance. It is a very late variety and is an inefficient maker of runners.

66833. PINUS CEMBRA SIBIRICA Loud. Pinaceae. Pine.

From Leningrad, Russia. Seeds presented by A. Kol, chief of the bureau of introduction, Institute of Applied Botany. Received April 20, 1926.

A native Siberian pine, growing into a stately tree, which prefers a climate with cool nights. It produces fine white lumber and heavy cones filled with edible seeds which are freely sold in western and central Siberia. Native Russian name "Kedr." (Note by Frank N. Meyer under No. 35289.)

66834. TRIFOLIUM PRATENSE L. Fabaceae. Red clover.

From Town Mills, St. Columb Major, Cornwall, England. Seeds presented by T. Rowse Hosking, at the request of R. G. Stapledon, Director, Welsh Plant-Breeding Station, Aberystwyth, Wales. Received April 21, 1926.

Cornish Marl. English-grown seed.

66835. EXACUM ZEYLANICUM Roxb. Gentianaceae.

From Peradeniya, Ceylon. Seeds presented by F. A. Stockdale, Director of Agriculture. Received April 16, 1926.

A herbaceous annual with a 4-sided stem, branched above, oblong, 3-nerved leaves about 3 inches in length, and sky-blue flowers, an inch and a half long, in terminal clusters. Native to Ceylon.

66836. TARENNA ASIATICA (L.) Kuntze (T. zeylanica Gaertn.). Rubiaceae.

From Coimbatore, India. Seeds presented by the Government lecturing and systematic botanist. Received April 16, 1926.

A large shrub or small tree, with leathery, shining-green, oblong leaves up to 8 inches long and cymes of small white flowers. Native to western India and Ceylon.

66837. GERBERA JAMESONI Bolus. Asteraceae. Flame-ray gerbera.

From Cattarattenne, Rattota, Ceylon. Seeds presented by C. J. Hutchinson. Received April 17, 1926.

Seeds of a hybrid strain of this South African herbaceous perennial, to be tested as an ornamental for the southern United States and California.

66838. LANDOLPHIA KIRKII Dyer. Apocynaceae.

From Pretoria, Union of South Africa. Seeds presented by I. B. Pole Evans, chief, division of botany. Received April 21, 1926.

A number of native climbing plants are used in East Africa as sources of rubber, and this shrubby vine is one of the most important, according to Thiselton-Dyer (Flora of Tropical Africa). It has thin, tough leaves, loose clusters of whitish flowers, and roundish fruits 1 to 3 inches in diameter.

For previous introduction see No. 61492.

66839 to 66860. NICOTIANA RUSTICA L. Solanaceae. Aztec tobacco.

From Leningrad, Russia. Seeds presented by A. Kol, chief of the bureau of introduction, Institute of Applied Botany. Received April 20, 1926.

Russian-grown strains.

66839 to 66845. From Russia.

66839. *Black Sultan.*

66840. *Jamskaja Sloboda.*

66841. *Kosloff.* White seeded.

66839 to 66860—Continued.66842. *Pekheltz-Khomutskoje*.66843. *Pekheltz-Korablino*.66844. *Seslavino*.66845. *Sisy-Drasghi*. Black-blue.

66846 to 66857. From the Ukraina.

66846. *Bakoun Sosnitza*.66847. *Bakoun Verkievka*.66848. *Black Bakoun*.66849. *Jabky*. Curled.66850. *Khaelivka*.66851. *Konotop*.66852. *Primak*.66853. *Shvitzent*.66854. *Srebrianka*.66855. *Talidan*.

66856. Tall green variety.

66857. *Yellow Makhorka*.

66858 to 66860. From Detskoje Selo.

66858. *Kolmak Turkestan*.66859. *Shvitzent Detskoje Selo*.66860. *Shvitzent*. White seeded.**66861 and 66862. CHAETOCHLOA ITALICA (L.) Scribn. (*Setaria italica* Beauv.). Poaceae. Millet.**

From Nanking, China. Seeds presented by Wang Sheo, University of Nanking. Received April 13, 1926.

Chinese-grown millet.

66861. A golden-yellow variety.

66862. A white variety.

66863 and 66864.

From Port of Spain, Trinidad, British West Indies. Seeds presented by H. Caracciolo. Received April 19, 1926.

66863. *BAUHINIA ACUMINATA* L. Caesalpinaceae. Snowy bauhinia.

An upright bush about 6 feet high, with oval leaflets which close at night and white flowers 2 to 3 inches across. Native to southwestern Asia and suitable for greenhouse culture or for growing outside in summer.

For previous introduction see No. 30714.

66864. *ERYTHROXYLON COCA* Lam. Erythroxylaceae. Cocaine tree.

A South American shrub, probably indigenous to Peru, which is grown commercially on a large scale throughout the warmer parts of South America, also in Java and Ceylon, for the sake of cocaine, which is extracted from the dried leaves. For its best development the shrub requires a humid atmosphere and high culture.

66865. DIANELLA ENSIFOLIA (L.) Red. Liliaceae.

From Canton, China. Rhizomes collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received April 21, 1926.

No. 370. Originally from Heungshaan, near Takking, West River, and grown for a time at the Canton Christian College. *Kaau tsin tso*. A very attractive member of the lily family about one-third of a meter high, with long, grasslike leaves, lax panicles of creamy white flowers, and globose

blue fruits which remain on the plant for some time after maturing. The leaves are often thickly dotted with tiny spots which seem to be the result of rust infection.

For previous introduction see No. 49531.

66866. ILEX INTRICATA Hook. f. Aquifoliaceae. Holly.

From Darjiling, India. Seeds presented by G. H. Cave, curator, Lloyd Botanic Gardens. Received January 8, 1923. Numbered April, 1926.

A low rigid straggling shrub which forms impenetrable masses of interlaced woody branches. The leaves are bright green, thick, leathery, and spreading, and the fruits are globular and red. The shrub is a native of Sikkim and eastern Nepal, India, where it grows at altitudes of 10,000 to 15,000 feet.

66867. HELIANTHUS TUBEROSUS L. Asteraceae. Jerusalem artichoke.

From Paris, France. Tubers purchased from Vil-morin-Andrieux & Co. by D. N. Shoemaker, Bureau of Plant Industry. Received April 26, 1926.

Potato. A French variety.

66868 and 66869. EREMOCITRUS GLAUCA (Lindl.) Swingle (*Atalantia glauca* Benth.). Rutaceae.**Australian desert kumquat.**

From Dundas, New South Wales. Seeds presented by Herbert J. Rumsey. Received April 27, 1926.

A shrub or small tree about 14 feet high, native to the deserts of northeastern Australia. The small thick leathery leaves are gray green and the fruits are about half an inch in diameter. The acid juice of the fruits forms the basis of an agreeable beverage, and the peel has the sweetish flavor of the kumquat. It is the hardiest of all the evergreen citrus fruits.

For previous introduction see No. 58552.

66868. Selection (from an old tree).

66869. Selection.

66870 to 66882. GOSSYPIMUM spp. Malvaceae. Cotton.

From Cawnpore, United Provinces, India. Seeds presented by B. Rama Prasada, assistant economic botanist to the Government, Agricultural Department. Received April 20, 1926.

A collection of locally grown cotton varieties.

66870. *GOSSYPIMUM ARBOREUM* L.

A rare variety which is not cultivated anywhere. It is grown in the vicinity of temples and mosques, the produce being used for religious purposes. (*Prasada*.)

66871 to 66873. *GOSSYPIMUM NEGLECTUM* Todaro.

66871. A broad-lobed, white-flowered variety.

66872. A broad-lobed, white-flowered variety.

66873. A broad-lobed, white-flowered (fertile) variety.

66874. A broad-lobed, yellow-flowered variety.

66875. A broad-lobed, yellow-flowered variety.

66876. A broad-lobed, yellow-flowered (khaki) variety.

66877. A narrow-lobed, white-flowered variety.

66878. A narrow-lobed, yellow-flowered variety.

66870 to 66882—Continued.**66879. GOSSYPIUM sp.**

No. 255.

No. 1031.

66882. GOSSYPIUM sp.

No. 1035.

**66883 to 66886. TRIFOLIUM PRATENSE.
L. Fabaceae. Red clover.**

From Aberystwyth, Wales. Seeds presented by R. G. Stapledon, Director, Welsh Plant-Breeding Station. Received April 26, 1926.

66883. Aa 1216. English Late.**66884. Aa 1217. Vale of Clwyd.****66885. Aa 1227. Wild red.****66886. Aa 1234. Wild red.****66887. PRUNUS SALICINA Lindl. Amygdalaceae. Japanese plum.**

From Harbin, Manchuria. Seeds presented by N. Glowkhoff, superintendent, botanical garden of the Manchurian Research Society. Received April 24, 1926.

To be tested as a hardy stock for stone fruits.

66888. CANNA sp. Cannaceae.

From Haina, Santo Domingo, Dominican Republic. Seeds presented by Dr. R. Ciferri, Director, Estación Agronómica de Haina. Received April 23, 1926.

A native species from Samana, Dominican Republic.

66889. SACCHARUM OFFICINARUM L. Poaceae. Sugar cane.

From Durban, Natal, South Africa. Cuttings presented by H. H. Dodds, through E. W. Brandes, Bureau of Plant Industry. Received April 28, 1926.

A local variety.

66890. TRICHOSANTHES HYBRIDA Hort. Cucurbitaceae.

From Paris, France. Plant presented by Vilmorin-Andrieux & Co. Received April 26, 1926.

An ornamental cucurbitaceous vine, probably with showy, highly colored, globose gourdlike fruits.

66891. ORNITHOGALUM THYRSOIDES Jacq. Liliaceae. Chincherichee.

From Pretoria, South Africa. Seeds presented by Mervyn C. Mossop. Received April 26, 1926.

The flower heads, when in full bloom, are somewhat larger than a half-pint tumbler, and in the natural state stand up to about 2 or 2½ feet on their stems. (Mossop.)

For previous introduction see No. 62800.

66892 to 66894. GOSSYPIUM spp. Malvaceae. Cotton.

From Valletta, Malta. Seed presented by J. Borg, Superintendent of Agriculture. Received April 21, 1926.

66892. GOSSYPIUM HERBACEUM L.

Malta.

66893 and 66894. GOSSYPIUM HIRSUTUM L.**66893. Gallipoli.****66894. Nankin.****66895. DIANELLA ENSIFOLIA (L.) Red. Liliaceae.**

From Canton, China. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received April 26, 1926.

No. 434. From plants grown at the Canton Christian College, which were originally collected at Heungshaan, in the vicinity of Takhing. *Kaau tain tso.*

For previous introduction and description see No. 49531.

66896. CHAYOTA EDULIS Jacq. Cucurbitaceae. Chayote.

From San Juan, Porto Rico. Fruits presented by O. W. Barrett, agricultural director, Department of Agriculture and Labor. Received April 28, 1926.

A white variety.

66897. PINUS CEMBRA SIBIRICA Loud. Pinaceae. Pine.

From Omsk, Siberia. Seeds presented by K. Murashinsky, Siberian Agricultural Academy. Received April 27, 1926.

No. 23162.

For previous introduction and description see No. 66833.

66898. CITRUS sp. Rutaceae.

From Kota Kenjaran, Sumatra. Seeds collected by David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition. Received April 29, 1926.

No. 631. A wild tree, about 6 inches in diameter and 30 feet or more in height, found on the trail near Kota Kenjaran. The fruit is practically round and 4½ inches in diameter, skin smooth and about three-fourths of an inch thick, flesh very sour and bitter.

66899. CITRUS sp. Rutaceae.

From Italy. Fruit obtained from a passenger arriving at New York. Received April 29, 1926.

To be grown to ascertain the horticultural value.

66900 to 66902. PHYLLOSTACHYS spp. Poaceae. Bamboo.

From China. Rhizomes collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received June and July, 1925. Numbered April, 1926.

66900 to 66902—Continued.

66900. PHYLLOSTACHYS sp.

No. 128. From Ooshek, on the Sui River, in the eastern part of Kwangsi Province. April 28, 1925. *Manchuk*, *Mansunchuk*. The sprouts are smaller, on the average, than those of *Manchuk* [No. 66901].

66901. PHYLLOSTACHYS sp.

No. 141. Ooshek. April 28, 1925. *Manchuk*.

66902. PHYLLOSTACHYS sp.

No. 150. Obtained from the wild on Beggar Mountain, Lohkongtung, May 24, 1925. *Ka fat to chuk*. This is a small bamboo, 2 to 3 meters high, and spreading by means of rhizomes. The young sprouts, which come in March and April, are considered by the local people to be very excellent, as it is not necessary to subject them to the parboiling and soaking process required by so many of the rhizome bamboos. Now and then a cane is said to appear with swollen nodes and shortened internodes, a characteristic doubtless responsible for the name given to this bamboo, which may prove to be the same as No. 110 [No. 63872]. Such canes are much sought after by the village people for pipestems.

66903 to 66950.

From Ottawa, Canada. Seeds presented by J. Adams, botanist, Central Experimental Farm. Received April 23, 1926.

66903 to 66910. ACONITUM spp. Ranunculaceae.

66903. ACONITUM FISHERI Reichenb.

Azure monkshood.

No. 675. Var. *acutum*. A herbaceous perennial with stems about 5 feet high, large three-parted leaves, and numerous pale-blue flowers in panicles. Native to Canada.

For previous introduction see No. 51745.

66904. ACONITUM HETEROPHYLLUM Wall.

No. 676. An erect herbaceous perennial 1 to 3 feet high, with broadly oval or rounded heart-shaped, more or less five-lobed leaves, and bright-blue flowers about an inch long, in panicle racemes. Native to the temperate Himalayas.

66905. ACONITUM KUSNEZOFFII Reichenb.

No. 679. An erect hardy herbaceous perennial, native to northeastern Asia, with terminal clusters of bluish flowers.

66906 and 66907. ACONITUM LYCOCTONUM L.

Wolfbane.

A slender perennial reaching a height of 6 feet, with yellow or whitish flowers. Native to Europe and Siberia.

For previous introduction see No. 53122.

66906. No. 680. Var. *pyrenaicum*.66907. No. 681. Var. *scholeri*.

66908 and 66909. ACONITUM NAPELLUS L.

Aconite.

An erect herbaceous European perennial, with stems about 3 feet high, much-divided leaves, and racemes of blue flowers.

For previous introduction see No. 53082.

66908. No. 677. Var. *braunii*.66909. No. 678. Var. *grandiflorus*.

66910. ACONITUM ORIENTALE Mill.

Monkshood.

No. 682. A herbaceous perennial 4 to 5 feet high, native to the Caucasus, with large palmately divided leaves and light-yellow flowers.

66903 to 66950—Continued.

66911 to 66919. ANEMONE spp. Ranunculaceae.

66911. ANEMONE BALDENIS L.

No. 691. A tuberous rooted white-flowered perennial about 6 inches high, native to Switzerland.

66912. ANEMONE CORONARIA L.

Poppy anemone.

No. 693. A low herbaceous perennial, a foot or less high with tuberous roots, finely divided leaves, and poppylike variously colored flowers. Native to the Mediterranean region.

66913. ANEMONE MONTANA Hoppe.

No. 694. A herbaceous perennial with oval pinnatifid leaves and nodding, deep-violet flowers. Native to southern Europe.

66914. ANEMONE NIGRICANS (Stoerck) Kerner.

No. 696. A hairy perennial native to central Europe, a foot or less high, with finely divided basal leaves, and blue or purple flowers an inch or two across.

66915 and 66916. ANEMONE PATENS L.

Spreading anemone.

A very hairy European anemone, about 8 inches high, with much-divided leaves and erect, bluish purple or whitish flowers with feathery styles.

66915. No. 698. Var. *wolfgangiana*.66916. No. 699. Var. *montana*.

66917. ANEMONE RIVULARIS Buch.-Ham.

Anemone.

No. 700. A woody ornamental plant from 1 to 3 feet in height, with three-parted basal leaves up to 6 inches in diameter and white or bluish flowers, 1 to 1½ inches long, in compound cymes. It is a native of temperate regions in India and Ceylon above 5,000 feet altitude.

For previous introduction see No. 47638.

66918 and 66919. ANEMONE SYLVESTRIS L.

Snowdrop anemone.

A European perennial commonly called the snowdrop anemone because of the drooping habit of the flowers before fully expanding, giving it a certain resemblance to the snowdrop (*Galanthus nivalis*). The white flowers, 1½ inches in diameter, are borne on long peduncles which arise singly from an involucre of leaves. These leaves are ternate or quinate with deeply toothed leaflets, and are hairy on the under surface.

For previous introduction see No. 49922.

66918. No. 701.

66919. No. 702. Var. *baicaliensis*.

66920 to 66922. BERBERIS spp. Berberidaceae.

Barberry.

66920. BERBERIS CARICA Hort.

No. 26.

66921. BERBERIS FISCHERI Hort.

No. 28. Probably a form of *Berberis canadensis*.

66922. BERBERIS CHINENSIS Poir.

A hardy barberry, native to the Caucasus, closely related to *Berberis sinensis*. It is 4 to 6 feet high, with slender branches and purplish berries.

66923 to 66925. COTONEASTER spp. Malaceae

66903 to 66950—Continued.

66923. *COTONEASTER ACUTIFOLIA* Turcz.
Peking cotoneaster.

No. 803. A bushy Chinese shrub, 5 to 7 feet high. The dull-green leaves are paler and hairy beneath, and the white flowers are borne three or more in corymbs. The smooth reddish fruits, one-third of an inch in diameter, are finally black.

For previous introduction see No. 53666.

66924. *COTONEASTER AFFINIS* BACILLARIS (Wall.) C. Schneid.

No. 804. A very graceful shrub, 15 feet high, spreading to a larger diameter. The white flowers, one-third of an inch across, are borne in clusters 1 to 2 inches in diameter. The small roundish fruits are purplish brown. Native to the Himalayas up to 10,000 feet altitude.

For previous introduction see No. 53668.

66925. *COTONEASTER* sp.

No. 810.

66926 to 66928. *CYTISUS* spp. Fabaceae. Broom.

66926. *CYTISUS SUPINUS* L.
Big flower broom.

No. 535. An upright shrub, up to 2 feet high, native to central Europe. The bright-yellow flowers are solitary in the spring but in headlike clusters later on in summer.

66927. *CYTISUS ELONGATUS* Waldest. and Kit.

No. 536. A stout, much-branched shrub up to 5 feet high with long upright branches, hairy leaflets, and yellow flowers. Native to central and southern Europe.

66928. *CYTISUS VULPINUS* Hort.

No. 539.

66929. *HEMEROCALLIS CITRINA* Baroni. Liliaceae.
Citron day lily.

No. 1181. A tall bulbous Chinese plant with very fragrant lemon-yellow flowers. The leaves are more than 3 feet long.

66930 to 66933. *IRIS* spp. Iridaceae. Iris.

66930. *IRIS APHYLLA* L. Stool iris.

No. 1124. A European iris with glaucous leaves up to a foot long, or sometimes leafless. The dark-lilac flowers are about 2 inches long.

66931. *IRIS DICHOTOMA* Pall. Vesper iris.

No. 1142. A northern Chinese iris with six to eight leaves, about a foot long, in fan-shaped clusters, a much-branched stem 2 feet high, and short-lived flowers, whitish and light purple.

For previous introduction see No. 65526.

66932. *IRIS SIBIRICA* L. Siberian iris

No. 1141. Var. *constantinopolitana*.

66933. *IRIS SORDIDA* Hort.

No. 1136.

66934. *LILUM REGALE* Wilson. Liliaceae.
Regal lily.

No. 1188.

For previous introduction see 63775.

66935. *PENTSTEMON GENTIANOIDES* (H. B. K.) Poir. Scrophulariaceae.

No. 1033. A Central American perennial 3 to 4 feet high with purple flowers in a long leafy raceme.

66903 to 66950—Continued.

66936. *PHELLODENDRON JAPONICUM* Maxim. Rutaceae.

No. 987. A Japanese tree, up to 30 feet high, with dark-brown bark, compound leaves composed of 9 to 13 ovate, dull-green leaflets, and black fruits in panicles 2 to 3 inches across.

66937 to 66940. *POLEMONIUM* spp. Polemoniaceae.

66937. *POLEMONIUM BOREALE* Adams.

No. 629. An erect hardy herbaceous perennial, native to Siberia, with terminal panicles of blue flowers.

66938. *POLEMONIUM CAERULEUM* L.
Greek valerian.

No. 630. A blue-flowered herbaceous perennial, 1 to 3 feet high, native to Europe.

66939. *POLEMONIUM MEXICANUM* Cerv.

No. 636. A herbaceous perennial, less than a foot high, with pinnate leaves. Native to Mexico.

66940. *POLEMONIUM PAUCIFLORUM* S. Wats.

No. 637. A herbaceous perennial 1 or 2 feet high, with yellow flowers. Native to Mexico.

66941 and 66942. *PUSCHKINIA* spp. Liliaceae.

66941. *PUSCHKINIA SCILLOIDES* LIBANOTICA (Zucc.) Boiss.

No. 1196. A half-hardy bulbous plant, native to Asia Minor, and related to the squills. The bluish white flowers are in racemes on a scape 4 to 12 inches high, and the leaves are about the same length.

66942. *PUSCHKINIA SCILLOIDES* Adams.

No. 1197. A bulbous plant, native to Asia Minor, about a foot high, with racemes of bluish flowers.

66943 to 66945. *ROSA* spp. Rosaceae. Rose.

66943. *ROSA CALCUTENSIS* Hort.

No. 943.

66944. *ROSA GUTTENSTEINENSIS* Jacq.

No. 950. A southern European shrub 6 feet high, with the whole plant glaucous and tinged with red. The five to seven oblong leaflets are simply toothed, the bright-red flowers are in small clusters, and the small globose fruits are red and pulpy.

66945. *ROSA WASSERBURGENSIS* Kirschl.

No. 972. Said to be a cross between *Rosa tomentosa* and *R. pendulina*.

66946. *SYRINGA EMODI* Wall. Oleaceae.
Himalayan lilac.

No. 598. A large robust Himalayan lilac 10 to 15 feet high, closely allied to *Syringa villosa*, but with the leaves whiter beneath. The panicles are usually columnar, 3 to 6 inches long, and not so richly colored as those of the above-mentioned species. It is useful in flowering rather late.

For previous introduction see No. 42319.

66947. *SYRINGA VILLOSA* Vahl. Oleaceae.
Late lilac.

No. 599. A bushy lilac about 8 feet high, with stout, upright branches, broadly oval, bright-green leaves, and pinkish lilac flowers in panicles 3 to 7 inches long. Native to China and the Himalayas.

For previous introduction see No. 38830.

66903 to 66950—Continued.

66948. *VIBURNUM HANCEANUM* Maxim. Caprifoliaceae.

No. 158. A hardy bushy deciduous shrub from southwestern China, where it becomes 6 to 10 feet high. The branches are mostly horizontal, and the roundish, slightly toothed, sharp-pointed leaves are dull dark green above and pale grayish beneath. The inflorescence consists of a flat umbel 2 to 4 inches across; the center is filled with small perfect inconspicuous flowers, surrounded by a few large white imperfect flowers about an inch wide. The roundish egg-shaped fruits are at first coral red and finally blue-black.

For previous introduction see No. 58473.

66949. *VIBURNUM MACROCEPHALUM* Fortune. Caprifoliaceae. Chinese viburnum.

No. 162. A spreading shrub 12 feet or more high, with dark-green, oval-oblong leaves 2 to 4 inches long, and yellowish white flowers in cymes 3 to 5 inches across. Native to China.

66950. *VIOLA ODORATA* L. Violaceae. Sweet violet.

No. 1091.

For previous introduction see No. 62798.

66951 to 66954.

From Groningen, Netherlands. Seeds presented by Dr. J. C. Schoute, director, botanic garden. Received April 29, 1926.

66951. *ALLIUM KARATAVIENSE* Regel. Liliaceae. Onion.

A herbaceous plant with very broad, ovate-oblong, flat leaves, and pink flowers borne in dense, convex umbels. The scapes are about 6 inches high. Native to Turkestan.

For previous introduction see No. 60228.

66952. *ALLIUM PANICULATUM* L. Liliaceae. Onion.

A perennial onion, up to 2 feet high, with linear, half-terete leaves and purplish flowers. Native to the Mediterranean region.

66953. *CREPIS BIENNIS* L. Cichoriaceae.

A biennial composite, native to Europe, 1 or 2 feet high, introduced for the use of geneticists.

66954. *TRIGONELLA CAERULEA* (L.) Seringe. Fabaceae.

An upright annual, 2 feet or less high, with bright-blue flowers. Native to southeastern Europe.

For previous introduction see No. 66644.

66955. *CYNOGLOSSUM WALLICHII* Don. Boraginaceae. Hound's-tongue.

From Bordeaux, Gironde, France. Seeds presented by Prof. L. Beille, Director, Botanic Garden of Talence. Received April 29, 1926.

An erect hairy, herbaceous perennial with ovate or lanceolate leaves and elongated racemes of very small, intensely blue flowers. It is very common in the western part of the temperate Himalayas.

For previous introduction see No. 47670.

66956 to 66969.

From Paris, France. Seeds presented by Prof. D. Bois, Paris Museum of Natural History. Received April 29, 1926.

66956. *CERCIS CHINENSIS* Bunge. Caesalpinaceae. Chinese redbud.

Tze ching. The Chinese redbud grows 10 to 12 feet high and stands drought very well. It is a very ornamental bush when in flower,

66956 to 66969—Continued.

blooming before the leaves are out. The leaves are large, glossy green, and more or less heart-shaped. (Note by Frank N. Meyer under No. 22458.)

66957. *CYTISUS LINIFOLIUS* (L.) Lam. Fabaceae. Broom.

A low shrub, 3 feet or less high, with erect silky hairy branches and very narrow shining-green leaflets with silvery lower surfaces. The bright-yellow flowers are in short compact clusters. Native to the Mediterranean countries.

For previous introduction see No. 66135.

66958. *HEMEROCALLIS MINOR* Mill. Liliaceae. Dwarf day lily.

An attractive bulbous plant, native to eastern Asia, with very narrow dark-green leaves a foot and a half long, with scapes about the same length bearing small clusters of golden-yellow flowers.

66959. *IRIS ENSATA* Thunb. Iridaceae. Russian iris.

Variety *pubularia*. A larger form with leaves purplish near the base; said to be used as a forage plant and to do well in very dry situations.

66960. *KNIPHOFIA ENSIFOLIA* Baker. Liliaceae. Torch lily.

A South African bulbous plant with sword-shaped leaves 3 feet long and a dense raceme of yellow flowers.

66961. *LABURNUM ANAGYROIDES ALSCHINGERI* (Vis.) C. Schneid. Fabaceae. Golden chain.

A variety with more silky leaves than the type and shorter racemes; native to southeastern Europe.

66962. *LIGUSTRUM COMPACTUM* Hook. f. and Thoms. Oleaceae. Privet.

A shrub 12 feet or less in height, with thick, narrowly oblong leaves 2 to 3 inches long. Native to Yunnan, China.

For previous introduction see No. 66581.

66963. *LILIUM POMPONIUM* L. Liliaceae. Lily.

A handsome graceful lily, native to the Alps of France and Italy, with 100 or more leaves and 1 to 15 flowers, brilliant scarlet, dotted purplish black, with an unpleasant odor.

66964. *ORNITHOGALUM LONGEBRACTEATUM* Jacq. Liliaceae.

A South African bulbous plant with five or six very narrow, fleshy leaves 1 to 2 feet long and a dense raceme of whitish flowers on a scape about 2 feet long.

66965. *PAEONIA VEITCHII* Lynch. Ranunculaceae. Peony.

A herbaceous peony, native to western China, about 2 feet high, with shining light-green leaves and purplish crimson flowers about 4 inches across.

66966 to 66968. *SCILLA* spp. Liliaceae. Squill.

66966. *SCILLA AMOENA* L.

A hardy European bulbous plant with four to seven leaves 6 to 9 inches long and blue flowers in many-flowered racemes.

66967. *SCILLA AUTUMNALIS* L.

A hardy North African bulbous plant with numerous half-terete leaves and pink flowers in open spikelike racemes.

66968. *SCILLA HISPANICA* Mill. Spanish squill.

An attractive bulbous plant, native to Spain and Portugal, with compact racemes of rose-purple or white flowers on long scapes

66956 to 66969—Continued.

66969. *STYRAX OFFICINALIS* L. *Styracaceae*.
Snowbell.

A handsome shrub or low tree, 20 feet high, with hairy broadly oval leaves and numerous white flowers about three-fourths of an inch long, in small clusters. Native to Europe and Asia Minor.

66970 to 66974. *FRAGARIA* spp. *Rosaceae*. Strawberry.

From Vineland Station, Ontario, Canada. Plants presented by E. F. Palmer, Director, Horticultural Experiment Station. Received May 5, 1926.

66970. *FRAGARIA* sp.

Pocomoke. The medium to large berries are round-conic and bright crimson; the medium red, firm flesh is a brisk subacid of good quality. This variety produces numerous runners and closely resembles *Parsons*. Season medium late. (*Virginia Polytechnic Institute, Bul. 11.*)

66971. *FRAGARIA* sp.

Valonia. A cross between *Dunlap* and *Early Ozark*. It is a vigorous grower, with perfect flowers, and is productive. In season it is two or three days earlier than *Dunlap*. The fruits are of medium size, bright red, moderately firm, and fair to good in quality. (*The Canadian Horticulturist, vol. 47, No. 4.*)

For previous introduction see No. 63663.

66972. *FRAGARIA* sp.

Vanguard. A cross between *Pocomoke* and *Early Ozark*. The plants are vigorous, healthy, and productive, with perfect flowers. The ripening season is about a week before *Dunlap*. The fruits are of medium size, round-conic, regular in shape, bright red, firm and of good quality, being sweeter than most early varieties. (*The Canadian Horticulturist, vol. 47, No. 4.*)

For previous introduction see No. 63664.

66973. *FRAGARIA* sp.

Vantage. A cross between *Williams* and *Early Ozark*. This is described (Report of the Vineland Station to the Ontario Department of Agriculture for 1919) as a vigorous grower, with early maturing, bright-pink fruits which retain their color in storage. In quality this variety is fair.

For previous introduction see No. 63665.

66974. *FRAGARIA* sp.

Williams. A cross between *Crescent* and *Sharpless*. Berries large, round-conic to wedge-conic, dark crimson, often with white tip; flesh dark red, firm subacid and of good quality; runners numerous. Midseason variety. This has been a popular commercial variety in Canada, especially in southern Ontario, and it is still valued. (*Virginia Polytechnic Institute, Bul. 11.*)

66975 and 66976. *CHAYOTA EDULIS* Jacq. *Cucurbitaceae*. Chayote.

From San Juan, Porto Rico. Fruits presented by O. W. Barrett, agricultural director, Department of Agriculture and Labor. Received May 4, 1926.

66975. A green variety.

66976. A white variety.

66977. *TRICHOSANTHES BRACTEATA* (Lam.) Voigt. *Cucurbitaceae*.

From Solan Brewery, Simla, Punjab, India. Seeds presented by H. E. J. Peake, Khaltoo Orchards. Received April 30, 1926.

A stout annual ornamental vine climbing to 30 feet, with broadly oval leaves, scabrous above and deeply lobed; globose fruits, red streaked with orange. Native to India.

66978 to 66982.

From Capetown, South Africa. Bulbs purchased from W. S. Duke & Co. Received April 10, 1926.

A collection of South African bulbous plants.

66978. *AMARYLLIS BELLADONNA* L. *Amaryllidaceae*.
Belladonna lily.

66979. *AMARYLLIS BRUNSVIGIA* Hort. *Amaryllidaceae*.

66980. *HAEMANTHUS COCCINEUS* L. *Amaryllidaceae*.
Scarlet blood lily.

A low bulbous plant, native to South Africa, with the bulb compressed sidewise; there are two suberect strap-shaped leaves and red flowers on a scape 6 to 10 inches tall.

66981. *NERINE SARNIENSIS* (L.) Herbert. *Amaryllidaceae*.
Guernsey lily.

A South African bulbous plant with bright-green linear leaves about a foot long, developed after the bright-crimson flowers; the latter are in umbels of about 12.

66982. *WATSONIA IRIDIFOLIA* (Jacq.) Ker. *Iridaceae*.
White bugle lily.

Variety *Ardennii*. A South African plant closely resembling the gladiolus, with sword-shaped leaves and regular pure-white flowers in spikes on a scape 3 to 4 feet high.

66983 to 66994. *ORYZA SATIVA* L. *Poaceae*. Rice.

From Dacca, India. Seeds presented by the economic botanist to the Government of Bengal. Received May 3, 1926.

Indian rice varieties.

66983 to 66990. Selections of *Dacca*.

66983. No. 1.

66984. No. 2.

66985. No. 4.

66986. No. 5.

66987. No. 6.

66988. No. 9.

66989. No. 7.

66990. No. 15.

66991. No. 297. *Methiamon*. A deep-water variety.

66992. No. 507. *Chingair*. A deep-water variety.

66993. *Larkoch*.

66994. *Marich Bati*.

66995. HYDNOCARPUS ALPINA Wight.
Flacourtiaceae.

From St. Jean le Blanc, via Orleans, Loiret, France. Seeds presented by Edmond Versin. Received May 4, 1926.

Introduced for study because of its close relationship to *Taraktogenos kurzii*, the source of the genuine chaalmoogra oil.

A large tree, 70 to 100 feet in height, with very variable leaves (red when young and deep green when old), up to 7 inches long and $2\frac{1}{2}$ inches wide, and dioecious flowers in axillary racemes. The fruit is globose, about the size of an apple, with a brown hairy surface. The seeds yield an oil which is used as fuel, and the wood is employed for general carpentry. The tree is native to the Nilgiri Hills in southern India.

For previous introduction see No. 56445.

66996 to 66998. CHAYOTA EDULIS Jacq.
Cucurbitaceae. Chayote.

From Guatemala. Seeds presented by Wilson Popenoe, superintendent of agricultural experiments, United Fruit Co. Received May 7, 1926.

66996. A large green variety.

66997. A small green variety.

66998. A small white variety.

66999. ULMUS PUMILA L. Ulmaceae.
Chinese elm.

From Washington, D. C. Seeds collected by Paul Russell, Bureau of Plant Industry. Received May 4, 1926.

The tree from which these seeds were collected, in front of the District Building, is one of a lot presented to the Office of Public Buildings and Public Parks in May, 1908 (No. 40898). This is probably the first Chinese elm to produce seeds in this part of the United States.

67000 to 67018.

From Leningrad, Russia. Seeds presented by Dr. B. L. Issatschenko, director, botanic garden. Received May 4, 1926.

67000. ASTER YUNNANENSIS Franch. Asteraceae.

A herbaceous perennial from southwestern China with unusually large brilliant lilac-blue flowers with a yellow disk.

67001. CYNOGLOSSUM AMABILE Stapf and Drummond. Boraginaceae. Hound's-tongue.

A hardy Chinese biennial which produces a mass of bright-blue flowers.

67002. LIBERTIA GRANDIFLORA (R. Br.) Sweet. Iridaceae.

A tender bulbous plant, native to New Zealand, with rigid linear leaves 1 to $2\frac{1}{2}$ feet long and a large panicle of white flowers.

67003 to 67006. IRIS spp. Iridaceae.

67003. IRIS sp.

67004. IRIS RUTHENICA Ker.

A Chinese iris with tufts of linear leaves, about 6 inches long at flowering time, up to a foot long later. The outer segments of the violet-scented flowers are lilac, marked with bluish purple; the inner segments are deep purple-violet.

67005. IRIS ENSATA Thunb. Russian iris.

The Russian iris has leaves 1 to 3 feet long, and a flattened stem up to a foot in height, bearing a single head of bright blue or lilac flowers.

67000 to 67018—Continued.**67006. IRIS SETOSA Pall.**

Arctic iris.

According to Dykes (Iris, p. 64), this was originally described as an Asiatic plant, but forms that can not be separated from it are found in North America. At least half a dozen forms come true from seed. The peculiarity of this iris is that the standards have dwindled until they are only small points about half an inch long, but their disappearance is usually counterbalanced by the increased size of the falls. The color is usually blue, but some shades are so light as to be almost gray.

For previous introduction see No. 57297.

67007 to 67010. CREPIS spp. Cichoriaceae.**67007. CREPIS SIBERICA L.**

A perennial composite, 2 to 3 feet high, covered with short rough hairs, bearing a terminal cluster of bright-yellow flowers. Native to Asia Minor and the Himalayas.

For previous introduction see No. 66628.

67008. CREPIS RUBRA L.

An annual composite about a foot high with solitary red flowers. Native to southern Europe.

For previous introduction see No. 66522.

67009. CREPIS CAPILLARIS Wallr.

A more or less prostrate herbaceous plant, with much-branched stems and small flower heads. Native to southern Europe.

67010. CREPIS ALPESTRIS (Jacq.) Reichenb.

A perennial composite, native to southern Europe, with oblong or lanceolate leaves and yellow flower heads.

67011. HYACINTHUS PYCNANTHUS (Koch) Baker.
Liliaceae. Hyacinth.

A wild Armenian hyacinth with very narrow oblong leaves and small, dense racemes of azure-blue flowers with yellow anthers.

67012. MUSCARI PENDULUM Trautv. Liliaceae.
Grape hyacinth.

A narrow-leaved bulbous plant from Asia Minor, with dense racemes of sky-blue flowers.

67013. HEMEROCALLIS MINOR Mill. Liliaceae.
Dwarf day lily.

An attractive day lily from northeastern Asia, with narrow dark-green leaves about $1\frac{1}{2}$ feet long and golden-yellow flowers in few-flowered corymbs.

67014 to 67016. COLCHICUM spp. Melanthiaceae.
Autumn crocus.**67014. COLCHICUM UMBROSUM Stev.**

A low bulbous plant, native to the Caucasus, with about five narrow leaves and small clusters of lilac flowers.

67015 and 67016. COLCHICUM SPECIOSUM Stev.

67015. Variety *album*. A low bulbous plant with a stem about a foot high, four or five shining green leaves, and nearly white flowers, often 6 inches across. Native to the Caucasus.

67016. A bulbous plant, flowering in autumn, with large showy dark-rose flowers. The strong foliage appears in spring, but dies off in midsummer, and after some weeks of rest the flowers appear. (Note by Frank N. Meyer, under No. 27304.)

67000 to 67018—Continued.

67017. *IRIS APHYLLA* L. Iridaceae. Stool iris.

A European iris with glaucescent leaves 6 to 12 inches long and dark-lilac flowers with white beards.

67018. *IRIS ACUTILOBA* Meyer. Iridaceae.

A wild iris, native to the Caucasus, with purple and fawn-colored flowers.

For previous introduction see No. 30581.

67019. *LITHOCARPUS CORNEA* (Lour.) Rehder. Fagaceae.

From Canton, China. Seeds obtained by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received May 3, 1926.

No. 440. *Shek lut*. Purchased at the market, Canton, March 6, 1926. The original source is not definitely known, but probably was in the Chunwong Mountains, west of Tsinguen. This variety is said to appear on the Canton markets in small quantities at infrequent intervals, and the nuts are esteemed as an article of food. (McClure.)

67020 and 67021.

From Algiers, Algeria. Seeds presented by Dr. L. Trabut. Received April 30, 1926. Notes by Doctor Trabut.

67020. *DAUCUS CAROTA* L. Apiaceae. Carrot.

Collected in a Saharan oasis, March, 1926.

67021. *HORDEUM VULGARE PALLIDUM* Seringe. Poaceae. Six-rowed barley.

A gray barley from a Saharan oasis, March, 1926.

67022 to 67066.

From Paris, France. Seeds presented by Vil-morin-Andrieux & Co. Received April 27, 1926.

67022. *ABIES HOMOLEPIS* Sieb. and Zucc. Pinaceae. Nikko fir.

A hardy fir, native to the mountains of central Japan, ultimately about 90 feet tall. The leaves are dark green, sharp pointed, and silvery white below; the stout dark-purple cones are 3 inches long.

67023. *ABIES HOMOLEPIS* Sieb. and Zucc. Pinaceae. Nikko fir.67024. *AEGILOPS SPELTAEFORMIS* Jord. Poaceae. Grass.

An annual grass, a hybrid between *Triticum aestivum* and *T. aestivum* × *ovatum*.

67025. *ASTILBE CHINENSIS* Maxim. Saxifragaceae. Chinese astilbe.

Variety *pumila*. A dwarf form of the commonly cultivated herbaceous perennial.

67026. *CLEMATIS RECTA MANDSHURICA* (Rupr.) Maxim. Ranunculaceae.

Variety *feuille pourpre*. A tall slender herbaceous purple-leaved perennial with terminal and axillary panicles of pure white flowers. The typical form is native to Manchuria.

67027. *COLUTEA ISTRIA* Mill. (*C. halepica* Lam.). Fabaceae. Bladder senna.

A North African leguminous shrub about 6 feet high with small glaucous leaflets and yellow flowers nearly an inch long.

For previous introduction see No. 38210.

67022 to 67066—Continued.

67028 to 67030. *CYTISUS* spp. Fabaceae.67028. *CYTISUS AUSTRIACUS VIRESCENS* Kov. Broom.

A low shrub, 1 or 2 feet high, with horizontal branches, gray-green leaflets, and bright-yellow flowers. Native to south-central Europe.

67029. *CYTISUS CILIATUS GRISENBACHI* C. Schneid. (*C. ponticus* Griseb.). Broom.

A yellow-flowered leguminous shrub, native to southeastern Europe, of variable habit and height.

67030. *CYTISUS SESSILIFOLIUS* L. Sessile broom.

A low shrub, 2 to 4 feet high, with erect branches, nearly sessile leaves, and short racemes of yellow flowers. Native to southern Europe.

67031. *HEMIPTLEA DAVIDII* (Hance) Planch. (*Zelkova davidii* Hemsl.). Ulmaceae.

A shrubby spiny elmlike tree, native to Chosen and northern China, which has merit as an ornamental tree because of its handsome dark-green foliage; the leaves are oval or oblong, deeply toothed, and about 2 inches long. Because of its spines, the tree may be useful for tall hedges.

For previous introduction see No. 63681.

67032. *ILEX PERNYI* Franch. Aquifoliaceae. Holly.

A dense-growing species of very dwarf compact habit, with small, spiny leaves and red berries, probably allied to *Ilex cornuta*, discovered by Père Paul Perny during his travels in China between 1850 and 1860. (*Veitch, Hortus Veitchii*, under No. 34527.)

67033 to 67039. *IRIS* spp. Iridaceae. Iris.67033. *IRIS CHRYSOGAPHES* Dykes. Goldvein iris.

One of the handsomest of the Siberian irises; the velvety dark-purple flowers are brightened by golden reticulations at the throat.

For previous introduction see No. 66575.

67034. *IRIS CLARKEI* Baker. Clarke iris.

A curiously local species native to a circumscribed area in the Sikkim and Bhutan region at a height of 6,000 to 11,000 feet in ground that is swampy half the year and frozen hard under snow during most of the remaining months. The narrow leaves, 2 feet long, droop at the tops; the upper surface is polished and shiny, the under side glaucescent. The solid stem is 2 feet long and bears one or two lateral heads. The falls are blue purple, blotched with white, and are reflexed laterally. The upper part of the haft is marked with yellow. The reddish purple lanceolate standards are poised almost horizontally. The styles form the highest point of the flower; they are keeled, very convex, and $1\frac{1}{2}$ inches long. (Dykes, *The Genus Iris*, p. 29.)

For previous introduction see No. 66464.

67035. *IRIS FISCHERIANA* Hort.67036. *IRIS HALOPHILA* Pal.

A low-growing Siberian iris, 1 or 2 feet high, with pale-green leaves and spicate clusters of yellow flowers.

For previous introduction see No. 60343.

67022 to 67066—Continued.

67037. IRIS MUSULMANICA Fomin.

An iris from the vicinity of Elisabethopol, Caucasus, which, according to the *Moniteur du Jardin Botanique de Tiflis* (vol. 14, 1909), inhabits brackish swamps. It is less than 2 feet tall, and the flowers are either sky blue or yellowish.

For previous introduction see No. 64299.

67038. IRIS OCHAUREA Hort.

A hybrid between *Iris ochroleuca* and *I. aurea* about 5 feet high. The outer segments are rich yellow with a creamy border, and the inner segments are erect and yellowish.

67039. IRIS SPURIA DESERTORUM Ker.

A European iris, with firm linear, glaucous leaves about a foot long and one to three spicate heads of flowers, which are pale lilac with the claws of the segments yellow.

For previous introduction see No. 40519.

67040. LIGUSTRUM DELAVAYANUM Hariot.
Oleaceae. Privet.

An evergreen shrub about 6 feet high with long graceful branches and dark, shining-green oval leaves. The white flowers, borne in downy panicles, and the black fruits make the shrub very ornamental. It is native to the mountainous regions of Yunnan, China.

For previous introduction see No. 58613.

67041. LIGUSTRUM WALKERI Decaisne.
Oleaceae. Privet.

An evergreen shrub native to southern India, with oval or lanceolate leaves and large panicles of white flowers.

67042. MELLILOTUS ALBA Desr. Fabaceae.
Hubam.

Variety *annua*.

67043. MUSCARI HELDREICHII Boiss. Liliaceae.
Grape hyacinth.

An early-flowering bulbous plant, native to Greece, with linear leaves and 5 to 10 amethyst flowers on a scape 4 to 6 inches long.

67044 to 67050. PAEONIA spp. Ranunculaceae.
Peony.

67044. PAEONIA ABIETINA Anders.

A European herbaceous peony about 3 feet high, with five-lobed or six-lobed leaves and a large solitary dark-red flower.

67045. PAEONIA BAKERI Lynch.

A peony of unknown origin which, as described by R. Irwin Lynch (*Journal of the Royal Horticultural Society*, vol. 12, p. 441), has a spindle-shaped root, a stout red stem 2 feet high, about six biternate leaves, and deep-pink, single flowers 5 inches across.

67046. PAEONIA CORALLINA Retz.
Coral peony.

A tall peony with carrotlike roots and purple flowers, rarely whitish or yellowish. Native to southern Europe.

For previous introduction see No. 30522.

67047. PAEONIA CORIACEA Boiss.

A Spanish peony, allied to *Paeonia albiflora*, with nearly unbranched, reddish stems, leathery leaves, and bright-crimson flowers.

For previous introduction see No. 62671.

67048. PAEONIA LUTEA Delavay.
Golden peony.

A shrubby Chinese peony, with a short, woody stem 1 or 2 feet high, and deep-green,

67022 to 67066—Continued.

leathery, three-parted leaves, white beneath and about a foot in length. The golden yellow single or slightly double flowers are 2½ inches across.

For previous introduction see No. 62758.

67049. PAEONIA PEREGRINA Mill.

A herbaceous European peony about 2 feet high, with deep-green leaves, paler beneath, and dark-crimson flowers.

67050. PAEONIA TRITERNATA Pail.

A tall herbaceous peony with carrot-shaped roots which resembles *Paeonia coralina*, but differs in having rounded leaves, green stems, and rose-colored or whitish flowers. It is native to southeastern Europe.

For previous introduction see No. 64305.

67051. PYRACANTHA sp. Malaceae. Fire thorn.

An evergreen shrub from eastern Asia.

67052. ROSA ADIANTIFOLIA Hort. Rosaceae.
Rose.67053. ROSA DAVIDI ELONGATA Rehd. and Wils.
Rosaceae. David rose.

A shrubby rose, 10 feet high, with scattered straight prickles and single pink flowers about 2 inches across, in corymbs.

67054. SKIMMIA FOREMANNII Hort. Rutaceae.

A densely branched evergreen shrub, a hybrid between *Skimmia fortunei* and *S. japonica*.

67055. SYRINGA TOMENTELLA Bur. and Franch.
Oleaceae. Wilson lilac.

A bushy shrub about 8 feet high with elliptic leaves, hairy beneath, and white or lilac flowers in clusters 6 inches long. Native to western China.

67056 to 67060. TRITICUM spp. Poaceae. Grass.

67056 to 67058. TRITICUM CYLINDRICUM
(Host.) Ces. Pas. and Gib.

67056. Received as *Aegilops bicornis*, but does not agree with that species.

67057. An ornamental annual grass with stiff, upright stems and narrow leaves. Native to dry sandy places in southern and southeastern Europe.

For previous introduction see No. 64097.

67058. Received as *Aegilops speltioides*, but does not agree with that species.

67059. TRITICUM TRIUNCIALE (L.) Gren. and Godr.

A thickly branched, annual grass with ascending stems and flat, rough leaves. Native to dry places in the Mediterranean region.

For previous introduction see No. 64099.

67060. TRITICUM VENTRICOSUM (Tausch)
Ces. Pas. and Gib.

An annual grass, native to the Mediterranean region, with upright stems and panicles up to 8 inches long.

For previous introduction see No. 57072.

67061 and 67062. TRITOMA UVARIA (L.) Ker.
Liliaceae. Torch lily.

67061. Variety *nobilis*. A variety having uniformly red flowers in short ovoid spikes.

67062. Variety *saundersii*. A variety with reddish orange flowers in elliptical spikes; the plant grows 4 to 6 feet high.

67022 to 67066—Continued.

67063 to 67065. *VIBURNUM* spp. Caprifoliaceae.67063. *VIBURNUM HUPEHENSE* Rehder.
Hupei viburnum.

A fairly hardy deciduous shrubby species, allied to *Viburnum wrightii*, with coarsely toothed, long-pointed dark-green leaves, and ovoid dark-red fruits. Native to central China.

For previous introduction see No. 63687.

67064. *VIBURNUM THEIFERUM* Rehder.
Tea viburnum.

One of the more recent introductions from China made by E. H. Wilson, which is especially beautiful because of its brilliant red fruits. It is an upright shrub 4 meters high, with oval-oblong dark-green leaves.

For previous introduction see No. 62854.

67065. *VIBURNUM* sp.67066. *VICIA MICHAUXII* Spreng. Fabaceae.
Vetch.

A creeping or climbing annual vetch, native to Syria, with very narrow leaflets, light-yellow flowers, and hairy pods about an inch long.

For previous introduction see No. 59357.

67067 to 67087.

From Blackwood, South Australia. Seeds presented by Edwin Ashby. Received April 28, 1926.

67067. *BAECHEA PLATYCEPHALA* E. Pritz.
Myrtaceae.

A small densely branched shrub, 1 or 2 feet high, with thick erect leaves crowded at the ends of the branches and small white flowers in the upper axils. Native to Western Australia.

67068. *BEAUFORTIA MICRANTHA* Schauer.
Myrtaceae.

A small much-branched shrub, with opposite, triangular-oval, thick leaves and small pink flowers, the staminate in small round heads and the pistillate in oblong spikes. Native to Western Australia.

67069 to 67071. *CALOTHAMNUS* spp. Myrtaceae.67069. *CALOTHAMNUS ASPER* Turcz.

A hairy shrub, with crowded linear flat leaves and short dense clusters of flowers with crimson stamens. Native to Western Australia.

67070. *CALOTHAMNUS GILESH* F. Muell.

A stout hairy shrub native to Victoria, Australia, with terete linear leaves and loose clusters of flowers.

67071. *CALOTHAMNUS QUADRIFIDUS* Ait.

An erect shrub 7 feet high, with crowded linear leaves about an inch long and dense spikes of flowers which are conspicuous because of the rich crimson stamens. Native to Western Australia.

67072. *CANDOLLEA CUNEIFORMIS* Labill. Candolleaceae.

An erect evergreen shrub about 7 feet high, with thick wedge-shaped leaves and yellow flowers.

67073 to 67075. *KUNZEA* spp. Myrtaceae.67073. *KUNZEA RECURVA* Schauer.

A tall rigid shrub with rather narrow leaves and dense globular flower heads. Native to Western Australia.

67067 to 67087—Continued.

67074. *KUNZEA SPICATA* S. Moore.

A shrub native to Western Australia, with small, widely oval, leathery leaves about one-eighth of an inch long and small flowers in short spikes.

67075. *KUNZEA SULPHUREA* Hort.

A heathlike shrub, native to Australia.

67076. *LEPTOSPERMUM ROEI* Benth. Myrtaceae.

A hairy slender-branched Australian shrub with flat, silky white leaves nearly half an inch long and rather large, axillary white flowers.

67077 to 67086. *MELALEUCA* spp. Myrtaceae.67077. *MELALEUCA CORDATA* Benth.

A rigid red-flowered shrub from Western Australia. The numerous rounded leaves are about half an inch long, and the flowers are in dense globular terminal heads.

67078. *MELALEUCA CRASSIFOLIA* Benth.

A bushy shrub with scattered thick oblong leaves half an inch long and leafy spikes of pink or white flowers. Native to Western Australia.

67079. *MELALEUCA FULGENS* R. Br.

A tall shrub, native to Western Australia, with linear concave leaves and loose lateral spikes of large showy red flowers.

67080. *MELALEUCA HOLOSERICEA* Schauer.

A bushy shrub, about 3 feet high, with hairy branches and foliage, crowded linear leaves, and dense terminal heads of pink flowers. Native to Western Australia.

67081. *MELALEUCA LATERITIA* Otto and Dietr.

A medium-sized shrub with very narrow leaves and oblong spikes of large rich-scarlet flowers. Native to Western Australia.

67082. *MELALEUCA RADULA* Lindl.

A tall bushy shrub with opposite linear concave leaves up to 2 inches long and rather large pink or white flowers in pairs at the bases of the branchlets. Native to Western Australia.

67083. *MELALEUCA THYMOIDES* Labill.

A tall slender-branched shrub from Western Australia, with rigid, scattered leaves and dense terminal heads of yellowish white flowers.

67084. *MELALEUCA UNCINATA* R. Br.

A tall somewhat hairy Australian shrub with linear-subulate leaves an inch or two long and numerous small flowers in very dense terminal heads.

67085. *MELALEUCA VIOLACEA* Schauer.

A low spreading shrub, with the flowering branches often corky, and oval heart-shaped leaves. The purple-red flowers are either in terminal globular heads or in small axillary clusters. Native to Western Australia.

67086. *MELALEUCA WEBSTERI* S. Moore.

An Australian shrub with opposite, narrowly oblong thick leaves about one-third of an inch long and roundish heads of small white flowers.

67087. *ORTHOSANTHUS MULTIFLORUS* Sweet. Iridaceae.

An Australian irislike plant with a short perennial rhizome and flat grasslike radical leaves up to 2 feet in length. The blue flowers are in a several-flowered oblong spike borne on a stem 1 to 2 feet high.

67088. POA FLABELLATA (Lam.) Hook.
f. Poaceae. **Tussock grass.**

From the Falkland Islands. Seeds presented by Dr. A. W. Hill, Director, Royal Botanic Gardens, Kew, England. Received May 1, 1926.

According to Hogg (Vegetable Kingdom, p. 823), this is a coarse grass which grows on peaty soil near the sea in the Falkland Islands. It forms dense masses of stems which frequently rise to a height of from 4 to 6 feet, and the long tapering leaves hang gracefully over in curves, from 5 to 8 feet long and an inch wide at the base. The plant is much relished by cattle, being nutritious and containing saccharin. The inner portion of the stem, a little way above the root, is soft and crisp and flavored like a hazelnut; the inhabitants of the Falkland Islands are very fond of it. They also boil the young shoots and eat them like asparagus.

For previous introduction see No. 64210.

67089. SOLANUM TUBEROSUM L.
Solanaceae. **Potato.**

From Honolulu, Hawaii. Tuber presented by J. M. Westgate, Director, Hawaii Agricultural Experiment Station, through C. F. Clarke, Bureau of Plant Industry. Received May 12, 1926.

A strain of the *Hamakua* variety of potato which is a good yielder and a better keeper than the original *Hamakua*.

67090 to 67131. ORYZA SATIVA L. Po-
aceae. **Rice.**

From Sabour, India. Seeds presented by A. C. Dobbs, director of agriculture, Bihar and Orissa. Received May 3, 1926.

Locally developed strains.

67090 to 67111. From Bihar.

- 67090. *Bachi-Aman*.

67132. CITRUS GRANDIS (L.) Osbeck
(*C. decumana* Murr.). Rutaceae.
Grapefruit.

From China. Seeds collected by J. F. Rock, Arnold Arboretum, Jamaica Plain, Mass. Received May 4, 1926.

A wild grapefruit found in the dry arid district of southern Kansu, below Siku, at an altitude of 3,000 to 4,000 feet. The tree is 15 to 20 feet in height, and the fruit 5 to 6 inches in diameter, very juicy, but sour and full of seeds. (*Rock*.)

67133. ROTHIA INDICA (L.) Druce
(*R. trifoliata* DC.). Fabaceae.

From Peradeniya, Ceylon. Seeds presented by A. H. G. Alston, systematic botanist, Ceylon Department of Agriculture. Received May 8, 1926.

An annual leguminous plant, native to India, which, according to T. Petch (Tropical Agriculturist, December, 1924) is common in dry situations in Ceylon and because of its trailing habit should make a good cover plant.

67134. POA FLABELLATA (Lam.)
Hook. f. Poaceae. **Tussock grass.**

From Stanley, Falkland Islands. Seeds presented by the colonial secretary. Received May 10, 1926.

For previous introduction and description see No. 67088.

67135. FICUS ERECTA Thunb. Mor-
aceae. **Fig.**

From Hakojuoka, Japan. Seeds received May, 1926, at the Plant Introduction Garden, Chico, Calif., from Dr. Tyozaburo Tanaka, department of agriculture, Kyushu Imperial University, through Ira J. Condit, University of California, Berkeley, Calif.

An ornamental shrub or small tree, native to China, Japan, and the Himalayas, very variable in size, character of foliage, and degree of pubescence. The fruits are single or in pairs, globular or pear-shaped, and long-stalked or sessile.

67136. CREPIS PRAEMORSA (L.) Tausch. Cichoriaceae.

From Zurich, Switzerland. Plants presented by Professor Chellung. Received May 14, 1926.

A perennial composite from the mountains of the Caucasus, with radical oval-oblong leaves and small yellow flower heads.

67137. BERBERIS PARVIFOLIA Sprague. Berberidaceae. Barberry.

From San Francisco, Calif. Seeds presented by Eric Walther, superintendent of parks. Received May 12, 1926.

A low shrub from western China, with half-evergreen, occasionally spiny-toothed leaves, golden yellow flowers, and globose berries of a terra-cotta color.

67138 to 67160. ORYZA SATIVA L. Poaceae. Rice.

From Gurdaspur, India. Seeds presented by the director of the agricultural station. Received May 12, 1926.

Locally developed strains.

67161. ORYZA SATIVA L. Poaceae. Rice.

From Manila, Philippine Islands. Seeds presented by S. Youngberg, director, Bureau of Agriculture. Received May 14, 1926.

Pirurutong.

67162 to 67169.

From Brignoles, France. Seeds presented by Dr. R. Salgues, Director, Station Botanique de Brignoles. Received May 10, 1926.

67162 to 67169—Continued.**67162. ANTHYLLIS TETRAPHYLLA L. Fabaceae.**

A creeping leguminous annual, with white flowers, native to the Mediterranean region.

67163. ANTHYLLIS VULNERARIA L. Fabaceae. Kidney vetch.

A perennial herb, found throughout Europe, northern Africa, and Asia, which is grown for sheep fodder and is particularly recommended for lime soils. In Norway it grows as far north as 70° F.

For previous introduction see No. 55376.

67164. STATICE JUNCEA (Girard) Hubbard, Plumbaginaceae.

A low herbaceous perennial, with a rosette of linear leaves and small heads of pink flowers. Native to Europe.

67165. CISTUS ALBIDUS L. Cistaceae. White-leaf rockrose

A low shrub about 4 feet high, with white hairy leaves and rosy flowers in small clusters. Native to southern Europe and northern Africa.

For previous introduction see No. 62244.

67166. CLEMATIS VITALBA L. Ranunculaceae. Traveler's-joy

The common wild clematis of English hedges. It climbs up into the trees, covering them in July with its numerous panicles of greenish white, scented flowers. In winter its silky tufts adorn the hedgerows.

For previous introduction see No. 53661.

67167. INULA VISCOSA (L.) Ait. Asteraceae.

A yellow-flowered shrubby perennial about 18 inches high, native to southern Europe.

67168. LINUM NARBONENSE L. Linaceae. Narbonne flax.

An attractive herbaceous perennial from southern Europe, with linear leaves and a graceful drooping habit; it is about 2 feet across and 18 inches high. The flowers, which appear throughout the summer, are arranged in a loose panicle with long pedicels. Each flower is 1½ inches across, bright azure blue, somewhat paler beneath, with white anthers and a white spot in the center of each flower.

For previous introduction see No. 49898.

67169. PSORALEA BITUMINOSA L. Fabaceae. Scurf pea.

A herbaceous perennial legume, native to the Mediterranean countries, sometimes over 3 feet high; it emits a disagreeable odor from all parts of the plant. The leaves are trifoliate. The small, bluish flowers are in 10-flowered to 30-flowered heads.

For previous introduction see No. 65585.

67170. TRIFOLIUM SQUARROSUM L. Fabaceae. Clover.

From Haina, Dominican Republic. Seeds presented by Dr. R. Ciferri, Director, Estación Nacional Agronómica. Received May 19, 1926.

An upright or ascending, robust annual, with branches up to 30 inches long; native to the Mediterranean countries. The pink or white flower heads are oval when young, becoming more elongated later.

For previous introduction see No. 63995.

67171. SOLANUM TUBEROSUM L.
Solanaceae. **Potato.**

From Mowbray, Launceston, Tasmania, Australia. Tubers presented by R. Kidd. Received May 14, 1926.

Gem of the South. Derived from the variety which for many years was the main crop and export potato of Tasmania, variously known as the "Tasmanian red-skinned," "Brown's River," "Derwent," and "Circular Head." It was the king of keepers among potatoes, carried splendidly in bulk, was a fair yielder, and a fine quality table potato. The berry containing the seed which produced the new variety was abnormally large. (Kidd.)

67172. TRIFOLIUM PRATENSE L. Fabaceae. **Red clover.**

From Leningrad, Russia. Seeds purchased from A. Kol, chief of the bureau of introduction, Institute of Applied Botany. Received May 19, 1926.

For previous introduction and description see No. 66793.

67173. CASTANEA HENRYI (Skan) Rehd.
and Wils. Fagaceae. **Chestnut.**

From China. Seeds obtained by F. A. McClure, agricultural explorer, Bureau of Plant Industry, Received January 25, 1926. Numbered June, 1926.

No. 255. November 23, 1925. *Kuai lam yui.* Purchased in Wuchow, Kwongsai, and said to have originally come from Lwallam, Kwongsai, where this variety is extensively cultivated. The nuts, with sweet tender flesh, are said to be inclosed in a 1-seeded spiny bur, like that of the chestnut, but smaller. The nuts do not dry out and lose their viability so quickly as those of the Chinese chestnut, *Castanea mollissima* Blume. The endosperm is densely covered with long, silky hairs. The nuts are widely sold in Kwantung and Kwongsai and are highly esteemed by the Chinese as an article of diet.

67174 to 67190.

From Sumatra. Seeds obtained by David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition. Received May 14, 1926.

67174 to 67181. From the Sibolangit Botanic Garden, which is on the east coast near Medan.

67174. ADENIA MACROPHYLLA Hort. Passifloraceae.

No. 501. February 26, 1926. A vine bearing beautiful scarlet fruits which split open into three segments and exhibit seeds covered with a white arillus; not edible but very ornamental.

67175. ALANGIUM CHINENSE (Lour.) Rehder (*Marlea begoniaefolia* Roxb.). Cornaceae.

No. 400. February 24, 1926. Var. *tomentosum*. This Indian tree makes a remarkably rapid growth, reaching its full height of 50 feet in five years after which the trunk merely thickens. It is being planted in Sumatra for its timber.

67176. AMOMUM sp. Zinziberaceae.

No. 505. February 25, 1926. A plant of gorgeous foliage for the irrigated gardens in southern Florida, Panama, and Hawaii.

67177. SAGUERUS LANGKAB Blume (*Arenga obtusifolia* Mart.). Phoenicaceae. **Palm.**

No. 448. February 26, 1926. A handsome palm related to the sugar palm (*Arenga saccharifera*) of Malaya, but smaller in size and having larger fruits.

67174 to 67190—Continued.

67178. SAGUERUS PINNATUS Wurm (*Arenga saccharifera* Labill.). Phoenicaceae. **Sugar palm.**

No. 441. February 24, 1926. A handsome though rather untidy palm with immense leaves and tremendous bunches of fruit. A rich-flavored palm sugar is made from the sap which flows from the bruised fruit stalk.

For previous introduction see No. 47527.

67179. DAEMONOROPS DRACO (Willd.) Blume (*Calamus draco* Willd.). Phoenicaceae. **Palm.**

No. 439. February 24, 1926. A handsome climbing palm, with recurved spines, producing ornamental fruits the size of marbles. This is the rattan palm whose fruits furnish the substance known as *dragon's blood* and is different from that produced by *Dracaena draco*.

67180. CLERODENDRUM SUMATRANUM Hort. Verbenaceae.

No. 405. February 24, 1926. A showy ornamental with large panicles of flowers and brilliant-blue fruits which are in striking contrast with the bright-red corollas.

67181. GRAMMATOPHYLLUM SPECIOSUM Blume. Orchidaceae. **Orchid.**

No. 447. February 26, 1926. The "queen of the orchids." A giant species having stems 6 to 10 feet long and flower clusters 6 feet long. The flowers are 6 inches in diameter and are yellow, blotched with deep purple.

67182. ERYTHRINA sp. Fabaceae. **Coral tree.**

No. 431. Sabang, Pulu We Island, northern coast of Sumatra. February 17, 1926. The tree is spiny, 40 feet high, and a rapid grower. The large, deep-crimson flowers, produced when the tree is without leaves, make a wonderful showing.

67183. MANGIFERA INDICA L. Anacardiaceae. **Mango.**

No. 535. March 3, 1926. A huge mango tree, producing yellow fruits, which is growing on the shore of Lake Tawar, near Takengon. The tree is 100 feet tall and has a girth of nearly 14 feet.

67184. MUSA sp. Musaceae. **Banana.**

No. 549. On the road between Takengon and Blasun. March 6, 1926. The tree is not over 18 to 20 feet high, and it has a very dark trunk. It is found wild in virgin forest at an altitude of 3,000 feet. The fruits are small and contain many seeds.

67185. HERNANDIA SONORA L. Hernandiaceae.

No. 422. Sabang, Pulu We Island, northern coast of Sumatra. February 17, 1926. A soft-wooded large tree with rather thin broad leaves and masses of very interesting curiously shaped fruits. The black seed hangs in the center of a large white translucent inverted bell-shaped covering. Through a hole in the bottom of this covering is seen the black fruit. This tree grows close to the beach where it is hit by the salt spray.

67186. ACTINORRHYZIS CALAPPARIA Wendl. and Drude. Phoenicaceae. **Palm.**

No. 446. From the Sibolangit Botanic Garden. February 25, 1926. A tall stout pinnate-leaved palm, about 40 feet high, with a ringed trunk and leaves about 8 feet long. Native to the Malay Archipelago.

67187. PTYCHOSPERMA sp. Phoenicaceae. **Palm.**

No. 452. From the experiment station, Medan. February 20, 1926.

67174 to 67190—Continued.

67188. (Undetermined.)

No. 478. Collected near Takengon, March 5, 1926. A beautiful foliage plant with red flower heads, 4 inches across, at the base of leaves which rise from the ground to a height of 3 feet; excellent for moist places.

67189. *ARECA* sp. *Phoenicaceae*. **Palm.**

No. 541. From Takengon, at an altitude of 3,000 feet. March 2, 1926. A slender, very decorative, pinnate palm, 12 feet high.

67190. *CORYPHA* sp. *Phoenicaceae*. **Palm.**

No. 670. Collected northwest of Lho Semawe on the road to Bireun, March 12, 1926. The native name is *Tboh*. This tree resembles the Talipot palm in that the tree dies when the terminal inflorescence flowers. It is smaller than the Talipot with the trunk often twisted.

67191 to 67227. *ORYZA SATIVA* L. **Po-aceae. Rice.**

From Cawnpore, United Provinces, India. Seeds purchased from the deputy director of agriculture. Received May 18, 1926.

Locally developed varieties.

67191. *Nankia*. A late variety sown in Safipur Tansil, Unao district.67192. *Badal Phooi*. An early variety sown in Safipur Tansil, Unao district.67193. *Badar Phuha*. From Kudwa. A variety sown during May in the Cawnpore district, later transplanted, and harvested in September.67194. *Bagdi*. From Bhodras. A variety sown during May in the Cawnpore district, later transplanted, and harvested in October.67195. *Bakki*. A variety, which is a good yielder, from the Unao district, sown in June, transplanted in July, and harvested the first part of November.67196. *Bansi*. An early variety sown in Safipur Tansil, Unao district.67197. *Banspati*. A good yielder from the Unao district which is sown during June, transplanted in July, and harvested in October.67198. *Batsa*. An early variety sown in Safipur Tansil, Unao district.67199. *Bindia*. From Phuphuar. A variety sown in the Cawnpore district during May, later transplanted, and harvested in November.67200. *Bendia*. From Parsauli. A variety sown in the Cawnpore district during May, later transplanted, and harvested in November.67201. *Dudhia*. An early variety sown in Safipur Tansil, Unao district.67202. *Sujidana*. From Laukana. A variety sown in the Cawnpore district during May, later transplanted, and harvested in October.67203. *Gaurahva*. From Parsauli. A variety grown in the Cawnpore district during May, later transplanted, and harvested in November.67204. *Ghaghrapari Bakka*. A variety from the Unao district sown during July and harvested in October.67205. *Hansraj*. A late variety sown in Safipur Tansil, Unao district.67206. *Harkis*. From the Unao district. Sown in July and harvested in September.67207. *Jalsaim*. A late variety sown in Safipur Tansil, Unao district.

67191 to 67227—Continued.

67208. *Jardhana*. An early variety sown in Safipur Tansil, Unao district.67209. *Jardhon*. From Oria. A variety sown in the Cawnpore district in May, later transplanted, and harvested in October.67210. *Jardhana*. From Unao district. Sown in July and harvested in September.67211. *Jarithwa*. A late variety sown in Safipur Tansil, Unao district.67212. *Kathwa*. From the Unao district. A good yielder sown in June, transplanted in July, and harvested in October.67213. *Lalli*. An early variety sown in Safipur Tansil, Unao district.67214. *Ram Bhagwa*. An early variety sown in Safipur Tansil, Unao district.67215. *Rambhagwa*. A good yielder from the Unao district. Sown in June, transplanted in July, and harvested in the first part of November.67216. *Saidha*. An early variety sown in Safipur Tansil, Unao district.67217. *Sambhalu*. From Oria. A variety sown in the Cawnpore district in May, later transplanted, and harvested in October.67218. *Sambhalu*. From Parsauli. A variety sown in the Cawnpore district in May, later transplanted, and harvested in September or October.67219. *Sumbhra*. From Phuphuar. A variety sown in May in the Cawnpore district, later transplanted, and harvested in November.67220. *Sammaluwa*. From the Unao district. A good yielder sown in July and harvested the first part of September.67221. *Sathi*. An early variety sown in Safipur Tansil, Unao district.67222. *Sathi* or *Sathia* (Black). From Parsauli. A variety sown with the rains in June in the Cawnpore district and harvested early in September.67223. *Shyam Zira*. A late variety sown in Safipur Tansil, Unao district.67224. *Shiamjira*. From Kudwa. A variety sown in the Cawnpore district in May, later transplanted and harvested in October.67225. *Suhari*. A late variety sown in Safipur Tansil, Unao district.67226. *Sondhi*. From Jahangirabad. A variety sown in the Cawnpore district with the June rains and harvested in October.67227. *Uswas*. A late variety sown in Safipur Tansil, Unao district.67228. *NYPA FRUTICANS* Wurm. **Phoenicaceae. Nipa palm.**

From Sibolangit, Sumatra. Seeds obtained by David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition, Received May 20, 1926.

The nipa palm is one of the handsomest as well as most useful palms of the Malayan region. It grows in the brackish and quite salty waters on the coasts everywhere. (Fairchild.) According to Brown and Merrill (Philippine Palms and Palm Products, p. 98), the nipa palm has a stout, creeping underground stem, and the pinnate leaves, which are in erect clusters, are 7 meters or more in length. The flat fruits, 5 inches long, 4 inches wide, and 2 inches thick, are crowded in a large, round head which is borne on a special erect stalk. The juice obtained by cutting this stalk just below the fruiting head is a very promising source of sugar and alcohol. The leaves are extensively used for thatching and for making baskets and mats.

For previous introduction see No. 57940.

67229. GOSSYPIUM OBTUSIFOLIUM Roxb. **Malvaceae.** **Cotton.**

From Algiers, Algeria. Seeds presented by Dr. L. Trabut, Government botanist, through T. H. Kearney, Bureau of Plant Industry. Received May 18, 1926.

Collected in the Gourara, northwestern Sahara, where it is cultivated by the natives. (*Trabut.*)

For previous introduction see No. 45326.

67230 and 67231. SACCHARUM OFFICINARUM L. **Poaceae.** **Sugar cane.**

From Santiago de las Vegas, Cuba. Cuttings presented by Dr. Gonzalo M. Fortun, Director Estación Experimental Agronómica, through E. W. Brandes, Bureau of Plant Industry. Received May 24, 1926.

67230. *C. 281.* Imported at the Estación Experimental Agronómica as a promising cane free from the mosaic disease.

67231. *P. R. 492.*

67232. EUPHRASIA OFFICINALIS L. **Scrophulariaceae.**

From Paris, France. Seeds presented by Prof. D. Bois, Paris Museum of Natural History. Received May 22, 1926.

A low annual which grows in damp places throughout Europe. The axillary flowers have a lilac corolla with a yellow throat.

67233. GOSSYPIUM sp. **Malvaceae.** **Cotton.**

From Sumatra. Seeds collected by David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition. Received May 14, 1926.

No. 498. March 9, 1926. A tree kidney cotton, native to northern Sumatra, on the northwest shore of Lake Tawar, near Takengon. These seeds are from an old tree which was growing in the dooryard of a Gayoc. The stems are 4 inches through and 12 to 14 feet high.

67234. GOSSYPIUM TOMENTOSUM Nutt. **Malvaceae.** **Cotton.**

From Honolulu, Hawaii. Seeds presented by J. M. Westgate, Director, Hawaii Agricultural Experiment Station. Received May 17, 1926.

Mao or *Hula* cotton. Plant softly pubescent; lint reddish brown.

67235. ANEMONE ALBA Hort. **Ranunculaceae.**

From Ottawa, Canada. Seeds presented by J. Adams, botanist, Central Experimental Farm. Received April 23, 1926.

A form of the Japanese anemone with large white flowers.

67236. CASSIA OCCIDENTALIS L. **Caesalpiniaceae.**

From Ibadan, Nigeria, Africa. Seeds presented by O. T. Faulkner, director, Agricultural Department. Received May 21, 1926.

A commonly cultivated tropical leguminous annual, herbaceous or somewhat shrubby; the seeds are sometimes used as a coffee substitute.

67237. ORNITHOGALUM LACTEUM Jacq. **Liliaceae.** **Star-of-Bethlehem**

From Mowbray, Cape Town, South Africa. Seeds purchased from C. Starks & Co. Received May 22, 1926.

A bulbous plant from the Cape of Good Hope, with about 10 fleshy basal leaves and white flowers in a large, dense raceme on a stout stem 1 or 2 feet long.

67238 to 67256. ORYZA SATIVA L. **Poaceae.** **Rice.**

From Poona, India. Seeds presented by the director of the agricultural college station. Received May 22, 1926.

67238. *Ambemohor Kata.*

67239. *Anter Sal.*

67240. *Bangali.*

67241. *Dhanya.*

67242. *Early Mugad.*

67243. *Gajaweli.*

67244. *Halwi Patni.*

67255. *Sutar Sal.*

67256. *Wak Sal.*

67257 to 67292.

From Jerusalem, Palestine. Seeds obtained by Prof. W. L. Jepson, collaborator, Bureau of Plant Industry. Received May 11, 1926.

67257. ASTRAGALUS BRACHY CERAS Ledeb. **Fabaceae.**

No. 10961. An annual legume, about 14 inches high, native to Syria.

67258 and 67259. CALENDULA spp. **Asteraceae.**

Herbaceous annuals, native to Syria, to be grown to ascertain their horticultural value.

67258. *CALENDULA* sp.

No. 10943.

67259. *CALENDULA* sp.

No. 10948.

67260 and 67261. Cicer ARIETINUM L. **Fabaceae.** **Chick pea.**

67260. No. 10793.

67261. No. 10792.

67262. CITRULLUS VULGARIS Schrad. **Cucurbitaceae.** **Watermelon.**

No. 10791.

67257 to 67292—Continued.

67263. *CORYLUS* sp. Betulaceae. Hazelnut.
No. 10796.

67264. *CUCURBITA PEPO* L. Cucurbitaceae. Pumpkin.
No. 10798.

67265. *CYAMOPSIS TETRAGONOLOBA* (L.) Taub. (C. *psoraloides* DC.). Fabaceae. Guar.

No. 10960. An erect leguminous annual, about 4 feet high, grown in eastern Asia as green forage and for the seeds, which are used as human food and also to fatten cattle.

67266. *HIPPOCREPIS MULTISILIQUOSA* L. Fabaceae.

No. 10959. An annual legume, 18 inches high, with odd-pinnate leaves and yellow flowers. Native to Syria.

67267. *HOLCUS SORGHUM* L. (*Sorghum vulgare* Pers.). Poaceae. Sorghum.

No. 10787.

67268. *LATHYRUS SATIVUS* L. Fabaceae. Bitter vetch.
No. 10978.

67269. *LATHYRUS* sp. Fabaceae.
No. 10971.

67270. *LENTILLA LENS* (L.) W. F. Wight (*Lens esculenta* Moench). Fabaceae. Lentil.
No. 10789.

67271. *LOTUS TETRAGONOLOBUS* L. Fabaceae.

No. 10957. A purple-flowered annual legume, native to the Mediterranean countries.

67272. *LOTUS* sp. Fabaceae.
No. 10964.

67273. *LUPINUS TERMIS* Forsk. Fabaceae. Lupine.

No. 10797. An annual legume, about 2 feet high, with bluish white flowers, native to Syria.

For previous introduction see No. 52172.

67274. *CIRCINNUS CIRCINATUS* (L.) Kuntze. Fabaceae.

No. 10969. A legume, about 1 foot high, native to the Mediterranean countries.

67275 and 67276. *MEDICAGO MURICATA* (L.) All. Fabaceae.

An annual European leguminous plant, about a foot high.

67275. No. 10950. 67276. No. 10966.

67277. *MELILOTUS SULCATA* Desf. Fabaceae.

No. 10954. An erect annual leguminous plant, with racemes of yellow flowers. Native to Syria.

For previous introduction see No. 43597.

67278. *MESEMBRYANTHEMUM* sp. Aizoaceae.
No. 10962.

67279 and 67280. *PHASEOLUS VULGARIS* L. Fabaceae. Common bean.

67279. No. 10790. 67280. No. 10973.

67281 and 67282. *PISUM SATIVUM* L. Fabaceae. Pea.

67281. No. 10951. 67282. No. 10965.

67283. *SCORPIURUS* sp. Fabaceae.

No. 10963. Annual leguminous herb with curiously twisted pods.

67257 to 67292—Continued.

67284 to 67286. *TRIFOLIUM ALEXANDRINUM* L. Fabaceae. Berseem.

67284. No. 10974. 67286. No. 10976.

67285. No. 10975.

67287. *TRIFOLIUM* sp. Fabaceae.
No. 10945.

67288 and 67289. *TRIGONELLA FOENUM-GRÆCUM* L. Fabaceae. Fenugreek.

67288. No. 10792. 67289. No. 10977.

67290. *VICIA ERVILIA* (L.) Willd. Fabaceae. Vetch.

No. 10786. An annual vetch up to a foot and a half high, cultivated in Syria for fodder.

67291. *VICIA FABA* L. Fabaceae. Broadbean.
No. 10799.

67292. *VIGNA SINENSIS* (Torner) Savi. Fabaceae. Cowpea.

No. 10788.

67293. *ASTREBLA LAPPACEA* (Lindl.) Domin. Poaceae. Mitchell grass.

From Queensland, Australia. Seeds obtained from the botanical gardens, Brisbane, through J. E. W. Tracy, Bristol, Pa. Received May 25, 1926.

A strong-growing somewhat wiry perennial grass found in stiff clayey soil. Its flowering spikes, resembling heads of wheat, are said to have highly fattening qualities and are readily eaten by stock. Native to South Australia, New South Wales, and Queensland.

For previous introduction see No. 50341.

67294. *MALUS SYLVESTRIS* Mill. (*Pyrus malus* L.). Malaceae. Apple.

From Dublin, Irish Free State. Seeds presented by Dr. Augustine Henry, College of Science for Ireland. Received May 25, 1926.

Var. *acerba*. A wild apple of Ireland which is not in cultivation in the United States. It is valuable as a pollen parent in apple orchards. (Henry.)

67295 to 67312.

From Leningrad, Russia. Seeds presented by A. Kol, chief of the bureau of introduction, Institute of Applied Botany. Received May 21, 1926. Notes by Mr. Kol.

Originally from Tchardjony, Turkmenistan, unless otherwise stated.

67295. *ALLIUM CEPA* L. Liliaceae. Onion.

A very good yielder, adapted to sandy soils; white and violet.

67296. *CITRULLUS VULGARIS* Schrad. Cucurbitaceae. Watermelon.

An unnamed variety from Farab, Turkmenistan.

67297 to 67303. *CUCUMIS MELO* L. Cucurbitaceae. Melon.

67297. No. 1. *Tarandjony*. A very sweet, white-fleshed variety.

67298. No. 2. *Ak-Koun*. An early summer variety with very sweet white flesh.

67299. No. 3. *Ksoul-Koun*. A summer melon with red flesh and pale-yellow skin.

67300. No. 4. *Deikhany-Zarny*. A very sweet orange-fleshed variety with yellowish skin.

67295 to 67312—Continued.

67301. No. 5. *Bischeck*. An early summer variety with very sweet white flesh and yellow skin.

67302. No. 6. *Kara-Kotour*. A round melon, a winter variety, with white flesh and yellow skin.

67303. No. 7. *Magassare*. A dark-skinned variety with white flesh of a rich sugary flavor.

67304. No. 8. *Kostjanka*. A variety cultivated at the experiment fields of the Emba Oil Co., near the Caspian Sea.

67305. No. 9. *Logara-Kouk*. A summer melon with greenish flesh and dark-green skin.

67306. No. 10. *Gouliabi*. A winter variety.

67307. No. 11. *Eneyry*. A summer variety with pale-yellow skin and green flesh.

67308. *Emiry*. From the Emba Experiment Station near the Caspian Sea.

67309 to 67311. *CUCURBITA* spp. Cucurbitaceae.

67309. *CUCURBITA MAXIMA* Duchesne. Squash.
Selle-Kiady.

67310. *CUCURBITA MOSCHATA* Duchesne. Cushaw.
Plor-Kiady. From Farab, Turkmenistan.

67311. *CUCURBITA PEPO* L. Pumpkin.
Nan-Kiady.

67312. *DAUCUS CAROTA* L. Apiaceae. Carrot.

From the Amu-Darya River district, Tchardjony, Turkmenistan. A pale-yellow variety with roots, when fully grown, measuring 7 to 11 inches in length.

67313. *DIALIUM GUINEENSE* Willd. Caesalpiniaceae. Velvet tamarind.

From the Gold Coast, West Africa. Seeds intercepted at Philadelphia, Pa., by the Federal Horticultural Board. Received May 24, 1926.

A tall pinnate-leaved tree, native to West Africa, with small, dark-brown, velvety, edible fruits which are in large clusters. The fruits are about the size of small filberts, and the thin, brittle shell incloses one or two seeds surrounded by a mildly acid farinaceous pulp, used in the preparation of pickles and in other ways. The timber is a handsome dark red.

67314 to 67343.

From Dookie P. O., Victoria, Australia. Seeds presented by Hugh Pye, Dookie Agricultural College. Received May 14, 1926.

This district is a relatively good one, with an average rainfall of 20 inches. The summers and autumns are usually dry, but the winter and spring rains are good, hence wheat succeeds well. The highest temperature is 108° F. and the lowest, July, 37° F. The air is low in humidity.

67314. *AVENA BYZANTINA* Koch. Poaceae. Oats.
Dookie No. 11.

67315. *HORDEUM DISTICHON* PALMELLA Harlan. Poaceae. Two-rowed barley.
Pryor.

67316. *HORDEUM VULGARE PALLIDUM* Seringe. Poaceae. Six-rowed barley.
Cape Early.

67314 to 67343—Continued.

67317 to 67343. *TRITICUM* spp. Poaceae.

67317 to 67333. *TRITICUM AESTIVUM* L. Common wheat.
(*T. vulgare* Vill.).

67317. *Austarn*.

67318. *Bald Early*.

67319. *Bena*. One of the new wheats becoming popular.

67320. *Clarendon Early*.

67321. *College Purple*.

67322. *Curramin*.

67323. *Darts Imperial*.

67324. *Federation*. The most popular variety of the State. Last season 40 bushels per acre were threshed from this variety. Generally speaking, it gives a better yield than *Hard Federation*.

67325. *Gerating*.

67326. *Glucub*.

67327. *Hard Federation*. A selection from *Federation*, but its flour is strong. Last season 50 bushels per acre were threshed from this variety.

67328. *Improved Glugas*.

67329. *Indcret*. A rust-resistant variety which yields well in the North and South.

67330. *Joffre*. A rust-resistant variety which yields well in the North and South.

67331. *Major*. The second most popular variety of the State. It has strong straw and is less liable to rust than *Federation*. In the South or cooler parts it gives big yields and has done well in New Zealand.

67332. *Minister*. The champion high-strength wheat of the State and the most prolific of the high-strength varieties grown here.

67333. *Moir*.

67334. *Nabawa*.

67335. *Nobby*. A bald durum type which is really a cross with a bald common wheat.

67336. *Unuyip*.

67337. *Wardfir*.

67338. *Yanward*.

67339 to 67342. *TRITICUM DURUM* Desf. Poaceae. Durum wheat.

67339. *Dookie Hasta*. This variety has multiple ears produced mainly by selection.

67340. *Dookie Marvel*. A variety having multiple ears produced mainly by selection.

67341. *Huguenot*. A bald durum type which is really a cross with a bald common wheat. In a few places it is grown for silage.

67342. *Laidly Poulard*.

67343. *TRITICUM POLONICUM* L. Poaceae. Polish wheat.

Australian Poulard.

67344 to 67376.

From Cambridge, England. Seeds presented by H. G. Carter, Director, Cambridge Botanic Garden. Received May 12, 1926.

67344. ALLIUM NARCISSIFLORUM Vill. Liliaceae.
Onion.

An elegant Italian species, about 9 inches high, with nodding heads of beautiful rose-colored flowers.

For previous introduction see No. 58682.

67345. ARISTEA AFRICANA (L.) Hoffmannsegg
(*A. cyanea* Ait.). Iridaceae.

A dwarf, irislike plant from the Cape of Good Hope, with spikes of short-lived blue flowers.

67346. ASTER FARRERI Hort.

A herbaceous perennial about a foot high, with handsome flowers. The narrow ray flowers are rich velvet, and the disk is reddish orange.

67347 to 67349. BERBERIS spp. Berberidaceae.

67347. BERBERIS CHITRIA D. Don. Barberry.

A spiny shrub, 6 feet or less high, with oblong leaves 1 to 3 inches long, deep-yellow or reddish flowers in long-stemmed panicles, and ovoid, purple berries. Native to the Himalayas.

67348. BERBERIS EMPETRIFOLIA Pers.
Crow barberry.

A low densely branched barberry, 1 or 2 feet high, with linear, bright-green leaves and bluish black fruits. Native to southern South America.

For previous introduction see No. 35923.

67349. BERBERIS STENOPHYLLA Lindl.
Rosemary barberry.

A hybrid between *Berberis darwinii* and *B. empetrifolia* which first appeared, according to Bean (Trees and Shrubs Hardy in the British Isles, vol. 1), in the nursery of Fisher and Holmes, near Sheffield, England, several years ago. As described by Bean it is an evergreen bush about 10 feet high, which forms a dense thicket of slender interlacing stems. The small deep-green leaves are spine tipped, and the small golden-yellow flowers are profusely borne in small clusters. The globular fruits are covered with a blue-white bloom.

For previous introduction see No. 65240.

67350. CISTUS VILLOSUS L. Cistaceae. Rockrose.

An erect hairy shrub, 3 to 4 feet high, with wrinkled, gray-green leaves and one to three reddish flowers about 2 inches wide. Native to the Mediterranean region.

67351. CYNOGLOSSUM AMABILE Stapf and Drummond. Boraginaceae.

Hound's-tongue.

For previous introduction and description see No. 67001.

67352 to 67355. CYTISUS spp. Fabaceae. Broom.

67352. CYTISUS BIFLORUS L'Herit.

A leguminous shrub 3 feet high, with slender branches and leaflets with silky lower surfaces. The yellow flowers are single or in pairs. Native to Europe and western Asia.

For previous introduction see No. 66557.

67353. CYTISUS MONSPESSULANUS L. Broom.

A leguminous shrub about 10 feet high, with fragrant bright-yellow flowers in small racemes. Native to the Canary Islands.

67344 to 67376—Continued.

67354. CYTISUS PURGANS (L.) Spach.
Province broom.

A yellow-flowered leguminous shrub about 3 feet high. Native to southern France and Spain.

67355. CYTISUS PURPUREUS Scop.

An erect or procumbent shrub, 2 feet or less in height, with one to three purple flowers and black pods. Native to southern Europe.

67356. DAHLIA MERCKII Lehm. Asteraceae.

A single-flowered dahlia, 2 to 3 feet high, with bipinnate leaves and flowers typically lilac color.

For previous introduction see No. 47552.

67357. ELSHOLTZIA STAUNTONI Benth. Men-
thaceae.

A shrubby perennial 2 to 5 feet high, with bright-green oblong leaves and dense one-sided spikes of purple-lilac flowers. Native to northern China.

For previous introduction see No. 38819.

67358. GENISTA RADIATA (L.) Scop. Fabaceae.
Broom.

A rigid erect yellow-flowered leguminous shrub with oval silky pods. Native to south-eastern Europe.

67359. GENISTA SAGITTALIS (L.) Fabaceae.
Broom.

A dwarf procumbent leguminous shrub with ascending or erect branches, hairy oval leaves, and short terminal racemes of yellow flowers. Native to Europe and western Asia.

67360. HERMODACTYLUS TUBEROSUS (L.) Mill.
Iridaceae.

A hardy irislike plant, native to southern Europe, with glaucous four-angled stems, 1 or 2 feet long, and black-purple solitary flowers.

67361 to 67363. ILEX spp. Aquifoliaceae. Holly.

67361. ILEX INTEGRA Thunb.

An evergreen Japanese shrub or tree, up to 40 feet in height, with oval or oblong, usually entire leaves 2 to 3 inches long and globular or ovoid red berries.

67362. ILEX LATIFOLIA Thunb.

A Japanese holly, one of the most attractive of the genus, which sometimes develops into a tree 60 feet tall. The glossy green leaves, 3 to 7 inches long, are oval or narrowly oblong, and the red berries, about one-third of an inch in diameter, are produced in dense clusters.

For previous introduction see No. 59391.

67363. ILEX SIKKIMENSIS Kurz.

A Himalayan holly described by Kurz (Journal of the Asiatic Society of Bengal, vol. 44, pt. 2) as a moderately tall tree with stout branches, broadly oblong leathery leaves 5 or 6 inches long, and globular yellow berries.

For previous introduction see No. 62810.

67364 to 67366. IRIS spp. Iridaceae.

67364. IRIS BULLEYANA Dykes.
Hollow-stem iris.

An iris from western China which, as described by Dykes (The Genus Iris, p. 30), resembles *Iris clarkei*, having a hollow unbranched stem. The narrow leaves are glossy above and glaucous beneath. The stem, 15

67344 to 67376—Continued.

to 18 inches long, bears a single head of one to two flowers. The falls have a greenish yellow oblong haft, veined and dotted with purple. On the obovate blade the coloring becomes clearer and consists of broken veins and blotches of bright blue purple on a creamy ground. The extremity is a uniform blue purple paler at the edges. The oblanceolate, channeled standards are pale blue purple with deeper veins and diverge at an angle of about 60 degrees. The keeled, dark-purple styles are held high above the falls.

For previous introduction see No. 66463.

67365. IRIS MILESH Baker. Himalayan iris.

A large Himalayan iris with seven or eight leaves, 2 to 3 feet long, on the stem; the latter is branched and bears about four heads of bright lilac flowers.

For previous introduction see No. 66578.

67366. IRIS SISYRINCHIUM L. Moraea iris.

A tender rather low iris, 6 to 12 inches high, native to southern Europe, Asia, and Africa. The fugitive flowers are lilac purple with a yellow spot on the outer segments.

67367. LONICERA CHRYSANTHA Turcz. Caprifoliaceae. Coralline honeysuckle.

A shrubby honeysuckle from Japan, up to 12 feet high, with upright stems, somewhat rhombic leaves 2 to 5 inches long, and yellowish white flowers three-fourths of an inch long. It is particularly handsome in autumn with its bright coral-red fruit.

For previous introduction see No. 42315.

67368. MIRABILIS LONGIFLORA L. Nyctaginia-ceae. Sweet four-o'clock.

An attractive herbaceous perennial 2 to 3 feet high, native to Mexico, with heart-shaped hairy leaves and long-tubed white pink or violet flowers which are very fragrant in the evening.

67369. MORAEA IRIDIODES L. Iridaceae. Iris moraea.

A South African relative of the iris with white flowers over 3 inches across and leaves in basal fan-shaped rosettes.

For previous introduction see No. 31852.

67370. MORAEA ROBINSONIANA Moore and F. Muell. Iridaceae.

A bulbous irislike plant from Australia with radical leaves about 5 feet long and white flowers, spotted red and yellow near the base.

67371. NICOTIANA RUSTICA L. Solanaceae. Aztec tobacco.

67372. PHELLODENDRON CHINENSE GLABRIS-
USCULUM C. Schneid. Rutaceae. Chinese cork tree.

A handsome Chinese tree about 30 feet high, with dark gray-brown bark, dark yellowish green compound leaves hairy beneath, and black fruits in panicles about 3 inches long.

67373. RHODODENDRON SMIRNOWI Trautv.
Ericaceae. Smirnow rhododendron.

A shrub or small tree about 20 feet high with dark-green leaves grayish hairy beneath and compact heads of rosy red flowers each about 3 inches across. Native to the Caucasus.

For previous introduction see No. 66478.

67374. ROSA ACICULARIS Lindl. Rosaceae. Prickly rose.

A low densely prickly shrub native to northern America, Europe, and Asia. It bears three to seven leaflets and solitary deep-rose flowers followed by pear-shaped fruits.

For previous introduction see No. 54165.

67344 to 67376—Continued.

67375. SKIMMIA FOREMANNII Hort. Rutaceae.

A low densely branched Japanese evergreen shrub with narrow yellowish green leaves and roundish red berries. It is considered to be a hybrid between *Skimmia japonica* and *S. fortunei*.

67376. TRITOMA CAULESCENS (Baker) Carr.
(*Kniphofia caulescens* Baker). Liliaceae. Torch lily.

A showy herbaceous perennial from the Cape of Good Hope with sword-shaped radical leaves 2 to 3 feet long and a flower spike about 6 inches long. The lower flowers are yellow and the upper ones red.

67377 to 67396.

From Russia. Seeds presented by A. Kol, chief of the bureau of introduction, Institute of Applied Botany, Leningrad, Russia, through J. W. Pincus, Amtorg Trading Corporation, New York, N. Y. Received May 13, 1926.

67377 to 67379. AVENA SATIVA L. Poaceae. Oats.

67377. No. 9451. Variety *mutica*. Selection No. 145. From the Western Siberian Experiment Station.

67378. No. 9452. Variety *krausei*. Selection No. 117. From the Western Siberian Experiment Station.

67379. No. 10188. Variety *persica* Vav. From Persia.

67380 to 67385. HORDEUM spp. Poaceae.

67390 and 67381. HORDEUM DISTICHON NU-
DUM L. Two-rowed barley.

67380. No. 10249. Variety *nudum* L. Selection No. 07-B-III. From Turkestan.

67381. No. 10250. Variety *nudum* L. Selection No. 0128-A-VII. From Turkestan.

67382. HORDEUM DISTICHON PALMELLA Har-
lan. Two-rowed barley.

No. 10251. Variety *praecoccium* R. Reg. From the Erivan Government.

67383. HORDEUM VULGARE COELESTE L. Six-rowed barley.

No. 10041. Variety *nudum* L. From the Jaroslav Government.

67384. HORDEUM VULGARE NIGRUM (Willd.)
Beaven. Six-rowed barley.

No. 10247. Variety *tanaiticum* Reg. Selection No. 029-A-VII. From the north of Caucasia.

67385. HORDEUM VULGARE PALLIDUM Seringe. Six-rowed barley.

No. 10246. Variety *pallidum* Ser. Selection No. 0815-A-II. From Turkestan.

67386 and 67387. PANICUM MILIACEUM L. Poa-
ceae. Proso.

67386. No. 3003. Selection No. 853. From the Saratov Government.

67387. No. 10242. *Afganskoe*. From Afghanistan.

67388 to 67394. TRITICUM AESTIVUM L. (*T. vul-
gare* Vill.). Poaceae. Common wheat.

67388. No. 3000. Variety *albidum* Al. Belozesnaja. Selection No. 604. From the Saratov Government.

67389. No. 3001. Variety *albidum* Al. From the Saratov Government.

67390. No. 9446. Variety *calcium*. Selection No. 0111. From the Western Siberian Experiment Station.

67377 to 67396—Continued.

67391. No. 9447. Variety *lutescens*. Selection No. 0479. From the Western Siberian Experiment Station.

67392. No. 9449. Variety *millurum*. Selection No. 0254. From the Western Siberian Experiment Station.

67393. No. 10244. Variety *gracum* Körn. Sary Mahiz. Selection No. 0289 A IV. From Turkestan.

67394. No. 10245. Variety *gracum* Körn. Sary Mahiz. Selection No. 0283 A IV.

67395 and 67396. TRITICUM DURUM Desf. Poaceae. Durum wheat.

67395. No. 2995. Variety *hordeiforme*. *Belotourka*. Selection No. 189. From the Samara Government.

67396. No. 2996. Variety *melanopus* Al. *Belotourka*. Selection No. 69. From the Samara Government.

67397. SACCHARUM OFFICINARUM L. Poaceae. Sugar cane.

From Herradura, Cuba. Cuttings presented by F. S. Earle, through E. W. Brandes, Bureau of Plant Industry. Received June 1, 1926.

P. R. No. 492.

67398 and 67399. PHYLLOSTACHYS spp. Poaceae. Bamboo.

From Canton, China. Rhizomes collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received January and February, 1926. Numbered May, 1926. Notes by Mr. McClure.

67398. PHYLLOSTACHYS sp.

No. 247. November 22, 1925. *Koon yam chuk*, *Kan chuk*. A small monopodial bamboo growing wild along the banks of the West River, near Wuchow, Kwongsi. The culms are 1 to 1.5 meters high and 1 to 1.5 centimeters in diameter. The young shoots which begin to appear in April are edible and considered very delicious by the Chinese. It is not necessary to parboil them.

67399. PHYLLOSTACHYS sp.

No. 258. November 25, 1925. *Fa hok chuk*. These rhizomes were purchased from a grove near Takhing, West River. This bamboo is cultivated for its edible shoots, which begin to appear in April. The culms, medium thin-walled and rather tough, are used to some extent in weaving bamboo articles, such as baskets and trays.

67400 to 67404. SACCHARUM OFFICINARUM L. Poaceae. Sugar cane.

From China. Cuttings collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received May 3, 1926. Notes by Mr. McClure.

Obtained at T'owa, a village near the Canton Christian College, March 9, 1926.

67400. No. 435. *Haak kwat che*, *Tsz che*, *Hung che*. A very large variety, characterized by the purple color of the stalks. It has a thick "skin" and is considered the most durable in shipment. Most of the crop of this variety is consumed fresh.

67401. No. 436. *Paak che*. A smaller and thinner skinned variety than No. 435 [No. 67400]. It is largely consumed fresh. Though this variety contains the most juice, the flavor is said to be not so rich as that of others.

67400 to 67404—Continued.

67402. No. 437. *Kam shaan che*. This variety is said to have originally come from Australia. It is very large and coarse and is seldom eaten fresh, though it is said to give the best sugar return of any variety.

67403. No. 438. *Chuk che*, *Maau che*. This variety is characterized by a very hard "skin" and is consequently very little eaten fresh.

67404. No. 439. *Muk che*. This variety is said to have been introduced from Singapore and is considered the poorest from the Chinese point of view. The stalks are extremely hard (hence the name "wooden cane") and are said to reach the largest stature of any.

67405. GOSSYPIUM sp. Malvaceae.**Cotton.**

From Sumatra. Seeds collected by David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition. Received May 23, 1926.

No. 707. A kidney cotton found near the military camp of Lawe Aonan, in the very heart of Atjeh, at an altitude of 800 meters. It may be a form introduced into the Battak lands many years ago.

67406. STROPHANTHUS GRATUS Baill. Apocynaceae.

From Ibadan, Nigeria, Africa. Seeds presented by R. A. Sykes, senior conservator of forests. Received May 26, 1926.

A handsome woody climber, native to tropical Africa, with fragrant flowers, white tinged with pink, and seeds which furnish crystalline strophanthus, according to Holland (Useful Plants of Nigeria, pt. 3, p. 447). This substance is used in medicine, and the seeds of this species are preferred to the common strophanthus seeds of commerce, which yield this glucosid in an amorphous condition.

67407. PRUNUS sp. Amygdalaceae.**Smith plumcot.**

Growing at the Plant Introduction Garden, Chico, Calif. A form developed from scions of unnamed plumcots obtained in 1915 from M. Sharpe, Vacaville, Calif. Numbered June, 1926.

Fruit medium sized to medium large, $1\frac{3}{4}$ to 2 inches long and $1\frac{1}{2}$ to $1\frac{3}{4}$ inches in diameter. Practically all fruits are decidedly compressed. The shape is irregular, as with most plumcots and apricots, some specimens tending to be kidney-shaped. Stem short, medium stout. Suture a distinct line in most specimens, but a quite prominent depression in a few. Apex rounded to semi-pointed in some specimens. Some specimens almost completely overlaid with dark red; the majority, however, have only a limited amount of coloring, it not being uncommon for one side only to be entirely colored. Skin medium thick, medium tough. Flesh light yellow, medium juicy, with rather numerous small fibrous threads which are not objectionable. Mildly subacid, except in very ripe fruit. Flesh clings tightly to the medium-sized pit. Pit 1 inch long, five-eighths of an inch wide, and medium compressed. This plumcot is early, ships well, and is of fairly good quality. The irregular size and shape of the samples at hand perhaps may be overcome in part by good cultural methods. The shy bearing habit of this tree may be a handicap to commercial production. Row 8, tree 1, old test orchard; row 16, tree 45, and row 19, tree 34, new test orchard.

67408. MELILOTUS INDICA (L.) All. Fabaceae. Sweet clover.

From Rabat, Morocco. Seeds presented by A. Pochon, Directeur, Jardin d'Essais de Rabat. Received May 28, 1926.

Locally grown seed.

For previous introduction see No. 61322.

67409. LINUM USITATISSIMUM L. Lin-
aceae. **Flax.**

From Riga, Latvia. Seeds obtained from C. J. Mayer, commercial attaché, United States legation. Received June 18, 1926.

Locally grown seed.

67410 and 67411. LYSSOCHILUS spp.

From Africa. Roots obtained through H. L. Shantz, Bureau of Plant Industry. Received March 30, 1926. Numbered June, 1926.

Collected during November in dry ground in the highlands of northern Nyassaland, and sent to me by Mrs. W. P. Young, of Livingstonia. (Shantz.)

67410. No. 488.

67411. No. 490.

67412. VETIVERIA ZIZANIODES (L.)
Nash (Andropogon squarrosus L. f.).
Poaceae. **Grass.**

From Buitenzorg, Java. Cuttings presented by Dr. P. J. S. Cramer, Director, General Experiment Station, Department of Agriculture, Industry, and Commerce. Received September 1, 1925. Numbered June, 1926.

A stout grass, with tufted stems 2 to 5 feet high, rigid leaves 1 to 2 feet long, and erect conical panicles up to a foot in length. Native to lower India and Burma.

For previous introduction see No. 34928.

67413. COLOCASIA ESCULENTA (L.)
Schott. Araceae. Dasheen.

From San Pedro, Sula, Honduras. Tubers presented by Mrs. H. N. Auler. Received October 7, 1925. Numbered June, 1926.

The dasheen of this country is pink and white and very dry. We have had about 15 pounds from one plant. (Mrs. Auler.)

67414 and 67415. COLOCASIA ESCU-
LENTA (L.) Schott. Araceae. Dasheen.

From Aburi, Gold Coast, West Africa. Tubers presented by F. N. Howes, Government botanist. Received January 7, 1926. Numbered June, 1926. Notes by Mr. Howes.

These two varieties are grown extensively all over the forest country of this colony for food; they appear equally hardy and disease resistant.

67414. *Red*. The growing points of the tubers of the red variety are distinctly red, though the flesh, particularly when young, is sometimes of a pinkish tint.

67415. *White*. The tubers of the white variety have no pigment at all.

67416. MICHELIA CHAMPACA L. Mag-
noliaceae.

From China. Plants obtained by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received February 9, 1926. Numbered June, 1926.

No. 307. *Wong yuk laan*. Obtained at Fatsi, Canton, from a commercial flower garden. A small much-branched tree of cylindrical habit. The leaves are pale green, entire, narrow oblong, acute and shiny above. The long, slender, cream-colored, solitary flowers, mostly terminal, are borne the year round, but most abundantly in May and June. Owing to their rich fragrance these flowers are highly esteemed by the Chinese and are commonly worn by women in their hair on formal occasions and by children behind their ears and in their noses. The petals do not open very soon, but remain for a long time quite tight together. In this state the flowers are 3 to 4 centimeters long and 1 centimeter in diameter in the middle.

67417 to 67423. COLOCASIA ESCULENTA
(L.) Schott. Araceae. Taro.

From Canton, China. Tubers and offshoots collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received April 2, 1926. Notes by Mr. McClure.

67417. No. 357. *Tai oo tau*. Obtained at Yeunguk, Lungtau Mountain, January 13, 1926. The most commonly cultivated variety in this rural district.

67418. No. 358. *Leng oo tau*. Obtained at Yeunguk, Lungtau Mountain, January 13, 1926. This is a rather small variety which is commonly planted on hillsides (hence the name "hill taro"). It thrives without irrigation, which is considered essential for most of the commonly cultivated varieties.

67419. No. 393. *Kaau tsau oo tau, Paak nga oo tau*. Obtained at Shiuchow, January 23, 1926.

67420. No. 394. *Heung oo tau*. One of the most widely cultivated varieties of the Province, obtained at Shiuchow, January 23, 1926.

67421. No. 396. *Hung nga oo tau*. A widely cultivated variety obtained at Shiuchow, January 23, 1926.

67422. No. 398. *Hung yuk oo*. A "red-fleshed" variety obtained at Shiuchow, January 24, 1926.

67423. No. 399. *Paak nga oo tau*. A "white-sprouted" variety obtained at Shiuchow, January 24, 1926.

67424. XYLOCARPUS GRANATUM KOEN.
Meliaceae.

From Sibolangit, Sumatra. Seeds obtained by David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition. Received May 20, 1926.

A moderately large evergreen tree from southeastern Asia, the seeds of which yield an oil used as hair oil and for illumination. The hard wood is used for making tools.

67425 to 67484. PHASEOLUS VULGARIS
L. Fabaceae. Common bean.

From Tiflis, Georgia, Caucasus. Seeds presented by L. Dekaprelevis, chief specialist of plant breeding, botanical garden. Received June, 1926.

67425. *N-1*. A white elliptical variety.

67426. *N-4*. A short elliptical red variety.

67427. *N-5*. A black elliptical variety.

67428. *N-6*. Two-thirds red; one-third white with red spots.

67429. *N-7*. White with dark-red spot around hilum.

67430. *N-8*. Light brown with reddish-brown markings.

67431. *N-10*. Light buff with reddish-brown markings.

67432. *N-12*. Long dark-red variety.

67433. *N-13*. An elliptical white variety.

67434. *N-14*. A round snow-white variety.

67435. *N-15*. Dark buff with oblique square ends.

67436. *N-16*. An elliptical filbert-colored variety.

67437. *N-16*. A round yellowish variety.

67438. *N-17*. A dark-buff elliptical variety.

67439. *N-22*. A white variety.

67425 to 67484—Continued.

67440. *N-22*. An elliptical red variety.
67441. *N-23*. A long dark-buff bean with square ends.
67442. *N-24*. A long white bean with large black spot around hilum.
67443. *N-25*. A long elliptical solid-black bean.
67444. *N-28*. Light buff overlain with dark red.
67445. *N-29*. Dark buff with maroon stripes and spots.
67446. *N-32*. A long medium-sized white bean.
67447. *N-34*. A long flat dark-red bean.
67448. *N-36*. Long elliptical pure white.
67449. *N-38*. Small elliptical pure white.
67450. *N-39*. A long elliptical light-buff bean with square ends.
67451. *N-40*. Light buff with very faint darker lines.
67452. *N-41*. A long elliptical yellowish-brown bean.
67453. *N-42*. A dark-buff elliptical slightly curved bean.
67454. *N-43*. Long elliptical greenish bean.
67455. *N-44*. Dark-red solid color.
67456. *N-45*. Long elliptical dark red.
67457. *N-46*. Short elliptical dark grayish red.
67458. *N-47*. Long elliptical grayish black.
67459. *N-48*. A long elliptical dark-red variety.
67460. *N-49*. Similar to *N-48*, but much smaller.
67461. *N-51*. Light buff with darker markings.
67462. *N-53*. Light buff with nearly black markings.
67463. *N-54*. Similar to *N-53*, but smaller.
67464. *N-56*. Reddish brown with dark-brown lines.
67465. *N-57*. Light brown with dark lines and spots.
67466. An elliptical variety.
67467. An elliptical yellow variety.
67468. An elliptical reddish-brown variety.
67469. An elliptical black variety.
67470. An elliptical straw-colored variety.
67471. An oblong variety.
67472. A variety which is oblong and white.
67473. Variety oblong and toast colored.
67474. Oblong pale-yellow variety.
67475. Oblong pale-yellow variety.
67476. An oblong pale-yellow variety.
67477. An oblong buff-colored variety.
67478. An oblong buff-colored variety.
67479. An oblong dark-reddish variety.
67480. A round variety.
67481. A round cream-colored variety.
67482. No. 14. A round cream-colored variety.
67483. A small round light-yellow variety.
67484. A round buff-colored variety.

67485 to 67489. *FRAGARIA* spp. *Rosa-ceae*. **Strawberry.**

From Paris, France. Plants purchased from Vilmorin-Andrieux & Co. Received April 6, 1926. Notes from 1925-26 Catalogue of Vilmorin-Andrieux & Co.

67485. *FRAGARIA* sp.

Abondance. Fruits bright red, extra large, uniform shape; a very prolific variety.

67486. *FRAGARIA* sp.

Belle Bordelaise. Fruits aromatic, with raspberry-like flavor; sometimes everbearing.

67487. *FRAGARIA* sp.

Jucunda. Fruits abundant, large, almost round, scarlet-vermilion; flesh red, juicy, aromatic.

67488. *FRAGARIA* sp.

Louis Vilmorin. Fruits rather large, uniformly heart-shaped, dark red. A hardy, dependable variety.

67489. *FRAGARIA* sp.

M. nistre Pams. A vigorous, productive variety, fruits large, conical, shining red; flesh white, juicy, aromatic, of exquisite flavor.

67490. *ALOCASIA INDICA* Schott. *Ara-ceae*.

From Ceylon. Tubers obtained by David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition. Received February 26, 1926. Numbered June, 1926.

No. 320. Tubers of the yautia, or, as it is called in Ceylon, the "habarala," obtained at the Sunday market in Kadugannawa, near Kandy, January 12, 1926. After having some of them cooked and served, I decided that they were worth sending in for a comparative test with those now being grown experimentally in the Gulf States. (*Fairchild*.)

67491. *STELECHOCARPUS BURAHOL* (Blume) Hook. f. and Thoms. *An-nonaceae*.

From Diokjakarta, Java. Seeds obtained by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received June 12, 1926.

No. 765. Obtained in the market, May 1, 1926. The Kepel tree of the Javanese, which is grown around Diokjakarta. The fruits are produced in clusters on the branches and trunk of the tree. They resemble small potatoes in shape and color. They have a pleasant fragrance and flavor, somewhat like that of *Asimina triloba*.

67492. *TRITICUM TURGIDUM* L. *Poa-ceae*. **Poulard wheat.**

From Algiers, Algeria. Seeds presented by Dr. L. Trabut. Received June 12, 1926.

Touggourt, April, 1926. *Khalof*. Grown under irrigation; entirely immune from rust. (*Trabut*.)

67493 to 67495. *SACCHARUM OFFICINARUM* L. *Poaceae*. **Sugar cane.**

From Rio de Janeiro, Brazil. Cuttings presented by Antonio Carlos, Pastana Experiment Station, through E. W. Brandes, Bureau of Plant Industry. Received June 16, 1926.

67493. No. 2443.

67495. No. 4905.

67494. No. 4475.

67496 and 67497. TRIFOLIUM INCARNATUM L. Fabaceae.**Crimson clover.**

From Budapest, Hungary. Seeds obtained from Gebrüder Schwartz. Received June 15, 1926.
Locally grown seed.

67496. No. 286.

67497. No. 574.

67498. HYMENOCALLIS AMANCAES (Ruiz and Pav.) Nichols. Amaryllidaceae.**Spider lily.**

From Lima, Peru. Bulbs presented by R. Beaton. Received June 16, 1926.

A tender spider lily from Chile and Peru, about 2 feet high, with large bright-yellow flowers.

67499 and 67500. IPOMOEA BATATAS (L.) Poir. Convolvulaceae.**Sweet potato.**

From China. Tubers collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received February 18, 1926. Numbered May, 1926.

67499. No. 331. *Hung faan shue*. Obtained at Chukkouen, Lohkongtung, December 27, 1925. A variety of unusual flavor and quality with red skin and cream-colored flesh. The tubers often reach a fairly large size, but when they do the skin has a tendency to break open, resulting in malformed specimens.

67500. No. 332. *Heung shui faan shue*. Obtained at Chukkouen, Lohkongtung, December 27, 1925. A variety with pale-yellow skin and deliciously flavored flesh, containing no fibers, which is butter yellow when cooked. This variety never reaches a very large size, and for that reason it is not commonly cultivated. It compares favorably with, if not actually superior to, our better varieties.

67501 to 67504.

From Java. Seeds obtained by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received June 18, 1926.

67501. FICUS WARINGIANA Hort. Moraceae.

No. 769. May 7, 1926. A small tree growing below Karangpandan. The dark-red, almost black fruits, the size of a pigeon's egg, are very attractive. This waringian fig grows into an immense tree suitable for very wide avenues. It is of the banyan type, with many pendent aerial roots which descend into the ground.

67502. FICUS sp. Moraceae.

No. 770. A tall gray-barked tree with fine buttresses, medium-sized leaves, and red fruits as large as olives and of the same shape, which turn almost black when ripe. This tree is used as a shade tree at the gate of a private house near the Pablangan Hot Springs, near Karangpandan.

67503. SAPINDUS RARAK DC. Sapindaceae.**Soapberry.**

No. 772. From the market at Diokjakarta. May 7, 1926. A dioecious tree which grows at an altitude of 1,500 meters. The large sticky semitransparent fruits of a waxy texture contain much saponin and are used by the Javanese for washing clothes.

67504. SAURAUJA BLUMIANA Benn. Dilleniaceae.

No. 754. From the Dieng Plateau at an altitude of 6,000 feet. April 25, 1926. The Tjoewoet, also Oembel-Oembelan, named because of the slimy contents of the fruit in which the seeds are embedded. A small tree or shrub occurring all over Java at an altitude of about 5,000 feet, with attractive glossy leaves and white, bell-shaped fruits.

67505 to 67509.

From Calcutta, India. Seeds purchased from Frederico Varela. Received June 15, 1926. Notes by B. T. Galloway, Bureau of Plant Industry.

67505. BAMBOS JUBBULPORENSIS Hort. Poaceae.**Bamboo.**

This is the "dry-zone bamboo" of upper India. There is no recorded name or description of the species. The seedlings closely resemble those of *Bambos polymorpha* and *B. tulda*.

67506. BAMBOS POLYMORPHA Munro. Poaceae.**Bamboo.**

A promising bamboo which may have many uses commercially and domestically. It grows in tufts or clumps and under favorable conditions may reach a height of 75 to 80 feet. The culms are thick walled and 3 to 6 inches in diameter. The leaves are comparatively small for such a large bamboo, usually 3 to 7 inches long and from one-third to one-half inch wide. Native to Bengal and Burma, India.

For previous introduction see No. 61373.

67507. BAMBOS TULDA Roxb. Poaceae. Bamboo.

One of the most promising species introduced, but it will not stand much frost. The culms are green and smooth and under good conditions may reach a height of 60 to 70 feet and a diameter of 2 to 5 inches. They are nearly solid and extremely tough and strong. The culms split easily and therefore lend themselves to many uses. The plant is quite leafy and proves a beautiful ornamental with its graceful leaning stems and tropical frondage. Native to Bengal, India.

67508. DENDROCALAMUS STRICTUS (Roxb.) Nees. Poaceae.**Bamboo.**

A strikingly beautiful and useful bamboo already grown to a considerable extent in the warmer parts of Florida, but worthy of further planting. The culms under good conditions may grow to a height of 80 to 100 feet. This bamboo will stand considerable drought and cold. It is more especially suited for clump planting. Native to India.

67509. THYRSOSTACHYS SIAMENSIS Gamble. (Bambos regia Thoms.). Poaceae. Bamboo.

This is a so-called "regal bamboo" of Siam and as far as known has not previously been introduced into this country. The culms grow to a height of 35 to 40 feet, are very straight, and do not branch until high up. It is said to be one of the most graceful bamboos known. Its chief value will doubtless be in its ornamental nature. Suitable for the warmer coast sections of Florida, Porto Rico, and the Canal Zone.

67510 to 67514.

From Jalta, Crimea, Russia. Seeds presented by Th. K. Kalajda, horticultural director, Nikita Botanic Garden. Received June 19, 1926.
A collection of locally grown leguminous forage plants.

67510 to 67512. MELLLOTUS spp. Fabaceae.**67510. MELLLOTUS ALBA Desr.****White sweet clover.**

No. 274.

67511. MELLLOTUS OFFICINALIS (L.) Lam.**Sweet clover.**

No. 275.

67512. MELLLOTUS TAURICA (Bieb.) Seringe.**Sweet clover.****67513. TRIFOLIUM ARVENSE L. Fabaceae.****Clover.**

No. 286.

67514. TRIFOLIUM PRATENSE L. Fabaceae.**Red clover.**

No. 287.

67515 to 67519.

From Java. Seeds obtained by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received June 11, 1926.

67515. GARCINIA MANGOSTANA L. Clusiaceae. Mangosteen.

No. 771. Karangpandan. May 8, 1926. Locally grown seeds.

67516 and 67517. LANSIUM DOMESTICUM Jack. Meliaceae. Langsat.

For previous introduction see No. 61899.

67516. No. 771. Karangpandan. May 8, 1926. Seeds from the largest fruit I have ever seen.

67517. No. 771. Karangpandan. May 8, 1926. A very large-fruited variety.

67518 and 67519. CAPSICUM ANNUM L. Solanaceae. Red pepper.

67518. No. 780. May 10, 1926. A strikingly brilliant rather long slender variety which is sold both green and ripe at the Kediri market.

67519. No. 781. Obtained at the market in Kediri, May 10, 1926. A small very hot variety used extensively in making "R's Tavel."

67520 to 67526. GOSSYPIMUM spp. Malvaceae. Cotton.

From Trinidad, British West Indies. Seeds obtained from the Trinidad Imperial College of Tropical Agriculture through A. E. Longley, Bureau of Plant Industry. Received June 19, 1926.

67520 and 67521. GOSSYPIMUM BRASILIENSE Macfad.

67520. Trinidad red kidney cotton.

67521. Variety *apospermum*. A yellow-flowered shrub, usually about 4 feet high, native to Brazil.

67522. GOSSYPIMUM CERNUUM Todaro.

An erect bush, 3 feet high, cultivated in India. The flowers are pale sulphur yellow, and the petals are marked with a purple spot.

67523. GOSSYPIMUM NEGLECTUM Todaro.

Cawnpore. A cotton cultivated in certain parts of India and closely related to *Gossypium arboreum*, but less arborescent.

67524. GOSSYPIMUM OBTUSIFOLIUM Roxb.

Himbury. A shrubby, much-branched plant, with small three-lobed leaves and three-celled capsules with three seeds in each cell.

67525. GOSSYPIMUM PUNCTATUM Schum. and Thom.

Variety *laciniatum*. A wild cotton found in tropical America and also in central and western Africa. It is described (Watt, *Wild and Cultivated Cottons of the World*) as a shrub with hairy three-lobed leaves and yellow flowers spotted with purple. The wool is pure white and silky.

For previous introduction see No. 62597.

67526. GOSSYPIMUM PURPURASCENS Poir.

Trinidad red leaf. A tropical American shrub, 6 to 10 feet high, with purplish branches, three-lobed leaves, and sulphur-yellow flowers.

67527. GARCINIA MANGOSTANA L. Clusiaceae. Mangosteen.

From Java. Seeds obtained by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received June 28, 1926.

No. 786. Seeds from medium-sized fruits obtained in the market in Soerabaya, May 17, 1926.

67528. HEVEA BRASILIENSIS (H. B. K.) Muell. - Arg. Euphorbiaceae. Para rubber tree.

From Port au Prince, Haiti. Seeds obtained through O. F. Cook, Bureau of Plant Industry. Received June 8, 1926.

The Para rubber tree, native to Brazil and now extensively cultivated in the East Indies, has always ranked as the principal and most important rubber-producing tree of the world. In 1922 the world's production of rubber amounted to 379,200 tons, of which 354,980 tons, or 93 per cent, came from this source.

For previous introduction see No. 64542.

67529. CORYNOCARPUS LAEVIGATA Forst. Corynocarpaceae. Karaka.

From Avondale, Auckland, New Zealand. Seeds presented by H. R. Wright. Received May 20, 1926.

A large, handsome tree with oblong glossy laurellike leaves 3 to 7 inches long and small white flowers in erect panicles about 4 inches long. The pulp of the orange fruits, about an inch long, is extremely poisonous, but the kernel was one of the staple articles of diet of the Maoris, the original inhabitants of New Zealand, where this tree is native.

67530 to 67533.

From Nigeria, Africa. Seeds presented by H. Caracciolo, Port of Spain, Trinidad, British West Indies. Received May 27, 1926.

67530. ALBIZZIA WELWITSCHII Oliver. Mimosaecae.

A tropical African leguminous tree, 40 to 50 feet high, with a spreading crown and attractive feathery foliage.

67531. ANNONA SQUAMOSA L. Annonaceae. Sugar apple.

A special variety. (*Caracciolo*.)

For previous introduction see No. 51015.

67532. CHRYSOPHYLLUM CAINITO L. Sapotaceae. Caimito.

White star apple. A large handsome West Indian tree, with striking dark-green leaves which are copper colored underneath. The smooth round purplish fruit is four seeded. In an unripe state the fruit contains a sticky white latex, but when fully matured the white transparent jellylike substance surrounding the seeds is sweet and agreeable. This is well worth cultivating as an ornamental shade tree.

For previous introduction see No. 51814.

67533. PTEROSPERMUM ACERIFOLIUM (L.) Willd. Sterculiaceae.

A large Burmese tree, with very large oval leathery leaves, white or gray beneath, and long fragrant fleshy yellow flowers.

67534 and 67535.

From Sumatra. Seeds obtained by David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition. Received May 14, 1926.

67534. *AESCHYNOMENE JAVANICA* Miquel. Fabaceae.

No. 509. Found in plot experiments at the Avros Experiment Station, Medan. February 22, 1926. A leguminous plant which may prove suitable as a cover crop in the southern United States.

67535. *ALEURITES MOLUCCANA* (L.) Willd. (*A. triloba* Forst.). Euphorbiaceae.

Lumbang.

No. 445. Sibolangit Botanic Garden. February 24, 1926. The candlenut tree of the Malayan Archipelago. The fruits are four times as large as those of this species grown in southern Florida. The nuts are eaten roasted.

For previous introduction see No. 59301.

67536. *AMARANTHUS GANGETICUS* L. Amaranthaceae.

From Colombo, Ceylon. Seeds obtained by David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition. Received May 14, 1926.

No. 393. February 12, 1926. The leaves and shoots are dark and light red and when young are used as spinach.

For previous introduction see No. 58461.

67537 to 67631.

From Sumatra. Seeds obtained by David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition. Received May, 1926.

67537. *AMOMUM* sp. Zinziberaceae.

No. 442. Sibolangit Botanic Garden. February 24, 1926. A plant 15 feet high with immense pinnate leaves which are very handsome. It is ideal for borders of ponds.

67538. *CALOTROPIS GIGANTEA* (L.) R. Br. Asclepiadaceae.

No. 423. An asclepiad with enormous lilac flowers. This interesting showy species was found on a strand at Sabang, Pulu We Island, off the coast of Sumatra, February 17, 1926.

67539. *BARLERIA* sp. Acanthaceae.

No. 444. Sibolangit Botanic Garden. February 22, 1926. A spiny hedge plant used successfully as clipped hedge at the Avros Experiment Station, Medan.

67540. *BAUHINIA GLAUCA* Wall. Caesalpiniaceae.

No. 506. Sibolangit Botanic Garden. February 25, 1926. Small tree or tall shrub with white flowers, said to be very handsome.

67541. *CAJAN INDICUM* Spreng. Fabaceae.
Pigeon pea.

No. 656. Found in a little native clearing on the shore of Lake Tawar, near Takengon. March 9, 1926. This may be a distinct strain.

67542. *CASSIA JAVANICA* L. Caesalpiniaceae.

No. 438. Sibolangit Botanic Garden. February 24, 1926. A small tree with gorgeous pink flowers $2\frac{1}{2}$ inches across, borne in large clusters during February.

67537 to 67631—Continued.

67543. *CASUARINA SUMATRANA* Jungh. Casuarinaceae.

No. 443. Sibolangit. February 24, 1926. A tree with drooping branches and very fine pendent branchlets said to grow on rocky soils in Sumatra. The fruits are large and globose with prominent protruding tubercles. It is the handsomest of the genus.

For previous introduction see No. 54705.

67544. *CELTIS TETRANDBRA* Roxb. Ulmaceae.
Hackberry.

No. 544. A small tree growing by the roadside near Takengon, at an altitude of 3,000 feet. March 3, 1926.

67545. *CHAETOCHELOA* sp. Poaceae. Grass.

No. 513. A small delicate grass from the golf links at Brestagi, near Medan, at an altitude of 5,000 feet. February 21, 1926.

67546. *CITRUS AURANTIFOLIA* (Christm.) Swingle. Rutaceae. Lime.

No. 425. Obtained in the market at Sabang, Pulu We Island, off the coast of Sumatra, February 12, 1926. The so-called "Kaffir lime." The deep-green fruits are rougher than those of a rough lemon. They are boiled and used to kill lice in the head. May prove of value as stock.

67547. *CITRUS* sp. Rutaceae.

No. 494. A strange fruit the shape of a tangelo, light yellow and 4 inches long, found at Takengon at an altitude of 3,000 feet. The taste is resinous like the rind of a citrange, making it inedible. It is used by the natives for washing their hair.

67548. *CITRUS* sp. Rutaceae.

No. 493. Obtained in the market at Takengon. March 8, 1926. The rather juicy, though sour, green fruits, 3 inches long, are obovate, and the skin is somewhat rugose. There is an abundance of seeds.

67549. *COSTUS RUMPHIANA* Hort. Zinziberaceae.

No. 429. Sibolangit Botanic Garden. February 22, 1926. An attractive plant with immense pinnate leaves, which rise from a rhizome, and deep pink flowers borne on tall stalks.

67550. *COTONEASTER* sp. Malaceae.

No. 659. March 9, 1926. A scraggly bush, 10 feet high, found on a hillside in a small canyon leading down into Lake Tawar, near Takengon.

67551 and 67552. *CROTALARIA USARAMOENSIS* Baker f. Fabaceae.

For previous introduction see No. 64064.

67551. No. 466. Takengon. March 2, 1926. A crotalaria with long spikes of yellow to bronze flowers.

67552. No. 523. Lampehan. March 3, 1926. A bushy yellow-flowered species about 6 feet high, which is being grown as a protection crop on poor volcanic sand. It grows so rapidly that it shades the young seedlings.

67553. *CROTALARIA CALYCINA* Schrank. Fabaceae.

No. 532. Lampehan. March 3, 1926. A curious low-growing plant with long hairy sepals, found on poor volcanic sand at an altitude of 3,000 feet.

67537 to 67631—Continued.

67554. *CYPHOMANDRA* *BETACEA* (Cav.) Sendt.
Solanaceae. Tree tomato.

No. 433. Medan. February 21, 1926. A red-fruited variety shading into yellow. The fruits are made into a deep-red jelly or preserve resembling stewed apricots.

For previous introduction see No. 52740.

67555. *DONAX* *CANNAEFORMIS* (Forst.) Rolfe.
Marantaceae.

No. 519. Sibolangit Botanic Garden. February 25, 1926. A tall ornamental plant which makes a wonderful growth of broad leaves and long smooth stems in the shady forest.

67556. *EULALIA* sp. Poaceae. Grass.

No. 667. A tall, rather coarse grass which covers a considerable portion of the extensive grass lands of the mountains in northern Sumatra, at an altitude of about 2,000 feet. Found on the road between Takengon and Bireun. March 11, 1926.

67557 to 67570. *FICUS* spp. Moraceae.

67557. *FICUS* *TOXICARIA* L.

No. 672. A handsome species of fig tree which bears enormous quantities of non-poisonous though not edible fruits. An excellent shade tree. Sibolangit Botanic Garden, March, 1926.

67558. *FICUS* *VARIEGATA* Blume.

No. 674. Sibolangit Botanic Garden, March, 1926. The gondang tree of Java and Sumatra. A large forest tree with enormous numbers of long pedicelled fruits an inch or so across.

For previous introduction see No. 50398.

67559. *FICUS* *KALICARPA* Miquel.

No. 472. Between Takengon and Bireun. March 5, 1926. A climbing fig which covered a tall forest tree with its growth as does *Ficus repens*. It bears orange fruits $1\frac{1}{2}$ inches in diameter which are mottled with lighter yellow. From a distance this is a striking species and is quite a splendid covering for stone fences, etc.

67560. *FICUS* *AMPELOS* Burm. f.

No. 473. Road between Takengon and Bireun. March 5, 1926. A dwarf fig tree, about 10 inches high, with tiny brilliant red fruits produced in great abundance. Of possible use as a potted plant.

67561. *FICUS* *PARIETALIS* Blume.

No. 481. Takengon (Balica). March 5, 1926. A handsome climbing fig with leaves 8 inches by $3\frac{1}{2}$ inches, ovate and glossy. It bears pretty little figs five-eighths of an inch in diameter on a short stem.

67562. *FICUS* *SUBULATA* Blume.

No. 484. Found on the road between Bireun and Takengon. March 5, 1926. A handsome climbing large-leaved plant bearing small orange fruits half an inch in diameter.

67563. *FICUS* sp.

No. 492. Road between Bireun and Takengon. March 5, 1926. An attractive shade tree of medium to large size, bearing an abundance of fruits from the main branches. These fruits, $1\frac{1}{4}$ inches in diameter, are not edible.

67537 to 67631—Continued.

67564. *FICUS* *GIBBOSA* Blume.

No. 496. From the shore of Lake Tawar, Takengon. March 9, 1926. A handsome medium-sized tree with a single gray trunk. The large glossy leaves are dark green, and the berries are deep orange and half an inch in diameter.

67565. *FICUS* sp.

No. 522. From the cliffs above the shore of Lake Tawar, near Takengon. March 2, 1926. Hanging against the cliff there appeared a hundred or so of the most superbly colored fruits, a dull crimson shading into gold on the shady side, which were the size and shape of a lemon. The foliage, dark green on both sides, was coriaceous and as harsh to the touch as sandpaper. The surface of the fruits was rough and when ripe became soft and shiny. The large light-yellow seeds are embedded in a sweet purplish jellylike substance.

67566. *FICUS* *GLABELLA* Blume.

No. 537. Found near a bridge at Takengon, at an altitude of 3,000 feet. March 4, 1926. A beautiful shade tree with a fine rounded crown. In shape and general character it resembles *Ficus nitida*.

67567. *FICUS* *ALBA* Reinw.

No. 662. Found between Bireun and Takengon, at an altitude of 500 feet. March 11, 1926. A small but attractive tree having an abundance of brilliant yellow figs scarcely half an inch in diameter. When ripe these figs are red and sweet. They are called here "gompos."

67568. *FICUS* sp.

No. 675. February, 1926. One of the interesting fig trees at the Sibolangit Botanic Garden. It should be tried as a shade tree in southern Florida.

67569. *FICUS* sp.

No. 676. Sibolangit. February 26, 1926. A large forest tree which bears an abundance of small fruits.

67570. *FICUS* sp.

No. 677. A forest tree from the Sibolangit Botanic Garden. February, 1926.

67571. *ABELMOSCHUS* *ANGULOSUS* Wall. Malvaceae.

No. 540. Found on a road at Balek, near Takengon. March 3, 1926. A small shrubby annual which may be a wild form of the ordinary okra, but with more papery seed pods.

67572. *HONCKENYA* *FICIFOLIA* Willd. Tiliaceae.

No. 503. Sibolangit Botanic Garden. February 25, 1926. A very pretty shrub for door-yards, bearing attractive purple flowers.

For previous introduction see No. 62910.

67573. *INDIGOFERA* *SUFFRUTICOSA* Mill. Fabaceae.

No. 529. March 3, 1926. A plant with sharp-pointed pods which curl upwards, growing on poor volcanic sand at an altitude of 3,000 feet, near Lampehan.

67574. *INDIGOFERA* sp. Fabaceae.

No. 681. A leguminous plant found near Sibolangit. February 19, 1926.

67537 to 67631—Continued.

67575. *INDIGOFEA* sp. Fabaceae.

No. 682. A leguminous plant from the Sibolangit Botanic Garden. February, 1926.

67576. *LIGUSTRUM GLOMERATUM* Blume. Oleaceae. Privet.

No. 527. March 3, 1926. A shrub with white flowers and bluish fruits which resembles *Ligustrum japonicum*, found along a roadside in the jungle near Takengon.

67577. *LONICERA JAVANICA* (Blume) DC. Caprifoliaceae. Honeysuckle.

No. 542. Takengon. March 2, 1926. A handsome shrub, 10 to 12 feet high, with leaves glossy on the upper surfaces and tomentose beneath, and large clusters of fragrant white flowers. It resembles *Lonicera japonica* somewhat, but is much prettier and, being a shrub, it is not likely to be troublesome.

67578. *SHUTERIA VESTITA* Wight and Arn. Fabaceae.

No. 465. Takengon. March 1, 1926. A small strong-growing leguminous vine found on banks along the mountain-side road.

67579. *MEMECYLON NUDUM* Blume. Melastomaceae.

No. 450. Sibolangit Botanic Garden. February 26, 1926. A shrub bearing masses of sky-blue flowers on the stems.

67580. *MIMUSOPS ELENGI* L. Sapotaceae.

No. 434. February 20, 1926. A street tree called "Bua Tanjong" growing in a yard at Medan. It is a small handsome evergreen which produces an abundance of long acorn-shaped fruits which turn red when ripe.

For previous introduction see No. 59681.

67581. *MIMUSOPS KAUKI* L. Sapotaceae.

No. 661. March 12, 1926. A splendid shade tree found by the side of the road in a kampong near Lho Senmawe. The reddish brown fruits, about 1¼ inches long and almost round, contain white latex, seeds, and flesh resembling that of the sapodilla.

For previous introduction see No. 51820.

67582. *MUSSAENDA* sp. Rubiaceae.

No. 515. Brestagi. February 21, 1926. A decorative shrub, somewhat resembling the dogwood, with one enlarged brilliant white sepal to each flower cluster. Found at an altitude of 5,000 feet.

67583. *PASPALUM CONJUGATUM* Berg. Poaceae. Grass.

No. 511. February 24, 1926. A grass from the edge of the golf links at Brestagi, at an altitude of 5,000 feet. This grass forms part of the lawn at Brestagi.

For previous introduction see No. 62245.

67584 and 67585. *PHAEOMERIA MAGNIFICA* (Roscoe) Schum. Zinziberaceae.

For previous introduction see No. 45154.

67584. No. 516. Sibolangit Botanic Garden. February 26, 1926. A gigantic-leaved species resembling *Amomum* in general character. The bright pink flowers are produced in large heads on stalks 3 feet high and are quite showy.

67585. No. 517. February 19, 1926. Seeds obtained from large fruits bought as a vegetable at the market at Medan.

67586. *PHRYNIUM* sp. Marantaceae.

No. 512. Sibolangit. February 25, 1926. An ornamental bearing beautiful light-blue berries, which should prove very useful for borders where large leaves are desired.

67537 to 67631—Continued.

67587. *PHYTOLACCA* sp. Phytolaccaceae.

Pokeberry

No. 399. Brestagi. February 21, 1926. An attractive pokeberry having red flowers, fruits, and stems.

67588. *PINUS MERKUSII* Jungh. and De Vr. Pinaceae. Pine.

No. 524. Lampehan. March 3, 1926. The giant Sumatra pine which covers a vast area of the poor volcanic soil in northern Sumatra. It grows to a height of 240 feet, is 4 feet in diameter, and yields a superior grade of turpentine and resin.

For previous introduction see No. 62271.

67589. *PTEROCARPUS INDICUS* Willd. Fabaceae. Padouk.

No. 520. From the roadside between Medan and Langsar. March 2, 1926. A splendid roadside tree producing yellow flowers which are very fragrant.

For previous introduction see No. 51821.

67590. *RHODODENDRON* sp. Ericaceae.

No. 470. Obtained near Takengon. March 3, 1926. A tall bush, 5 feet high, bearing glossy coriaceous leaves and large salmon-yellow flowers 3 inches long, which are blotched in the throat with red.

67591. *RHODODENDRON JAVANICUM* (Blume) Benn. Ericaceae.

No. 471. Obtained near Takengon. March 3, 1926. This bush, similar to No. 470 [No. 67590], is a smaller species, the leaves are not so large, and the flowers, which are red, have much shorter tubes.

67592 to 67604. *RUBUS* spp. Rosaceae.67592. *RUBUS MOLUCCANUS* L.

No. 456. From Brestagi. February 21, 1926. A plant producing rather small wine-red berries similar to *Rubus rosae-folius* in appearance and taste.

67593. *RUBUS ALCAEFOLIUS* Poir.

No. 457. From Brestagi. February 21, 1926. A small yellow raspberry.

67594. *RUBUS ASPER* D. Don. Raspberry.

No. 458. Brestagi. February 21, 1926. An oblong yellow raspberry which is half an inch in diameter and about three-fourths of an inch long. The flavor is not especially good.

67595. *RUBUS ALCAEFOLIUS* Poir.

No. 461. Between Lho Senmawe and Takengon. March 1, 1926. A tall-growing thorny plant with large wine-red fruits, the individual drupelets being quite large. The leaves are mottled dark green on the upper surface and white tomentose below.

67596 and 67597. *RUBUS MOLUCCANUS* L.

67596. No. 462. Takengon. March 1, 1926. A tall, very thorny bush found on one of the high mountains. The fruit is of good size and bright wine red.

67597. No. 463. Takengon. March 1, 1926. The leaves of this plant are mottled green above and tomentose below. The small light golden-yellow fruits are very juicy and slightly acid.

67598. *RUBUS ELONGATUS* J. E. Smith.

No. 489. Between Bireun and Takengon. March 5, 1926. A beautiful climber with long drooping flower clusters and small glossy black berries. An extremely spiny species with very attractive foliage. The leaves are white tomentose below.

67537 to 67631—Continued.

67599 and 67600. *RUBUS MOLUCCANUS* L.

67599. No. 490. Between Bireun and Takengon. March 5, 1926. The leaves are very light green with a golden pubescence below, and the wine-red fruits are of fair flavor.

67600. No. 491. Between Bireun and Takengon. March 5, 1926. Variety *glomeratus*. A spiny trailing shrub of charming habit, which may have value as an ornamental. The leaves are pubescent and the fruits red.

67601. *RUBUS CHRYSOPHYLLUS* Reinw.

No. 526. Near Takengon. March 3, 1926. A very beautiful climber with light-red berries and leaves which are golden brown below.

67602. *RUBUS PYRIFOLIUS* J. E. Smith.

No. 538. Collected on the shore of Lake Tawar, near Takengon. March 4, 1926. An attractive scandent shrub, very spiny, which has large glossy oval leaves. The dark-red berries, with only two or three drupelets in each berry, do not have much flavor.

67603. *RUBUS MOLUCCANUS* L.

No. 657. Shore of Lake Tawar, near Takengon. March 9, 1926. A very handsome bush with few spines and leathery foliage, beautiful rusty yellow below.

67604. *RUBUS ALCAEFOLIUS* Poir. Rosaceae.

No. 668. Lake Tawar, near Takengon. March 9, 1926. A handsome bush growing on dry hillsides, worthy of cultivation because of its attractive foliage.

67605. *SAMBUCUS JAVANICA* Reinw. Caprifoliaceae. Elder.

No. 486. From the road between Takengon and Bireun. March 5, 1926. A black-berried species about 10 feet tall, producing coarse leaves and white flowers.

For previous introduction see No. 63377.

67606. *SAPINDUS RABAK* DC. Sapindaceae. Soapberry.

No. 435. Sibolangit Botanic Garden. February 22, 1926. A good-sized tree producing an abundance of very large round fruits which are larger than those of *Sapindus saponaria* or *S. mukorossi*. This may be a tropical source of saponin.

67607. *SOLANUM BIFLORUM* Lour. Solanaceae.

No. 398. Brestagi. February 21, 1926. A small bright-red fruit which looks distinctly ornamental.

67608. *SOPHORA TOMENTOSA* L. Fabaceae.

No. 436. From the island of Pulu We, near Sabang. February 17, 1926. A yellow-flowered beach-loving evergreen shrub with attractive foliage.

67609. *SPOROBOLUS* sp. Poaceae. Grass.

No. 531. Lampehan. March 3, 1926.

67610. *THYSANOLAENA MAXIMA* (Roxb.) Kuntze. Poaceae. Grass.

No. 528. Near Takengon. March 3, 1926. A very attractive grass with gray inflorescence resembling a puff of smoke.

For previous introduction see No. 61625.

67537 to 67631—Continued.

67611. *TRICHOSANTHES QUINQUANGULATA* A. Gray. Cucurbitaceae.

No. 530. Takengon. March 3, 1926. A vine with attractive white flowers and handsome foliage. The fruits are large and astonishingly brilliant red. This vine is very ornamental when seen in the jungle, hanging from tall forest trees.

For previous introduction see No. 49858.

67612. *TRICHOSANTHES* sp. Cucurbitaceae.

No. 485. From the road between Bireun and Takengon. March 5, 1926. A vine covering forest trees and producing egg-shaped fruits of an attractive deep orange color.

67613. *COLUMELLA GENICULATA* (Blume) Merr. Vitaceae.

No. 493. March 7, 1926. A scrambling vine covering vegetation by the roadside between Kota Dah and Takengon. The fruits are white and when green are very acid.

67614. *XIPHIDIUM* sp. Haemodoraceae.

No. 428. Sibolangit Botanic Garden. February 21, 1926. An attractive white-flowered plant resembling the iris. It should make a beautiful border plant in tropical gardens.

67615. *ZEA MAYS* L. Poaceae. Corn.

No. 395. From the market in Medan. February 19, 1926. A yellow flint corn said to have been grown in this vicinity.

67616 and 67617. *ZINZIBER* spp. Zinziberaceae. Ginger.67616. *ZINZIBER* sp.

No. 518. Sibolangit Botanic Garden. February 25, 1926. A plant having ornamental foliage.

67617. *ZINZIBER* sp.

No. 723. Sibolangit Botanic Garden. March 26, 1926. A plant having ornamental foliage.

67618. *SHUTERIA VESTITA* Wight and Arn. Fabaceae.

No. 432. Brestagi. February 22, 1926. A leguminous trailing plant found covering clay banks at a high altitude. The leaves are marked with light spots and are very attractive.

67619. *FLEMINGIA CONGESTA* Roxb. Fabaceae.

No. 469. A bushy legume, 3 feet high, found in dry volcanic sandy soil near Lampehan, March 3, 1926.

For previous introduction see No. 30878.

67620. *ARDISIA LANCEOLATA* Roxb. Myrsinaceae.

No. 474. March 5, 1926. A small attractive tree found in virgin forest near Baleg. The translucent shell-pink waxy bell-shaped flowers are very charming when in bud.

67621. *CAREX BACCANS* Nees. Cyperaceae.

No. 487. Between Bireun and Takengon. March 5, 1926. An ornamental sedge, useful for water gardens, with brilliant red fruits produced in long masses on upright stems.

67622. (Undetermined.)

No. 510. Sabang, island of Pulu We, north coast of Sumatra. February 17, 1926. An attractive low shrub with yellow fruits the size of peas.

67537 to 67631—Continued.

67623. *MEIBOMIA GYROIDES* (DC.) Kuntze
(*Desmodium gyroides* DC.). Fabaceae.

No. 525. Lampehan. March 3, 1926. A shrubby annual called "Asir Asir," which is native to northern Sumatra and is used as a protection crop to prevent the coarse grass from crowding out the seedlings of *Pinus merkusii*.

For previous introduction see No. 64177.

67624. *SAURAUJA VULCANI* Korth. Dilleniaceae.

No. 536. Shore of Lake Tawar, near Takenong. March 4, 1926. A shrub with broad thick leaves, white rather unattractive flowers, and fruits the size of small cherries which are green in color when ripe.

67625. *CURCULIGO CAPITULATA* (Lour.) Kuntze
(*C. recurvata* Ait.). Amaryllidaceae.

No. 548. Between Takenong and Bireun. March 6, 1926. An ornamental plant resembling the first broad undivided leaf of a palm. The leaves rise 3 feet from a rootstock, and among them is borne the head of yellow flowers. The fruits are white, succulent, ovoid berries, half an inch long, covered with spider-weblike brown hairs.

For previous introduction see No. 39665.

67626. (Undetermined.)

No. 651. Lho Senmawe. March 12, 1926. A tropical vine.

67627. *URARIA LAGOPODIODES* (L.) Desv. Fabaceae.

No. 660. Lho Senmawe. March 12, 1926. A pink-flowered cloverlike plant growing abundantly in wet land.

For previous introduction see No. 31719.

67628. (Undetermined.)

No. 664. From the road between Takenong and Bireun, at an altitude of 1,000 feet. March 11, 1926. An attractive small tree producing an abundance of large clusters of fruits.

67629. *LEEA RUBRA* Blume. Vitaceae.

No. 671. Found in moist places near Lho Senmawe. March 12, 1926. A shrub with flat corymbs of brilliant, deep-red flowers which are followed by large bunches of reddish to blue-black berries.

67630. (Undetermined.)

No. 680. Near Lho Senmawe. March 11, 1926. A cannalike plant with attractive red fruits.

67631. (Undetermined.)

No. 683. From northern Sumatra. March 26, 1926. A leguminous plant.

67632 to 67640.

From Ventimiglia, Italy. Seeds presented by S. W. McLeod Braggins, superintendent, La Mortola. Received June 2, 1926.

67632. *ANTHOLYZA AETHIOPICA* L. Iridaceae.

No. 181. An irislike plant, from the Cape of Good Hope, with a branched stem about 3 feet high, sword-shaped leaves a foot or so long, and red and yellow flowers about 2 inches long in rather dense spikes up to 9 inches in length.

67633. *ARTEMISIA ARGENTEA* L'Herit. Asteraceae. Wormwood.

No. 204. An erect shrubby perennial a foot or two high, with pinnate silvery leaves and panicles of nodding globose heads of yellow flowers. Native to Madeira.

67632 to 67640—Continued.

67634. *ARTEMISIA VULGARIS* L. Asteraceae. Mugwort.

No. 207. Italian-grown seeds.

67635. *BAUHINIA YUNNANENSIS* Franch. Caesalpiniaceae.

No. 249. A vigorous climber from southwestern China; the rounded two-parted leathery leaves are 1½ inches long. The flowers, rosy white striped with purple, are in many-flowered pendulous racemes.

67636. *CISTUS FLORENTINUS* Lam. Cistaceae. Rockrose.

No. 442. A dwarf shrub, a hybrid between *Cistus monspeliensis* and *C. salvifolius*. It has very narrow leaves and white flowers.

67637. *CISTUS PURPUREUS* Lam. Cistaceae. Rockrose.

No. 451. A shrub, 4 feet or less in height, a hybrid between *Cistus ladaniferus* and *C. villosus*. The narrowly oblong leaves are wrinkled above, and the lilac-purple flowers with yellow petal bases are 3 inches across and usually in threes.

67638. *CLERODENDRUM TRICHOTOMUM FARGESII* (Dode) Rehder. Verbenaceae.

No. 509. A rapid-growing Chinese shrub, with bright green or purplish strongly veined oval leaves and fragrant whitish flowers, borne in summer in panicles. The globose, peacock-blue fruits, about the size of peas, are set on the purple or crimson persistent calyx.

For previous introduction see No. 44533.

67639. *HYPERICUM HOOKERIANUM* Wight and Arn. Hypericaceae.

No. 984. A compact shrub up to 6 feet high, with bright reddish brown branches, evergreen leaves 1 to 4 inches long, and many-flowered corymbs of large golden-yellow flowers, each about 2 inches across. Native to the Himalayas.

For previous introduction see No. 35999.

67640. *PRUNUS CONRADINAE* Koehne. Amygdalaceae. Conradina cherry.

No. 1462. A graceful tree, about 25 feet high, native to central China, with doubly serrate, oval-oblong leaves up to 6 inches long, and cymes of whitish or pink flowers which appear before the leaves.

For previous introduction see No. 45215.

67641 to 67647.

From Java. Seeds obtained by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received June 28, 1926.

67641. *CITRUS GRANDIS* (L.) Osbeck (*C. decumana* Murr.). Rutaceae. Grapefruit.

No. 773. Purchased in the market at Kediri. May 10, 1926. A large light-yellow fruit which is inclined to be slightly pear shaped. The dark-pink flesh, which separates easily from the partition walls, is of a refreshing mild acid flavor.

67642. *DURIO ZIBETHINUS* Murr. Bombacaceae. Durian.

No. 774. Purchased in the market at Kediri. May 10, 1926. A deliciously flavored fruit.

For previous introduction see No. 51464.

67643 and 67644. *GARCINIA MANGOSTANA* L. Clusiaceae. Mangosteen.

67641 to 67647—Continued.

67643. No. 776. From the market at Kediri. May 10, 1926. The largest mangosteen fruits I have ever seen, the largest being 24 centimeters in circumference.

67644. No. 777. May 15, 1926. Seeds from ordinary-sized fruits served in the hotel at Suerabaya.

67645. *LANSIUM DOMESTICUM* Jack. *Meliaceae*. **Langsat.**

No. 778. May 17, 1926. A fruit of large size and fine quality, bought on the street in Malang.

67646. *LITCHI CHINENSIS* Sonner. (*Nephelium litchi* Cambess.). *Sapindaceae*. **Lychee.**

No. 775. Seeds of fresh fruits, which are light red, from a tree growing at the hillside residence of the Sultan of Solo, in Harangpandan, at an altitude of 3,000 feet.

67647. *PAYENA* sp. *Sapotaceae*.

No. 779. From a tree in the grounds of the Beyerstein Hotel at Madioen. It is quite ornamental when loaded with its bright orange-red fruits which are the size of a robin's egg. These fruits are mealy and sweetish, but not of any great value.

67648. COLEUS TUBEROSUS (Blume)
Benth. Menthaceae.

From Peradeniya, Ceylon. Tubers obtained by David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition. Received February 26, 1926. Numbered June, 1926.

Nos. 312 and 364. Collected at the Royal Botanic Gardens, Peradeniya, January 15, 1926. *Innala*. The tubers of this low-growing herbaceous plant are about an inch long and one-half inch in diameter, and are very nutritious. In Ceylon they are boiled like potatoes.

67649 to 67668.

From Leningrad, Russia. Seeds presented by A. Kol, chief, bureau of introduction, Institute of Applied Botany, through J. W. Pincus, Amtorg Trading Corporation, New York, N. Y. Received June 28, 1926.

67649 to 67656. *CITRULLUS VULGARIS* Schrad. *Cucurbitaceae*. **Watermelon.**

67649. No. 10205. *Bykovsk.* From Stalin-grad.

67650. No. 10206. *Murashka.* From the region of Kamyshinsk, in Lower Povolsh.

67651. No. 10207. *Azhinovski.* From Khutor Azhinof, Donsk.

67652. No. 10208. *Farm's Favorite.* From Kharkof Government.

67653. No. 10209. *Monastery.* From Kherson Government.

67654. No. 10210. *Kuban King.* From Kuban Province.

67655. No. 10211. *Early.* From Voronezh Government.

67656. No. 10214. *Fodder.* Obtained at the Ekaterinosk agricultural exhibition.

67657 to 67661. *CUCUMIS MELO* L. *Cucurbitaceae*. **Melon.**

67657. No. 10215. *Dubovka.* From Stalin-grad Government.

67658. No. 10216. *Queen Melon.* From Kharkof Government.

67659. No. 10217. *Kochanaya (Komovka).* From Astrakhan Government.

67649 to 67668—Continued.

67660. No. 10218. *Quick Maturing.* From Saratov Government.

67661. No. 10219. *Kuban Cantaloup.* From Kuban Province.

67662 to 67668. *CUCURBITA* spp. *Cucurbitaceae*.

67662 to 67664. *CUCURBITA MAXIMA* Duchesne. **Squash.**

67662. No. 10221. *Volzhanka.* From the Saratov Government.

67663. No. 10223. *Whale.* Obtained at the All-Russian agricultural exhibition at Moscow.

67664. No. 10224. *Table Chalmavaya.* From Saratov Government.

67665. *CUCURBITA MOSCHATA* Duchesne. **Cushaw**

No. 10230. *Perekhvotka.* From Astrakhan Government.

67666 to 67668. *CUCURBITA PEPO* L. **Pumpkin.**

67666. No. 10226. *Honey.* From Saratov Government.

67667. No. 10227. *Golosemanaya.* From Ekaterinoslav Government.

67668. No. 10228. *Squash (Greek).* From Astrakhan Government.

67669 to 67797.

From the Dutch East Indies and Ceylon. Seeds obtained by David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition. Received May and June, 1926.

67669. *AGATI GRANDIFLORA* (L.) Desv. (*Sesbania grandiflora* Poir.). *Fabaceae*.

No. 750. March 31, 1926. Seeds from trees 35 feet high, which were planted in rows near Medan, Sumatra, for the production of the white succulent flowers which are used extensively as a vegetable in the Orient. This variety grows very rapidly.

For previous introduction see No. 61778.

67670. *TETRASTIGMA* sp. *Vitaceae*.

No. 623. Simpang Tiga, Sumatra. March 11, 1926. Very strong-growing vines which climb to the tops of large trees. The almost round berries, a little flattened, are half an inch in diameter and juicy, with somewhat of a grape flavor. They are blue black when ripe.

67671. *ARALIA JAVANICA* Miquel.

No. 615. En route from Pang Mop to Lomot, Sumatra. March 10, 1926. An attractive tall-growing prickly stemmed plant with large compound serrate leaves and umbels of small flowers.

67672. *ARALIA* sp.

No. 647. Along the trail from Blang Kedjen to Kongke, Sumatra. March 17, 1926. A plant 20 feet or more in height.

67673. *ARTOCARPUS ELASTICA* Reinw. *Moraceae*.

No. 712. Sibolangit Botanic Garden, Sumatra. March 26, 1926. A tree which grows to a height of 40 meters. The young trees furnish a fiber, and the latex is a remarkable bird lime. The fruits are eaten by the natives of Sumatra.

67669 to 67797—Continued.

67674. *BEGONIA AREOLATA* Miquel. Begoniaceae.

No. 569. En route from Kota Dah (Tsag) to Pang Mop, Sumatra. March 8, 1926. A tall-growing form with red hairy stems. The leaves are green with reddish-brown veins below, and the flowers are white and pinkish.

67675. *BEGONIA* sp. Begoniaceae.

No. 636. Kota Kenjaran, Sumatra. March 12, 1926. A small white or slightly pink-flowered begonia.

67676. *BERBERIS NAPAULENSIS* (DC.) Spreng. Berberidaceae. **Barberry.**

No. 617. En route from Pang Mop to Lomot, Sumatra. March 10, 1926. A fine ornamental shrub which grows to a good size, with stiff, bright-green leaves having sharp thorns, yellow flowers, and maroon-colored berries.

For previous introduction see No. 60638.

67677. *BISCHOFIA TRIFOLIATA* (Roxb.) Hook. (*B. javanica* Blume). Euphorbiaceae.

No. 701. March 24, 1926. The gadok of Java and the tjingkam of Sumatra is said to be one of the very finest timbers in Sumatra, though not used there as a tree for forest plantings. It is now being largely planted in Java. A single specimen at Little River, Fla., made a splendid shade tree. This tree is recommended for street planting in frostless or nearly frostless localities.

For previous introduction see No. 61596.

67678. *CAESALPINIA SEPIARIA* Roxb. Caesalpinaceae. **Mysore thorn.**

No. 728. Found on a roadside near Haranggaol, northern Sumatra. March 24, 1926. A yellow-flowered spiny shrub, with recurved spines and pinnate leaves, which produces a great abundance of deep-brown pods containing egg-shaped beans.

For previous introduction see No. 49200.

67679. *CASUARINA RUMPHIANA* Miquel. Casuarinaceae.

No. 764. From the Sultan's zoological garden at Soerakarta, Java. May 1, 1926. A rather scraggly tree with very slender delicate pendent green branches and cones having few seeds.

67680 to 67692. *CASSIA* spp. Caesalpinaceae.

67680. *CASSIA LAEVIGATA* Willd. **Smooth senna.**

No. 687. Sumatra. March 22, 1926. A handsome yellow-flowered shrub or small tree with dark-green glossy evergreen foliage.

67681. *CASSIA LAEVIGATA* Willd. **Smooth senna.**

No. 703. Hakgala Botanic Garden, Newara Eliya, Ceylon. February, 1926. A handsome yellow-flowered shrub or small tree with dark-green, glossy evergreen foliage.

For previous introduction see No. 55599.

67682. *CASSIA TOMENTOSA* L. f. **Woolly senna.**

No. 702. Hakgala Botanic Garden, Newara Eliya, Ceylon. February, 1926. The ranawara of the Singhalese, which grows rapidly into a large yellow-flowered shrub, is found wild in the dry portions of northern Ceylon. The bark is chiefly used in India for tanning purposes, and the leaves and young pods are eaten as a vegetable. The leaves are also used for making tea.

67669 to 67797—Continued.

67683. *CASUARINA EQUISETIFOLIA* Stickm. Casuarinaceae.

No. 759. Planted along the roadside of the Dijeng Plateau, near Wonosobo, Java, at an altitude of 6,000 feet. April 25, 1926. A small handsome tree with a prettier habit of growth than that of our *Casuarina* in southern Florida.

For previous introduction see No. 30380.

67684. *CITRULLUS VULGARIS* Schrad. Cucurbitaceae. **Watermelon.**

No. 782. From the market at Soerabaya, Java. May 17, 1926. A remarkable tropical melon, 8 by 10 inches and oval in shape, which resembles a squash, having a ribbed surface. The skin is dark green and the flesh is light yellow and very spongy, having an agreeable flavor.

67685 to 67687. *CITRUS GRANDIS* (L.) Osbeck (*C. decumana* Murr.). Rutaceae. **Grapefruit.**

67685. No. 742. From the Hotel Haman at Bandoeng, Java. April 18, 1926. *Djeroek bali*. A beautiful red-fleshed variety. The dividing integument between the segments was a beautiful shade of pink.

67686. No. 743. Bandoeng, Java. April 18, 1926. A large red-fleshed variety known in Bandoeng as "djeroek bali." Although this variety is said to be identical with No. 742 [No. 67685] the flesh was neither so dark nor so juicy.

67687. No. 744. A deep pink-fleshed variety from a tree in a private garden at Bandoeng, Java. April 18, 1926.

67688. *CITRUS* sp. Rutaceae.

No. 631. March 12, 1926. A wild citrus plant found along the trail near Kota Kenjaran, Sumatra. The tree is about 6 inches in diameter and 30 feet or more high. The fruits are practically round, 4½ inches in diameter, with smooth skin about three-fourths of an inch thick. The flesh is very sour and bitter.

67689. *CLEMATIS PANICULATA* Thunb. Ranunculaceae. **Sweet autumn clematis.**

No. 748. From a private garden in Noesa Kambangan, Java. April 20, 1926. A large-flowered strain.

67690. *CROTALARIA STRIATA* DC. Fabaceae.

No. 726. Haranggaol, northern Sumatra. March 24, 1926. A native species which has been almost supplanted by other *Crotalaria*s.

For previous introduction see No. 65295.

67691. *CURCULIGO CAPITULATA* (Lour.) Kuntze (*C. recurvata* Ait.). Amaryllidaceae.

No. 716. Sibolangit Botanic Garden, Sumatra. March 26, 1926. A shade-loving plant with immense undivided leaves, 4 feet long, rising from the rhizome.

For previous introduction see No. 39665.

67692. *CYNOMETRA CAULIFLORA* L. Caesalpinaceae.

No. 747. From the market in Tegal, Java. April 19, 1926. *Namnam*. A curious tree producing an abundance of greenish yellow fruits which are the shape of triangular apple tarts. They have a tart taste with little character, but when cooked are said to make excellent pies. These fruits are produced from knot-like excrescences on the trunk, often near the ground.

For previous introduction see No. 44895.

67669 to 67797—Continued.

67693 and 67694. *CYPHOMANDRA BETACEA* (Cav.) Sendt. Solanaceae. Tree tomato.

67693. No. 704. Hakgala Botanic Garden, Newara Eliya, Ceylon. February, 1926. A blood-red variety of the tree tomato which is grown extensively in the highlands of Sumatra. It seems to have more flavor than the yellow variety and is used here for jelly making.

67694. No. 705. A red variety obtained in a garden in Kabandjahe, Sumatra. March 22, 1926.

67695. *EUONYMUS JAVANICA* Blume. Celastraceae.

No. 645. Variety *sphaerocarpus*. Kongke, Sumatra. March 17, 1926. A rather tall upright tree with beautiful green leaves and dark-pink angular fruits containing small black seeds with orange arillas.

67696 to 67705. *FICUS* spp. Moraceae.

67696. *FICUS FULVA* Reinw.

No. 556. Collected between Takengon and Koeto Tchane, near Kabandjahe, Sumatra. March 7, 1926. A small tropical tree with dense foliage and yellow-red fruits about three-fourths of an inch in diameter. Native to Burma and the East Indies.

67697. *FICUS* sp.

No. 577. March 8, 1926. An oblong yellow-spotted fruit of good size, picked up from along the trail between Kota Dah (Tsag) and Pang Mop, Sumatra.

67698. *FICUS* sp.

No. 578. March 8, 1926. A rather small, oblong, reddish yellow fruited fig, picked up along the trail between Kota Dah (Tsag) and Pang Mop, Sumatra.

67699. *FICUS* sp.

No. 619. En route from Lomot to Sim-pang Tiga, Sumatra. March 11, 1926.

67700. *FICUS AMPELOS* Burm. f.

No. 640. Kota Kenjaran, Sumatra. March 12, 1926. A large tree with good-sized leaves and small yellowish red to deep red fruits.

For previous introduction see No. 67560.

67701. *FICUS BENJAMINA* L.

No. 641. En route from Kota Kenjaran to Blang Kedjeren, Sumatra. March 14, 1926. A large fine-looking tree with small leaves and very small fruits.

For previous introduction see No. 41438.

67702. *FICUS PARIETALIS* Blume.

No. 644. En route from Kota Kenjaran to Blang Kedjeren, Sumatra. March 14, 1926. A good-sized well-formed tree which was loaded with deep golden-yellow fruits one-half to three-fourths of an inch in diameter. The large oblong leaves are shiny deep green above and dull green below.

For previous introduction see No. 67561.

67703. *FICUS ROSTRATA* Lam.

No. 649. En route from Blang Kedjeren to Kongke, Sumatra. March 17, 1926. This attractive bright-orange fruited fig is one of the smallest fruited varieties we have seen. With the exception of the color, this small shrub resembles a holly.

67669 to 67797—Continued.

67704. *FICUS* sp.

No. 695. En route from Kongke to Mel-oewoeh, Sumatra. March 18, 1926. Yellowish red fruits, $1\frac{1}{2}$ inches in diameter, found under a good-sized tree.

67705. *FICUS KALLICARPA* Miquel.

No. 699. En route from Kongke to Mel-oewoeh, Sumatra. March 18, 1926. A beautiful creeper covering a large stump in the virgin forest. The leaves are large, leathery, and dark green, the scarlet fruits spotted with a lighter color are $2\frac{1}{2}$ by 3 inches, and not edible; the seeds are elongated.

For previous introduction see No. 67559.

67706 and 67707. *GARCINIA ATROVIRIDIS* Griffith. Clusiaceae.

A large tree 50 feet tall with stiff, horizontal, finally drooping branches and medium-sized bright-red leaves. The bright deep-yellow fruits, 4 inches in diameter, are furrowed into a number of segments like a melon. These segments fall apart when the fruits are ripe, disclosing the seeds which are covered with a slimy yellow arillus, pleasant but very sour. When dried the segments of the the rind are used to give a sour taste to curries.

67706. No. 713. Sibolangit Botanic Garden, Sumatra. March 26, 1926.

67707. No. 745. Kabandjahe, Sumatra. March 28, 1926.

67708. *GARCINIA MANGOSTANA* L. Clusiaceae. Mangosteen.

No. 746. Seeds from fruits obtained in the market at Tegal, Java. April 19, 1926.

67709. *HYDRANGEA OBLONGIFOLIA* Blume. Hydrangeaceae.

No. 616. En route from Pang Mop to Lomot, Sumatra. March 10, 1926. A beautiful shrub 30 feet or more in height, with leaves white tomentose below and dark green above, having red stems and veins. The pink buds open into white flowers.

67710. *HYDRANGEA* sp. Hydrangeaceae.

No. 768. On the trail to the Dijeng Plateau, Java. An ornamental shrub cultivated in Java at high altitudes, ranging around 6,000 feet.

67711. *IMPATIENS* sp. Impatiensaceae. Snapweed.

No. 601. Pang Mop, Sumatra. March 9, 1926. A handsome herbaceous plant with leaves rich green above and reddish below, produced on red stems. The flowers are bright red and very showy.

67712. *IMPATIENS* sp. Impatiensaceae. Snapweed.

No. 602. Pang Mop, Sumatra. March 9, 1926. A yellow-flowered attractive plant which is more common than the red.

67713. *INDIGOFERA CONFUSA* Prain and Baker (*I. arrecta* Benth., not Hocht.). Fabaceae. Indigo.

No. 725. Haranggaol, Sumatra. March 24, 1926. A shrubby indigo growing on the shore of Toba Sea.

For previous introduction see No. 31848.

67714. *LAGERSTROEMIA SPECIOSA* (Muenchh.) Pers. (*L. flosreginae* Retz.). Lythraceae. Queen crape myrtle.

No. 733. Sibolangit Botanic Garden, Sumatra. March 28, 1926. An unusually large-flowered form of this superb tree, the flowers being $2\frac{1}{2}$ inches across and of the loveliest purple pink.

For previous introduction see No. 59315.

67669 to 67797—Continued.

67715. *LANSIUM DOMESTICUM* Jack. *Meliaceae*.
Langsat.

No. 751. From the market in Wonosobo, Java. April 23, 1926. *Doekoe*. A refreshing fruit with a mildly acid flavor which seems to be a great favorite with the Javanese. It has an unusually waxy texture and is very pleasant to the touch.

For previous introduction see No. 61899.

67716. *MEIBOMIA GYROIDES* (DC.) Kuntze
(*Desmodium gyroides* DC.). *Fabaceae*.

No. 727. Near Haranggaol, Sumatra. March 24, 1926. An attractive bush with dense clusters of flowers in two shades of blue.

For previous introduction see No. 61477.

67717. *MIMUSOPS* sp. *Sapotaceae*.

No. 784. Solo market, Java. May 17, 1926. A handsome shade tree, 50 feet tall, with olive-green obovate leaves which are a lighter color below. The red egg-shaped fruits, 1½ inches in length, remind one of a quite dry sapodilla in flavor and texture.

67718. *MIMUSOPS* sp. *Sapotaceae*.

No. 785. Solo market, Java. May 17, 1926. The fruits from which these seeds were taken were larger, more brilliant in color, and rounder than No. 784 [No. 67717].

67719. *MUSA GLAUCA* Roxb. *Musaceae*.
Banana.

No. 721. Sibolangit Botanic Gardens, Sumatra. March 26, 1926. A striking plant producing a leafy inflorescence. When planted in rich soil the plant becomes enormous. The flower clusters are a mass of leaves, hiding the small nonedible fruits which contain large black seeds.

67720. *NICOTIANA TABACUM* L. *Solanaceae*.
Tobacco.

No. 767. March 25, 1926. A high-altitude tobacco growing at an altitude of 6,000 feet in the Djeng Plateau, Java.

67721. *PANICUM PALUDOSUM* Roxb. *Poaceae*.
Grass.

No. 730. Lake Toba, Sumatra. March 24, 1926. A fodder grass which makes a good growth if grown in moist soil. Horses are very fond of this grass and will wade into the swamps to get it.

67722. *PASPALUM CONJUGATUM* Berg. *Poaceae*.
Grass.

No. 634. Kota Kenjarian, Sumatra. March 12, 1926. A creeping perennial grass with the flowering stems sometimes 3 feet tall. This species, originally from Dutch Guiana, is found in moist places in the Tropics of both hemispheres and forms extensive and close mats.

For previous introduction see No. 62245.

67723. *PASPALUM LONGIFOLIUM* Roxb. *Poaceae*.
Grass.

No. 686. Scattered on the embankment along the roadside between Kabandjahe and Siantar, Sumatra. March 22, 1926. A perennial tufted grass, native to southeastern Asia.

For previous introduction see No. 31600.

67724. *PASSIFLORA FOETIDA* L. *Passifloraceae*.

No. 694. En route from Kongke to Melewoen, Sumatra. March 18, 1926. A passion fruit with small purple flowers and delicately flavored yellow fruits, one-half to three-fourths of an inch in diameter.

For previous introduction see No. 50618.

67669 to 67797—Continued.

67725 to 67727. *RHODODENDRON* spp. *Ericaceae*.

67725. *RHODODENDRON JAVANICUM* (Blume) Benth.

No. 592. Pang Mop, Sumatra. March 9, 1926. An attractive variety with quite large pink and white flowers.

67726. *RHODODENDRON* sp.

No. 593. Pang Mop, Sumatra. March 9, 1926. A very showy rhododendron with the interior of the white flowers tinged pink and a dark purple spot at the base.

67727. *RHODODENDRON CITRINUM* Hassk.

No. 594. Pang Mop, Sumatra. March 9, 1926. An attractive small-leaved variety with very light-yellow small flowers.

67728 to 67740. *RUBUS* spp. *Rosaceae*.

67728. *RUBUS CHRYSOPHYLLUS* Reinw.

No. 758. Djeng Plateau, Java. April 25, 1926. A handsome plant with leaves which are rusty or gold below. The fruits are brilliant red and very juicy, though rather too acid to be acceptable.

67729. *RUBUS LINEATUS* Reinw.

No. 757. Djeng Plateau, Java. April 25, 1926. A very handsome plant with palmately divided leaves and clusters of large pinkish-yellow fruits three-fourths of an inch across, which are of an agreeable flavor.

For previous introduction see No. 59667.

67730. *RUBUS MOLUCCANUS* L.

No. 753. Wonosobo, Java. April 23, 1926. A stout prickly bramble, native to the Himalayas at altitudes of 3,000 to 7,000 feet with brilliant red, globose fruits of good size and appearance, but with too little flavor to be popular.

For previous introduction see No. 49653.

67731. *RUBUS NIVEUS* Thunb.

No. 756. Djeng Plateau, Java. April 25, 1926. A variety called "Kala koetjet" by the Javanese; it is found in the higher mountain regions of eastern and middle Java. The dark-colored berries have a fair flavor.

For previous introduction see No. 64214.

67732. *RUBUS ACUMINATISSIMUS* Hassk.

No. 560. En route from Takengon to Kota Dah (Tsag), Sumatra. March 7, 1926. A very thorny strong grower producing large orange-yellow fruits, three-fourths to an inch in diameter, on a very large receptacle. These fruits are watery and not of very good quality.

67733. *RUBUS ASPER* D. Don.

No. 571. En route from Kota Dah (Tsag) to Pang Mop, Sumatra. March 8, 1926. A strong grower with hairy stems and branches and long narrow yellow fruits.

67734. *RUBUS* sp.

No. 589. Pang Mop, Sumatra. March 9, 1926. A strong-growing, thornless plant with peculiarly parallel-veined leaves, which produces an abundance of light-yellow fruits.

67735. *RUBUS LINEATUS* Reinw.

No. 590. Pang Mop, Sumatra. March 9, 1926. A stout bush which bears large orange-yellow fruits of excellent flavor. The bush is very ornamental.

For previous introduction see No. 59667.

67669 to 67797—Continued.

67736. *RUBUS CHRYSOPHYLLUS* × *MOLUCCANUS*.

No. 610. En route from Pang Mop to Lomot, Sumatra. March 10, 1926. A strong-growing, thorny plant which is a free fruiter. The leaves are green above and rusty tomentose below.

67737. *RUBUS* sp.

No. 626. Simpang Tiga, Sumatra. March 11, 1926. A strong-growing plant with thin green leaves and recurved spines, producing large round orange berries.

67738. *RUBUS ASPER* D. Don.

No. 628. Simpang Tiga, Sumatra. March 11, 1926. This plant is a strong grower and has small thin green leaves and an abundance of recurved thorns. The golden yellow berries, three-fourths of an inch in diameter and 1¼ inches long, are very handsome.

67739. *RUBUS PYRIFOLIUS* J. E. Smith.

No. 684. Between Kabandjahe and Koto Tchane, Sumatra. March 19, 1926. A spiny-stemmed climber about 20 feet long, with shiny dark-green scattered leaves and flowers in terminal clusters 6 inches long. The brilliant-red sour berries mature only a few drupelets.

67740. *RUBUS MOLUCCANUS* L.

No. 698. En route from Kongke to Meloe-woeh, Sumatra. March 18, 1926. A semi-cordate shrub with few spines, rugose cordate leaves, deep green above and russet or golden tomentose below, and light-yellow fruits.

For previous introduction see No. 49653.

67741. *SAMBUCUS JAVANICA* Reinw. *Caprifoliaceae*. Elder.

No. 629. Simpang Tiga, Sumatra. March 11, 1926. A vigorous variety producing small black fruits.

For previous introduction see No. 63377.

67742. *SAPINDUS RARAK* DC. *Sapindaceae*. Soapberry.

No. 435. Sibolangit Botanic Garden, Sumatra. February 22, 1926.

For previous introduction and description see No. 67606.

67743. *SOLANUM* sp. *Solanaceae*.

No. 611. En route from Pang Mop to Lomot, Sumatra. March 10, 1926. An ornamental vine producing small, bright-red fruits about the size of a cherry.

67744. *SOLANUM* sp. *Solanaceae*.

No. 622. Simpang Tiga, Sumatra. March 11, 1926. A slender vine with small leaves and yellow fruits about the size of a cherry.

67745. *STROPHANTHUS GRATIS* (Wall. and Hook.) Baill.

No. 749. Noesa Kambangan, Java. April 20, 1926. A rank-growing woody creeper with pinkish white flowers in terminal clusters and enormous fruits nearly 3 feet in length.

67746. *THYSANOLAENA MAXIMA* (Roxb.) Kuntze. *Poaceae*. Grass

No. 685. Between Kabandjahe and Koto Tchane, Sumatra. March 20, 1926. An ornamental tropical grass, 8 to 10 feet high, which grows wild in the mountainous regions of northern India. The great masses of pinkish gray panicles give the huge clumps a handsome appearance during about four months of the year.

For previous introduction see No. 61625.

67669 to 67797—Continued.

67747. *VACCINIUM* sp. *Vacciniaceae*.

No. 763. Dijeng Plateau, Java. April 25, 1926. An attractive bush producing brilliant scarlet flowers and small black fruits with little flavor, found abundantly on the very edge of a large fumarole where the leaves were splashed with warm mud.

67748. *COLUMELLA GENICULATA* (Blume) Merr. *Vitaceae*.

No. 555. Between Kota Dah (Tsag) and Takengon, Sumatra. March 7, 1926. A variety producing light-pink fruits which are very juicy and sweet.

For previous introduction see No. 67613.

67749 and 67750. *ZEA MAYS* L. *Poaceae*. Corn.

67749. No. 729. March 24, 1926. A native Battak corn taken from a corncrib in a small village not far from Seribloedolok, near Lake Toba, Sumatra.

67750. No. 791. Obtained in the market at Soerabaya, Java. May 17, 1926. A flint type of Indian corn probably from the cornfields of Madoera where the soil is quite calcareous and the rainfall light, not over 40 or 50 inches.

67751. *ZIZIPHUS MAURITIANA* Lam. *Rhamnaceae*. Bor.

No. 783. Obtained in the market at Soerabaya, Java. May 16, 1926. An egg-shaped, brownish-yellow, tropical fruit not over 2 centimeters long, with an acid flavor.

For previous introduction see No. 60458.

67752. *CLERODENDRUM BRACTEATUM* Wall. *Verbenaceae*.

No. 551. Between Takengon and Kota Dah (Tsag), Sumatra. A soft-wooded shrub or small tree with white flowers and purple seeds produced in a red receptacle. The native name is Tjelala bosenga.

67753. *LEUCOSYKE* sp. *Urticaceae*.

No. 552. Between Takengon and Kota Dah (Tsag), Sumatra. March 7, 1926. A handsome tree 40 to 60 feet tall, with bright-green leaves, red petioles, and clusters of round, green mottled fruits about one-half to three-fourths of an inch in diameter.

Numbers 67754 to 67763 were collected en route from Takengon to Kota Dah (Tsag), Sumatra.

67754. *DEBREGEASIA LONGIFOLIA* (Burm.) Wedd. *Urticaceae*.

No. 553. March 7, 1926. A shrubby plant with leaves green above and white below. The small, sweet, orange-yellow fruits, edible though not especially good, are borne along the branches.

67755. *PETUNGA* sp. *Rubiaceae*.

No. 554. March 7, 1926. *Sengkewa*. A rather tall, handsome tree with leaves about 8 inches long and clusters of green and white fruits resembling coffee.

67756. *OPHIORRHIZA LONGIFLORA* Blume. *Rubiaceae*.

No. 557. March 7, 1926. A low-growing herbaceous plant with terminal clusters of attractive white flowers.

67757. (Undetermined.)

No. 561. March 7, 1926. A small tree with deep-green leaves, white flowers, and clusters of large, triangular orange fruits.

67669 to 67797—Continued.

67758. *ARDISIA CRISPA* (Thunb.) A. DC. Myrsinaceae.

No. 562. March 7, 1926. A small shrub, 6 to 8 feet high with lanceolate green leaves and very showy bright-red fruits.

For previous introduction see No. 48304.

67759. *PYGEUM LATIFOLIUM* Miquel. Amygdalaceae.

No. 564. March 6, 1926. A small tree with small dark-green leaves and dark-red, 1-seeded fruits.

67760. *SONERILA* sp. Melastomaceae.

No. 565. March 6, 1926. A small white-flowered herbaceous plant, 12 to 20 inches high, with beautiful leaves. The margins and upper surfaces are red and the lower surfaces silvery.

67761. *DIANELLA ENSIFOLIA* (L.) Red. Liliaceae.

No. 566. March 6, 1926. A long-leaved iris-like plant with the flower stems up to 3 or 4 feet, rather small flowers, and gorgeous purple seed pods.

For previous introduction see No. 49531.

67762. *CRAWFURDIA TRINERVIS* (Blume) Hassk. Gentianaceae.

No. 567. March 7, 1926. A low-growing vine with large oblong deep-red fruits, white inside, with many seeds. The flowers are probably small and white.

67763. (Undetermined.)

No. 568. March 7, 1926. One of the best timber trees in Sumatra, growing to a height of 200 feet or more and 3 or 4 foot in diameter. The small red plumlike fruits are juicy when fully ripe and fairly good but sour; they are eaten by birds.

Numbers 67764 to 67795 were collected in Sumatra.

67764. *SAPROSMA* sp. Rubiaceae.

No. 570. En route from Kota Dah (Tsag) to Pang Mop. March 8, 1926. A shrub or small tree with narrow lanceolate leaves dark green above and lighter beneath, bearing small clusters of oblong, rather small, yellow to red fruits.

67765. *ARDISIA LANCEOLATA* Roxb. Myrsinaceae.

No. 574. En route from Kota Dah (Tsag) to Pang Mop. A tree 12 to 30 feet high, with large yellowish-green leathery leaves and clusters of flattened dark-purple or black fruits. Each fruit contains one small round seed.

67766. *STERCULIA SPANGLERI* R. Br. Sterculiaceae.

No. 575. En route from Kota Dah (Tsag) to Pang Mop. March 8, 1926. A large, yellow-green leaved vine with very large showy capsules of three segments which, when ripe, spread out. The upper surfaces are brilliant velvety red and the lower surfaces dark salmon pink. The medium-sized black seeds hang from the edges of the segments.

67767. *PRATIA MONTANA* (Reinw.) Hassk. Campanulaceae.

No. 576. En route from Kota Dah (Tsag) to Pang Mop. March 8, 1926. A herbaceous plant with drooping branches, small lanceolate green leaves, and racemes of rather large, almost round, deep-purple to black fruits having sweet, snow-white flesh.

For previous introduction see No. 47764.

67669 to 67797—Continued.

67768. (Undetermined.)

No. 586. En route from Kota Dah (Tsag) to Pang Mop. March 8, 1926. A large tree having green, nutlike fruits with rough shells which contain a single white kernel.

67769. (Undetermined.)

No. 591. Pang Mop. March 9, 1926. A vine with thick heavy evergreen leaves and dense clusters of greenish to yellow fruits having sweet juicy white flesh.

67770. *DIPLYCOSIA HETEROPHYLLA* Blume. Ericaceae.

No. 595. Pang Mop. March 9, 1926. A thick leathery leaved vine with the upper surface of the leaves dark green and the lower surface a lighter green. The small fruits, which turn blue black when ripe, are borne in the axils of the leaves.

67771. (Undetermined.)

No. 597. Pang Mop. March 9, 1927. A small tree orchid with large beautiful pinkish flowers.

67772. *DIPLYCOSIA LATIFOLIA* Blume. Ericaceae.

No. 600. Pang Mop. March 9, 1926. A small shrub with attractive leaves and small brown berries.

67773. *SARCOPYRAMIS NAPAENSIS* Wall. Melastomaceae.

No. 603. Pang Mop. March 9, 1926. A herbaceous plant which grows in tufts, 12 to 15 inches in height, with red stems and leaves, producing an abundance of good-sized white and pink flowers.

67774. *MYRSINE SEMISERRATA* Wall. Myrsinaceae.

No. 604. Pang Mop. March 9, 1926. A small handsome shrub with round glossy green leaves, about half an inch across, and small dark-red fruits.

67775. *VACCINIUM LUCIDUM* (Blume) Miquel. Vacciniaceae.

No. 605. Pang Mop. March 9, 1926. An ornamental shrub with very small leaves and almost round black fruits. The tips of the branches are wine red.

67776. (Undetermined.)

No. 608. En route from Pang Mop to Lomot. March 10, 1926. A fruit somewhat resembling an apple, containing four angular oblong seeds.

67777. *MELIOSMA NITIDA* Blume. Sabiaceae.

No. 609. En route from Pang Mop to Lomot. March 10, 1926. A tree known locally as *kajor gading*. The trunk is 6 to 8 inches in diameter and 30 to 40 feet high; the medium-sized leaves are deep shiny green above and lighter green below; the red-brown fruits are about three-fourths of an inch in diameter, with sweetish white flesh which adheres to a single black seed.

67778. (Undetermined.)

No. 613. En route from Pang Mop to Lomot. March 10, 1926. A vine with small black fruits. The leaves, eight in number, are arranged in whorls at the ends of the branches.

67779. (Undetermined.)

No. 618. En route from Lomot to Simpang Tiga. March, 1926. A tree with oblong yellow red-seeded fruits which break into three segments.

67669 to 67797—Continued.

67780. *MELIOSMA NITIDA* Blume. *Sabiaceae*.

No. 620. Between Lomot and Simpang Tiga. March 11, 1926.

For previous introduction and description see No. 67770.

67781. (Undetermined.)

No. 621. Between Lomot and Simpang Tiga. March 11, 1926. A tree producing oblong green fruits, 1 inch or more in diameter and about 2 inches long, having three seed segments, two seeds in each cavity.

67782. *TINOSPORA* sp. *Menispermaceae*.

No. 624. Between Lomot and Simpang Tiga. March 11, 1926. A vine with dark-green leaves and racemes of bright-orange oblong fruits about three-fourths of an inch in diameter. The seeds are oblong, flattened, and have a depression on both sides.

67783. *DIPLYCOSIA PILOSA* Blume. *Ericaceae*.

No. 627. Simpang Tiga. March 11, 1926. A shrub with small, glossy green, lanceolate long-pointed leaves, tomentose underneath, and small purple fruits resembling blueberries.

67784. *POLYGALA VENENOSA* Juss. *Polygalaceae*.

No. 630. March 11, 1926. A plant 6 feet or more in height, found in the canyon along the trail to Simpang Tiga. It bears lavender seed pods of a peculiar shape and both purple and white flowers.

67785. (Undetermined.)

No. 634. To be grown to ascertain its horticultural value. Received without notes.

67786. (Undetermined.)

No. 635. Kota Kenjaran. March 12, 1926. A thorny vine with clusters of small red berries.

67787. *CHLORANTHUS BRACHYSTACHYS* Blume. *Chloranthaceae*.

No. 637. Simpang Tiga. March 12, 1926. A shrub bearing terminal clusters of bright-red berries which are very similar to holly berries.

67788. *ELAEAGNUS LATIFOLIA* L. *Elaeagnaceae*.

No. 642. En route from Kota Kenjaran to Blang Kedjeren. March 13, 1926. A small tree with rather small oval leaves, dark green above and lighter green below. The brown oblong fruits, about half an inch in diameter and 1 inch or more in length, have red flesh of a very good acid flavor, and long pointed, rather soft seeds which are markedly ribbed.

For previous introduction see No. 32940.

67789. *CORDIA MYXA* L. *Boraginaceae*.

No. 643. En route from Kota Kenjaran to Blang Kedjeren. March 13, 1926. A small tree with oval leaves and oval, pinkish fruits, one-half by three-fourths of an inch, set in a thin green cup, similar to that of an acorn. The flesh, surrounding a single seed, is white, gelatinous, and rather sweet.

For previous introduction see No. 43654.

67790. *ARDISIA VILLOSA* Roxb. *Myrsinaceae*.

No. 650. En route from Blang Kedjeren to Kongke. March 17, 1926. A small evergreen shrub with attractive small pink flowers in panicles and small red berries.

67669 to 67797—Continued.

67791. *MACARANGA TRILOBA* (Reinw.) Muell.-Arg. *Euphorbiaceae*.

No. 690. En route from Blang Kedjeren to Kongke. March 17, 1926. A tree 60 feet or more high, having palmate leaves and acutelobed fruits with conical fruitlets, four together, each fruit containing one round black seed. These fruits are sticky and exude a fragrant substance.

67792. *COLUMELLA GENICULATA* (Blume) Merr. *Vitaceae*.

No. 691. En route from Blang Kedjeren and Kongke. March 17, 1926. A handsome trellis vine with large, broadly lanceolate, deep-green leaves and clusters of pink ovate fruits, three-fourths of an inch long, resembling coffee berries. Each fruit contains two flattened oval corrugated light-brown seeds.

For previous introduction see No. 67748.

67793. *CISSUS REPENS* Lam. *Vitaceae*.

No. 692. A vine climbing over shrubs along the trail between Blang Kedjeren and Kongke. March 17, 1926. The tips of the branches were wine colored, the leaves thin cordate and 2 inches long, and the clusters of fruits were wine red, turning to purple black.

67794. *ABROMA AUGUSTA* L. f. *Sterculiaceae*.

No. 696. En route from Kongke to Meloewoeh. March 18, 1926. A herbaceous semishrub with large cordate, hairy leaves, small purple flowers and large angular seed pods, $1\frac{1}{2}$ inches across, containing large quantities of small black seeds.

For previous introduction see No. 64166.

67795. (Undetermined.)

No. 700. March 18, 1926. Fruits probably from a tall forest tree, found on the trail from Kongke to Meloewoeh. Yellow-purplish fruits, three-fourths by 1 inch, with white flesh adhering to plumlike seeds.

67796. *STELECHOCARPUS BURAHOL* (Blume) Hook. f. and Thoms. *Annonaceae*.

No. 762. April 29, 1926. A tree found in a private yard by the highway in Magelang, Java, producing hard, round fruits. This tree deserves to be grown especially for its young leaves, which are an attractive wine-red color.

67797. (Undetermined.)

No. 792. May 17, 1926. Sour, dull-magenta fruits the size of small grapes, from the market in Soerabaya, Java.

67798 and 67799.

From Paris, France. Plants presented by Vilmorin-Andrieux & Co. Received April 26, 1926.

67798. *FATSHEDERA LIZEI* Guillaumin. *Araliaceae*.

A hybrid between *Fatsia japonica moseri*, a compact Japanese shrub with shining green leaves, and *Hedera helix hibernica*, a large-leaved Irish variety of English ivy.

67799. *PIROCYDONIA DANIELI* Winkler. *Malaecae*.

A small shrub resembling the quince in general habit; originally cultivated by Lucian Daniel in the gardens of the Faculté des Sciences, at Rennes, France. According to Mr. Daniel this graft hybrid arose from an old pear grafted on quince stock.

For previous introduction see No. 62015.

67800 and 67801. IPOMOEA BATATAS
(L.) Poir. Convolvulaceae.

Sweet potato.

From China. Tubers obtained by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received April 2, 1926.

67800. No. 363. January 23, 1926. *Paak faan shue*. A white-fleshed variety of good quality obtained at Yeunguk, Lungtau Mountain.

67801. No. 392. January 23, 1926. *Fan shue*. This variety is commonly cultivated in the vicinity of Shiuchow, where these tubers were obtained.

67802. LAUROCERASUS OFFICINALIS
Roemer (*Prunus laurocerasus* L.).
Amygdalaceae. **Cherry laurel.**

From Elstree, Herts, England. Plants presented by Vicary Gibbs, Aldenham House Gardens. Received February 12, 1926. Numbered June, 1926.

Variety *zabeliana*. A very free-flowering low-spreading evergreen shrub with narrow, flat foliage. (Edwin Beckett, Superintendent, Aldenham House Gardens.)

67803. AXONOPUS sp. Poaceae. Grass.

From Vicosia, Minas Geraes, Brazil. Plants presented by P. H. Rolfs, escola superior de agricultura e veterinaria. Received May 7, 1926.

A tufted perennial grass, native to Brazil. To be tested as a lawn grass in the United States.

67804. BERBERIS sp. Berberidaceae.
Barberry.

From China. Seeds obtained by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received April 2, 1926.

No. 356. *Wong paak shue*. Seeds from wild plants found near Yeunguk, Lungtau Mountain, January 13, 1926. A shrub, 1 to 1.5 meters high, which is very ornamental with its persistent blue fruits and autumn-red leaves. The large leathery leaves have shiny upper surfaces and very spiny margins; the long swaying half-pendulous spikes are thickly covered with the bloom-covered fruits. The wood is bright yellow and is used in China as medicine.

67805 to 67834.

From Hobart, Tasmania. Seeds presented by L. A. Evans, Secretary of Agriculture, Agricultural and Stock Department. Received June 29, 1926.

67805. ANOPTERUS GLANDULOSUS Labill. Escalloniaceae.

A handsome evergreen Tasmanian shrub, sometimes a small tree 40 feet high in its native country. The thick narrow leaves, mostly at the ends of the branches, are 4 to 8 inches long, and the white flowers are in drooping terminal racemes. It is suitable for greenhouse culture, blooming in the spring.

For previous introduction see No. 66097.

67806. BELLENDENA MONTANA R. Br. Proteaceae.

A low bushy shrub, sometimes less than 6 inches high, with flat thick wedge-shaped leaves and small flowers in a dense terminal raceme. Native to Tasmania.

67807. BOSSIAEA CORDIGERA Benth. Fabaceae.

A straggling or trailing shrub, with opposite rounded cordate leaves about one-fourth inch wide. Native to Tasmania.

67805 to 67834—Continued.

67808. CASUARINA DISTYLA Vent. Casuarinaceae.

Unlike many of the better known casuarinas this species is usually a small shrub 2 to 3 feet high. It is common in Tasmania and in parts of Australia.

For previous introduction see No. 63765.

67809. CASUARINA STRICTA Ait. Casuarinaceae.

This tree, commonly cultivated in California but more rarely in Florida, is a fairly hardy species making a low, often shrubby growth. It is conspicuous on account of its very thick, often pendulous branchlets and very big cones. In appearance it is not so elegant as some of the other casuarinas, but it is very striking and is also of some economic value. The branchlets are said to be a favorite forage of Australian cattle. For shingles and posts the wood is especially valuable.

For previous introduction see No. 62017.

67810. CERMISIA LONGIFOLIA Cass. Asteraceae.

A herbaceous perennial which forms a dense tuft, with silvery hairy linear leaves and pink or white daisylike flowers on scapes up to 1½ feet long. Native to Australia and Tasmania.

67811. CERMISIA LONGIFOLIA SAXIFRAGA Benth. Asteraceae.

A variety of the preceding which is smaller in all its parts.

67812. CYATHODES DIVARICATA Hook. f. Epacridaceae.

A rigid juniperlike shrub with small, rigid, very narrow sharp-pointed leaves and white flowers on recurved stems. Native to Tasmania.

67813. DRIMYS LANCEOLATA (Poir.) Baill. (*D. aromatica* F. Muell.). Magnoliaceae.

The bark of this Tasmanian shrub or small tree, like that of its Chilean relative (*Drimys winteri*), possesses aromatic properties, and the round drupes, about the size of peas, are used as a condiment.

For previous introduction see No. 61327.

67814 to 67816. ELICHRYSUM spp. Asteraceae.
Everlasting.

67814. ELICHRYSUM BACCHAROIDES F. Muell.

An erect much-branched shrub with small scalelike leaves and dense terminal corymbs of small yellow flower heads. Native to mountainous regions in southern Australia and Tasmania.

67815. ELICHRYSUM DIOSMAEFOLIUM (Vent.) Sweet.

A tall evergreen shrub, native to Australia and Tasmania, which becomes 20 feet high. The leaves are small and very narrow. The flowers, which are white, sometimes tinged with pink, are in dense terminal corymbs of small heads.

67816. ELICHRYSUM LEDIFOLIUM (A. Cunn.) Benth.

A handsome evergreen shrub about 8 feet high, with linear leaves about an inch long and small white flower heads in dense terminal corymbs. Native to Tasmania.

67817. EUCALYPTUS COCCIFERA Hook. f. Myrtaceae.

A handsome Tasmanian eucalypt with leaves of two forms—in young trees these are opposite, sessile, and oval, while in full-grown trees they are alternate stalked and very narrow. The young branches are nearly pure white.

For previous introduction see No. 50208.

67805 to 67834—Continued.

67818. *GAULTHERIA HISPIDA* R. Br. Ericaceae.

An erect spreading shrub 2 to 3 feet high, with the branches and midribs of the oblong leaves covered with hispid hairs. The white flowers are in dense terminal or axillary racemes. Native to Australia and Tasmania.

67819. *GENTIANA SAXOSA* Forst. f. Gentianaceae.

An erect annual gentian, found in many parts of Australia and Tasmania, with white or blue bell-shaped flowers.

67820. *HAKEA ACICULARIS LISSOSPERMA* Benth. Proteaceae.

A small evergreen tree or tall shrub, with rigid terete sharp-pointed leaves about 2 inches long and axillary clusters of white flowers. Native to Tasmania.

67821. *HIBBERTIA PROCUMBENS* (Labill.) DC. Dilleniaceae.

A prostrate, much-branched, yellow-flowered evergreen shrub from Australia, with very narrow leaves about half an inch long.

67822 to 67824. *LEPTOSPERMUM* spp. Myrtaceae.67822. *LEPTOSPERMUM MYRTIFOLIUM* Sieber.

A tall evergreen shrub, about 9 feet high, with small flat oblong leaves less than half an inch in length. The white solitary flowers are produced in the leaf axils. Native to Australia.

67823. *LEPTOSPERMUM PUBESCENS* Lam.

Variety *montanum*. A tall erect evergreen shrub or small tree with small oblong leaves, hairy on both sides, and solitary yellow flowers. Native to Tasmania.

67824. *LEPTOSPERMUM RUPESTRE* Hook. f.

A procumbent or prostrate evergreen shrub with small thick oblong leaves and small white flowers. Native to Tasmania at altitudes of 3,000 to 5,000 feet.

67825. *NOTHOFAGUS GUNNII* (Hook. f.) Oerst. Fagaceae.

A dense bushy evergreen shrub from Tasmania, where it is said to make an impenetrable scrub 5 to 8 feet high. The leaves, about half an inch long, are broadly oval or almost round.

67826 to 67828. *OLEARIA* spp. Asteraceae.67826. *OLEARIA LEDIFOLIA* (DC.) Benth.

A small evergreen thickly-branched shrub, with crowded narrowly oval leaves, silvery hairy beneath. Native to Tasmania.

67827. *OLEARIA PERSOONIOIDES* (DC.) Benth.

A low evergreen bush, 3 feet or less high, with small shining-green leaves, silvery beneath, and white asterlike flowers in numerous small heads. Native to Tasmania.

67828. *OLEARIA PINIFOLIA* (Hook. f.) Benth.

A rigid shrub with stout hairy branches and crowded rigid, very narrow leaves. Native to Tasmania.

67805 to 67834—Continued.

67829. *OXYLOBIUM ELLIPTICUM* (Labill.) R. Br. Fabaceae.

An erect leguminous shrub, sometimes 10 feet tall, native to Australia and Tasmania. The small oval-oblong leaves are mostly in irregular whorls of three, and the yellow flowers are in dense racemes.

67830. *PERSOONIA GUNNII* Hook. f. Proteaceae.

An erect bushy shrub about 8 feet high with flat thick crowded leaves and solitary yellow flowers. Native to Tasmania.

67831. *PITTOSPORUM BICOLOR* Hook. Pittosporaceae.

A bushy shrub or small tree which is sometimes 40 feet high; the thick narrow leaves, 1 to 2 inches long, are entire, hairy beneath, and usually crowded; the purple and yellow flowers are in terminal clusters. Native to India.

For previous introduction see No. 42293.

67832 to 67834. *STYPHELIA* spp. Epacridaceae.67832. *STYPHELIA ACEROSA* (Gaertn.) Laing and Blackwell.

An evergreen shrub or small tree, native to New Zealand, with blackish branches and rigid, sharp, needle-shaped leaves about one-half inch in length with recurved margins. The small white flowers are succeeded by funnel-shaped corollas, forming small white or red drupes.

For previous introduction see No. 47880.

67833. *STYPHELIA ADCENDENS* R. Br.

A stout spreading evergreen white-flowered shrub, native to Tasmania, with oval-oblong flat leaves about one-fourth of an inch long.

67834. *STYPHELIA STRAMINEA* (R. Br.) Spreng.

A bushy evergreen Tasmanian shrub about 2 feet high, with very small broadly oblong leaves, usually crowded near the ends of the current year's shoots. The solitary flowers are white.

67835. *IPOMOEA BATATAS* (L.) Poir. Convolvulaceae. Sweet potato.

From San Juan, Porto Rico. Cuttings presented by O. W. Barrett, agricultural director, Department of Agriculture. Received June 30, 1926.

No. 74. Grown at Rio Piedras, Porto Rico.

67836. *CEDRELA* sp. Meliaceae.

From Chihli Province, China. Suckers obtained by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received March 2, 1925. Numbered June, 1926.

No. 1912. Village of Kechiatsum, near Feingtai. January 27, 1925. *Hsiang chun shu* (fragrant heaven tree). A tree which is forced in the greenhouses for the sake of the young leaves and shoots, which are eaten as a vegetable in the spring. The young trees are propagated by root suckers, and the trees are said to bear fruit only when they become quite old.

UNITED STATES DEPARTMENT OF AGRICULTURE

INVENTORY No. 88

Washington, D. C.

Issued April, 1929

PLANT MATERIAL INTRODUCED BY THE OFFICE OF FOREIGN PLANT INTRODUCTION, BUREAU OF PLANT INDUSTRY, JULY 1 TO SEPTEMBER 30, 1926 (NOS. 67837 TO 68955)

CONTENTS

Introductory statement.....	Page 1
Inventory.....	3
Index of common and scientific names.....	48

INTRODUCTORY STATEMENT

The plant material received during the summer months of 1926 covers a wide range of material from diverse parts of the world. Collections from the East Indies, made by David Fairchild, included additional cover and green-manure crops (Nos. 67838 to 67847) for testing in comparison with legumes previously introduced from this region. A pink-fleshed grapefruit (*Citrus grandis*, No. 67980) with flesh reported to be so dry that the follicles can be broken from one another and eaten from the hand was also obtained. Many tropical and subtropical trees, shrubs, and fruits (Nos. 67932 to 67941, 67982 to 67985, 67994 to 67996, 68015 to 68040, 68151 to 68153, 68295 to 68298) were included in Doctor Fairchild's collection.

P. H. Dorsett continued to collect field crops and miscellaneous native trees and ornamental shrubs in Manchuria. His introductions are represented by Nos. 67992, 68001 to 68014, 68404 to 68414, and 68420 to 68825. The greater part of these were soy-bean varieties which already, in preliminary tests in the United States, show great promise.

F. A. McClure, continuing his work in southern China, sent in a large number of varieties of rice and vegetables (Nos. 68361 to 68403, 68867 to 68907, 68913 to 68948). From the Institute of Applied Botany, at Leningrad, through A. Kol, was received a good collection of seeds of field crops and miscellaneous plants (Nos. 68054 to 68104, 68171 to 68177). Other seeds from Russia are represented by Nos. 68180 to 68293, wheat and barley, and Nos. 68158 to 68169, *Iris* spp. The collection of iris from Asia Minor (*Iris* spp., Nos. 67909 to 67921) is deserving of special mention.

Attention is called to *Macadamia ternifolia* (No. 67883) and also to the attempt to introduce a related species with a larger nut, *M. prealta* (No. 67882). The horticultural possibilities of *M. ternifolia* make it appear desirable to encourage the planting of this species as specimen trees for homeyards and also for avenue and street purposes in the warmer portions of the country. In this way superior horticultural varieties may be selected from such seedling plantings. *M. ternifolia* is a very fine specimen and avenue tree, and the fact that it is an evergreen makes it serviceable in places where such trees are preferred. Thin-shelled varieties are known to exist in Australia as individual trees, and to find such a variety is one of the objectives of large plantings in this country. Attention perhaps should be called to the fact that the area having climatic conditions suitable to species of *Macadamia* is limited and somewhat more restricted than in the case of citrus plants. However, more hardy strains than the ones already introduced may yet be found. While *M. prealta* is less well known than *M. ternifolia* and not yet established in the United States, its large nut makes it seem worth special attention by further introductions and subsequent testing.

The introduction of *Pentzia incana* under No. 67880 should again call attention to this shrub as a possible asset to the dry range area of the southwestern United States from the Panhandle of Texas south to the Rio Grande and west to the Pacific coast. It is the well-known karoo bush of the pasture lands of South Africa and affords the best dry-land reserve feed in that region. It is essentially a sheep browse and is reputed to be responsible for the fine quality of wool shipped from Africa. If it can be successfully established in our Southwest it should be a great feed insurance for drought years.

Other plants in this inventory that should be specifically mentioned on account of the results with previous introductions or their promise as indicated by their behavior in their original homes are *Telopea speciosissima* (No. 68912), *Calopogonium mucunoides* (No. 68845), *Arachis nambyquarae* (Nos. 68830 and 68831), *Populus maxmowiczii* (No. 68170), and *Myoporum sandwichensis* (No. 68157). The *Myoporum* is suggested for special testing in windy and exposed areas along ocean fronts where a mild climate prevails.

The botanical determinations of these introductions have been made and the nomenclature determined by H. C. Skeels, and the descriptive matter has been prepared under the direction of Paul Russell, who has had general supervision of this inventory.

KNOWLES A. RYERSON,
Senior Horticulturist, in Charge.

OFFICE OF FOREIGN PLANT INTRODUCTION,
Washington, D. C., July 16, 1928.

INVENTORY¹

67837 to 67847.

From Buitenzorg, Java. Seeds obtained by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received July 27, 1926.

The following seeds were obtained at the tea experiment station, Buitenzorg, May 22, 1926.

67837. ACACIA VILLOSA (Swartz) Willd. Mimosaceae.

No. 803. A native of Venezuela which is used in Java for the same purpose as *Leucaena glauca*; that is, as a shade for field crops, and is preferred because of its slower growth. It is said to be used in the teak forest plantings as a permanent leguminous undershrub to add nitrogen and humus to the soil.

For previous introduction see No. 44865.

67838. ALYSICARPUS VAGINALIS NUMMULARIFOLIUS (L.) Baker. Fabaceae.

No. 808. A low creeping annual legume.

For previous introduction see No. 33640.

67839. BRADBURYA PUBESCENS (Benth.) Kuntze (*Centrosema pubescens* Benth.) Fabaceae. Butterfly pea.

No. 806. A climbing tropical American annual legume of great value in Java as a cover crop, having roots which penetrate 11½ feet into the soil in one year's time.

For previous introduction see No. 65315.

67840. CRACCA CANDIDA (DC.) Kuntze (*Tephrosia candida* DC.). Fabaceae.

No. 799. A low leguminous shrub with slender branches and large clusters of reddish or white flowers, which is used as a cover crop.

For previous introduction see No. 60642.

67837 to 67847—Continued.

67841. CRACCA NOCTIFLORA (Bojer) Kuntze (*Tephrosia noctiflora* Bojer). Fabaceae.

No. 796. A bushy brown-hairy leguminous plant which is used as a cover crop. It has compound leaves about 4 inches long and lax terminal racemes of reddish flowers which open late in the afternoon. Native to tropical Africa.

67842. CROTALARIA ALATA Buch.-Ham. Fabaceae.

No. 805. A bushy annual leguminous plant, about a foot high, with pale-yellow flowers; suitable for use as a cover crop.

For previous introduction see No. 51832.

67843. CROTALARIA USARAMOENSIS Baker f. Fabaceae.

No. 804. One of the less important cover crops. A leguminous plant which forms a dense low growth and endures partial shade.

For previous introduction see No. 64064.

67844. INDIGOFERA ENDECAPHYLLA Jacq. Fabaceae.

No. 809. A native of southern British India, which is considered one of the best cover crops used in Java on the tea estates. It roots from the internodes, as well as from the nodes, and stands drought well.

For previous introduction see No. 63605.

67845. INDIGOFERA SUFFRUTICOSA Mill. (*I. anil* L.). Fabaceae.

No. 807. A slender yellow-flowered bushy legume, 3 to 5 feet high, producing a rather scanty growth, which is not considered one of the best cover crops.

For previous introduction see No. 64036.

¹ It should be understood that the names of horticultural varieties of fruits, vegetables, cereals, and other plants used in this inventory are those under which the material was received when introduced by the Office of Foreign Plant Introduction and, further, that the printing of such names here does not constitute their official publication and adoption in this country. As the different varieties are studied, their entrance into the American trade forecast, and the use of varietal names for them in American literature becomes necessary, the foreign varietal designations appearing in this inventory will be subject to change, with a view to bringing the forms of the names into harmony with recognized horticultural nomenclature.

It is a well-known fact that botanical descriptions, both technical and economic, seldom mention the seeds at all and rarely describe them in such a way as to make possible identification from the seeds alone. Many of the unusual plants listed in these inventories are appearing in this country for the first time, and there are no seed samples or herbarium specimens with ripe seeds with which the new arrivals may be compared. The only identification possible is to see that the sample received resembles seeds of other species of the same genus or of related genera. The responsibility for the specific identifications therefore must necessarily often rest with the person sending the material. If there is any question regarding the correctness of the identification of any plant received from this office, herbarium specimens of leaves and flowers should be sent in, so that definite identification can be made.

67837 to 67847—Continued.

67846. *STIZOLOBIUM VELUTINUM* (Hassk.)
Piper and Tracy. Fabaceae.

No. 802. A selected variety of the velvet bean which covers the ground in two and one-half months. It grows up to an altitude of 3,000 feet.

For previous introduction see No. 43536.

67847. *VIGNA VEXILLATA* (L.) Rich. Fabaceae.

No. 798. A South American yellow-flowered climber which is being used as a cover crop in Java.

For previous introduction see No. 48607.

67848. *ZIZIPHUS XILOPYRUS* (Retz.) Willd. Rhamnaceae.

From Bombay, India. Seeds obtained by Wilbur Kehlner, United States consul. Received August 24, 1926.

A small thorny Indian tree, a close relative of the Chinese jujube (*Ziziphus jujuba*). In its native country, where it grows in hot dry places, the young shoots, leaves, and fruits serve as fodder for livestock, and the hard tough wood is used in making carts. The hard bony fruits in close two or three edible kernels.

For previous introduction see No. 53593.

67849. *ZINZIBER OFFICINALE* Roscoe. Zinziberaceae. Ginger.

From Kandy, Ceylon. Tubers obtained by David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition. Received February 26, 1926. Numbered July, 1926.

No. 819. January 12, 1926. A variety grown in the vicinity of Kandy.

67850. *QUERCUS* sp. Fagaceae. Oak.

From San Jose, Costa Rica. Seeds presented by Federico Peralta, Director, San Jose Department of Agriculture. Received July 19, 1926.

A central American tree of possible value for the warmer parts of the United States.

67851. *COUSINIA* sp. Asteraceae. Taimat.

From Tangier, Morocco. Seeds presented by Moses Albert Azancot, Paseo Cenarro. Received July 23, 1926.

Taimat. This plant grows wild here around the wheat fields. The flower buds are boiled in salted water and eaten; they taste something like asparagus. The uncooked juice from the plant is used with apparent success as a substitute for rennet by the local cheese manufacturers. (Azancot.)

A prickly leaved thistlelike plant.

67852 to 67856.

From Yalta, Crimea, Russia. Seeds presented by Th. K. Kalajda, horticultural director, Nikta Botanic Garden. Received July 23, 1926.

Locally grown seeds.

67852 to 67856—Continued.

67852. *MELILOTUS ALBA* Desr. Fabaceae. White sweet clover.

67853. *MELILOTUS OFFICINALIS* (L.) Lam. Fabaceae. Sweet clover.

67854. *MELILOTUS TAURICA* (Bieb.) Seringe. Fabaceae. Sweet clover.

67855. *TRIFOLIUM ARVENSE* L. Fabaceae. Clover.

67856. *TRIFOLIUM PRATENSE* L. Fabaceae. Red clover.

67857 to 67863. *TRIFOLIUM RESUPINATUM* L. Fabaceae. Persian clover.

From Leningrad, Russia. Seeds presented by A. Kol, chief, bureau of introduction, Institute of Applied Botany. Received August 3, 1926.

A small prostrate annual clover common in the vicinity of Cairo, Egypt; usually found in heavy soils.

67857. No. 2525. 67861. No. 3287.

67858. No. 2526. 67862. No. 3701.

67859. No. 2537. 67863. No. 4155.

67860. No. 2541.

67864 to 67879. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceae. Common wheat.

From Melbourne, Victoria, Australia. Seeds presented by H. A. Mullett, superintendent of agriculture. Received July 15, 1926.

67864. *Confederation*. 67872. *Omrah*.

67865. *Free Gallipoli*. 67873. *Rajah*.
No. 58.

67874. *Rajah Seln*.

67866. *Ghurka*. 67875. *Ranee*.

67867. *Mac's White*. 67876. *Sepoy*.

67868. *Mahratta*. 67877. *Sterling* (78 A).

67869. *Marmora*. 67878. *Turvey*.

67870. *Mogul*. 67879. *Wannon*.

67871. *Nizam*.

67880. *PENTZIA INCANA* (Thunb.) Kuntze (*P. virgata* Less.). Asteraceae.

From Cape Province, Union of South Africa. Seeds presented by George A. Gill, principal, Grootfontein School of Agriculture, Middleburg. Received July 25, 1926.

A low-growing, spreading bush which layers naturally when the tips of its branches arch over and touch the ground. In the eastern Provinces of Cape Colony, where the rains occur in summer but where long, severe droughts are frequent, this is one of the most valuable of all the karoo plants for fodder purposes. It is especially good for sheep and goats, which eat it down almost to the ground. (Note by David Fairchild under No. 10635.)

For previous introduction see No. 64649.

67881 to 67883.

From Dundas, New South Wales, Australia. Seeds presented by Herbert J. Rumsey. Received August 9, 1926.

67881 to 67883—Continued.

67881. *HICKSBEACHIA PINNATIFOLIA* F. Muell. Proteaceae.

This tree, native to New South Wales, grows to a height of 30 to 40 feet, and the fruit is borne in racemes, attached to the bark and branches of the tree. Each raceme consists of 10 or 12 fruits. The flavor is not quite so good as the Queensland nut, *Macadamia ternifolia*, nor does it keep so well, but nevertheless they are sold in some fruit shops in New South Wales.

For previous introduction see No. 39871.

67882. *MACADAMIA PREALTA* (F. Muell.) F. M. Bailey. Proteaceae.

An evergreen tree, sometimes as much as 100 feet tall, with narrow leathery shining-green leaves about 7 inches long and smooth hard nuts about an inch in diameter which are said to be edible. Native to Queensland and New South Wales, Australia.

67883. *MACADAMIA TERNIFOLIA* F. Muell. Proteaceae.

Var. *integrifolia*. A form of the so-called Queensland nut which has entire leaves. The typical form is a large evergreen tree with narrowly oblong leaves in whorls of three or four and thick-shelled edible nuts an inch in diameter.

For previous introduction see No. 44769.

67884 to 67889.

From San Juan,* Porto Rico. Seeds and bud wood presented by O. W. Barrett, agricultural director, Department of Agriculture and Labor. Received August 3, 1926.

67884 to 67887. *CITRUS* spp. Rutaceae.

Varieties grown in Porto Rico.

67884 and 67885. *CITRUS AURANTIUM* L. Sour orange.

67884. *Reg. Seville.*

67885. *Spineless.*

67886. *CITRUS BERGAMIA* Risso. Bergamot.
Bergamote cordoba.

67887. *CITRUS LIMONIA* Osbeck. Lemon.
Tusk lemon.

67888. *MEIBOMIA RENSONI* Painter. Fabaceae.

The *barajillo* is a rapid-growing shrub, which, as described in the *Revista de Agricultura Tropical*, Salvador (vol. 1, p. 65), is found in Salvador at altitudes of 2,000 to 4,000 feet. The trifoliolate leaves are softly hairy and up to 3½ inches in length, and the small purplish flowers are borne in terminal racemes late in October. The roots of the *barajillo* are very large and penetrate deeply into the soil; the tubercles formed by the nitrogen-gathering bacteria are usually found only on the upper third of the root. Cattle are exceedingly fond of this plant; furthermore, it endures prolonged drought and thrives in very poor soil.

For previous introduction see No. 55446.

67884 to 67889—Continued.

67889. *TERAMNUS LABIALIS* (L.) Spreng. Fabaceae.

A slender leguminous tropical American vine, used as forage in St. Thomas, Virgin Islands. (*Barrett.*)

67890 to 67893.

From Avondale, Auckland, New Zealand. Seeds presented by H. R. Wright. Received July 29, 1926.

67890. *CORYNOCARPUS LAEVIGATA* Forst. *Karaka.*
Corynocarpaceae.

The karaka is a large, handsome New Zealand tree, with a round crown and glossy laurel-like leaves 3 to 7 inches long. The small white flowers are in erect panicles about 4 inches long, and the extremely poisonous orange fruits are oblong and about an inch in length. The kernel of the fruits, however, is not poisonous, and was one of the staple articles of diet of the Maoris, the original inhabitants of New Zealand.

For previous introduction see No. 46764.

67891 and 67892. *HOHERIA POPULNEA* A. Cunn. Malvaceae.

67891. A small ornamental tree or large shrub, up to 30 feet high, with leaves varying in shape from broadly oval and deeply toothed to long and narrow, and attractive snow-white flowers borne in great profusion in axillary clusters. Native to New Zealand, where the white tough wood is sometimes used by cabinetmakers.

For previous introduction see No. 45094.

67892. Var. *Osbornii*. Differs from the normal form in having blue instead of white stamens.

67893. *NAGEIA FERRUGINEA* (G. Benn.) Kuntze (*Podocarpus ferruginea* G. Benn.). Taxaceae. *Miro.*

A large evergreen tree from New Zealand with gray or blackish bark, which peels off in large flakes, and small narrow pointed leaves arranged in two rows on the branches. The bright-red fruits, the size of small plums, have the taste and odor of turpentine, but are eaten eagerly by the native pigeons.

For previous introduction see No. 44851.

67894 to 67896.

From Stockholm, Sweden. Seeds presented by Dr. Eric Hulten, Stockholm, through David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received August 13, 1926.

67894. *BETULA ERMANI* Champ. *Betula.*
Birch.

No. 915. July 22, 1926. Collected during 1925 by Doctor Hulten at the botanical gardens, Leningrad, Russia. According to the collector this birch covers considerable areas in Kamchatka, where it is native. The tree is rather low growing, and owing to its hardness it deserves to be tested in the extreme North. The trunk is white and the branches orange or yellowish. The broadly oval, coarsely toothed leaves are hairy when young.

67894 to 67896—Continued.

67895. *HEDYSARUM HEDYSAROIDES* (L.) Stuntz (*H. obscurum* L.). Fabaceae.

No. 916. July 22, 1926. Collected during 1919 near the mouth of the Kamchatka River by Doctor Hulten. A hardy herbaceous ornamental perennial native to the alpine regions of central Europe. It is about a foot high and produces spikes of purple flowers in mid-summer.

67896. *LONICERA CAERULEA EDULIS* (Turcz.) Regel. Caprifoliaceae.

Honeysuckle.

No. 914. July 22, 1926. Collected in Kamchatka by Doctor Hulten. An erect or spreading hardy shrub about 5 feet high, native to northeastern Asia. The oblong or lanceolate pubescent leaves are up to 2 inches long, and the oblong edible blue berries are sweet and are used for making excellent jam.

67897 to 67904.

From Buitenzorg, Java. Seeds presented by Dr. W. M. Docters van Leeuwen, director, botanic gardens. Received August 24, 1926.

67897. *ALTINGIA EXCELSA* Noronha. Hamamelidaceae.

A magnificent tree of the tropical evergreen forests of the Indian archipelago and northeastern India. In Java it yields in small quantity an odorless medicinal resin known in Europe as "storax," which is obtained by incisions in the trunk; the tree is not regularly cultivated. The soft reddish gray wood with lighter streaks is used in India for building and ordinary domestic purposes.

For previous introduction see No. 50695.

67898. *CARYOTA RUMPHIANA* Mart. Phoenicaceae. Palm.

An East Indian palm about the size of the coconut palm, with a smooth trunk and graceful bipinnate leaves composed of segments with truncate jagged tips. From the central pith of the bark is prepared a sago which is eaten in the East Indies in times of scarcity.

For previous introduction see No. 51710.

67899. *CASSIA ABSUS* L. Caesalpiniaceae.

An erect annual tropical legume, about 2 feet high, with small reddish yellow flowers.

67900. *EUTERPE ACUMINATA* (Willd.) Wendl. Phoenicaceae. Palm.

A graceful spineless palm from tropical South America, with a trunk 36 feet tall, terminated by about 10 pinnate fronds 7 or 8 feet long. The black roundish fruits are fleshy and about half an inch in diameter.

For previous introduction see No. 51719.

67901. *GLAZIOVA TREUBIANA* Beccari. Phoenicaceae. Palm.

A small palm, cultivated in the Botanical Garden, Buitenzorg, Java. According to Beccari (*Annals du Jardin Botanique de Buitenzorg, Supplement 3, pt. 2, p. 791*) its native country is unknown. The trunk is entirely covered with old leaf bases and terminates in gracefully arching pinnate leaves about 10 feet long.

67897 to 67904—Continued.

67902. *GLORIOSA ABYSSINICA* A. Rich. Melanthiaceae. Glory lily.

A tall, lilylike Abyssinian plant, with large, long-stalked yellow flowers.

67903. *PIGAFETTIA ELATA* (Mart.) Wendl. Phoenicaceae. Palm.

A tall ornamental palm, with a stout trunk, spiny above, and spreading pinnate foliage resembling that of the coconut. Native to the East Indies.

67904. *TRADESCANTIA GENICULATA* Jacq. Commelinaceae. Spiderwort.

A tender herbaceous perennial from the West Indies, about a foot high, with blue flowers.

67905 to 67926.

From Tiflis, Georgia, Russia. Seeds presented by A. Grossheim, director, botanic garden. Received September 1, 1926.

67905. *AMYGDALUS GEORGICA* Desf. (*Prunus nana georgica* DC.). Amygdalaceae.

A hardy bush, native to southern Russia, which closely resembles *Amygdalus nana*, differing in its larger colored flowers and smaller leaves.

67906. *AMYGDALUS NANA* L. (*Prunus nana* Stokes). Amygdalaceae. Russian almond.

A hardy bush about 5 feet high, native to Russia and western Asia, with thick stiff sharply toothed leaves and solitary pinkish flowers. The small hard hairy fruit contains a large pit of bitter flavor.

For previous introduction see No. 43814.

67907. *BRASSICA ELONGATA* Ehrh. Brassicaceae.

An annual herb, native to south-central Europe, of possible use as a vegetable.

67908. *GALANTHUS CAUCASICUS* Baker. Amaryllidaceae. Snowdrop.

A spring-blooming bulbous plant, native to the Caucasus, with sword-shaped leaves about 9 inches long and large white flowers.

67909 to 67921. *IRIS* spp. Iridaceae.

67909 and 67910. *IRIS ACUTILOBA* Meyer.

67909. A dwarf purple-flowered iris about a foot in height, native to the Caucasus.

67910. Var. *lineolata*.

67911. *IRIS CARTHAGINENSIS* Fomin.

A Caucasian iris described (Moniteur du Jardin Botanique de Tiflis, 1909) as having a thick rhizome and four-flowered or five-flowered stems nearly 3 feet high. The sword-shaped leaves are about two-thirds of an inch wide, and the flowers are light blue. In its native country the plant grows in damp places.

For previous introduction see No. 64297.

67905 to 67926—Continued.

67912. IRIS CAUCASICA Hoffm.

A rather dwarf iris described by Baker (Irideae, p. 45) as having about six bright-green, very narrow leaves 3 to 6 inches long, a short stem, and pale or bright-yellow flowers which appear in March or April. It is native from Asia Minor to Turkestan, ascending to 6,000 feet above sea level.

For previous introduction see No. 64298.

67913. IRIS FOMINII Hort.

A horticultural variety.

67914. IRIS GROSSHEIMII Hort.

A horticultural variety.

67915. IRIS IBERICA Hoffm. Iberian iris.

A dwarf iris, 18 inches high, native to Asia Minor, with falcate, narrow leaves and large flowers; these are pale-brown marked with purple-brown on the outer segments, with the inner segments pure white, faintly veined.

67916. IRIS LYCOTIS Woron.

67917. IRIS MUSULMANICA Fomin.

An iris from the vicinity of Elisabethpol, Caucasus, which, according to the *Moniteur du Jardin Botanique de Tiflis* (vol. 14, 1909), inhabits brackish swamps. It is less than 2 feet tall, and the flowers are either sky blue or yellowish.

For previous introduction see No. 64299.

67918. IRIS PARADOX Stev. Velvet iris.

A low iris with linear leaves 3 to 6 inches long and large flowers, lilac to white. Native to dry places in Asia Minor.

67919. IRIS RETICULATA Bieb.

Netted iris.

An early-flowering iris, native to Asia Minor, with a tuft of two to four short, erect, four-angled leaves 18 inches high, a very short stem, and very fragrant, bright-purple flowers.

67920. IRIS SCHELKOWNIKOWI Fomin.

67921. IRIS TALYSCHI Hort.

A horticultural variety.

67922 to 67924. MUSCARI spp. Liliaceae.
Grape hyacinth.

67922. MUSCARI CAUCASICUM (Griseb.) Baker.

An ornamental purple-flowered bulbous plant with a scape 8 inches high. Native to the dry mountainous regions of the Caucasus.

67923. MUSCARI LONGIPES Boiss.

A spring-flowering bulbous plant, native to Palestine, about a foot high, with wavy-margined leaves and dense racemes of purple flowers.

67924. MUSCARI NEGLECTUM Guss.

A low bulbous plant, native to the Mediterranean countries, with numerous strap-shaped leaves up to a foot in length, and fragrant dark-blue flowers.

For previous introduction see No. 66589.

67905 to 67926—Continued.

67925. PISUM ELATIUS Bieb. Fabaceae.
Pea.

A hardy annual, about 5 feet high, with leaves composed of one to three pairs of narrow leaflets, and purple flowers. Native to woods and thickets in the alpine regions of Europe.

For previous introduction see No. 64640.

67926. ULMUS ELLIPTICA Koch. Ulmaceae.
Elm.

A large hardy elm, native to the Caucasus.

67927. SOLANUM TUBEROSUM L. Solanaceae.
Potato.

From Wolverhampton, England. Tubers obtained from F. W. Keay, through William Stuart, Bureau of Plant Industry. Received July 3, 1926.

Patterson's Victoria. English-grown tubers.

67928. HEDYCHIUM sp. Zinziberaceae.
Ginger lily.

From Brazil. Roots obtained from Miss Mary C. Bell, Bayside, N. Y. Received May 11, 1926. Numbered September, 1926.

A leafy, strong-growing tropical ornamental herbaceous perennial, related to ginger. The flowers are in terminal spikes.

67929 to 67931. LILIUM spp. Liliaceae.

From Tunbridge Wells, England. Seeds purchased from R. Wallace & Co., The Old Gardens. Received August 5, 1926.

67929. LILIUM MARTAGON L.

Martagon lily.

Variety *dalmaticum*. A Dalmatian variety which often grows to be over 6 feet high, with 12 to 40 flowers of richer, deeper purple than the typical variety.

67930. LILIUM MONADELPHUM Bieb.

Great Caucasian lily.

Variety *szovitzianum*. A variety with larger, lemon-yellow flowers, more thickly purple-dotted than the typical species, and with reddish brown anthers.

67931. LILIUM MARTAGON × HANSONI.

Lily.

Seeds of hybrids between *Lilium martagon* and *L. hansonii*, raised by the late Mrs. R. O. Backhouse, an English plant breeder.

67932 to 67941.

From Ceylon. Seeds obtained by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received July, 1926.

67932 and 67933. SESBANIA GRANDIFLORA (L.) Poir. Fabaceae.

Seeds, purchased in Peradeniya, of small, rapid-growing, soft-wooded trees, 15 to 20 feet high, with pinnate leaves and large pendulous flowers, followed by long, sickle-shaped pods. The fleshy petals are used in curries and soups in the Indian Archipelago, where these trees are native. The leaves and young shoots are sometimes used as fodder.

For previous introduction see No. 61778.

67932 to 67941—Continued.

67932. No. 914-a. A red-flowered variety.

67933. No. 915-a. A white-flowered variety.

68934. *KLUGIA NOTONIANA* (Wall.) A. DC. Gesneriaceae.

No. 811. Hakgala Botanic Gardens. May 22, 1926. The dyanilla of the Singhalese. A small blue-flowered annual native to Ceylon.

67935. *MONODORA TENUIFOLIA* Benth. Annonaceae.

No. 911. Peradeniya Botanic Gardens. June 9, 1926. A small deciduous tropical African tree, which bears an abundance of yellow, orchidlike flowers in the dry season, when the tree is leafless.

67936. *MUNTINGIA CALABURA* L. Elaeocarpaceae.

No. 912. Peradeniya Botanic Gardens. June 9, 1926. A small ornamental spreading tropical American tree with pinnate leaves and small white flowers. The small yellow berries make good tarts or jam, and the leaves are used for tea.

67937. *PITHECOLOBIUM SUBCORIACEUM* Thwaites. Mimosaceae.

No. 812. Hakgala Botanic Gardens. May 22, 1926. An ornamental tropical leguminous tree about 30 feet high, with glossy leathery compound leaves and dense flower heads about an inch in diameter. Native to Ceylon.

67938. *RHODODENDRON ARBOREUM* J. E. Smith. Ericaceae.

This Himalayan rhododendron is variable both in its foliage and in the color of its flowers. In one form the leaves are silvery on the lower surface, while in another they are covered with a brownish red down. The bell-shaped flowers, borne in dense trusses, vary from deep crimson to pure white. The tree sometimes reaches a height of 35 feet, with a trunk 4 feet in circumference.

For previous introduction see No. 60655.

67939. *RUBUS ELLIPTICUS* J. E. Smith. Rosaceae. Raspberry.

No. 813. Hakgala Botanic Gardens. A Himalayan raspberry, described as follows by J. F. Rock, under No. 55499: "A very stout shrub which, especially when young, is densely covered with long, red, almost hairlike spines. The flowers are white, and the deep-yellow, almost orange, very juicy acid fruits are collected by the hill tribes and brought to the markets; the fruits ripen earlier on the mountains than in the valley. The shrub is found at altitudes of 6,000 to 7,000 feet."

67940. *RUBUS MOLUCCANUS* L. Rosaceae.

No. 814. Hakgala Botanic Gardens. Variety *macrocarpus*. A variety of the tropical high-altitude *Rubus* which produces large fruits with little flavor.

67941. *RUBUS* sp. Rosaceae.

No. 815. Hakgala Botanic Gardens.

67942. *LILIUM PYRENAICUM* Gouan. Liliaceae. Lily.

From London, England. Seeds purchased from Watkins & Simpson, Covent Garden. Received July 29, 1926.

A lily from the Pyrenees Mountains, about 4 feet high, with pale lemon-yellow flowers, dotted purplish black. It resembles *Lilium pomponium*, differing in its greater height, larger bulbs, wider leaves, and larger flowers.

67943. *ERYTHROXYLON COCA* Lam. Erythroxylaceae. Cocaine tree.

From Port of Spain, Trinidad, British West Indies. Plants presented by W. G. Freeman, Director of Agriculture. Received July 21, 1926.

A native tree of tropical South America which thrives from sea level up to 5,000 feet altitude.

67944. *SACCHARUM OFFICINARUM* L. Poaceae. Sugar cane.

From Rio Piedras, Porto Rico. Cuttings obtained from the Porto Rican Insular Experiment Station, through E. W. Brandes, Bureau of Plant Industry. Received July 20, 1926.

A Porto Rican variety.

67945. *GOSSYPIUM* sp. Malvaceae. Cotton.

From Caracas, Venezuela. Seeds presented by H. Pittier, Ministerio de Relaciones Exteriores, Museo Comercial. Received July 16, 1926.

Wild Venezuelan cotton.

67946 to 67948.

From Richmond, Victoria, Australia. Seeds presented by F. H. Baker. Received July 16, 1926.

67946. *ACACIA DECURRENS* Willd. Mimosaceae.

Variety *normalis*. A variety of the Green wattle, which is cultivated in California, with sepals as long as the petals. The typical form is a handsome tree with light-green feathery foliage and bright yellow flowers.

67947. *ACACIA DISCOLOR* Willd. Mimosaceae.

A tall unarmed shrub or small tree, native to southeastern Australia and Tasmania, which bears, in autumn, terminal and axillary clusters of yellow flowers.

For previous introduction see No. 62960.

67948. *HAKEA LAURINA* R. Br. Proteaceae. Sea-urchin hakea.

A tall Australian shrub, 30 feet or less high, remarkable for its showy crimson flowers. These are in globular heads, about 2 inches in diameter, from which numerous golden yellow styles protrude an inch or so in all directions.

For previous introduction see No. 64483.

87949. PSIDIUM sp. Myrtaceae. Guava.

From Merauke, New Guinea. Seeds presented by P. T. L. Putnam. Received July 14, 1926.

A locally developed form.

67950 to 67964. PRUNUS spp. Amygdalaceae.

A collection of flowering cherries growing at the United States Plant Introduction Garden, Chico, Calif., originally received from Highland Park, Rochester, N. Y. Numbered July, 1926.

67950 to 67954. PRUNUS SERRULATA Lindl.

67950. P. I. G. No. 16776. Row 123, tree 4, O. T. O. *Ochichima*. A small spreading tree with rough light-brown bark and rather deeply toothed leaves. The double flowers, produced on slender pedicels $1\frac{1}{2}$ inches long, are white, with faint shadings of pink; they are about $1\frac{1}{8}$ inches in diameter.

67951. P. I. G. No. 16784. Row 127, tree 4, O. T. O. *Gosiozakura*. A small spreading tree with rough light-brown bark. The semidouble flowers, produced in clusters of five on slender pedicels $1\frac{1}{4}$ inches in length, are white, faintly overspread with pink, and are $1\frac{1}{2}$ inches in diameter.

67952. P. I. G. No. 16787. Row 131, tree 4, O. T. O. *Oshimazakura*. A quick-growing and comparatively short-lived tree up to 30 feet high, with pale-gray bark and thick, spreading branches. The numerous small, single, white or pinkish flowers are fragrant, and the small ovoid fruits are shining black. Native to central and southern Japan.

67953. P. I. G. No. 16790. Row 133, tree 4, O. T. O. *Hisakura*. A small tree with light-brown bark. The semidouble flowers, produced in clusters of four on slender pedicels an inch in length, are about 1 inch in diameter and delicate rose pink. The rather round petals of the flowers are daintily frilled on the edges.

67954. P. I. G. No. 16783. Rows 139 and 141, trees 4, O. T. O. *Minakami*. Flowers about $1\frac{1}{2}$ inches across, fragrant, single or nearly so, white, in clusters of three, profusely produced. One of the best single white varieties.

67955. PRUNUS SERRULATA SACHALINENSIS (Schmidt) Makino (P. sargentii Rehder).

P. I. G. No. 16795. Row 133, tree 5, O. T. O. *Yamazakura*. The mountain cherry of northern Japan, which under favorable conditions becomes a large tree, up to 70 feet tall, with a spreading crown. It is hardy and long lived and is said to be one of the handsomest of the wild cherries of eastern Asia. The young foliage is bronze green, and the mature leaves assume brilliant colors in autumn, changing to shades of yellow, orange, and crimson. The numerous single flowers, pink or at times nearly white, are up to 4 centimeters across, and the black fruits are about the size of peas. An important feature of this wild cherry is the possibility of its use as a stock for cultivated forms, for which purpose it appears to be well suited.

67950 to 67964—Continued.**67956 to 67959. PRUNUS SERRULATA Lindl.**

67956. P. I. G. No. 16801. Rows 139 and 140, trees 5, O. T. O. *Takinioi*. Tree rather small and spreading, about 15 feet high; bark brownish gray; flowers pure white, single, very fragrant, about $1\frac{1}{2}$ inches across, in clusters of three or four; blooming midseason. The Japanese varietal name means "fragrant white water-fall."

67957. P. I. G. No. 16806. Rows 139 to 141, trees 6, O. T. O. *Senriko*. Tree upright ascending in habit, about 20 feet high; bark brownish gray; young foliage coppery green; flowers single or nearly so, white with a pink blush, fragrant, about $1\frac{1}{4}$ inches across, usually three or four in a cluster.

67958. P. I. G. No. 16811. Row 144, tree 1, O. T. O. *Oshimazakura*.

For previous introduction and description see No. 67952.

67959. P. I. G. No. 16821. Rows 146 to 148, trees 2, O. T. O. *Gyoiko*. A vigorous, erect tree, 12 to 14 feet in height, bearing flowers in great profusion. The semidouble, greenish-white flowers, the petals of which are striped darker green with an occasional tinge of pink, are about $1\frac{1}{2}$ inches in diameter and produced in clusters of three to five.

67960. PRUNUS SUBHIRTILLA AUTUMNALIS Makino.

P. I. G. No. 16831. Row 145, tree 4, O. T. O. *Jugatsuzakura*. Tree spreading, with a rounded crown, about 20 feet high; flowers rosy pink, semidouble, about half an inch in diameter, produced freely in the early spring and also sparingly in October. Occasionally a scanty crop of flowers in the spring is followed by a normal crop the following fall.

67961 and 67962. PRUNUS SERRULATA Lindl.

67961. P. I. G. No. 16835. Row 146, tree 4, O. T. O. *Yedozakura*. Tree about 15 feet high, with brownish bark; buds red; flowers double, light pink, large, about $1\frac{1}{4}$ inches across, freely produced in clusters of three. An excellent variety.

67962. P. I. G. No. 16836. Rows 147 to 149, trees 4, O. T. O. *Taizanfun*. Tree erect, about 15 feet high, with dark-brown bark; flowers semidouble to double, pink, about an inch in diameter, often borne near the ends of the branches.

67963. PRUNUS SERRULATA SPONTANEA (Maxim.) Wilson.

P. I. G. No. 16838. Rows 146 and 147, trees 5, O. T. O. *Yamazakura*. A native Japanese cherry, common on mountain sides from the extreme southern part of Japan to about the central portion. It becomes a tree 80 feet high, of spreading habit, with single pink flowers, and is of value chiefly because of its possible use as a stock for the better varieties of flowering cherries.

67950 to 67964—Continued.

67964. *PRUNUS YEDOENSIS* Mats.
Yoshino cherry.

P. I. G. No. 16845. Rows 146 to 148, trees 6, O. T. O. *Yoshino*. A handsome Japanese tree, ultimately about 40 feet high, with smooth pale-gray bark, thick wide-spreading branches, and large oblong sharply-toothed leaves which normally appear after the flowers have passed their prime. The flowers, borne in great profusion in the spring, are single, pink, or nearly white and about an inch across. The small black fruits are sometimes produced abundantly and afford an easy means of propagation.

67965 to 67968.

From Peradeniya, Ceylon. Seeds presented by the manager, publication depot and central seed store, Department of Agriculture. Received July 1, 1926.

The following are being tested as cover plants at the experiment station, Peradeniya.

67965. *ALBIZZIA FALCATA* (L.) Backer.
(*A. moluccana* Miquel). Mimosaceae.

A rapid-growing tree with large feathery leaves and small globular flower heads. Because of its thin foliage it is grown as a shade for field crops in Ceylon.

For previous introduction see No. 40776.

67966. *CRACCA VILLOSA PURPUREA* (L.) Kuntze (*Tephrosia purpurea* Pers.). Fabaceae.

A purple-flowered herbaceous perennial, of low spreading habit, which is native to tropical Africa. According to T. H. Holland (Planters' Chronicle, Ceylon, vol. 21, p. 87), trials in Ceylon show this plant to be suited for growing in the dry parts of the island as a source of green manure.

For previous introduction see No. 62909.

67967. *ERYTHRINA VARIEGATA ORIENTALIS* (L.) Merr. (*E. lithosperma* Blume). Fabaceae.

A moderate-sized spineless leguminous East Indian tree of very rapid growth, with trifoliate leaves and red flowers. In Ceylon, where it is called the *dadap*, this tree is used as a shade for cover plants, and the foliage is lopped for use as green manure.

67968. *INDIGOFERA CONFUSA* Prain and Baker (*I. arrecta* Benth., not Hochst.). Fabaceae.

A slender bushy, South African perennial, 1 to 2 feet high. The whole plant is a livid, blue-green, indicating the presence of indigo, according to W. H. Harvey (Flora Capensis, vol. 2, p. 183). The small flowers are silky white.

67969. *LILIUM CHALCEDONICUM* L. Liliaceae. Chalcedonian lily.

From Athens, Greece. Bulbs purchased from D. Demades, Botanical Museum of the University of Athens. Received August 18, 1926.

The Chalcedonian lily, which came originally from southern Europe, has a green purple-tinged stem 2 to 4 feet high, 100 or more leaves 2 to 6 inches long, and three

to six or more flowers about 3 inches in diameter. These are brilliant scarlet, with scarlet anthers.

67970. *CASTILLA* sp. Moraceae. Rubber tree.

From San Pedro, Honduras. Seeds presented by H. A. Dike. Received September 7, 1926.

The Castillas are Central American trees from several of which rubber is obtained.

67971. *GARCINIA BANCANA* Miquel. Clusiaceae.

From Singapore, Straits Settlements. Seeds presented by the superintendent of the botanic gardens. Received July 12, 1926.

An East Indian tree, which, as described by Ridley (Flora of the Malay Peninsula, vol. 1, p. 174), is 20 to 80 feet tall, with leathery, broadly oval leaves and ovoid fruits.

67972. *NERINE SARNIENSIS* (L.) Herbert. Amaryllidaceae. Guernsey lily.

From Capetown, South Africa. Bulbs purchased from W. S. Duke & Co. Received February 4, 1926. Numbered July, 1926.

A South African bulbous plant with bright-green linear leaves about a foot long, developed after the bright-crimson flowers; the latter are in umbels of about twelve.

For previous introduction see No. 66981.

67973. *CASTILLA* sp. Moraceae. Rubber tree.

From Bayeau, Haiti. Seeds collected by W. H. Jenkins. Received July 12, 1926.

A Central American tree introduced as a possible source of rubber, which is obtained from a number of species of this genus.

67974 to 67976. *GOSSYPIMUM* spp. Malvaceae. Cotton.

From Kulikoro, French West Africa. Seeds presented by R. H. Forbes, collaborator of the Bureau of Plant Industry. Received July 2, 1926.

67974. *GOSSYPIMUM ANOMALUM* Wawra.

This is described by Oliver (Flora of Tropical Africa, vol. 1, p. 211) as a shrub 5 to 10 feet high, with rough branches, reddish flowers, and oval capsules about an inch in length.

For previous introduction see No. 62591.

67975. *GOSSYPIMUM ARBOREUM* L.

Locally grown seeds.

67976. *GOSSYPIMUM OBTUSIFOLIUM* Roxb.

Locally grown seeds of a native Indian cotton.

67977. *PAVETTA ZIMMERMANNIANA* Valet. Rubiaceae.

From Buitenzorg, Java. Seeds presented by Dr. W. M. Docters van Leeuwen, director, botanic gardens. Received July 6, 1926.

A small East Indian evergreen tree or large shrub, with opposite elliptic leaves and clusters of slender-tubed white flowers. One of the most interesting features of this

plant is that the leaves have been found to contain colonies of nonmotile, nitrogen-fixing bacteria, making the species of possible agricultural value. This feature is discussed by Zimmermann and Faber in the *Jahrbücher für Wissenschaftliche Botanik*, vol. 51, p. 285, 1912, and vol. 54, p. 243, 1914.

67978. MIMUSOPS KAUKI L. Sapotaceae.

From Merauke, New Guinea. Seeds presented by P. T. L. Putnam. Received July 14, 1926.

A medium-sized tropical evergreen tree, 20 to 30 feet high, with oval leaves about 4 inches long, crowded at the ends of the branches, and small clusters of white flowers. The slightly acid fruits, about an inch in diameter, are eaten in parts of India.

67979. PASPALUM NOTATUM Fluegge. Poaceae.

From Jaguey Grande, Cuba. Seeds presented by Eugenia Gomez. Received August 9, 1926.

A perennial tropical American grass which has shown promise as a pasture grass in the southern United States. It has very stout rootstocks, makes a firm sod, and does well on sandy as well as on loam soils. The flowering culms and ascending stems attain a height of about 1 foot.

For previous introduction see No. 62049.

67980. CITRUS GRANDIS (L.) Osbeck (*C. decumana* Murr.). Rutaceae. Grapefruit.

From Buitenzorg, Java. Seeds obtained by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received July 16, 1926.

No. 810. May 22, 1926. A deep pink-fleshed variety which is so dry the follicles can be broken from each other and eaten out of hand.

67981. POPULUS sp. Salicaceae. Poplar.

From Santiago, Chile. Cuttings presented by Salvador Izquierdo. Received July 9, 1926.

A tall fastigiate rapid-growing poplar developed by selection at Santa Ines, the nursery of Señor Izquierdo, located near Santiago.

67982 to 67985.

From India. Seeds obtained by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received July 19, 1926.

67982. BROWNEA GRANDICEPS Jacq. Caesalpiniaceae.

No. 907. Peradeniya Botanic Gardens, Ceylon. June 9, 1926. A large handsome Venezuelan tree, up to 40 feet in height, with attractively mottled young foliage and bright-red flowers in large, dense clusters borne at the ends of the branches.

For previous introduction see No. 52308.

67983. GARCINIA CORNEA L. Clusiaceae.

No. 909. Peradeniya Botanic Gardens, Ceylon. June 9, 1926. A handsome tree much like the mangosteen, but with

67982 to 67985—Continued.

smaller leaves. The fruits are about the size of a small orange and are said to be edible.

For previous introduction see No. 49537.

67984. GARCINIA MANGOSTANA L. Clusiaceae. Mangosteen.

Seeds obtained in India.

67985. GARCINIA sp. Clusiaceae.

A tropical Asiatic tree closely related to the mangosteen.

67986 to 67988. CITRUS GRANDIS (L.) Osbeck (*C. decumana* Murr.). Rutaceae. Grapefruit.

From Java. Seeds obtained from Mr. Cornelio, through W. T. Swingle, Bureau of Plant Industry. Received July 9, 1926. Locally developed grapefruit varieties.

67986. Djerook Panden Wangi.

67987. Djerook Bale.

67988. Djerook Delima.

67989. TRIFOLIUM PRATENSE L. Fabaceae. Red clover.

From Melbourne, Australia. Seeds purchased from F. H. Brunning. Received July 15, 1926.

Giant Colonial cowgrass. A high-yielding form of red clover developed under New Zealand conditions, of high feeding value, suitable for grazing, cutting for green feed, or cutting for hay. (Bunning.)

67990. TRIFOLIUM PRATENSE L. Fabaceae. Red clover.

From Leningrad, Russia. Seeds purchased from A. Köl, chief, bureau of introduction, Institute of Applied Botany. Received July 15, 1926.

Seeds grown in Perm, Russia.

67991. LITCHI CHINENSIS Sonner. (*Nephelium litchi* Cambess.). Sapindaceae. Lychee.

From Manila, Philippine Islands. Seeds presented by S. Youngberg, Director, Bureau of Agriculture. Received July 19, 1926.

Seeds from trees growing spontaneously in the Philippines.

67992. ULMUS PUMILA L. Ulmaceae. Chinese elm.

From Harbin, Manchuria. Seeds obtained by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received July 17, 1926.

No. 5489. June 1, 1926. Seeds from trees growing on the streets and in the parks of Harbin.

67993. HYMENOCALLIS AMANCAES (Ruiz and Pav.). Nichols. Amaryllidaceae. Spider lily.

From Lima, Peru. Bulbs presented by Carlos Rospigliosi, founder and director, Museo de Historia Natural. Received July 26, 1926.

A tender bulbous plant about 2 feet high with large bright-yellow flowers. Native to Peru and Chile.

67994 to 67996.

From Ceylon. Seeds obtained from the Peradeniya Botanic Garden by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received July 19, 1926.

67994. *COURUPITA GUIANENSIS* Aubl.
Lecythidaceae.

No. 910. June 9, 1926. The "cannon-ball" tree, native to Guiana, is one of the strangest freaks of the vegetable kingdom. It is a large, handsome tree which produces pink fleshy flowers of curious shape on special crooked branches rising from the trunk. These flowers are followed by cannon-ball shaped fruits 4 to 5 inches in diameter.

For previous introduction see No. 50475.

67995. *PARKIA TIMORIANA* (DC.) Merr.
(*P. roxburghii* G. Don.). Mimosaceae.

No. 913. June 9, 1926. A beautifully shaped park tree with a clear smooth trunk, attaining a height of 100 feet or more. It is a rapidly growing legume native to Burma. The flowers appear during November, and large clusters of long brown pods are produced on long peduncles. The fine feathery foliage and the graceful form of the tree combine to make an exceptional shade tree for tropical gardens.

For previous introduction see No. 61064.

67996. *STERCULIA LANCEOLATA* Cav. Sterculiaceae.

No. 908. June 9, 1926. A rather small evergreen tree from southeastern Asia, with small lanceolate leaves, which is particularly striking when bearing its bright scarlet fruits. These consist of a cluster of five spreading follicles which open on the under side, displaying the black shiny seeds.

67997 to 68000.

From Buitenzorg, Java. Seeds presented by Dr. W. M. Docters van Leeuwen, director, botanic gardens. Received July 12, 1926.

67997. *ECHINOCHLOA STAGNINA* (Retz.) Beauv. Poaceae. Grass.

A tall perennial grass, 6 feet or less high, which grows wild in marshy land in tropical Africa, where, according to Holland (Useful Plants of Nigeria, pt. 4, p. 831), it is a good fodder, much relished by stock.

For previous introduction see No. 49845.

67998. *ORYZA LATIFOLIA* Desv. Poaceae.

A native Brazilian rice, which is a perennial, sometimes 8 feet high, growing on land which is not flooded, according to a note by Andre Goeldi, of the Museu Goeldi, Para, Brazil, published under No. 50491.

67999. *PANICUM REPENS* L. Poaceae. Grass.

A gray-green creeping or ascending perennial grass up to 2 feet high, native to the Mediterranean countries, and distributed throughout Asia Minor and tropical Africa. The stout rootstocks of this grass make it difficult to eradicate.

67997 to 68000—Continued.

68000. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceae. Soy bean.

Locally grown seeds.

68001 to 68014.

From Kungchuling, Manchuria. Seeds obtained by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received July 16, 1926.

From the Kungchuling Agricultural Experiment Station.

68001 to 68005. *SORGHUM VULGARE* Pers. Poaceae. Sorghum.

68001. No. 5490. *Hung ko tai she jen* (red-husked large snake eye).

68002. No. 5491. A late-maturing variety with a stalk over 3 meters long.

68003. No. 5492. *Kei ko she jen hing* (black-husked red snake eye). A land variety which matures in mid-season.

68004. No. 5493. *Lao mu chu pu tai tou* (old pig does not lift up his head). An early dwarf variety.

68005. No. 5494. *Pai kao liang* (white kaoliang). A late-maturing variety.

68006. *HORDEUM VULGARE NIGRUM* (Willd.) Beaven. Poaceae. Six-rowed barley.

No. 5496½. *Feng tien hei* (Mukden black barley). A local strain.

68007. *HORDEUM VULGARE PALLIDUM* Seringe. Poaceae. Six-rowed barley.

No. 5495. *Feng tien pai* (Mukden white barley). The best strain in southern Manchuria, widely cultivated near Mukden.

68008 to 68011. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceae. Soy bean.

68008. No. 5498. *Ssu li huang* No. 4. Selected from a local variety in Kungchuling in 1914. It is the best strain available for distribution.

68009. No. 5499. *Mukden pai mei*. An early-maturing variety cultivated in the vicinity of Mukden.

68010. No. 5500. *Ssu piu chieh hei chi*. Cultivated in the vicinity of Ssuiuchieh.

68011. No. 5501. *Pai hua tso zu*. A midseason variety cultivated in the vicinity of Kungchuling.

68012 to 68014. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceae. Common wheat.

68012. No. 5496. Originally from Sanghai, northern Manchuria.

68013. No. 5497. A local variety cultivated near Nangan, southern Manchuria, which matures in midseason.

68014. No. 5498½. *Kung chuling improved* No. 3. A selected strain.

68015 to 68040.

From southeastern Asia and the Balearic Islands. Seeds obtained by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received July 29, 1926.

68015 to 68040—Continued.

68015. *SESBANIA GRANDIFLORA* (L.) Poir.
Fabaceae.

No. 859. Tandjong Priok, Java. May 26, 1926. A remarkably rapid-growing small leguminous tree which produces attractive purplish flowers, 2½ inches long. This tree is much used as a half shade for various cultures in the East Indies. The white variety is much more common, and seeds of the purple variety are very hard to obtain.

For previous introduction see No. 61778.

68016. *ALLAMANDA SCHOTTH* Pohl. Apocynaceae.

No. 847. Botanic garden, Singapore, Straits Settlements. May 30, 1926. A shrub having an abundance of flowers which are smaller than those of *A. grandiflora*.

68017. *ALLIUM CEPA* L. Liliaceae. Onion.

No. 793. Iviza, Balearic Islands. May 21, 1926. The giant onion of Iviza produces bulbs of very large size, some measuring over 6 inches in diameter and 2 inches thick. These onions were found to be an excellent dish when boiled; a single onion will serve five persons.

For previous introduction see No. 64449.

68018. *ARTOCARPUS CHAMPEDEN* (LOUR.) Spreng. (*A. polyphema* Pers.). Moraceae.

No. 843. Singapore, Straits Settlements. May 31, 1926. A handsome shade tree bearing small elongated fruits which are rather smooth skinned. The arillus has a peculiar sweet flavor.

For previous introduction see No. 51804.

68019. *BRADBURYA PLUMIERI* (TURP.) Kuntze (*Centrosema plumieri* Turp.). Fabaceae. Butterfly pea.

No. 801. Buitenzorg, Java. May 22, 1926. An ornamental leguminous vine, native to Brazil.

For previous introduction see No. 48597.

68020. *CASSIA BACILLARIS* L. f. Caesalpiniaceae.

No. 734. Sibolangit Botanic Garden, Sumatra. March 28, 1926. A small tree suitable for street and park planting. The flowers are golden yellow and an inch or more in diameter.

68021. *CASUARINA SUMATRANA* Jungh. Casuarinaceae.

No. 844. Botanic garden, Singapore, Straits Settlements. May 31, 1926. This species is one of the handsomest of the Casuarinas. It has large cones and very fine drooping branchlets.

For previous introduction see No. 54705.

68022. *CITRUS GRANDIS* (L.) Osbeck (*C. decumana* Muir.). Rutaceae. Grapefruit.

No. 795. From the Department of Agriculture, Buitenzorg, Java. May 22, 1926. The "Djeroek pandan wangi" of Java. A very large variety which has brilliant pink flesh of good quality and texture. The fruit has a secondary

68015 to 68040—Continued.

fruit in its interior. In fact it is a navel, showing this character on the exterior. It is very good for eating out of hand because it is so dry.

68023. *CITRUS* sp. Rutaceae.

No. 794. From the Department of Agriculture, Buitenzorg, Java. May 22, 1926. "Japanese citron." A very productive curious hybrid variety found in the kampongs of Java. It is suggestive of a cross between the tangerine and the lime and is very sour. It is a remarkable citrus stock in the wet region of western Java.

68024. *DIALIUM LAURINUM* Baker. Caesalpiniaceae.

No. 840. From the market at Singapore, Straits Settlements. May 31, 1926. The so-called "Velvet tamarind." The attractive gray fruits have a thin shell which is easily broken, and they contain a thin, very sweet, and agreeable pulp.

For previous introduction see No. 51770.

68025. *DIALIUM MAINGAYI* Baker. Caesalpiniaceae.

No. 841. Singapore market, Straits Settlements. May 31, 1926. A smaller fruited species with acid pulp instead of sweet; otherwise much like *Dialium laurinum*.

68026. *EUGENIA AQUEA* Burm. f. Myrtaceae.

No. 735. Botanic garden, Sibolangit, Sumatra. March 28, 1926. This small tree makes a superb showing with its crimson fruits, which have a color quality rarely seen.

For previous introduction see No. 48223.

68027 to 68034. *GARCINIA* spp. Clusiaceae.

68027. *GARCINIA BANCANA* Miquel.

No. 860. Botanic garden, Penang, Straits Settlements. June 5, 1926. A tree with large handsome leaves and large yellow one-sided fruits with thick rind, extremely sour flesh, and seeds 1½ inches long and half an inch thick. The fruits are about the size of the largest fruits of *Garcinia xanthochymus*, but in character of the rind remind one more of *G. atroviridis*. There is little arillus, but what there is has a pleasant acid flavor.

68028. *GARCINIA DULCIS* (Roxb.) Kurz.

No. 821. Singapore, Straits Settlements. May 31, 1926. A sour variety called Munda by the Malays. The fruits are larger than those of *Garcinia xanthochymus*, and like them are very acid.

For previous introduction see No. 30970.

68029. *GARCINIA FORBESII* King.

No. 817. Botanic garden, Singapore, Straits Settlements. May 31, 1926. A small-leaved lowland tree, 15 feet high, of Singapore, where the annual precipitation is 150 inches. The red fruits are the size of a cherry and have acid pulp. The arillus is red.

68030. *GARCINIA GRIFFITHII* T. Anders.

No. 819. Botanic garden, Singapore, Straits Settlements. May 31, 1926.

68015 to 68040—Continued.

A common tree in the woods of Singapore. It is 60 feet tall, with smooth bark and large leaves, 9 to 16 inches long. The acid fruits are said to be 3 inches in diameter, globose, flattened at the top and brownish green, resembling a russet apple.

68031. *GARCINIA MANGOSTANA* L.
Mangosteen.

No. 861. Penang, Straits Settlements. The largest seeds, separated from the smaller ones, to see whether they had more vitality.

68032. *GARCINIA MANGOSTANA* L.
Mangosteen.

No. 862. Penang, Straits Settlements. The small seeds, which are believed to have little vitality.

68033. *GARCINIA MANGOSTANA* L.
Mangosteen.

No. 864. Penang, Straits Settlements. A mixture of medium-sized and large seeds.

68034. *GARCINIA NIGRO-LINEATA* Planch.

No. 818. Botanic garden, Singapore, Straits Settlements. May 31, 1926. A handsome park tree 40 feet tall, with large leaves 6 to 8 inches long and small edible fruits.

68035. *GUSTAVIA* sp. Lecythidaceae.

No. 849. Botanic garden, Singapore, Straits Settlements. May 30, 1926. A handsome shrub or small tree with rather curious flowers, reminding one of a passion flower with its many stamens.

68036. *MIMOSA INVISA* Mart. Mimosa-
ceae.

No. 797. Tea experiment station, Buitenzorg, Java. May 22, 1926. A most remarkable humus producer which makes a mat of herbage 3 feet high. It is a pink-flowered, very spiny bush, native to tropical America.

For previous introduction see No. 45618.

68037. *OLEA MARITIMA* Wall. Oleaceae.

No. 845. Botanic garden, Singapore, Straits Settlements. May 31, 1926. A shrub or small tree common in the lowlands near the sea in Singapore, and there probably capable of withstanding some salt. It bears round velvety black or very dark brown fruits, one-fourth of an inch in diameter, which resemble olives.

68038. *PASSIFLORA LAURIFOLIA* L. Passi-
floraceae. Yellow granadilla.

No. 846. Botanic garden, Singapore, Straits Settlements. May 30, 1926. A yellow-fruited granadilla with refreshing pulp which is not so juicy as *Passiflora edulis*. It is a handsome evergreen climber.

For previous introduction see No. 44852.

68039. *SHUTERIA VESTITA* Wight and Arn.
Fabaceae.

No. 379. Ramboda Falls, Ceylon. January 27, 1926. A trailing legume with trifoliate leaves, which have a dark spot on each leaflet. The stems are extremely strong and slender and difficult to break.

68015 to 68040—Continued.

68040. *VIGNA HOSEI* Hort. Fabaceae.

No. 800. Buitenzorg, Java. One of the most successful cover crops which has been used on the shady ground under the rubber plantations, and one which does not die back when exposed to the sun.

68041 to 68053. *SACCHARUM OFFICINARUM* L. Poaceae. Sugar cane.

From Paseroean, Java. Cuttings purchased from J. Kuyper, assistant director, sugar experiment station. Received August 6, 1926.

Varieties grown in Java.

68041. No. 331. 68048. No. 2752.

68042. No. 105. 68049. No. 2753.

68043. No. 139. 68050. No. 2878.

68044. No. 501. 68051. No. 2883.

68045. No. 1335. 68052. *Gr. D. N. G.*

68046. No. 1499. 68053. *White Ceram.*

68047. No. 2722.

68054 to 68104.

From Leningrad, Russia. Seeds presented by A. Kol, chief, bureau of introduction, Institute of Applied Botany. Received July 26, 1926.

68054 and 68055. *AGROPYRON CRISTATUM* (L.) Gaertn. Poaceae. Wheatgrass.

A perennial, thickly caespitose grass with stout rhizomes, native to southeastern Europe. It is both drought and cold resistant and promises to be of value for the cold grassland area of the Rocky Mountains.

For previous introduction see No. 64090.

68054. No. 2997. From Nemkommuna, Samara Government.

68055. No. 2998. A broad-leaved variety from Nemkommuna, Samara Government.

68056. *AGROPYRON TENERUM* Vasey. Poa-
ceae. Slender wheatgrass.

No. 9453. From the Western Siberian Experiment Station, Omsk.

68057. *ALLIUM SCHOENOPRASUM* L. Lili-
aceae. Chives.

No. 9270. From Moscow Government. The sand leek or rocambole of Europe and Asia Minor resembles garlic, but has smaller bulbs of milder flavor, which are produced at the tip of the stem as well as at its base.

For previous introduction see No. 59691.

68058. *AMARANTHUS CAUDATUS* L. Ama-
ranthaceae. Amaranth.

No. 1101. From the Voronezh Government Step. Experiment Station.

For previous introduction see No. 56611.

68059. *ANETHUM GRAVEOLENS* L. Api-
aceae. Dill.

No. 9260. From Kiev Government.

For previous introduction see No. 64340.

68054 to 68104—Continued.

- 68060 to 68063. *AVENA SATIVA* L. Poaceae. Oats.
68060. No. 1328. From the Shatilov Experiment Station, Tula Government.
68061. No. 1329. From the Shatilov Experiment Station, Tula Government.
68062. No. 9451. From the Western Siberian Experiment Station, Omsk.
68063. No. 9452. From the Western Siberian Experiment Station, Omsk.
- 68064 and 68065. *BRASSICA OLERACEA CAPITATA* L. Brassicaceae. Cabbage.
- From Moscow Government.
68064. No. 2918. *Kubysbka*.
68065. No. 2919. *Leverka*.
68066. *BROMUS ERECTUS* Huds. Poaceae. Meadow brome grass.
- No. 7395. From the Tulun Experiment Station, Irkutsk Government. A perennial, thickly caespitose grass, with upright stems 1 to 3 feet high. Native to Europe and Asia Minor.
68067. *CORIANDRUM SATIVUM* L. Apiaceae. Coriander.
- No. 9256. From Geraj, Afghanistan.
- 68068 to 68071. *CUCUMIS SATIVUS* L. Cucurbitaceae. Cucumber.
- From Moscow Government.
68068. No. 2929. 68070. No. 2935.
68069. No. 2933. 68071. No. 2937.
68072. *DACTYLIS GLOMERATA* L. Poaceae. Orchard grass.
- No. 7408. From Bekasovo, Moscow Government.
- For previous introduction see No. 55382.
68073. *DAUCUS CAROTA* L. Apiaceae. Carrot.
- No. 2927. *Vorobjewsk*. From Moscow Government.
68074. *FESTUCA ELATIOR* L. Poaceae. Meadow fescue.
- No. 7416. From the Tulun Experiment Station, Irkutsk Government.
68075. *HELIANTHUS ANNUUS* L. Asteraceae. Sunflower.
- No. 3002. From the Saratov Experiment Station.
- 68076 and 68077. *LENS ESCULENTA* Moench. Fabaceae. Lentil.
68076. No. 3006. From the Bogorodizkaja Experiment Station, Kursh Government.
68077. No. 3454. From Kasvin, Persia.
68078. *LEPIDIUM SATIVUM* L. Brassicaceae. Garden cress.
- No. 9276. From Faisabad, Afghanistan.
68079. *LOTUS CORNICULATUS* L. Fabaceae. Bird's-foot trefoil.
- No. 7435. From the Tulun Experiment Station, Irkutsk Government.
- For previous introduction see No. 57967.

68054 to 68104—Continued.

68080. *MEDICAGO SATIVA* L. Fabaceae. Alfalfa.
- No. 9893. From Tashaus, Turkestan.
68081. *PANICUM MILIACEUM* L. Poaceae. Proso.
- No. 3003. From the Saratov Government Experiment Station.
- 68082 to 68085. *PAPAVR SOMNIFERUM* L. Papaveraceae. Poppy.
- From Mongolia.
68082. No. 9263. 68084. No. 9265.
68083. No. 9264. 68085. No. 9267.
68086. *PHALARIS CANARIENSIS* L. Poaceae. Canary grass.
- No. 9286. From Tauris.
- 68087 and 68088. *PHASEOLUS VULGARIS* L. Fabaceae. Common bean.
68087. No. 2909. From Kharkof Government.
68088. No. 2910. From Kiev Government.
68089. *PIMPINELLA ANISUM* L. Apiaceae. Anise.
- No. 9255. From Mongolia.
- 68090 to 68092. *PISUM SATIVUM* L. Fabaceae. Pea.
68090. No. 1085. From the Kokutchev Experiment Station.
68091. No. 1090. From the Moscow Agricultural Academy.
68092. No. 1096. From Rostov, Don.
68093. *RAPHANUS SATIVUS* L. Brassicaceae. Radish.
- No. 2944. From Moscow Government.
68094. *SPINACIA OLERACEA* L. Chenopodiaceae. Spinach.
- No. 9273. From Kandagar, Afghanistan.
68095. *TRIGONELLA FOENUM-GRÆCUM* L. Fabaceae. Fenugreek.
- No. 9284. From Afghanistan.
- 68096 to 68102. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceae. Common wheat.
68096. No. 2999. *Belokoloska*. From the Saratov Experiment Station.
68097. No. 3001. From the Saratov Experiment Station.
68098. No. 6985. From the Ekaterinoslav Experiment Station.
68099. No. 9446. From the Western Siberian Experiment Station, Omsk.
68100. No. 9447. From the Western Siberian Experiment Station, Omsk.
68101. No. 9448. From the Western Siberian Experiment Station, Omsk.
68102. No. 9449. From the Western Siberian Experiment Station, Omsk.
- 68103 and 68104. *TRITICUM DURUM* Desf. Poaceae. Durum wheat.
68103. No. 2996. From the Krasnokut Experiment Station, Samara Government.
68104. No. 10407. *Mieri Bugdaj*. From Merv District, Turkestan.

68105 to 68125.

From Buitenzorg, Java. Seeds presented by Dr. W. M. Docters van Leeuwen, director, botanic gardens. Received August 13, 1926.

68105. *ALPINIA HOOKERIANA* Valet. Zinziberaceae.

A biennial tufted leafy herb, 4 to 6 feet high, with bright-green leaves a foot or so long and drooping white and orange flowers in erect panicles. Native to the Malay Peninsula.

68106. *ANGIOTERIS JAVANICA* Presl. Marattiaceae. Fern.

A coarse tropical fern native to Java, with a massive rounded rootstock and large bipinnate fronds.

68107. *ARECA ALICAE* F. Muell. Phoenicaceae. Palm.

An Australian palm with several slender graceful spineless trunks, 9 feet or more in height, and pinnate shining-green leaves 3 to 6 feet long.

68108. *ARECA TRIANDRA* Roxb. Phoenicaceae. Palm.

A graceful spineless palm, ultimately about 25 feet high, usually with several trunks, which bears crowns of pinnate leaves 4 to 6 feet in length. The fruits, about the size of olives, are orange-scarlet. Native to India.

For previous introduction see No. 45956.

68109. *ARENGA MICROCARPA* Beccari. Phoenicaceae. Palm.

A handsome East Indian palm, with a ringed trunk, covered with black hairs when young and a crown of large pinnate leaves.

68110. *ASPLENIUM SQUAMULATUM* Blume. Polypodiaceae. Fern.

A tropical fern, native to Java.

68111. *CARYOTA MITIS* Lour. Phoenicaceae. Palm.

A Malayan palm about 20 feet high with a straight cylindrical spineless ringed trunk, 4 inches or more in diameter, and bipinnate leaves 4 to 9 feet in length. The purple fruits are about the size of cherries.

For previous introduction see No. 51709.

68112. *CARYOTA SOBOLOFERA* Mart. Phoenicaceae. Palm.

A handsome East Indian palm with a spineless trunk about 25 feet high, crowned by a graceful cluster of pinnate leaves composed of short broad segments.

68113. *CHRYSALIDOCARPUS MADAGASCARIENSIS* Beccari. Phoenicaceae. Palm.

A graceful palm, native to Madagascar, about 15 feet high with leaves 10 feet long. The pinnate leaves, with 18-inch long segments arranged in fascicles of six or eight, seem to be arranged on the stem in threes, giving it a triangular appearance. This arrangement of the leaves and the fascicled arrangement of the leaflets is peculiar to this genus, not being found in any other pinnate-leaved palm.

For previous introduction see No. 45958.

68105 to 68125—Continued.

68114. *CORYPHA GEBANGA* Blume. Phoenicaceae. Palm.

A tall East Indian palm with a stout, spineless trunk and large, terminal orbicular fanlike leaves.

68115. *CYRTOSTACHYS LAKKA* Beccari. Phoenicaceae. Palm.

A stately and elegant palm, native to the East Indies, with a slender spineless stem crowned by a cluster of boldly arched leaves 3 to 4 feet in length. The fruits are elongate egg-shaped and about half an inch long.

For previous introduction see No. 55579.

68116. *CYRTOSTACHYS RENDA* Blume. Phoenicaceae. Palm.

A Sumatran palm of stately habit, about 25 feet high, with a slender spineless trunk crowned by a graceful cluster of pinnately divided leaves, with bright-red leaf sheaths.

68117. *IXORA JAVANICA* (Blume) DC. Rubiaceae.

An ornamental East Indian evergreen shrub, about 3 feet high, with oval-oblong leaves up to 7 inches long and clusters of deep orange-red flowers.

68118 to 68120. *LATANIA* spp. Phoenicaceae. Palm.

68118. *LATANIA COMMERSONII* Gmel.

A palm from the island of Mauritius which reaches a height of 30 to 40 feet, with slightly spiny, fan-shaped, dark-green leaves marked with red in young trees. The leaves are used by the natives in making fans, hats, mats, etc.

For previous introduction see No. 51720.

68119. *LATANIA LODDIGESII* Mart.

A low spineless palm, native to Mauritius, with rounded, fan-shaped leaves 3 to 5 feet long and pear-shaped fruits over 2 inches long.

For previous introduction see No. 59316.

68120. *LATANIA VERSCHAFFELTII* Lem.

A fan-leaved palm about 20 feet high, with pale-green leaves 5 feet long, and hairy petioles, with orange margins, 5 to 8 feet long. Native to the island of Rodriguez, east of Mauritius.

For previous introduction see No. 51722.

68121. *LICUALA AMPLIFRONS* Miquel. Phoenicaceae. Palm.

A showy dwarf fan palm from Sumatra with leaves about 2½ feet long and usually 12-parted.

68122. *MARATTIA SAMBUCINA* Blume. Marattiaceae. Fern.

A large coarse tropical fern with stiff bipinnate fronds. Native to damp situations in the mountains of Java.

68123. *NORMANBYA MUELLERI* Beccari. Phoenicaceae. Palm.

An elegant Australian palm with attractive pinnate leaves.

68105 to 68125—Continued.

68124. *TRICHOSANTHES GLOBOSA* Blume.
Cucurbitaceae.

An ornamental cucurbitaceous climber, native to Java, with 3-palmate to 5-palmate leaves and globose fruits.

68125. *ZEPHYRANTHES CITRINA* Baker.
Amaryllidaceae. Zephyr lily.

A bulbous plant, unknown except in cultivation, with linear bright-green leaves a foot long and bright-yellow flowers $1\frac{1}{2}$ inches long, on scapes about 5 inches high.

68126. *CANNA* sp. Cannaceae.

From Haina, Santo Domingo, Dominican Republic. Seeds presented by Dr. R. Ciferri, Director, Estación Agronómica de Haina. Received August 18, 1926.

A native canna from the Dominican Republic.

68127 and 68128.

From Kedjadar, Java. Seeds presented by A. M. Cramer. Received August 18, 1926.

68127. *CASSIA LAEVIGATA* Willd. Caesalpinziaceae.

An erect shrubby ornamental tropical cassia about 3 feet in height, with axillary and terminal racemes of large yellow flowers and cylindrical leathery pods 2 to 3 inches long, inflated when ripe.

For previous introduction see No. 55599.

68128. *PHASEOLUS LUNATUS* L. Fabaceae.
Lima bean.

Java-grown seeds of a pole Lima bean.

68129. *PHASEOLUS CARACALLA* L. Fabaceae. Bertoni bean.

From Summit, Canal Zone. Seeds presented by Holger Johansen, Plant Introduction Garden. Received August 8, 1926.

A perennial leguminous climber from the warmer parts of Paraguay, which bears attractive purplish or yellowish flowers during the late summer and autumn.

For previous introduction see No. 37010.

68130 to 68136. *AVENA SATIVA* L. Poaceae. Oats.

From Melbourne, Victoria, Australia. Seeds presented by H. A. Mullett, Superintendent of Agriculture. Received August 5, 1926.

Australian-grown oat varieties.

68130. *Burt's Early*.

68131. *Lachlan*.

68132. *Palestine*.

68133. *Ruakura*.

68134. *Sunrise*.

68135. *Wild oats* \times *Ruakura*.

68136. *Yarran*.

68137 to 68140.

From Bayswater, Bloemfontein, South Africa. Seeds presented by Charles A. Beck. Received August 18, 1926.

68137 to 68140—Continued.

68137. *ACACIA HORRIDA* (L.) Willd. Mimosaceae.

A spreading, flat-topped, spiny tree, about 20 feet high, widely distributed throughout South Africa. The fragrant yellow flower heads are often visited by bees, but the main value of the tree in South Africa is as a shade for stock.

For previous introduction see No. 48518.

68138. *CUSSONIA UMBELLIFERA* Sond. Araliaceae.

A South African tree, about 35 feet high, with compound, shining-green leaves a foot or so long, and large umbels of small fleshy fruits.

68139. *ERAGROSTIS* sp. Poaceae.

A South African perennial grass.

68140. *ZIZIPHUS MUCRONATA* Willd. Rhamnaceae.

A spiny tree, native to South Africa, about 25 feet high, with small, three-nerved leaves, inconspicuous yellowish flowers, and red fruits about the size of cherries.

68141 to 68150.

From Brignoles, France. Seeds presented by R. Salgues, Station Botanique de Brignoles. Received August 18, 1926.

68141. *ANDROSACE MAXIMA* L. Primulaceae.

A small ornamental tufted European annual, about a foot high, which belongs to the primrose family. The white flowers appear in the spring.

68142. *ANTHYLLIS TETRAPHYLLA* L. Fabaceae.

A leguminous annual, native to southern Europe, about a foot high, with spikes of yellow flowers.

68143. *ELICHRYSUM STOECHAS* (L.) DC. Asteraceae.

A handsome evergreen shrub about 2 feet high, with yellow flowers. Native to the Mediterranean region.

68144. *HUMULUS LUPULUS* L. Moraceae.
Hop.

European-grown hop seeds.

For previous introduction see No. 42024.

68145. *IRIS FOETIDISSIMA* L. Iridaceae.
Gladwin iris.

An iris, native to the Mediterranean countries, with leaves a foot long and bright-lilac flowers borne on a stem about 2 feet high.

For previous introduction see No. 66576.

68146. *PHALARIS ARUNDINACEA* L. Poaceae.
Reed canary grass.

Locally grown seeds.

For previous introduction see No. 60881.

68147. *RANUNCULUS FALCATUS* L. Ranunculaceae.
Buttercup.

A low annual, with small yellow flowers, native to southern Europe.

68141 to 68150—Continued.

68148. *RUSCUS ACULEATUS* L. Convallariaceae. Butcher's-broom.

An ornamental evergreen shrub, about a foot high, with prickly stems and large red berries. Native to England.

68149. *SCORPIURUS SUBVILLOSA* L. Fabaceae.

A decumbent or ascending annual with one to three stems up to 20 inches in length, long-stemmed, simple, grass-green, narrow leaves, and small yellow flowers. Native to the Mediterranean countries.

For previous introduction see No. 65035.

68150. *TRAGOPOGON LONGIROSTRIS* Bisch. Cichoriaceae.

A hardy biennial with narrow grass-like leaves and yellow flower heads. Native of southern Europe.

68151 to 68153.

From the Balearic Islands and Morocco. Seeds obtained by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received August 20, 1926.

68151. *CERATONIA SILIQUA* L. Caesalpiniaceae. Carob.

San Antonio, Iviza, Balearic Islands. August 15, 1925. Variety *Pauseca*. One of the best sorts in this section.

68152. *POLYCARPÆA NIVEA* (Ait.) Webb. Silenaceae.

Obtained near Mogador, Morocco. June 5, 1925. A low-growing gray hairy perennial plant used extensively and successfully in the sand-binding experiments on the sand dunes.

68153. *THYMUS ZYGIS* L. Menthaceae.

San Antonio, Iviza, Balearic Islands. August 14, 1925. *Frigola*. An aromatic plant from which a strong intoxicant is brewed.

68154 to 68157.

From Honolulu, Hawaii. Seeds presented by C. S. Judd, superintendent of forestry. Received August 20, 1926.

68154. *COLUBRINA OPPOSITIFOLIA* Brongn. Rhamnaceae.

A small evergreen tree, with opposite, oval or oblong papery leaves up to 7 inches in length. The wood is very hard and was once used by the native Hawaiians for making spears.

68155. *KOKIA ROCKII* Lewton. Malvaceae. Kokio.

A Hawaiian tree, up to 40 feet in height, closely related to cotton (*Gossypium* spp.). When covered with its large orange-red flowers it is of striking beauty.

68156. *MEZONEURUM KAUAIENSE* (Mann.) Hillebr. Caesalpiniaceae.

A leguminous tree growing to a height of 30 feet. The blossoms are red, and the hard, black heartwood is used by the Hawaiians for clubs and fapa beaters. (Judd.)

68157. *MYOPORUM SANDWICENSE* (A. DC.) A. Gray. Myoporaceae.

A tree 20 to 30 feet high, or sometimes a shrub, with alternate oblong leaves.

68154 to 68157—Continued.

up to 6 inches long, crowded toward the ends of the branches, and clusters of small white flowers. The heartwood becomes very fragrant when dried, with an odor resembling that of sandalwood.

68158 to 68169. Iris spp. Iridaceae.

From Tiflis, Georgia, Russia. Rhizomes presented by A. Grossheim, director, botanical garden. Received September 1, 1926.

68158. *IRIS ACUTILOBA* Meyer.

A wild iris native to the Caucasus, with purple and fawn-colored flowers.

For previous introduction see No. 67018.

68159. *IRIS CARTHALINIAE* Fourn.

A Caucasian iris described (Moniteur du Jardin Botanique de Tiflis, 1909) as having a thick rhizome, and four-flowered or five-flowered stems nearly 3 feet high. The sword-shaped leaves are about two-thirds of an inch wide, and the flowers are light blue. In its native country the plant grows in damp places.

For previous introduction see No. 64297.

68160. *IRIS FOMINII* Hort.

A horticultural variety.

68161. *IRIS APHYLLA* L. Stool iris.

A European iris with glaucescent leaves up to a foot long or sometimes leafless. The dark-lilac flowers are about 2 inches long.

For previous introduction see No. 66930.

68162. *IRIS GROSSHEIMII* Hort.

A horticultural variety.

68163. *IRIS IBERICA* Hoffm. Iberian iris.

A dwarf, nearly stemless iris, native to mountainous parts of Asia Minor, with narrow leaves 3 to 6 inches long, and large flowers; these have pale-brown outer segments blotched with purple-brown, and pure white inner segments, although these colors are not constant.

68164. *IRIS LYCOTIS* Worm.

A species belonging to the *Oncocyclyus* section and probably related to *Iris acutiloba*.

68165. *IRIS MUSULMANICA* Fourn.

An iris from the vicinity of Elisabethopol, Caucasus, which, according to the Moniteur du Jardin Botanique de Tiflis (vol. 14, 1909), inhabits brackish swamps. It is less than 2 feet tall, and the flowers are either sky-blue or yellowish.

For previous introduction see No. 67917.

68166. *IRIS PARADOXA* Stev. Velvet iris.

A dwarf, linear-leaved iris, 2 to 6 inches high, with large lilac or white flowers. Native to northern Persia and Asia Minor, where it grows in dry situations.

68167. *IRIS RETICULATA* Bieb. Netted iris.

A tufted iris, native to Asia Minor, with short erect leaves about 1½ feet high, a very short stem, and very fragrant, bright-purple flowers with the outer segments about 2 inches long.

68158 to 68169—Continued.**68168. IRIS SCHELKOWNIKOWI** Fomin.

A species belonging to the *Oncocyclus* section and probably related to *Iris acutiloba*.

68169. IRIS TASCHIA Hort.

A horticultural variety.

For previous introduction see No. 64300.

68170. POPULUS MAXIMOWICZII A. Henry. Salicaceae. Poplar.

From Jamaica Plain, Mass. Cuttings presented by the Arnold Arboretum. Received November 8, 1922. Numbered September, 1926.

A very fast growing and stately tree native to China. It will succeed in the coldest portions of the United States on the poorest and driest soils. At all times it makes phenomenally rapid growth. Its leaves, which are handsomely crinkled like those of *Rosa rugosa*, appear very early in the spring and remain longer in the fall than those of almost any other deciduous plant. The tree is not attacked by borers or leaf-eating insects. It is highly recommended as a shade tree and windbreak generally, especially for the northwest Plains country.

For previous introduction see No. 51877.

68171 to 68177.

From Leningrad, Russia. Seeds presented by A. Kol, chief, bureau of introduction, Institute of Applied Botany. Received August 23, 1926.

68171. BROMUS INERMIS Leyss. Poaceae. Brome grass.

No. 7393. A perennial European grass, with creeping rhizomes and stems up to 30 inches high.

68172. FESTUCA ELATIOR L. Poaceae. Meadow fescue.

No. 2963. A loosely tufted perennial European grass with short creeping rootstalks and erect stems up to 4 feet high.

68173. LENS ESCULENTA Moench. Fabaceae. Lentil.

No. 3455. An annual legume, 1½ feet high, of Russian strain, native to southern Europe.

68174 and 68175. PHASEOLUS VULGARIS L. Fabaceae. Common bean.

Russian varieties.

68174. No. 2892. Bomba. Variety *elipticus*.**68175. No. 2908.** Variety *oblongus*.**68176. TRITICUM AESTIVUM** L. (*T. vulgare* Vill.). Poaceae. Common wheat.

No. 6984. Variety *ferrugineum*. A Russian strain.

68177. VICIA ERVILIA (L.) Willd. Fabaceae. Vetch.

No. 3453. An annual erect vetch, native to the Mediterranean countries.

68178. AMYGDALUS PERSICA NECTARINA Ait. Amygdalaceae. Nectarine.

From Chico, Calif. A variety of unknown origin, grown at the United States Plant

Introduction Garden under No. 26503, but distinct from the original trees of that number. Numbered September, 1926.

(Trees 7 and 8, new test orchard, propagated from trees 4 and 5, old test nursery.) Fruit very large, spherical, about 2½ inches in diameter; stem heavy; skin almost uniformly yellow-green, sometimes overlaid with more or less red; flesh medium firm, greenish white, moderately juicy, mildly subacid, of good rich flavor and of excellent quality; pit of medium size, slightly staining flesh. Fruit ripens at Chico the latter part of August.

68179. GARCINIA BENTHAMII Pierre. Clusiaceae.

From Manila, Philippine Islands. Seeds presented by S. Youngberg, Director, Bureau of Agriculture, through Dr. W. A. Orton, director, Tropical Plant Research Foundation, Washington, D. C. Received August 31, 1926.

A small, evergreen, rapidly growing tropical tree, closely related to the mangosteen (*Garcinia mangostana*). The edible fruits are very similar to those of the mangosteen except that they are slightly smaller, bright red, and have very acid flesh; probably suited for making preserves. Native to low altitudes in the Philippines.

68180 to 68293.

From Gandja, Transcaucasia, Russia. Seeds presented by the Director, Central Transcaucasian Agricultural Plant Breeding and Experiment Station. Received August 30, 1926.

Locally grown strains.

68180 to 68229. HORDEUM spp. Poaceae.**68180. HORDEUM DISTICHON** PALMELLA Harlan. Two-rowed barley.

No. 8.

68181 to 68200. HORDEUM VULGARE NIGRUM (Willd.) Beaven.

Six-rowed barley.

-----------------	----------------

68294. AGAVE FUNKIANA Koch and
Bouche. Amaryllidaceae.

From Ciudad Victoria, Tamaulipas, Mexico. Seeds presented by Bernardo Zorrilla's Sons, through L. H. Dewey, Bureau of Plant Industry. Received September 16, 1926.

This plant grows wild on the mountain sides surrounding the Jaumave and Las Palmas Valleys, in the State of Tamaulipas. The leaves are 5 to 7 centimeters wide

and 50 to 100 centimeters long, with horny borders bearing sharp-hooked prickles and a terminal spine. The fiber, known in the market as Jaumave itle, is cleaned by hand from the leaves forming the central cogollos or buds. This fiber is used in the manufacture of brushes and also twines. The plant has not been cultivated commercially, but it may be propagated either from seeds or from suckers. (*Dewey*.)

68295. DOLICHOS LABLAB L. Fabaceae.
Hyacinth bean.

From Sumatra. Seeds obtained by David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition. Received May 14, 1926. Numbered September, 1926.

No. 539. March 4, 1926. Seeds black with a white hilum; plant found growing along the shore of Lake Tewar, near Taken-gon.

68296 to 68298.

From Sumatra and Ceylon. Seeds obtained by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received August 31, 1926.

68296. PHASEOLUS SCABERULUS Miquel.
Fabaceae.

From Sumatra. A twining, leguminous vine, with hairy stems and leaves, and leaflets up to 3½ inches in length, according to Miquel (*Flora Indiae Batavae*, vol. 1, pt. 1, 197). It is native to Java.

68297. SOPHORA TOMETOSA L. Fabaceae.

No. 436. Found on the beach at Pulu We, near Sebang, Sumatra. February 17, 1926. A beach-loving shrub with attractive foliage.

For previous introduction see No. 46446.

68298. (Undetermined.)

February, 1926. A leguminous vine found on salt plains near the sea at Jaffna, Ceylon.

68299 and 68300.

From Teneriffe, Canary Islands. Seeds presented by Juan Bolinaga, Jardin de Aclimatación de Orotava. Received September 1, 1926.

68299. JUNIPERUS CEDRUS Webb. Pina-
ceae. Juniper.

A Canary Island relative of the common juniper, differing only in minor botanical characters and also in being less hardy. According to Bean (*Trees and Shrubs Hardy in the British Isles*, vol. 1, p. 669), Dr. Georges Perez of Orotava, Canary Islands, reported trees of this species with trunks a yard or more in diameter. The leaves are uniformly awl-shaped and in whorls of threes. The wood is pleasantly perfumed.

For previous introduction see No. 57080.

68300. PINUS CANARIENSIS C. Smith.
Pinaceae. Canary pine.

A pine, native to the Canary Islands, which thrives in warm temperate climates. It is suited to nearly all soils and has a straight trunk even when it grows in an isolated position. The wood of this pine, known in the Canary Islands as

68299 and 68300—Continued.

"tea," is very hard, very difficult to work but unequaled for duration and building purposes because it does not rot.

For previous introduction see No. 62096.

68301 to 68323. VITIS VINIFERA L. Vitaceae. Grape.

From Teheran, Persia. Cuttings presented by F. J. Harris, Teheran, at the request of the Earl of Chichester, through Thomas Cook & Sons, New York, N. Y. Received March 24, 1926. Numbered September, 1926.

68324. DAVIDIA INVOLUCRATA Baill. Cornaceae. Dove tree.

From Newry, Ireland. Plant purchased from T. Smith, Daisy Hill Nursery. Received September 24, 1926.

The Chinese dove tree, as this is sometimes called, is a native of the mountain forests of central and western China. In its native home it becomes a tree 75 feet tall, with a shapely pyramidal crown. When in bloom the tree is unusually striking because of the two or three large, snow-white bracts which subtend each flower. These bracts are of unequal size, the largest being 4 to 8 inches long and 2 to 4 inches broad. The bright-green, oval, sharply toothed leaves are 3 to 6 inches long.

For previous introduction see No. 65439.

68325 to 68348.

From Darjiling, India. Seeds presented by G. H. Cave, Curator, Lloyd Botanic Garden. Received September 9, 1926.

68325. ACACIA CATECHU (L. f.) Willd. Mimosaceae.

The pale-yellow gum obtained from this acacia has very strong adhesive

68325 to 68348—Continued.

powers and is considered a better substitute for gum arabic than that of *Acacia arabica*, according to Watt (Dictionary of the Economic Products of India, vol. 1). The tree is found wild in parts of India and Burma, where it sometimes becomes 70 feet high, though usually smaller. The leaves are very finely pinnate, and the white or pale-yellow flowers are in spikes.

For previous introduction see No. 65246.

68326. ACACIA PENNATA (L.) Willd. Mimosaceae.

A climbing, prickly shrub, up to 20 feet in height, with very narrow, rigid leaflets and dense panicles of yellow flower heads. Native to the central and eastern Himalayas.

68327 to 68329. ACER spp. Aceraceae. Maple.**68327. ACER CAMPBELLII Hook. f. and Thoms.**

The pleasing contrast of the bright-green leaves and red stalks of this Himalayan maple make it worthy of a trial as an ornamental shade tree for the warmer parts of the United States. In its native country the grayish white, moderately hard timber is used for cabinetwork and for planking.

For previous introduction see No. 58901.

68328. ACER HOOKERI Miquel.

A handsome tree 40 to 50 feet high, with deeply fissured brown bark, native to the Sikkim Himalayas at altitudes of 8,000 to 10,000 feet. The oval leaves, though usually green, are sometimes copper colored. The wood is gray with small pores and very numerous fine red medullary rays.

For previous introduction see No. 58902.

68329. ACER OBLONGUM Wall.

A subtropical maple described by Hiern (Hooker, Flora of British India, vol. 1) as a tree 40 to 50 feet tall, with a trunk 1 or 2 feet in diameter, and dark-green, oblong, entire leaves up to 7 inches long. The reddish wood is used for making agricultural implements.

For previous introduction see No. 62808.

68330. ALNUS NEPALENSIS D. Don. Betulaceae. Alder.

A tree up to 70 feet high, with a trunk 3 to 4 feet in diameter, which is very common all over Yunnan at altitudes of 4,000 to 7,000 feet. It is a rapid grower, used chiefly for firewood, and appears to thrive in spite of the tall grass, 5 to 8 feet high, which surrounds it. I would recommend it strongly for planting in grassland where trees can not usually be grown. (Note by J. F. Rock, under No. 56636.)

68331. CAPPARIS OLACIFOLIA Hook. f. and Thoms. Capparidaceae.

An erect, thorny shrub, 6 to 8 feet tall, with shining green leaves and large, axillary flowers, white with blue anthers. The shrub is found in the tropical valleys of the Himalayas from Nepal to Assam.

For previous introduction see No. 47653.

68325 to 68348—Continued.

68332. *CLEMATIS GOURIANA* Roxb. Ranunculaceae.

A tall-climbing, subtropical clematis, with pinnate or bipinnate shining-green leaves, and large panicles of white or yellowish flowers. Native to the western Himalayas at altitudes up to 3,000 feet.

For previous introduction see No. 50336.

68333. *CLEMATIS MONTANA* Buch.-Ham. Ranunculaceae.

A vigorous subtropical climber, native to the Himalayas, which often attains a stem length of 20 feet. The sweet-scented, white flowers, with conspicuous yellow stamens, are about 2 inches across and are produced in several-flowered axillary clusters.

For previous introduction see No. 50337.

68334. *ERYTHRINA ARBORESCENS* Roxb. Fabaceae. Coral tree.

When covered with its bright-scarlet flowers this small tree is very attractive and is often planted as an ornamental in the streets of Darjiling. There are but few prickles on its branches, and the thin greenish leaves are often a foot in width. The strongly curved pods are about an inch wide and 6 to 9 inches long. The tree is found native in the central and eastern Himalayas at altitudes ranging up to 7,000 feet.

For previous introduction see No. 58907.

68335. *ERYTHRINA VARIEGATA* Stickm. (*E. indica* Lam.). Fabaceae. Coral tree.

A moderate-sized, quick-growing, deciduous tree, native throughout India, and cultivated in many parts of the Tropics. The clusters of large bright-red flowers appear before the leaves. The pods, 4 to 8 inches long, contain several dark carmine seeds. The flowers are dried for use as a dye; the bark is used for tanning and dyeing and yields an excellent, pale straw-colored fiber. The leaves are used as cattle fodder; the bark and leaves are also used medicinally. The open-grained, light wood is durable and does not split or warp; it is used for boxes, toys, and also for firewood. Much of the lacquered ware of India is made of the wood of this tree.

For previous introduction see No. 54898.

68336. *FICUS HOOKERI* Miquel. Moraceae. Fig.

A subtropical tree with large, oval leaves up to 11 inches in length, native to the temperate Himalayas of north-eastern India. It is of possible use as a shade tree for the warmer parts of the Gulf States and California.

For previous introduction see No. 49635.

68337. *FRAXINUS FLORIBUNDA* Wall. Oleaceae. Ash.

A large handsome deciduous tree, native to the more temperate portions of the Himalayas at altitudes up to 11,000 feet. The leaves, up to 15 inches long, are composed of seven to nine leaflets, and the white flowers are in large terminal panicles.

For previous introduction see No. 50366.

68325 to 68348—Continued.

68338. *HIBISCUS PUNGENS* Roxb. Malvaceae.

An erect bristly annual or perennial, native to the tropical Himalayas, with roundish heart-shaped, deeply lobed leaves 5 to 8 inches long and purple-centered yellow flowers 5 inches in diameter.

For previous introduction see No. 47691.

68339. *LUCULIA GRATISSIMA* (Wall.) Sweet. Rubiaceae.

A tree or spreading shrub, native to the temperate Himalayas, where it attains a height of 10 to 16 feet. It is a very attractive ornamental because of the gorgeous rounded masses of pink or rose-colored flowers. It is said to make an excellent table plant when grown in a pot and treated somewhat similarly to a gardenia.

For previous introduction see No. 47710.

68340. *MIMOSA RUBICAULIS* Lam. Mimosaceae.

A low straggling spiny shrub or small tree, native throughout India up to 5,000 feet altitude. The thin, finely pinnate foliage and reddish yellow flower heads make the shrub of possible value as an ornamental in the warmest parts of the United States. It is said also to make a good hedge.

For previous introduction see No. 55749.

68341. *XOLISMA OVALIFOLIA* (Wall.) Rehd. (*Andromeda ovalifolia* Wall.). Ericaceae.

Although this shrub or small tree may prove of value as a semihardy ornamental because of its racemes of bluish or white flowers, it is used as an insecticide in its native country, India, because of the presence of a poisonous principle in the young leaves and buds. The oblong, leathery leaves are 3 to 6 inches long.

For previous introduction see No. 64121.

68342. *QUERCUS INCANA* Roxb. Fagaceae. Oak.

A large evergreen oak from the mountains of eastern India, with bark rich in tannin and acorns which are eaten by the wild animals of the Himalayas.

For previous introduction see No. 61621.

68343 to 68345. *RHODODENDRON* spp. Ericaceae.

68343. *RHODODENDRON CILIATUM* Hook. f. Fringed rhododendron.

A Himalayan rhododendron of somewhat dwarf habit, bearing many small loose trusses of pinkish white flowers less than 3 inches wide. It rarely exceeds 6 feet in height.

For previous introduction see No. 58919.

68344. *RHODODENDRON GRANDE* Wight.

A handsome shrub about 15 feet high, native to the Himalayas. It bears numerous loose trusses of bell-shaped flowers about 2½ inches in diameter. These are at first suffused

68325 to 68348—Continued.

with a faint rose tint which later changes to white.

For previous introduction see No. 58923.

68345. RHODODENDRON MADDENI Hook. f.

A shrub 6 to 8 feet high with red-stemmed, dark-green leaves. The large delicately fragrant flowers, tinged with rose, are produced in threes at the ends of the branches. Native to the Himalayas.

For previous introduction see No. 58927.

68346. RUBUS ROSAEFOLIUS J. E. Smith. Rosaceae.

A Philippine raspberry, which, as described by Brown (Wild Food Plants of the Philippines, p. 66), is a spiny shrub, rarely over 3 feet high, common in the mountains of Luzon, the Visayan Islands, and Mindanao, Philippine Islands. The red fruits, borne singly or in clusters, are about 1.5 centimeters in diameter; they are juicy but rather insipid.

For previous introduction see No. 65267.

68347. VACCINIUM DUNALIANUM Wight. Vacciniaceae. Blueberry.

A large erect subtropical shrub with narrow oblong slender-tipped leaves and axillary clusters of small inconspicuous flowers. It is native to the mountainous sections of northern and eastern India.

For previous introduction see No. 60667.

68348. VIBURNUM STELLULATUM Wall. Caprifoliaceae.

A large evergreen shrub with small orange-red berries, native to the temperate Himalayas, and said to be hardy in England.

68349. BAMBUSA MURIAKI Hort. Poaceae. Bamboo.

From France. Plant obtained through the Federal Horticultural Board. Received April 20, 1926. Numbered September, 1926.

A Japanese bamboo.

68350. PHOENIX DACTYLIFERA L. Phoeniceae. Date palm.

From Culiacan, Sinaloa, Mexico. Seeds presented by C. J. Stafford, through T. Ralph Robinson, Bureau of Plant Industry. Received September 8, 1926.

Mexican-grown date seeds.

68351. CHALCAS KOENIGII (L.) KURZ (Murraya koenigii Spreng.). Rutaceae.

From Peradeniya, Ceylon. Plants obtained by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received July 19, 1926.

No. 894. Peradeniya Botanic Gardens. June 9, 1926. A small tree of the orange family closely related to the orange jasmine (*Murraya exotica*), but with larger leaves and less attractive habit. The fresh leaves form a constant ingredient of the Ceylon curries and give them a very agreeable flavor.

68352 to 68355.

From New South Wales, Australia. Trees received during July and September, 1923, at the United States Plant Introduction Garden, Chico, Calif., where these trees are now growing. Numbered September, 1926.

68352 to 68354. AMYGDALUS PERSICA L. (Prunus persica Stokes). Amygdalaceae. Peach.

68352. *Pullar's Cling*. Fruits nearly spherical, about $2\frac{1}{2}$ inches long; skin dark rich yellow overlaid on one side with red blush or striping; flesh firm, dark lemon yellow or orange, somewhat rough, medium juicy, slightly red at pit, slightly acid, flavor good. Appears to have the qualities of a good canning peach.

68353. *Golden Queen*. Fruits generally spherical, about $2\frac{1}{2}$ inches long; skin firm, uniformly orange-yellow, with medium heavy fine tomentum; flesh firm, medium fine texture, orange-yellow, medium juicy, mildly subacid, clinging tightly to pit, of good quality, but lacking in special aroma, not stained at pit; pit medium size. Appears to be a good canning peach.

68354. *Goodman's Choice*. Fruits spherical, about $2\frac{1}{2}$ inches long; skin medium firm, ground color yellow, overlaid in part or almost entirely with dark red, medium heavy fine tomentum; flesh dark yellow, almost orange, firm, medium juicy, medium fine texture, with little or no staining at pit, of rich sweet flavor; pit medium or small. Would make an excellent canning peach.

68355. PRUNUS ARMENIACA L. Amygdalaceae. Apricot.

Trevatt. Trees 9 to 14 feet high, yielding well. Fruits almost round, 2 inches in diameter, yellow; skin smooth; flesh apricot yellow, rather soft, sweet, of fair quality; pit large, loose in cavity. Ripen at Chico, Calif., in June.

68356 and 68357.

From Ceylon and Sumatra. Seeds obtained by David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition. Received February and May, 1926. Numbered September, 1926.

68356. BROWNEA MACROPHYLLA Masters. Caesalpiniaceae.

No. 301. Peradeniya Gardens, Ceylon. January 9, 1926. A beautiful plant bearing very large clusters of bright-rose flowers with long protruding bright-colored stamens. It is one of the rare ornamental trees from Colombia.

68357. ARTOCARPUS ELASTICA Reinw. Moraceae.

No. 712. Sibolangit Botanic Gardens, Sumatra. March 26, 1926. A tree which grows to a height of 40 meters. The young trees furnish a fiber, and the latex is a remarkable bird lime. The fruits are eaten by the Battaks.

For introduction of seeds see No. 67673.

68353. DICELLOSTYLES AXILLARIS
(Thwaites) Benth. Malvaceae.

From Peradeniya, Ceylon. Seeds presented by F. A. Stockdale, Director of Agriculture. Received September 10, 1926.

A malvaceous tree, closely related to cotton (*Gossypium* spp.), with narrowly oval leaves about 4 inches long, white flowers, and globose, hispid capsules. Native to Ceylon.

68359. RUBUS FRAXINIFOLIUS Poir.
Rosaceae.

From the Philippine Islands. Seeds presented by P. J. Wester, Ballston, Va. Received September 24, 1926.

Palawan. A tropical raspberry, described (Brown, Wild Food Plants of the Philippines, p. 63) as a scrambling shrub, with branches 2 to 4 meters long, which is very common in the mountains from Luzon to Mindanao, Philippine Islands. The stems and leaves are armed with sharp spines, and the white flowers are about 2 cm. across. The bright-red berries, 10 to 15 mm. in diameter, borne in clusters, are fairly juicy and edible, but rather tasteless.

68360. (Undetermined.)

From Sumatra. Seeds obtained by David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition. Received May 14, 1926. Numbered September, 1926.

No. 669. Between Takengon and Bireun. March 9, 1926. A very striking tree with purple, olive-shaped fruits hanging from brown capsules.

68361 to 68403.

From China. Seeds obtained by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received September 14, 1926.

68361. ALEURITES MONTANA (Lour.) Willson. Euphorbiaceae. **Mu-oil tree.**

No. 242. Baptist Mission Compound. Wuchow, Kwangsi. November 18, 1925. *Tung yau*. Trees of average yield growing at the foot of a terrace in yellow-clay granitic subsoil, with their roots partly in filled soil of the same composition, but naturally looser in texture.

For previous introduction see No. 66064.

68362 to 68402. ORYZA SATIVA L. Poaceae. **Rice.**

In general there are two harvests of rice each year in this latitude, one in July or August and another in October or November. It is of interest that the varieties planted for the first crop are apparently distinct from those which are planted for the second crop. Preliminary experiments carried out at the Canton Christian College confirm this. When the first-crop variety is planted at the second-crop season, or vice versa, it does not develop and ripen properly or at the expected time. It may be that the two groups have different adaptations as to length of day required for bringing them to proper flowering and fruition. The second-crop varieties, in general, are said to be of better quality, possibly because of the fine weather that usually prevails during the ripening and harvesting time. It is said that poor soil, while yielding less, gives a better quality of grain.

68361 to 68403—Continued.

68362 to 68373. These seeds of second-crop varieties were obtained at Fohhsuen, Lohkongtung district.

68362. No. 442. Paang chim. Starchy.

68363. No. 443. Shue nga kuk. Starchy.

68364. No. 444. Chim tsai kuk. Starchy.

68365. No. 445. Wong hok yau chim kuk. Starchy.

68366. No. 446. Paak hok yau chim kuk. Starchy.

68367. No. 447. Paak hin tsai neh kuk. Glutinous.

68368. No. 448. Tsai mei chim kuk. Starchy.

68369. No. 449. Kam fung kuk. Starchy.

68370. No. 450. Sz miu kuk. This is one of the two most popular starchy varieties because of the excellent quality.

68371. No. 451. So kuk. A bearded, starchy variety.

68372. No. 452. Taai neh kuk. Glutinous.

68373. No. 453. On naam neh kuk. Glutinous.

68374. No. 454. Chiu on lai chim kuk. A starchy second-crop variety which has been growing at the Canton Christian College for four years. The growing season is about 104 days, and the average yield is about 2,400 pounds per acre.

68375. No. 455. Toi shaan hung tau tsai kuk. A starchy second-crop variety originally from the Toishaan district, Kwangtung, which has been growing at the Canton Christian College for the last year. The growing season is about 89 days, and the yield is about 1,800 pounds per acre.

68376. No. 456. Tung koon taai chim kuk. A starchy second-crop variety originally from the Tungkoon district, which has been growing at the Canton Christian College. This is one of the most popular second-crop varieties of rice because of its excellent quality.

68377. No. 457. Lok cheung maah kuk. A starchy second-crop variety, originally from the Lokcheung district, which has been growing at the Canton Christian College for the last year. The growing season is 89 days, and the yield is about 1,100 pounds per acre.

68378. No. 458. Toi shaan sheung kong chim kuk. An early starchy second-crop variety originally from the Toishaan district, Kwangtung, which has been growing at the Canton Christian College for the last year. The growing season is 91 days, and the yield is about 800 pounds per acre.

68379. No. 459. Kwai peng paak fa chim kuk. A starchy second-crop variety, originally from the Kwai peng district, which has been growing at the Canton Christian College for four years. The growing season is about 101 days, and the average yield is about 2,600 pounds per acre.

68361 to 68403—Continued.

68380. No. 460. *Foh shiu chim kuk.* A starchy second-crop variety which has been grown at the Canton Christian College for one year. The growing season is 91 days, and the yield is about 1,140 pounds per acre.
68381. No. 491. *Wong hok noh kuk.* A glutinous second-crop variety which has been grown at the Canton Christian College for four years. The growing season is about 105 days, and the average yield is about 2,200 pounds per acre.
68382. No. 462. *Paak hok sheung kong chim kuk.* An early starchy second-crop variety which has been grown at the Canton Christian College for the last year. The growing season is 91 days, and the yield is about 2,400 pounds per acre.
68383. No. 463. *Wan fau paak kuk tsai.* A starchy second-crop variety, originally from the Wanfa district, which has been grown at the Canton Christian College for the last year. The growing season is 95 days, and the yield is about 2,100 pounds per acre.
68384. No. 464. *Tsuen shui kuk.* A starchy second-crop variety which has been grown at the Canton Christian College for the last four years. The average growing season is 105 days, and the average yield is about 2,600 pounds per acre.
68385. No. 465. *Ng wa hoi woh.* A starchy second-crop variety, originally from the Ngwa district, which has been growing at the Canton Christian College for the last year. The growing season is 99 days, and the yield is about 1,600 pounds per acre.
68386. No. 466. *King chow paak fa chim kuk.* A starchy second-crop variety originally from Kingchow, in the island of Hainan, which has been grown at the Canton Christian College for one year. The growing season is 100 days, and the yield is about 2,300 pounds per acre.
68387. No. 467. *Haung kwang noh.* A second-crop glutinous variety which has been grown at the Canton Christian College for one year. The growing season is 90 days, and the yield is about 500 pounds per acre.
68388. No. 468. *Naam hoi yau chim kuk.* A starchy second-crop variety originally from the Naamhoi district, which has been grown at the Canton Christian College for the last four years. The growing season is about 103 days, and the average yield is about 3,000 pounds per acre.
68389. No. 469. *Shui kai noh kuk.* A glutinous second-crop variety originally from Shui kai, which has been grown at the Canton Christian College for the last four years. The average growing season is 106 days, and the average yield is about 1,600 pounds per acre.
68390. No. 470. *Toi shaan cheung miu chui ue kuk.* A starchy second-crop variety originally from the Toishaan district, which has been

68361 to 68403—Continued.

- grown at the Canton Christian College for the last year. The growing season is 96 days, and the yield is about 2,100 pounds per acre.
68391. No. 471. *Hoi niu kuk.* A starchy second-crop variety which has been grown at the Canton Christian College for the last four years. The average growing season is 105 days, and the average yield is about 2,300 pounds per acre.
68392. No. 472. *Paak hok yau chim.* A starchy second-crop variety which has been grown at the Canton Christian College for the last four years. The average yield is about 2,600 pounds per acre.
68393. No. 473. *Taai po paak hok noh kuk.* A glutinous second-crop variety which has been grown at the Canton Christian College for the last four years. The average growing season is 98 days, and the average yield is about 2,500 pounds per acre.
68394. No. 474. *Toi shaan oo uk tsai kuk.* A starchy second-crop variety originally from the Toishaan district, which has been grown at the Canton Christian College for the last year. The growing season is 96 days, and the yield is about 2,400 pounds per acre.
68395. No. 475. *Ng tsuen noh chaap kuk.* A glutinous second-crop variety originally from Ngtsuen, a village on Honam Island, which has been grown at the Canton Christian College for the last year. The growing season is 105 days, and the yield is about 2,600 pounds per acre.
68396. No. 476. *Tsang sheng sz miu kuk.* A starchy second-crop variety originally from the Tsangsheng district, which has been grown at the Canton Christian College for the last year. The growing season is 95 days, and the yield is about 2,200 pounds per acre.
68397. No. 477. *Heung shaan noh chaap kuk.* A glutinous second-crop variety originally from the Heungshaan district, which has been grown at the Canton Christian College for four years. The average growing season is 98 days, and the average yield is about 2,600 pounds per acre.
68398. No. 478. *Shui kai wong noh kuk.* A glutinous second-crop variety originally from Shui kai, which has been grown at the Canton Christian College for four years. The growing season is about 98 days, and the average yield is about 1,900 pounds per acre.
68399. No. 479. *Kam shaan chim kuk.* A starchy second-crop variety which has been grown at the Canton Christian College for the last year. The growing season is 97 days, and the yield is about 1,400 pounds per acre.
68400. No. 480. *Sai chim kuk.* A starchy second-crop variety which has been grown at the Canton Christian College for the last year. The growing season is 91 days, and the yield is about 1,200 pounds per acre.

68361 to 68403—Continued.

68401. No. 481. *Tung koon paai hok sz miu kuk*. A starchy second-crop variety originally from the Tung-koon district, which has been grown at the Canton Christian College for the last four years. The average growing season is 102 days, and the average yield is about 1,900 pounds per acre.

68402. No. 482. *Paak hok yau chim kuk*. A starchy second-crop variety which has been grown at the Canton Christian College for four years. The average yield is about 2,400 pounds per acre.

68403. *SMILAX* sp. Smilacaceae.

No. 441. *Ma kaap*. An attractive ornamental vine with very large shiny leaves and large clusters of bright-red fruits which persist for a long period. Collected on Chauen Mountain, northern Kwantung.

68404 to 68414.

From Manchuria. Seeds obtained by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received September 18, 1926.

68404. *ACER BARBINERVE* Maxim. Aceraceae. **Maple.**

No. 6098. From the V. F. Kovalsky forest concession near Hingtaohotze, July 3, 1926. A shrubby maple, native to Manchuria, with coarsely toothed, five-lobed leaves.

For previous introduction see No. 65909.

68405. *ACER MANDSHURICUM* Maxim. Aceraceae. **Maple.**

No. 6099. From the V. F. Kovalsky forest concession near Hingtaohotze, July 3, 1926. A hardy Manchurian maple which forms a shrub or small tree.

For previous introduction see No. 65480.

68406. *ACTAEA SPICATA* L. Ranunculaceae. **Black baneberry.**

No. 6325. From the White River Valley, near Bariam, July 24, 1926. A hardy herbaceous perennial, 3 feet high, with a rather long spike of bright-red, oblong berries.

For previous introduction see No. 65483.

68407. *AQUILEGIA OXYSEPALA* Trautv. and Mey. Ranunculaceae. **Columbine.**

No. 6304. Bariam, July 19, 1926. A hardy herbaceous perennial native to Siberia. The large flowers are blue, yellow, and white.

For previous introduction see No. 64766.

68408. *CALAMAGROSTIS* sp. Poaceae. **Grass.**

No. 6318. From the White River Valley, near Bariam, July 25, 1926. A grass from Manchuria, said to be good for hay.

68409. *CORNUS ALBA* L. Cornaceae. **Tartarian dogwood.**

No. 6324. From the White River Valley, near Bariam, July 24, 1926. A

68404 to 68414—Continued.

hardy ornamental shrub, native to Manchuria, producing creamy white fruits.

68410. *Daucus carota* L. Apiaceae. **Carrot.**

No. 6336. Pingtingchow, Shansi, August 2, 1926. A short thick red variety from northern China.

68411. *PRUNUS TOMENTOSA* Thunb. Amygdalaceae. **Manchu cherry.**

No. 6075. Purchased from the agricultural section of the Manchurian Research Society, Harbin, June 30, 1926. A hardy fruiting shrubby cherry, native to Manchuria.

68412. *RHEUM* sp. Polygonaceae. **Rhubarb.**

No. 6328. From the White River Valley, near Bariam, July 23, 1926. A vigorous variety with leaves 6 to 18 inches across and stalks 12 to 20 inches long and sometimes an inch in diameter.

68413. *SALIX LIVIDA CINERASCENS* Wahlenb. Salicaceae. **Willow.**

No. 6125. Boketu, July 5, 1926. A very dwarf willow with small leaves which are mottled above and quite tomentose beneath. The bark is yellow to yellowish brown.

68414. *CRATAEGUS SANGUINEA* Pall. Malaceae.

No. 6334. From the White River Valley, near Bariam, July 31, 1926. A hardy ornamental tree, native to Manchuria, with roundish red and yellow fruits. The tree from which this material was obtained was quite small, about 10 feet high and only about 3 inches in diameter.

For previous introduction see No. 65693.

68415 to 68419.

From Rangoon, Burma. Seeds presented through Richard R. Willey, United States vice consul in charge. Received September, 1926.

68415. *CHAETOCLOA ITALICA* (L.) Scribn. (*Setaria italica* Beauv.). Poaceae. **Millet.**

This millet is cultivated to a limited extent on light sandy soils in the dry districts.

68416. *ORYZA SATIVA* L. Poaceae. **Rice.**

Theikpan Taungdeikpan paddy gives the best table rice in Upper Burma and is in great demand.

68417. *PANICUM MILIACEUM* L. Poaceae. **Proso.**

This grain, like millet, is grown as a dry crop on high ground.

68418. *PISUM SATIVUM* L. Fabaceae. **Pea.**

A variety which is grown throughout Burma both as a field and a garden crop. It is generally sown on light soils and silts.

68419. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceae. **Common wheat.**

A variety of hard wheat grown in the plains of Burma (Sagaing, Shwebo, and Mandalay), which is generally used for making flour. It can be grown profitably on black cotton soil.

68420 to 68825.

From Manchuria. Seeds obtained by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received June, July, August, and September, 1926.

68420 to 68816. SOJA MAX (L.) Piper
(*Glycine hispida* Maxim.). Fabaceae.
Soy bean.

The following seeds of huang tou (yellow bean) from the 1925 crop were obtained through the agricultural section of the Manchurian Research Society, Chinese Eastern Railway, during June, July, and August, 1926.

68420. No. 5820. Yaomyn. Beans yellow, almost round, with brown hilum. R. S.² No. 255.

68421. No. 5821. Shuanchenpu. Beans yellow, medium size, oblong; hilums brown.

68422. No. 5822. Shuanchenpu. Beans yellow, medium size, slightly oblong; hilums range from brown to almost black.

68423. No. 5823. Shuanchenpu. Beans yellow, of medium size, slightly oblong to round; hilums brown.

68424. No. 5824. Shuanchenpu. Beans yellow, of medium size, slightly oblong to round; hilums vary from brown to black.

68425. No. 5825. Antah. Beans yellow, slightly oblong to round, hilums vary from almost white to brown.

68426. No. 5826. Mangou. Beans yellow, hilums vary from white to nearly black.

68427. No. 5827. Shuanchenpu. Beans yellow, slightly oblong to round; hilums vary from brown to almost black.

68428. No. 5828. Shuanchenpu. Beans yellow, medium size, slightly oblong to almost round; hilums vary from brown to practically black.

68429. No. 5829. Shuanchenpu. Beans yellow, medium size, slightly oblong to nearly round; hilums vary from brown to almost black.

68430. No. 5830. Shuanchenpu. Beans yellow, medium size, oblong to almost round; hilums vary from brown to almost black.

68431. No. 5831. Antah. Beans yellow, medium size, oblong to nearly round; hilums vary from almost white to brown, sometimes to nearly black.

68432. No. 5832. Shuanchenpu. Beans yellow, medium size, oblong to practically round; hilums vary from nearly white to almost black.

68433. No. 5833. Shuanchenpu. Beans yellow, medium size, oblong to almost round; hilums range from brown to almost black.

68434. No. 5834. Shuanchenpu. Beans yellow, medium size, oblong to nearly round; hilums vary from light to dark brown, sometimes to nearly black.

68435. No. 5835. Antah. Beans yellow, average size, oblong to round; hilums vary from almost white to brown and nearly black.

68420 to 68825—Continued.

68436. No. 5836. Shuanchenpu. Beans yellow, medium size, oblong to round; hilums vary from brown to almost black. R. S. No. 17.

68437. No. 5837. Antah. Beans yellow, average size, oblong; hilums vary from almost white to dark brown. R. S. No. 146.

68438. No. 5838. Shuanchenpu. Beans yellow, medium size, oblong to nearly round; hilums vary from light to dark brown and almost black. R. S. No. 67.

68439. No. 5839. Shuanchenpu. Beans yellow, medium size, oblong to round; hilums vary from nearly white to brown and almost black. R. S. No. 20.

68440. No. 5840. Shuanchenpu. Beans yellow, below the average size, oblong to round; hilums grading from light to dark brown. R. S. No. 72.

68441. No. 5841. Shuanchenpu. Beans yellow, average size, oblong to almost round; hilums light brown. R. S. No. 43.

68442. No. 5842. Shuanchenpu. Beans yellow, average size, oblong to almost round; hilums dark brown ranging to almost black. R. S. No. 85.

68443. No. 5843. Shuanchenpu. Beans yellow, average size, oblong to almost round; hilums vary from light to dark brown, sometimes to almost black. R. S. No. 45.

68444. No. 5844. Shuanchenpu. Beans yellow, below average size, oblong to round; hilums range from light to dark brown and in some cases to almost black. R. S. No. 51.

68445. No. 5845. Duitsinshan. Beans yellow, larger than the average, oblong to round; hilums vary from almost white to dark brown. R. S. No. 206.

68446. No. 5846. Shuanchenpu. Beans yellow, below the average size, oblong to round; hilums vary from light to dark brown. R. S. No. 73.

68447. No. 5847. Shuanchenpu. Beans yellow, average size, oblong to round; hilums vary from nearly white to dark brown, sometimes practically black. R. S. No. 57.

68448. No. 5848. Antah. Beans yellow, average size, oval to round; hilums vary from white to deep brown, sometimes to almost black. R. S. No. 186.

68449. No. 5849. Duitsinshan. Beans yellow, average size, oblong to almost round; hilums vary from nearly white to dark brown, sometimes to almost black. R. S. No. 225.

68450. No. 5850. Antah. Beans yellow, average size, oblong to almost round; hilums vary from almost white to dark brown, sometimes to almost black. R. S. No. 187.

68451. No. 5851. Shuanchenpu. Beans yellow, average size, oblong to almost round; hilums vary from nearly white to dark brown and almost black. R. S. No. 34.

² R. S.—Research Society.

68420 to 68825—Continued.

68452. No. 5852. Shuanchenpu. Beans yellow, average size, oblong to nearly round; hilums vary from almost white to dark brown, in some instances to almost black. R. S. No. 100.
68453. No. 5853. Shuanchenpu. Beans yellow, average size, oblong to almost round; hilums vary from almost white to dark brown, sometimes to almost black. R. S. No. 25.
68454. No. 5854. Duitsinshan. Beans yellow, average size, oblong to nearly round; hilums vary from white to dark brown. R. S. No. 209.
68455. No. 5855. Shuanchenpu. Beans yellow, below average size, oblong to nearly round; hilums vary from almost white to dark brown, occasionally to almost black. R. S. No. 59.

68816. No. 6450-n. Harbin. Beans light greenish yellow, a mixed collection culled out of the many samples of commercial soy beans submitted to the grading board of the Chinese Eastern Railway, season of 1925.
- 68817 and 68818. *LONICERA CAERULEA* EDULIS (Turcz.) Regel. Caprifoliaceae. Honeysuckle.
68817. No. 5983. Kaolingtzu. June 22, 1926. A bush 10 to 12 feet in height, producing oblong fruits, one-half to three-fourths of an inch in length and about one-fourth of an inch in diameter, which are very dark purple, almost black with plenty of bloom. The fruits are not very good when fresh, but are extensively used in the vicinity of Vladivostok for making jam.
68818. No. 6143. Hingan. July 8, 1926. Found in peaty soil where the climate, though now dry, is at seasons apparently very wet.
68819. *PRUNUS SIBIRICA* L. Amygdalaceae. Siberian apricot.

No. 6315. From the White River Valley, near Bariam. July 29, 1926. *Shan hsing* (wild mountain apricot). The plants are rarely more than 3 feet in height and are frequently heavily fruited. The fruits vary greatly in size and shape, the largest found being three-fourths of an inch in diameter. They range from pale yellowish green to golden and very often to almost red.

68420 to 68825—Continued.

68820. *PRUNUS PADUS* L. Amygdalaceae. European bird cherry.
- No. 6305. Bariam. July 19, 1926.
68821. *RIBES DIACANTHA* Pall. Grossulariaceae. Red currant.
- No. 6312. Near Bariam. July 21, 1926. The fruit is bright red and of very good quality.
68822. *ROSA* sp. Rosaceae. Rose.
- No. 6326. From the White River Valley, near Bariam. July 24, 1926. Very spiny plants, with the hips pale pink to almost red.
68823. *RUBUS IDAEUS STRIGOSUS* (Michx.) Maxim. Rosaceae. Raspberry.
- No. 6322. From the White River Valley, near Bariam. July 23, 1926. A pale-pink fruited raspberry of good size, which caps easily.
68824. *RUBUS SAXATILIS* L. Rosaceae. Dewberry.
- No. 6323. From the White River Valley, near Bariam. July 24, 1926. A dewberry producing large bright-red fruits of good quality.
68825. *VIOLA TENUICORNIS* W. Becker. Violaceae. Violet.
- No. 5987. Kaolingtzu. June 22, 1926. The flowers of this plant are rather light purple or violet, and are of fairly good size for a wild variety.
- 68826 to 68828. *FRAGARIA* sp. Rosaceae. Strawberry.
- From St. Jean le Blanc, par Orleans, France. Plants presented by Edmond Versin. Received March 4, 1926. Numbered September, 1926.
- Locally developed varieties.
68826. *FRAGARIA* sp. *Géante Rouge*.
68827. *FRAGARIA* sp. *L'Indispensable*.
68828. *FRAGARIA* sp. *Nomblot Bruneau*.
- 68829 to 68835.
- From Sao Paulo, Brazil. Seeds presented by Dr. Henrique Löbbe, Eng. Agrônomo. Director do Campo de Sementes de Sao Simao, through A. J. Pieters, Bureau of Plant Industry. Received September 27, 1926.
- 68829 to 68831. *ARACHIS* spp. Fabaceae. Peanut.
68829. *ARACHIS HYPOGAEA* L.
- A small-podded form from southern Brazil.
- 68830 and 68831. *ARACHIS NAMBYQUARAE* Hoehne.
- A Brazilian relative of the peanut, which, according to Hoehne (Historia Natural Botanica, Matto Grosso, Brazil, Part XII), is a much-branched, prostrate, or ascending plant. The pod is 2 to 3 inches long, with usually two seeds which are edible and very oily.
- For previous introduction see No. 65296.

68829 to 68835—Continued.

68830. A shorter podded form than No. 68831.

68831. A long-podded form.

68832. *CANAVALIA ENSIFORMIS* (L.) DC.
Fabaceae. Jack bean.

Locally grown seeds.

68833 to 68835. *STIZOLOBIUM* spp. Fabaceae.

Coarse leguminous annual vines. Locally grown seeds.

68833. *STIZOLOBIUM ATERRIMUM* Piper and Tracy. Mauritius bean.

68834. *STIZOLOBIUM DEERINGIANUM* Bort. Florida velvet bean.

68835. *STIZOLOBIUM NIVEUM* (Roxb.) Kuntze. Lyon bean.

68836. *ACACIA RETINODES* Schlecht.
Mimosaceae.

From Paris, France. Seeds obtained from Vilmorin-Andrieux & Co. Received September 15, 1926.

Var. *floribunda*. A tall shrub or small tree, native to Australia, with feathery foliage and dense yellow flower heads.

68837 to 68866.

From Buitenzorg, Java. Seeds presented by Dr. W. M. Docters van Leeuwen, director, botanic gardens. Received September 29, 1926.

68837 to 68840. *ALBIZZIA* spp. Mimosaceae.

68837 and 68838. *ALBIZZIA FALCATA* (L.) Backer (*A. moluccana* Miquel).

A rapidly growing tree with large feathery leaves and small globular flower heads. Because of its thin foliage it is grown in Ceylon as a shade for field crops.

For previous introduction see No. 67965.

68837. No. 1. 68838. No. 2.

68839. *ALBIZZIA ROTUNDATA* Blume.

An East Indian leguminous tree with rounded leaflets, of possible use as a shade for crop plants.

68840. *ALBIZZIA SAPONARIA* (Lour.) Blume.

A small tree, 65 feet or less high, with gray bark and alternate double compound leaves. The bark contains saponin and is used by the natives of the Philippines as soap for washing their hair. Native to the Philippines and the East Indies.

68841. *BARYXYLUM INERME* (Roxb.) Pierre (*Peltophorum ferrugineum* Benth.). Caesalpinaceae.

A large, quick-growing, symmetrical tree, with a spreading top and graceful feathery foliage, indigenous to the dry regions of Ceylon and Malaya, where the annual rainfall varies from 50 to 70 inches. The young leaves and shoots are covered with a brown velvety tomentum. The tree flowers twice a year at irregular seasons, some specimens being in blossom while others near by are in ripe fruit. The flowers are rusty yellow, sweet scented, and borne in large erect

68837 to 68866—Continued.

panicles. The tree is a magnificent sight when in full bloom. It is especially suited to dry districts, but also thrives to perfection in the moist regions up to 1,800 feet.

For previous introduction see No. 51810.

68842 to 68844. *BAUHINIA* spp. Caesalpinaceae.

68842. *BAUHINIA MONANDRA* Kuntz. Butterfly baubinia.

An ornamental pink-flowered tropical African bush or small tree.

For previous introduction see No. 50734.

68843. *BAUHINIA TOMENTOSA* L. St. Thomas tree.

A handsome leguminous shrub, native to tropical Asia and Africa, with clusters of large showy yellow flowers.

For previous introduction see No. 38651.

68844. *BAUHINIA VIOLACEA* Hort.

A leguminous tropical plant, native to the East Indies.

68845. *CALOPOGONIUM MUCUNOIDES* Desv. Fabaceae.

A tropical American plant which is said to be popular as a cover plant in Sumatra, according to J. N. Milsum and E. A. Curtler (Malayan Agricultural Journal, vol. 13, No. 8, August, 1925, pp. 271-272). These authorities state that a fair cover is obtained after three months from sowing, when flowering commences. The plant is a vigorous creeping herb which forms a mat of foliage 1½ feet or so in thickness over the soil. The stems, 3 to 10 feet long, form roots at each node. The pale blue flowers are in racemes 1 to 4 inches long.

For previous introduction see No. 66085.

68846 to 68848. *CASSIA* spp. Caesalpinaceae.

68846. *CASSIA MARGINATA* Roxb.

A small, graceful tropical tree with rose-colored flowers and drooping branches. Native to the East Indies.

68847. *CASSIA SURATTENSIS* Burm. f. (*C. glauca* Lam.).

A tropical leguminous shrub or small tree with pale-green compound leaves and clusters of pale-yellow flowers. Native to the East Indies.

For previous introduction see No. 33562.

68848. *CASSIA* sp.

A tropical leguminous plant native to the East Indies.

68849 to 68852. *CROTALARIA* spp. Fabaceae.

68849. *CROTALARIA GRANTIANA* Harv.

A small slender herbaceous plant with an erect, branching, leafy stem about a foot high and small yellow flowers. Native to Natal.

For previous introduction see No. 51833.

68837 to 68866—Continued.

68850. *CROTALARIA USARAMOENSIS* Baker f.

This East African crotalaria has been tested in Java as a green manure, according to Dr. P. J. S. Cramer, Director of the Department of Agriculture, Buitenzorg. Doctor Cramer states that it has proved very successful as a green manure when grown in alternation with corn, producing large quantities of vegetation rich in nitrogen. In the cinchona plantations it is very satisfactory, as it endures partial shade and forms a dense, low growth, which keeps the edges of the terraces together.

For previous introduction see No. 64064.

68851. *CROTALARIA VALETONII* Backer.

An East Indian plant described by C. A. Backer (Bulletin du Jardin Botanique, Buitenzorg, vol. 2, p. 324) as an erect, densely branched herb, 1 to 4 feet high, with simple, hairy leaves and yellow flowers in terminal, 5-flowered to 12-flowered racemes.

For previous introduction see No. 65299.

68852. *CROTALARIA VERRUCOSA* L.

A much-branched leguminous herb, about 2 feet high, found throughout the Tropics of both hemispheres. The white and blue flowers are in many-flowered, compact racemes.

For previous introduction see No. 65300.

68853. *DETARIUM SENEGALENSE* Gmel. Caesalpiniaceae.

A large spreading evergreen South African tree, up to 60 feet high, which bears large numbers of yellow oval smooth-skinned fruits about 3 inches long. The jellylike pulp is sweet and of pleasant flavor. The tree grows in regions practically free from frost.

68854. *DONAX CANNAEFORMIS* (Forst.) Rolfe. Marantaceae.

A shrubby moisture-loving perennial, up to 3 meters high, native to tropical America. The large leaves resemble those of a canna, and the white flowers are in lax spikes.

68855. *ERYTHRINA VARIEGATA ORIENTALIS* (L.) Merr. Fabaceae.

A moderate-sized spineless leguminous East Indian tree of very rapid growth, with trifoliate leaves and red flowers. In Ceylon, where it is called the "dadap," the tree is used to shade crop plants and also the foliage is lopped for use as green manure. It is being tested as a cover plant at the experiment station, Peradeniya.

For previous introduction see No. 67967.

68856 to 68859. *FICUS* spp. Moraceae.

68856. *FICUS AMPELOS* Burm. f.

A tropical Indian tree with rough ovate-oblong leaves and small grape-like fruits.

68857. *FICUS KORTHALSI* Miquel.

A wild fig from southern Borneo which resembles *Ficus elastica* in foliage and habit. The leaves are rigid

68837 to 68866—Continued.

and leathery and up to 8 inches long, and the ellipsoid fruits are nearly an inch in length.

68858. *FICUS HIRTA* Vahl.

A shrub or small tree with leaves up to a foot long, from the tropical Himalayas.

68859. *FICUS RETUSA* L.

A large tropical tree with aerial roots, leathery leaves 4 inches long, and red or yellow fruits a third of an inch in diameter. Native to the East Indies.

68860. *MEIBOMIA GYROIDES* (DC.) Kuntze (*Desmodium gyroides* DC.). Fabaceae.

A shrubby leguminous plant, 8 to 10 feet high, from the warmer parts of the central and eastern Himalayas. It has hairy leaves and terminal clusters of red flowers.

For previous introduction see No. 64177.

68861. *MEIBOMIA TRIQUETRA* (L.) Kuntze (*Desmodium triquetrum* DC.). Fabaceae.

A handsome shrub with triangular branches, stiff leathery leaflets, and long axillary and terminal racemes of red flowers. It is found in most places in eastern and southern India and also in China and the Philippines.

For previous introduction see No. 47727.

68862. *PITHECOLOBIUM JUNGHUHNIANUM* Benth. Mimosaceae.

A tropical leguminous tree, native to the mountainous regions of Java, with rather small bipinnate leaves and numerous globular umbels of small flowers.

68863. *TALINUM PATENS* (L.) Willd. Portulacaceae.

An erect perennial, 1 to 2 feet high, native to tropical America, with fleshy leaves and carmine flowers. The leaves are boiled and eaten like spinach.

68864. *TALINUM TRIANGULARE* (Jacq.) Willd. Portulacaceae.

An erect branching herbaceous plant, about 3 feet high, native to the West Indies and recently introduced from Java into the Philippine Islands. The flowers are pink and produced in great profusion. In the Philippines the fleshy tender leaves are boiled like spinach and served with meat, for which purpose they are excellent.

For previous introduction see No. 59292.

68865. *TERMINALIA ARBOREA* (Teyssm.) Koord. and Val. Combretaceae.

An East Indian tree about 100 feet high, with alternate entire leaves. The astringent fruits are used medicinally.

For previous introduction see No. 49564.

68866. *TERMINALIA BELLERICA* (Gaertn.) Roxb. Combretaceae.

The small round fruits of this handsome tropical Indian tree have been exported from India for tanning purposes under the name of myrobalans. The yellowish gray wood is used for general construction. The tree also has merit as a

68837 to 68866—Continued.

shade tree for avenues, with its huge buttressed trunk and long horizontal branches.

For previous introduction see No. 61505.

68867 to 68907.

From China. Seeds obtained by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received September, 1926.

68867. *APIUM GRAVEOLENS* L. Apiaceae.
Celery.

No. 550. *Fuk chow pak kan tsoi*. Seeds obtained from a seed store, Sanmiu, Honam, and said to have come from Fukchow, Fukien Province. This variety is planted here in August.

68868. *ARDISIA* sp. Myrsinaceae.

No. 521. Lungtau Mountain, northern Kwangtung. *Mo chung yeuk*. A low rosette plant having bright-green, sometimes reddish, leaves densely covered with long soft hairs, and clusters of bright-red berries which follow the small but pretty white flowers. This plant is found in moist shady situations and is good for rock gardens.

68869. *BETA VULGARIS* L. Chenopodiaceae.

No. 528. Canton. *Kwan taat tsoi*. A Chinese vegetable similar to Swiss chard. It is grown here during the winter months, and the large, white petioles, together with the leaves, are eaten.

68870 to 68883. *BRASSICA* spp. Brassicaceae.

68870. *BRASSICA* sp.

No. 530. Canton. *Paak fa kai laan*. A white-flowered native Chinese vegetable with a habit of growth much like wild mustard, but with much thicker, more succulent, glaucous leaves. It is grown during the winter months.

68871. *BRASSICA* sp.

No. 545. From a seed store in Sanmiu, Honam, originally from Lausek, near Fatshaan, Kwangtung. *Ma i paak tsoi* (horse ear). A variety planted in July; the leaves are edible in about 40 days, and the seeds ripen in about 120 days. The leaves and their broad white tender fleshy petioles make a delicious vegetable; any surplus is dried for later use.

68872. *BRASSICA* sp.

No. 546. *Kong moon ai keuk paak tsoi*. A variety with shorter, broader leaf petioles, originally from Kongmoon, in the Sunui district, Kwangtung. It is planted from July to November; the leaves are edible in about 60 days, and the seeds ripen in about 120 days. The leaves and petioles are sometimes dried for off-season consumption.

68873. *BRASSICA* sp.

No. 547. From a seed store in Sanmiu, Honam, originally from Potting, Chihli Province. *Ai keuk wong nga paak, wong paau sam*. A variety which is planted in July, forming a rather loose, globular head in about 85 days. The seeds ripen in about 150 days. It is used as a winter

68867 to 68907—Continued.

vegetable and is very tender, delicious, and of a much milder, sweeter flavor than the common cabbage.

68874. *BRASSICA* sp.

From a seed store in Sanmiu, Honam, originally from Tientsin. *Ko keuk taai tsing nga paak*. A variety planted in July; the heads form in about 80 days, and the seeds ripen in about 120 days. The heads formed by this variety are longer than those of *wong paau sam*, No. 547 [No. 68873], and loose, requiring to be tied up in order to attain their highest perfection.

68875. *BRASSICA* sp.

No. 549. From a seed store in Sanmiu, Honam, and originally from Potting, Chihli Province. *Ai keuk paau sam tsing paau nga paak*. This variety, planted in July, forms subglobular heads in about 80 days. It is distinguished from No. 547, *wong paau sam* [No. 68873], by its greener color.

68876. *BRASSICA* sp.

No. 551. From a seed store in Sanmiu, Honam, originally from Chiuchow, Kwangtung. *Chiu chow paau sam taai kai tsoi*. A variety planted in August here, which is commonly used to make a kind of salt kraut. The leaves are edible in about 80 days, and the seeds are said to ripen in about 120 days.

68877. *BRASSICA* sp.

No. 552. From a seed store in Sanmiu, Honam, originally from Chiuchow, Kwangtung. *Taai haap chiu chow kaai tsoi*. A variety planted in August; the leaves are edible in about 80 days, and the seeds are said to ripen in about 120 days. It is largely used in making a salt kraut.

68878. *BRASSICA* sp.

No. 553. From a seed store in Sanmiu, Honam, originally from Fatshaan, Kwangtung. *Naam fung kai tsoi*. A variety planted throughout the year. The leaves are edible in about 40 days.

68879. *BRASSICA* sp.

No. 554. From a seed store in Sanmiu, Honam, originally from Datshaan, Kwangtung. *Paak fa kai faam tsoi*. A white-flowered variety planted from July to September. The leaves are edible in about 60 days.

68880. *BRASSICA* sp.

No. 555. A locally grown variety obtained at a seed store in Sanmiu, Honam. *Tsing kwat tsoi sam*. It is planted in July, and the stems and leaves are edible in about 40 days.

68881. *BRASSICA* sp.

No. 556. Said to have come from Shanghai. *Sheung hoi paau sam ye tsoi*. This variety, which is cultivated locally, is planted in July, and the heads are said to form in about three months.

68882. *BRASSICA* sp.

No. 557. From a seed store in Sanmiu, Honam. *Kong naam taai tau tsoi*. A variety planted here in August; the roots and the leaves are

68867 to 68907—Continued.

edible in about 70 days, and the seeds are said to ripen in about 120 days. The whole plant is often preserved with salt and dried.

68883. *BRASSICA* sp.

No. 558. From a seed store in Sanmiu, Honam. *Kong naam sai miu ching tsoi*. A variety planted in August, with leaves and roots edible in about 70 days. The roots are largely used after having been pickled in salt, and often the whole plant is preserved in the same way.

68884. *CHLORANTHUS* sp. Chloranthaceae.

No. 522. *Chuk chit cha*. A wild shrub, promising as an ornamental, found in thickets in northern Kwangtung, at an altitude of about 300 meters. It has a pleasing, clean, green foliage and stems and produces fruits of a striking red color.

68885 and 68886. *CHRYSANTHEMUM CORONARIUM* L. Asteraceae. Crown daisy.

For previous introduction see No. 64352.

68885. No. 529. *Tong ho tsoi*. The pretty yellow flowers of this plant make it worthy of a place in the flower gardens, although the odor of the plant itself is not altogether pleasing to some. The young plants are cultivated by the Chinese as a vegetable, during the winter months, and are used only when young. They are a favorite ingredient in the native soups.

68886. No. 559. *Tai ip tong ho tsoi*. A large-leaved variety said to have come from Chiuchow, Kwangtung. It is planted here in September and October, and the whole plant is eaten when quite young. The common use is as an ingredient in soups.

68887. *CRAWFURDIA* sp. Gentianeae.

No. 520. A slender twining vine with persistent, ornamental purplish red fruits, collected in the wild near Yeunguk, Lungtau Mountain, northern Kwangtung.

68888 to 68890. *CUCUMIS MELO* L. Cucurbitaceae. Melon.

68888. No. 531. *Heung kwa*. A native cucurbitaceous fruit very similar in fragrance and flavor to our muskmelon. The rich-yellow, smooth-skinned fruits are oblong and rather small, rarely exceeding 12 or 15 centimeters in length. This variety would be a very good addition to our list of kitchen garden melons, as it could be grown on fences or light trellis with very little trouble.

68889. No. 532. *Mat tong ching*. A melon somewhat resembling the honeydew melon. It is cylindrical in shape, rarely exceeding 8 inches in length. The skin is covered with a dense, short pubescence while the melons are young, but later it becomes very smooth and turns pale green. The flesh has an excellent flavor and texture, is light colored, and has a crispness which is akin to mealiness.

68890. No. 562. *Cheung shan paak kwa*. A locally grown variety obtained at a seed store in Sanmiu,

68867 to 68907—Continued.

Honam. It is planted from May to July and is said to produce edible fruits in 80 days. It is a long, fleshy, white-skinned cucumberlike vegetable, usually eaten stewed with meat or pickled while the fruits are young.

68891. *DOLICHANDRONE CAUDA-FELINA* (Hance) Benth. and Hook. Bignoniaceae.

No. 519. *Maau mei shue*. A tree of fairly rapid growth on poor soil, which has a pleasing foliage, large yellow purple-throated flowers, and woolly cat-tail-like fruits (from which it takes its native name). Its one bad feature as an ornamental is the fact that the pods are persistent after the seeds have been shed, giving the tree a somewhat untidy appearance. The wood is of no special value, but the seeds are credited by the Chinese as having therapeutic value in the treatment of venereal diseases.

68892 and 68893. *LACTUCA SATIVA* L. Cichoriaceae. Lettuce.

68892. No. 539. *Poh lei shaang tsoi*. Obtained at a seed store in Sanmiu, Honam, and said to have originally come from Annam. This is said to be a very delicate and delicious variety. It is planted any time from July to November, sandy clay soil being preferred; the leaves are edible in about 50 days, and the seeds ripen in about 100 days.

68893. No. 540. *Yau maak shaang tsoi*. Obtained at a seed store in Sanmiu, Honam, originally from Chiuchow, Kwangtung. A variety planted in July; the leaves are edible in about two months, and the seeds are said to ripen in about 120 days. A central stem rapidly develops, and the leaves, which are quite long, slender, and rather coarse, are removed progressively from the lower portion of the stem as fast as they reach their full size. This variety is never eaten raw.

68894 to 68896. *LAGERSTROEMIA INDICA* L. Lythraceae. Grape myrtle.

68894. No. 523. *Tsz shik tsz mei fa*. An ornamental purple-flowered shrub cultivated on the campus of the Canton Christian College and probably introduced from India.

68895. No. 524. *Taam hung tsz mei fa*. An ornamental pink-flowered shrub, probably introduced originally from India, which has been cultivated on the campus of the Canton Christian College.

68896. No. 525. *Hung tsz mei fa*. An ornamental red-flowered shrub, probably introduced from India, which has been cultivated on the campus of the Canton Christian College.

68897. *PISUM SATIVUM* L. Fabaceae. Pea.

No. 561. *Hoh laan tau*. Obtained at a seed store in Sanmiu, Honam, and said to have come from Chiuchow, Kwangtung. A variety usually planted in August. The tender young tips of the vines are used as a vegetable here, as well as the seeds and pods when quite young, and are said to be very sweet and delicious. The Chinese name of this dish is *lung so tsoi* (dragon's-beard vegetable).

68867 to 68907—Continued.

68898 to 68902. *RAPHANUS SATIVUS* L.
Brassicaceae. Radish.

68898. No. 534. *Loh paak, Laap chuk tan loh paak* (candlestick). Obtained at a seed store in Sanmiu, Honam, originally from Taaifoo, near Fats-haan, Kwangtung. A variety planted in June. The roots are edible in about 50 days and are eaten raw, with raw fish, as a hot-weather dish. The seeds ripen in about 150 days and are said to be very short-lived; they are never kept until the second year.

68899. No. 535. *Cheung shan shui paak loh paak*. A variety originally from Chiuchow, Kwangtung, which is planted in June, sandy clay soil being preferred. The roots are edible in about 50 days, and the seeds ripen in about four months. A large portion of the crop is salted and dried for off-season use.

68900. No. 536. *Chi fa tai loh paak*. Obtained at a seed store in Sanmiu, Honam, originally from Chiuchow, Kwangtung. A late-flowering variety planted in September, sandy clay soil being preferred. The roots are edible in about 60 days, and the seeds ripen in about 120 days. The crop is largely salted and dried to make a product known locally as *haam loh paak kon*.

68901. No. 537. *Tung kwa paak loh paak*. Obtained at a seed store in Sanmiu, Honam, originally from Chiuchow, Kwangtung. A variety planted in September, sandy clay soil being preferred; the roots are edible in about 60 days, and the seeds ripen in about 120 days. The surplus crop is salted and dried for future consumption.

68902. No. 538. *Pa chi loh paak* (harrow tooth). A long slender variety obtained at a seed store in Sanmiu, Honam, originally from Taaichaak, Sanui district. It is planted in July, and the roots are edible in about 40 days. The seeds ripen in about 120 days. Sandy clay soil is preferred for this variety.

68903. *RUBUS PARVIFOLIUS* L. Rosaceae.
Raspberry.

No. 527. *She paau lak, nga ying lak*. A low, rambling raspberry which occurs commonly on the uncultivated clay hills about Canton. Its inconspicuous lavender flowers are followed by small, yellowish red juicy fruits of good flavor, made up of few drupelets and sometimes nearly inclosed in the large calyx. The plants seem sturdy and free from disease and may prove of interest to breeders of small fruits.

For previous introduction see No. 52948.

68904. *RUBUS ROSAEFOLIUS* J. E. Smith. Rosaceae. Raspberry.

No. 526. *She paau lak*. Seeds of plants growing on the Canton Christian College campus, which were brought from the vicinity of Kwongning during the spring of 1925. A low-growing raspberry which spreads by means of rhizomes and seems to thrive and bear best in moist sandy soil. The bright-red spherical fruits of fair flavor but rather seedy are made up of numerous small drupelets.

68867 to 68907—Continued.

The plants seem especially free from disease, and may be of interest to breeders of small fruit.

For previous introduction see No. 65267.

68905 and 68906. *SPINACIA OLERACEA* L.
Chenopodiaceae. Spinach.

68905. No. 543. *Chi fa haak in poh tsoi*. Originally from Fatshaan, Kwangtung. A late-flowering variety with dark-green leaves; it is planted in August. The leaves and stems are edible in about 60 days, and the seeds ripen in about 120 days.

68906. No. 544. *Tso fa poh tsoi*. An early flowering variety originally from Chiuchow, Kwangtung, obtained in Sanmiu, Honam. It is planted during August and September; the leaves and stems are edible in about 50 days, and the seeds ripen in about 120 days.

68907. *VIGNA SESQUIPEDALIS* (L.) Frurth. Fabaceae. Yard Long bean.

No. 560. *Kam shaan tau kok*. A variety of the Chinese long bean, planted in June and July.

68908 and 68909. *GOSSYPIMUM NEGLECTUM* Todaro. Malvaceae. Cotton.

From Rangoon, Burma. Seeds presented through Richard R. Willey, United States vice consul in charge. Received September 18, 1926. Notes by Mr. Willey.

68908. Variety *roseum arvensis*. A white-flowered strain of *wagale* cotton which gives a high ginning percentage and yield. It grows on the upland gravelly soils of the dry zone area of Burma.

68909. Variety *Burmanica*. An improved strain of ordinary cotton, with white flowers, producing from 600 to 700 pounds of seed cotton per acre and having a ginning percentage of 36 to 38. It is an important staple crop of the dry districts of Burma and is cultivated on a variety of soils, the typical soil being a loamy alluvial one.

68910 and 68911. *HORDEUM VULGARE COELESTE* L. Poaceae.

Six-rowed barley.

From Mongolia. Seeds obtained by Dr. Carl I. Krebs, Danish agricultural expedition to Mongolia. Received September 30, 1926.

Mongolian strains of barley.

68910. No. 1. 68911. No. 2.

68912. *TELOPEA SPECIOSISSIMA* (J. E. Smith) R. Br. Proteaceae.

Waratah.

From Sydney, New South Wales, Australia. Seeds presented by Dr. G. P. Darnell-Smith, Government botanist. Received September 30, 1926.

A very striking, evergreen Australian shrub, about 8 feet high, with irregular toothed, dark-green leaves 6 inches long and deep crimson, tubular flowers about an inch long, borne in a dense, globular head surrounded by blood-red bracts 2 or 3 inches in length. The waratah, as this

shrub is known in its native land, has come to be recognized as the State flower of New South Wales.

For previous introduction see No. 58513.

68913 to 68948. ORYZA SATIVA L. Poaceae. Rice.

From China. Seeds obtained by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received September, 1926.

Numbers 68913 to 68944 are from a collection of starchy, second-crop varieties which have been grown at the Canton Christian College for the last few years.

68913. No. 483. *Tsinguen. Tsing uen yeung chim kuk.* Growing season 90 days; yield about 1,770 pounds per acre.

68914. No. 484. A glutinous variety from Kukkong district. *Kuk kong fa noh kuk.* Growing season 90 days; yield about 2,400 pounds per acre.

68915. No. 485. *King chow hung mai chim kuk.* A red-kerneled variety from Kingchow, island of Hainan. Growing season 111 days; yield about 2,100 pounds per acre.

68916. No. 486. *Paak hok kei kuk.* Growing season 105 days; yield about 2,500 pounds per acre.

68917. No. 487. *Hop po paak fa chim kuk.* Originally from Hoppo district. Growing season 106 days; yield about 2,000 pounds per acre.

68918. No. 488. *Oon chung kuk.* A late variety. Growing season 97 days; yield about 2,075 pounds per acre.

68919. No. 489. *Tsang sheng lau fa chim kuk.* Originally from the Tsangsheng district. Growing season 90 days; yield about 1,970 pounds per acre.

68920. No. 490. *Taai koon wong shong kuk.* Growing season 100 days; yield about 2,900 pounds per acre.

68921. No. 491. *Tung koon yau chim kuk.* Growing season 101 days; yield about 2,300 pounds per acre.

68922. No. 492. *Dau fa chim.* Growing season 102 days; average yield about 2,900 pounds per acre.

68923. No. 493. *Chau hei kuk.* Growing season 104 days; yield about 1,900 pounds per acre.

68924. No. 494. *Kuk kaai kuk.* Growing season 102 days; yield about 2,100 pounds per acre.

68925. No. 495. *Hop po wong chim kuk.* Originally from the Hoppo district. Growing season 97 days; yield about 1,900 pounds per acre.

68926. No. 496. *Ma kui yau chim kuk.* Growing season 88 days; yield about 1,480 pounds per acre.

68927. No. 497. *Lin uen yau chim kuk.* Originally from Linuen district. Growing season 91 days; yield about 1,900 pounds per acre.

68928. No. 498. *Tsai mei kuk.* Growing season 96 days; yield about 1,230 pounds per acre.

68913 to 68948—Continued.

68929. No. 499. *Ngau mei tao kuk.* Growing season 104 days; yield about 2,530 pounds per acre.

68930. No. 500. *Wan fau taai paak kuk.* Originally from the Wanfa district. Growing season 96 days; yield about 2,350 pounds per acre.

68931. No. 501. *Cheung po sz miu kuk.* Originally from the Wanfa district. Growing season 94 days; yield about 2,700 pounds per acre.

68932. No. 502. *Tit chui kuk.* Growing season 100 days; yield about 2,275 pounds per acre.

68933. No. 503. *Heung chim kuk.* Growing season 105 days; yield about 1,570 pounds per acre.

68934. No. 504. *Wat naam chim kuk.* Originally from Watnaam district. Growing season 97 days; yield about 2,085 pounds per acre.

68935. No. 505. *Yeung chung saam pei kuk.* Originally from the Yeungchun district. Growing season 106 days; yield about 2,380 pounds per acre.

68936. No. 506. *Kik sz kai kuk.* Growing season 96 days; yield about 2,025 pounds per acre.

68937. No. 507. *Oo hok kuk.* Growing season 98 days; yield about 2,200 pounds per acre.

68938. No. 508. *Noh chaap kuk.* A glutinous variety with a growing season of 105 days; yield about 2,500 pounds per acre.

68939. No. 509. *Aai keuk tai paak kok kuk.* Growing season 104 days; yield about 2,590 pounds per acre.

68940. No. 510. *Yeung chun chuk chim kuk.* Originally from the Yeungchun district. Growing season 100 days; yield about 2,900 pounds per acre.

68941. No. 511. *Tung koon yau chim kuk.* Originally from the Tungmoon district. Growing season 97 days; yield about 1,600 pounds per acre.

68942. No. 512. *Ja wa kuk.* No. 1. An awned variety originally from Java.

68943. No. 513. *Ja wa kuk.* No. 2. An awned variety originally from Java.

68944. No. 514. *Taai noh kuk.* A glutinous variety originally from Kamngauhaang. Growing season 105 days; yield about 1,180 pounds per acre.

68945. No. 515. *Paak chim kuk.* From Kamngauhaang.

68946. No. 516. *Hung mai sha chim kuk.* A red-kerneled variety from Taaifohte.

68947. No. 517. *Chim tsai noh kuk, fa hok noh kuk.* A glutinous variety from Taaifohte.

68948. No. 518. *Paak chim luk tau tsai kuk.* From Taaifohte.

68949 to 68951. PRUNUS spp. Amygdalaceae.

From Jamaica Plain, Mass. Scions presented by E. H. Wilson, Arnold Arboretum. Received July 19, 1926.

68949 to 68951—Continued.**68949. PRUNUS MEYERI** Rehder.

In 1906 Frank N. Meyer, while carrying on agricultural explorations in northern Chosen, collected seeds of a small wild cherry, which, according to his note (see No. 20084) was of handsome appearance and suited for growing in parks. At the Arnold Arboretum, a tree grown from one of these seeds was described as new by Alfred Rehder (Journal of the Arnold Arboretum, vol. 2, No. 2, p. 123) and named for Mr. Meyer. Doctor Rehder states that this appears to be a hybrid between *Prunus maackii* and *P. marimowiczii*, since it has characters intermediate between those of the above species. The tree is about 20 feet high, of vigorous growth, with a dense pyramidal habit, and pleasing bright-green foliage. The small white flowers are in dense racemes.

68950. PRUNUS SERRULATA PUBESCENS Wilson. **Kasumi** cherry.

As described by Wilson (Cherries of Japan, p. 31), this variety develops into a tree up to 55 feet in height, with a trunk sometimes 7 feet in circumference, and leaves with pale-green lower surfaces. The white or pink single flowers are usually about four-fifths of an inch in diameter. This variety has the widest distribution of any of the Japanese cherries and flowers about two weeks later than *Prunus serrulata spontanea*, from which variety it differs in the slight hairiness of the leaves.

For previous introduction see No. 55715.

68951. PRUNUS SERRULATA SACHALINENSIS (Schmidt) Makino (*P. sargentii* Rehder). **Sargent's** cherry.

This variety is very similar to *Prunus serrulata pubescens*, according to E. H. Wilson (Cherries of Japan, p. 35), except that the leaves are not hairy, and the flowers, which are pink or rose colored, rarely white, are usually a little more than an inch in diameter. It is probably the handsomest of all the wild cherries of

68949 to 68951—Continued.

eastern Asia, and is the parent of several of the finest double-flowered Japanese cherries.

For previous introduction see No. 55716.

68952. CASTANOPSIS sp. **Fagaceae.**

Evergreen chinquapin.

From China. Seeds obtained by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received January 25, 1926. Numbered July, 1926.

No. 268. Kamngauhaang. November 26, 1925. *Chui tsai, yui tsai*. A tree 6 to 8 meters high, with small entire lanceolate acuminate shiny leaves and small oblong-globular nuts which are solitary in the burs. The tree is very healthy and free from pests, though the nuts are occasionally wormy.

68953. JUGLANS sp. **Juglandaceae.**

Walnut.

From Santiago, Chile. Plants collected by Wilson Popenoe, United Fruit Co., Tela, Honduras. Received November 4, 1921. Numbered September, 1926.

No. 650. A South American walnut which closely resembles *Juglans nigra* in general appearance. It inhabits the highlands of Ecuador at altitudes of 6,000 to 10,000 feet. The edible nuts, 1½ inches in diameter, are thick shelled, and the wood is fine grained and handsome.

68954 and 68955. SATYRIUM CARNEUM (Ait.) R. Br. **Orchidaceae.**

From Cape Town, South Africa. Tubers purchased from W. S. Duke & Co. Received March 11, 1926. Numbered July, 1926.

A terrestrial herbaceous South African orchid with stout stems, a pair of fleshy radical oval-rounded leaves, and large pink flowers borne on scapes up to 2 feet in height.

Introductory statement-----	1
Inventory-----	3
Index of common and scientific names-----	54

INTRODUCTORY STATEMENT

During the period covered by this inventory P. H. Dorsett concluded his explorations in Manchuria. The great number of introductions of soy beans, mung beans, barley, and wheat recorded here is due to the cooperation afforded Mr. Dorsett toward the close of his work in that country. Through the courtesy of D. McLorn, Postal Commissioner at Harbin, about 500 rural postmasters, several of them in sections of the country never yet visited by white men, were instructed to send in small seed samples of wheat, barley, soy beans, and mung beans, and the majority of the postmasters were able to supply seed. The nature of the country where these grew makes them of unusual promise for the northern and northwestern United States.

While continuing his work in southeastern China, F. A. McClure collected, among other things, tubers of 6 cultivated varieties of yams from Kwangtung (*Dioscorea* spp., Nos. 69072 to 69077), 55 local strains of rice, also from Kwangtung (*Oryza sativa*, Nos. 69172 to 69226), and scions of 20 locally grown varieties of kaki from Anhwei (*Diospyros kaki*, Nos. 70256 to 70275).

During his visit to the Stockholm Botanic Gardens, at Stockholm, Sweden, David Fairchild obtained seeds of three species of rhubarb (*Rheum* spp., Nos. 69105 to 69107). These are not only of possible use to rhubarb growers for breeding experiments but are also of ornamental value and are not now known in this country.

Five species of Cassia are recorded in this inventory (Nos. 69147 to 69151). The showy flowers of this genus make them valuable as ornamentals, and they should be a very interesting group for local collections in sections of the United States where they are adapted.

Agronomists engaged in wheat investigations will be interested in 51 locally developed varieties (*Triticum* spp., Nos. 70689 to 70739) presented by the inspector general of agriculture of Iraq. Since Iraq is essentially a subtropical country, these varieties should be of most promise in the southern portions of the wheat-growing areas of the United States.

Mimosa invisa (No. 69122) deserves mention from the fact that it has been used successfully in the East Indies as a cover and green-manure plant. Its spiny nature is objectionable from this standpoint and may make it less desirable than other good legumes that we are now using. However, it is a worthy plant for experimentation in this connection and may also have value as an ornamental.

In propagating the papaw, *Asimina triloba* (No. 69166), attention should be called to this outstanding native fruit which has so much to recommend it in its wild state and which has received so little attention at the hands of plant breeders and horticulturists. It should be given special consideration in connection with the custard apple, *Annona cherimola*, and other species. Selection and hybridization of these fruits should be attempted under glass or in southern areas having climatic conditions favorable to such plants.

The Cohune palm, *Attalea cohune* (No. 69063), although already established in a few places in Florida, is deserving of much greater attention. It is a magnificent palm and one that should be in every good collection.

The copihue, *Lapageria rosea* (No. 69168), the national flower of Chile, is a woody vine producing extremely showy flowers. While it has been introduced into the United States a number of times, its exacting requirements have prevented its ever being commonly cultivated. It should be given special trial in the immediate coastal area of the Pacific coast wherever climatic conditions approach those of its native habitat in central and southern Chile.

On account of the difficulty with which *Davidia involucreta* (No. 69872) is propagated, it has not become common in this or other countries. It is possible, however, to grow it from cuttings, also from seeds. When in bloom the large showy white floral bracts make the tree very conspicuous. It is deserving of special consideration.

The botanical determinations of these introductions have been made and the nomenclature determined by H. C. Skeels, and the descriptive matter has been prepared under the direction of Paul Russell, who has had general supervision of this inventory.

KNOWLES A. RYERSON,
Senior Horticulturist, in Charge.

OFFICE OF FOREIGN PLANT INTRODUCTION,
Washington, D. C., July 20, 1928.

INVENTORY¹

68956 and 68957. LITCHI spp. Sapindaceae.

From Manila, Philippine Islands. Seedlings presented by the Director of Forestry, Manila, through W. T. Swingle, Bureau of Plant Industry. Received December 4, 1926.

68956. LITCHI ARAUCARIA Hort.

[Place of publication not found.]

68957. LITCHI PHILIPPINENSIS Radlk.

A Philippine relative of the lychee (*Litchi chinensis*) which, as described by Webster (Food Plants of the Philippines, p. 99) is a tree about 50 feet high, with dark-green pinnate leaves, similar to those of the lychee, and roundish oblong fruits, about 3 centimeters long, borne in loose terminal clusters. The tough leathery "shell" of the fruit, which is covered with short spiny projections, incloses a scant edible pulp, in which is embedded a relatively large seed. This seed is roasted and eaten. The tree may have value as a stock for the lychee.

68958 to 68960. GOSSYPIUM HIRSUTUM L. Malvaceae. Cotton.

From Barberton, Transvaal, South Africa. Seeds presented by F. R. Parnell, cotton breeder Empire Cotton Growing Corporation. Received November 30, 1926.

South African selections of Cambodian cotton said to be resistant to infestations of jassids (cotton fleas).

For previous introduction see No. 66179.

68958. Cambodia No. 37.

68959. Cambodia No. 516.

68960. Cambodia No. 664.

68961 to 68973.

From Luchenza, Nyasaland Protectorate, Africa. Seeds presented by L. S. Norman. Received November 26, 1926.

68961. ARACHIS HYPOGAEA L. Fabaceae. Peanut.

68961 to 68973—Continued.

A native variety which surpasses in yield any of the imported varieties.

68962. ARISTOLOCHIA sp. Aristolochiaceae.

A native creeper, of possible value as an ornamental.

68963. CRACCA VOGELII (Hook. f.) Kuntze (*Tephrosia vogelii* Hook. f.). Fabaceae.

A shrubby legume, the leaves of which are macerated by the natives of Nyasaland and thrown into the water to kill fish.

For previous introduction see No. 66250.

68964. SORGHUM VULGARE Pers. Poaceae. Sorghum.

A native variety.

68965. INDIGOFERA sp. Fabaceae. Indigo.

A native leguminous plant 2 feet high, said to be nematode resistant.

68966. JATROPHA CURCAS L. Euphorbiaceae.

A large tropical American shrub, grown in Nyasaland for the oil which is obtained from the seeds. This oil is used in soap making.

For previous introduction see No. 50835.

68967. MANISURIS EXALTATA (L. f.) Kuntz. Poaceae. Grass.

A rapid-growing annual grass used as fodder in Rhodesia, Africa, where it is native.

For previous introduction see No. 55068.

68968 and 68969. NICOTIANA TABACUM L. Solanaceae. Tobacco.

Native varieties of tobacco.

68968. No. 1. Rabo.

68969. No. 2. Rabo.

¹ It should be understood that the names of horticultural varieties of fruits, vegetables, cereals, and other plants used in this inventory are those under which the material was received when introduced by the Office of Foreign Plant Introduction and, further, that the printing of such names here does not constitute their official publication and adoption in this country. As the different varieties are studied, their entrance into the American trade forecast, and the use of varietal names for them in American literature becomes necessary, the foreign varietal designations appearing in this inventory will be subject to change with a view to bringing the forms of the names into harmony with recognized horticultural nomenclature.

It is a well-known fact that horticultural descriptions, both technical and economic, seldom mention the seeds at all and rarely describe them in such a way as to make possible identification from the seeds alone. Many of the unusual plants listed in these inventories are appearing in this country for the first time, and there are no seed samples or herbarium specimens with ripe seeds with which the new arrivals may be compared. The only identification possible is to see that the sample received resembles seeds of other species of the same genus or of related genera. The responsibility for the identifications therefore must necessarily often rest with the person sending the material. If there is any question regarding the correctness of the identification of any plant received from this office, herbarium specimens of leaves and flowers should be sent in, so that definite identification can be made.

68961 to 68973—Continued.

68970. *PHASEOLUS VULGARIS* L. Fabaceae.
Common bean.

A native variety.

68971. *STIZOLOBIUM VELUTINUM* (Hassk.)
Piper and Tracy. Fabaceae.

Said to be a cross between a black-seeded variety and a local white-seeded variety.

For previous introduction see No. 43556.

68972. *VOANDZEA SUBTERRANEA* (L.)
Thouars. Fabaceae.

A locally grown variety which is used by the natives as a relish; matures in four or five months.

For previous introduction see No. 63731.

68973. *ZEA MAYS* L. Poaceae. Corn.

A native-grown corn, originally introduced by the Portuguese into Nyasaland.

68974. *MACADAMIA TERNIFOLIA* F.
Muell. Proteaceae.

From San Diego, Calif. Seeds presented by John Stafford. Received December 7, 1926.

Two of my three trees are bearing heavily; the trees are very handsome, with straight trunks and slender branches with pendulous branchlets. No insect pests or diseases have so far injured the trees. (Stafford.)

Nuts rounded-ovoid, about 20 millimeters long; surface dull brown and somewhat roughened; shell varying in thickness from one-half to 4 millimeters, comparatively easy to crack; kernel white, tender, with a sweet flavor and of excellent quality.

For previous introduction see No. 49307.

68975. *CHAMAEDOREA TEPEJILOTE*
Liebm. Phoenicaceae. Palm.

From Zacuapam, Huatusco, Vera Cruz, Mexico. Seeds presented by Dr. C. A. Purpus. Received November 29, 1926.

This relative of the pacayito (*Chamaedorea elegans*) is a slightly larger palm, becoming about 10 feet high with leaves 4 feet long. Doctor Purpus says that the undeveloped flowers make an excellent vegetable and are eaten throughout the State of Vera Cruz, Mexico. It grows best in shady places.

For previous introduction see No. 61386.

68976. *AMYGDALUS KANSUENSIS* (Rehder) Skeels (*Prunus kansuensis* Rehder). Amygdalaceae.

From China. Seeds collected by J. F. Rock, Arnold Arboretum, Jamaica Plain, Mass. Received December 6, 1926.

No. 14889. Kansu-Tibet border. September 13, 1926. A thorny shrub, 6 to 10 feet high, with black stems and pink flowers which appear before the leaves. The small fruits, the size of a marble or larger, contain no flesh. This species occurs on the dry arid loess slopes both in the Tao River Valley and in the arid gorges of the Minchow River and endures temperatures of 10° to 20° F. below zero. This is the earliest flowering shrub in this region, blooming in April at an altitude of 8,500

to 9,000 feet, when the country is still covered with snow and the streams are frozen. (Rock.)

For previous introduction see No. 40864.

68977. *CORYLUS HETEROPHYLLA* Fisch.
Betulaceae. Hazel.

From Manchuria. Seeds obtained by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received December 7, 1926.

No. 8362. *Chen tzu*. From Baream, Heilungkiang Province.

For previous introduction see No. 65622.

68978. *CITRUS* sp. Rutaceae.
Cuban shaddock.

From Holguin, Cuba. Seeds presented by Thomas R. Towns. Received December 10, 1926.

Seeds of a shaddock used as a stock for citrus varieties in Cuba; especially good for navel orange, but not good for grapefruit or the kumquat. (Towns.)

68979. *EREMURUS HIMALAICUS* × *ROBUSTUS*. Liliaceae. Desert candle.

From Stockholm, Sweden. Seeds presented by Dr. Robert Fries, director, botanic garden. Received December 13, 1926.

A tall, hardy, ornamental, perennial yuccalike plant with rosy white flowers. The parents are native to central Asia.

68980. *SCHINOPSIS LORENTZII* (Griseb.) Engl. (*Quebrachia lorentzii* Griseb.).
Anacardiaceae. Quebracho.

From Tucuman, Argentina. Seeds presented by Dr. William E. Cross, Director, Estación Experimental Agrícola. Received December 10, 1926.

An Argentine timber tree with leathery, compound leaves and branched clusters of small flowers. The wood is very hard and durable, and the bark yields an important tannin of commerce.

For previous introduction see No. 43548.

68981 to 68995.

From Manchuria. Seeds obtained by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received December 8, 1926.

68981. *EUONYMUS* sp. Celastraceae.

No. 8363. Ertsengtientzu. October 24, 1926. *Nuan shu tiao tzu* (warming tree). This tree is said to grow on the hillside, and the wood is used for making whip handles and walking sticks.

68982. *HEMEROCALLIS* sp. Liliaceae.
Day lily.

No. 8350. Bokotu, Heilungkiang Province. October 24, 1926. *Huang hua* (yellow flower lily).

68983. *IRIS* sp. Iridaceae.

No. 8356. Bokotu, Heilungkiang Province. October 24, 1926. *Ma lien hua* (horse lily flower).

68984. *LESPEDEZA BICOLOR* Turcz. Fabaceae.
Shrub bush clover.

No. 8355. Bokotu, Heilungkiang Province. October 24, 1926. *Shan sao chu* (wild broom plant).

68981 to 68995—Continued.

For previous introduction see No. 65746.

68985. *LILium* sp. Liliaceae.

No. 8349. Bokotu, Heilungkiang Province. October 24, 1926. *San yu hua* (umbrella flower).

68986. *LILium* sp. Liliaceae.

No. 8353. Bokotu, Heilungkiang Province. October 24, 1926. *Hsiao san tzu hua* (small umbrella flower).

68987. *MALUS BACCATA* (L.) Moench. Malaceae. Crab apple.

No. 6749. September 28, 1926. Obtained at Ertsemdiantzy, through the Manchurian Research Society. A fine woody ornamental producing small red fruits which do not contain many fertile seeds.

For previous introduction see No. 54266.

68988. *MALUS BACCATA* MANDSHURICA (Maxim.) C. Schneid. Malaceae. Crab apple.

No. 7964. October 15, 1926. The fruits containing these seeds were from some 15 or 20 trees in the new Russian cemetery, Harbin. The trees have flowered and fruited very heavily for the last two seasons; they are very handsome when in full flower and also in the fall when the bright-red fruits are ripe.

For previous introduction see No. 45675.

68989 and 68990. *PAEONIA OBOVATA* Maxim. Ranunculaceae. Peony.

For previous introduction see No. 65188.

68989. No. 8351. Bokotu, Heilungkiang Province. October 24, 1926. *Shan shao yao* (wild peony).

68990. No. 8360. Baream, Heilungkiang Province. October 24, 1926. *Shan shao yao* (wild peony).

68991 and 68992. *QUERCUS MONGOLICA* Fisch. Fabaceae. Oak.

For previous introduction see No. 65676.

68991. No. 8358. Bokotu, Heilungkiang Province. October 24, 1926. *Tso shu tzu* or *hsiang tzu*.

68992. No. 8361. Baream, Heilungkiang Province. October 24, 1926. *Hsiang tzu*.

68993. *SALIX* sp. Salicaceae. Willow.

No. 8352. Bokotu, Heilungkiang Province. October 24, 1926. *Lang wei pa hua* (wolf tail flower).

A hardy Manchurian willow.

68994. *SYRINGA AMURENSIS* Rupr. Oleaceae. Manchurian lilac.

No. 7269. Obtained at the station of Shitoukhetsy on the Chinese Eastern Railway, October 8, 1926. A handsome shrub which grows to a height of 20 feet or more and produces large panicles of white flowers.

For previous introduction see No. 65509.

68995. (Undetermined.)

No. 8357. Bokotu, Heilungkiang Province. October 24, 1926. *Yieh ta yen* (wild opium flower).

68996. *BORASSUS FLABELLIFER* L. Phoenicaceae. Palmyra palm.

From Jaffna, Ceylon. Seeds presented by W. P. A. Cooke, division agricultural officer. Received December 22, 1926.

The famous "Palmyra palm" of India and Ceylon, which, in the northern part of this island, takes the place of the coconut palm. Though a slow grower, it is a very handsome palm when old. Inasmuch as it grows in the dry coastal regions of Ceylon, is apparently able to withstand any amount of lime, and is said to have been used successfully as a binder for sand dunes, it should prove of real value in the calcareous soils of southern Florida. In the number of uses to which it is put here it rivals the coconut. A delicate sugar is made from the sap which flows in abundance from its inflorescence when cut. The seeds are germinated and the young subterranean hypocotyl is used as a vegetable. The leaves are used in many different ways. The fruit, half the size of a coconut, is very attractive in appearance and when ripe exhales a delicate fragrance. The hull is eaten by the Tamils of Ceylon. (Note by David Fairchild under No. 66649.)

68997. *LILium SULPHUREUM* Baker. Liliaceae. Lily.

From Tunbridge Wells, England. Bulbs purchased from R. Wallace & Co. Received December 27, 1926.

This is described (Curtis's Botanical Magazine, pl. 7257) as a large and handsome lily, native to northern Burma, with an erect green stem 6 or 7 feet high and numerous scattered linear bright-green leaves, the longest of which are about 4 inches long and near the base of the plant. The flowers, usually in clusters of two or three, are pendent on long peduncles.

For previous introduction see No. 57676.

68998 and 68999. *CITRUS GRANDIS* (L.) Osbeck (*C. decumana* Murr.). Rutaceae. Grapefruit.

From Asia. Seeds obtained from H. J. Webb, Seattle, Wash., through W. T. Swingle, Bureau of Plant Industry. Received December 13, 1926.

68998. A red-fleshed variety of fine quality.

68999. [Seeds of unknown origin.]

69000. *ITEA YUNNANENSIS* Franch. Escalloniaceae.

From Kew, England. Cuttings presented by Dr. A. W. Hill, Director, Royal Botanic Gardens. Received December 28, 1925. Numbered October, 1926.

An ornamental evergreen shrub, native to the mountainous districts of Yunnan, southwestern China. The bark is light green, the leaves ovate and thin, and the small white flowers are in graceful axillary racemes about 6 inches long.

69001. *CALYPTROCALYX SPICATUS* (Lam.) Blume. Phoenicaceae. Palm.

From Peradeniya, Ceylon. Seeds obtained by David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition. Received February 26, 1926. Numbered October, 1926.

No. 281. Royal Botanic Gardens. January 3, 1926. A graceful palm 30 to 40 feet high, with pinnate leaves and slender spikes of red berries.

For previous introduction see No. 45957.

69002 to 69004.

From the Dutch East Indies. Seeds, plants, and rhizomes obtained by David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition. Received May and June, 1926. Numbered October, 1926.

69002. *LANSIUM DOMESTICUM* Jack. Meliaceae. Langsat.

No. 766. Java. Obtained in the market near the Boerboedior Temple, April 30, 1926. A handsome tropical tree of moderate size, native to tropical Asia. It bears long, dense, hanging clusters of pale-yellow berries which have aromatic juicy pulp. It is a local strain with large, fine-flavored fruits of good size and color, having only occasional mature seeds.

69003. *TREVESIA BURCKII* Boerl. Araliaceae.

No. 722. From the Royal Botanic Gardens, Sibolangit, Sumatra. March 26, 1926. A remarkable tropical plant, about 15 feet high, discovered in Sumatra in 1887 and related to the Hercules club (*Aralia spinosa* L.). The leaves, however, have a solid base of mesophyll and are then so contracted as to consist only of the midrib, and finally the tip expands into a large digitately compound blade.

69004. *XIPHIDIUM ALBUM* Hort. Haemodoraceae.

No. 428. Sibolangit Botanic Gardens, Sumatra. February 21, 1926. Rhizomes of a beautiful border plant for tropical gardens, having foliage which resembles that of the iris; it is said to bear attractive white flowers.

69005. *LOTUS CORNICULATUS* L. Fabaceae. Bird's-foot trefoil.

From Bologna, Italy. Seeds presented by Ditta Ernesto Pini, Società Anonima. Received October 30, 1926.

Italian-grown seeds.

For previous introduction see No. 60875.

69006. *PRUNUS CERASUS MARASCA* (Host) C. Schneid. Amygdalaceae.

From Yugoslavia. Seeds sent in at the request of W. F. Wight, Bureau of Plant Industry. Received October 25, 1926.

A cherry variety grown in south-central Europe, from which the genuine Maraschino cherries of commerce are obtained.

69007. *Gossypium* sp. Malvaceae. Cotton.

From Egypt. Seeds collected by Joseph A. Mullen, Houston, Tex.; received through the Federal Horticultural Board, October 28, 1926.

Egyptian-grown cotton seeds.

69008. *LILIUM CENTIFOLIUM* Stapf. Liliaceae. Lily.

From Stevenage, Herts. England. Bulbs purchased from Clarence Elliott, Six Hills Nursery. Received October 11, 1926.

This Chinese lily was originally discovered by Reginald Farrer, according to the Botanical Magazine (pl. 8960). Mr. Farrer found it growing in a little garden at Siku, Kansu, in 1914. The stem, densely leafy and somewhat glaucous, is up to 7 or 8 feet in height, arising from a slightly depressed bulb about 3 inches in diameter. The numerous leaves are dark green above and paler below, linear or linear-lanceolate, and up to 18 inches long. The sweet-scented flowers, 6 to 18 in number, are arranged in a short, almost umbellike raceme. The individual flowers are 6 inches long and about 4 inches across the mouth. Within, the perianth is pure white, blending into lemon yellow in the throat; the outer segments are richly flushed with dark purple, while the broader inner segments are greenish with deep, brownish purple midribs. The anthers are rusty red.

For previous introduction see No. 61748.

69009 to 69019. *FICUS CARICA* L. Moraceae. Fig.

From Golfe Juan pres Cannes, Alpes Maritimes, France. Plants purchased from Paul Nabonnand. Received February 25, 1926. Numbered November, 1926.

Locally developed varieties.

69009. *Barnisotte*.

69010. *Belle Dame*.

69011. *Col de Dame*.

69012. *De Dalmatia*.

69013. *Des Abruzzes*.

69014. *Figue Grise*.

69015. *Grise de St. Jean*.

69016. *Hative d'Argenteuil*.

69017. *Kennedy tr*.

69018. *Madeleine*.

69019. *Précoce de Barcelone*.

69020 and 69021. *LILIUM* spp. Liliaceae.

From Manchuria. Bulbs obtained by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received November 17, 1926.

69020. *LILIUM CONCOLOR* Salisb. Lily.

No. 6764. Ertsendiastys. September 29, 1926. A very attractive little Japanese lily, 1 to 3 feet in height, which produces three to six bright-scarlet flowers; these are erect, star-shaped, and spotted with black. This species succeeds best in a half-shady place.

For previous introduction see No. 59381.

69021. *LILIUM DAURICUM* Ker. Candlestick lily.

No. 6765. Harbin. September 29, 1926. A plant about 3 feet in height, with a smooth or slightly furrowed stem which is green or tinged with brown or purple. The 20 to 50 horizontal leaves are 3 to 5 inches long, and the flowers, one to five in a cluster and 3 to 5 inches across, are orange-red, slightly spotted with purplish black, and tinged with yellow in the center; the anthers are red.

For previous introduction see No. 65281.

69022. CITRUS AURANTIFOLIA (Christm.) Swingle. Rutaceae. Lime.

From Los Banos, Philippine Islands. Seeds presented by J. D. Bigarino, through W. T. Swingle, Bureau of Plant Industry. Received November 4, 1926.

The native Philippine lime, known there as the dayap. It is an arborescent, thorny shrub, 10 to 15 feet high, with greenish yellow rounded fruits of pleasant acid flavor, excellent for making limeade. The wild Philippine lime is distributed generally throughout the archipelago, but the fruits are mostly of poor quality.

69023 to 69026. PHASEOLUS COCCINEUS L. Fabaceae. Scarlet Runner bean.

From Angol, Chile. Seeds presented by D. S. Bullock, Instituto Agrícola Bunster. Received November 8, 1926.

Locally grown seeds.

69023. Beans mulberry colored with dark spots.

69024. Beans mulberry colored with black spots.

69025. White beans.

69026. Light-tan beans with dark spots.

69027 to 69034.

From Kotgarh, Simla Hills, India. Seeds presented by Richard B. Gregg. Received November 3, 1926.

69027 and 69028. HORDEUM VULGARE PALLIDUM Seringe. Poaceae. **Six-rowed barley.**

69027. From Rorhoo, Bushaihr, near Kotgarh. October 1, 1926. A bearded barley.

69028. From Khanola, Bushaihr, near Kotgarh. October 2, 1926.

69029 to 69031. ORYZA SATIVA L. Poaceae. **Rice.**

69029. From Khanola, Bushaihr, near Kotgarh. October 2, 1926. A red variety grown without irrigation.

69030. From Khanola, Bushaihr, near Kotgarh. October 2, 1926. A black variety grown without irrigation. It is said to be very tasty.

69031. From Rorhoo, Bushaihr, near Kotgarh. October 1, 1926.

69032. PANICUM MILIACEUM L. Poaceae. **Froso.**

69033 and 69034. TRITICUM AESTIVUM L. (T. vulgare Vill.). Poaceae. **Common wheat.**

69033. A red wheat from Khanola, Bushaihr, near Kotgarh. October 2, 1926.

69034. A red wheat from Rorhoo, Bushaihr, near Kotgarh. October 1, 1926.

69035 and 69036. EPHEDRA spp. Gneta-ceae. **Joint fir.**

From Chene Bourg, near Geneva, Switzerland. Seeds purchased from Henry Correvon. Received November 9, 1926.

69035. EPHEDRA FRAGILIS Desf.

A low bushy evergreen plant, native to the Mediterranean countries. The minute leaves are borne on pale green branches.

69035 and 69036—Continued.

69036. EPHEDRA HELVETICA Meyer.

An alpine evergreen bush, with pale green branches and minute leaves, native to Switzerland. This is said to yield the alkaloid known as ephedrine, a powerful heart stimulant.

69037. FRANKLINIA ALATAMAHIA Bartr. (Gordonia pubescens L'Herit.). Theaceae.

From Philadelphia, Pa. Plants presented by Samuel N. Baxter, landscape gardener, Fairmount Park. Received November 18, 1926.

An ornamental shrub or small tree, up to 30 feet in height, native to Georgia, but not seen in the wild state since 1790. The bright-green, oblong-obovate leaves turn scarlet in fall and the pure-white flowers, about 3 inches across, appear in September and October.

For previous introduction see No. 39414.

69038. MACADAMIA TERNIFOLIA F. Muell. Proteaceae.

From Santa Barbara, Calif. Seeds presented by M. M. Yates. Received November 4, 1926.

Nuts spherical, about 22 millimeters in diameter; surface dull brown mottled with yellow, shell 2 to 6 millimeters in thickness and very hard to crack; kernel whitish, with sweet, chestnutlike flavor and of good quality.

69039. MACADAMIA TERNIFOLIA F. Muell. Proteaceae.

From Glendora, Calif. Seeds obtained through Robert W. Hodgson, University of California, Berkeley, Calif. Received November 4, 1926.

Trees of regular bearing habit; nuts rounded-ovoid, about 25 centimeters long; surface dull brown, usually mottled with yellow; shell 1 to 4 millimeters thick and very hard to crack; kernel white, with sweet, chestnutlike flavor, and of good quality.

69040. MACADAMIA TERNIFOLIA F. Muell. Proteaceae.

From Fort Myers, Fla. Seeds presented by Ewald Stulpner. Received November 4, 1926.

The one tree which I have is the only bearing tree of this species growing in this vicinity. (Stulpner.)

Husks gray to black, 2 millimeters thick; nuts rounded-oblate, about 22 millimeters long; surface dull yellowish brown; shell 1 to 6 millimeters thick, and very hard to crack; kernel white, slightly coarse in texture, fairly sweet, and of good quality.

69041. POPULUS TREMULA L. Salicaceae. **Poplar.**

From Stockholm, Sweden. Cuttings presented by Dr. Robert Fries, director, botanic garden. Received November 22, 1926.

Variety *erecta*. An erect variety of the European aspen.

69042. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceae.

Common wheat.

From Stockholm, Sweden. Seeds obtained through C. E. Leighty, Bureau of Plant Industry. Received November 22, 1926.

Swedish-grown seeds.

69043. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceae.

Common wheat.

From Ukraina, Russia. Seeds obtained through J. W. Pincus, Amtorg Trading Corporation, New York, N. Y. Received November 15, 1926.

Ukrainka. A selection by the Mironovsky Plant Breeding Station, which has given excellent results in various sections of Ukraina. (*Pincus*.)

69044. *ZIZANIA LATIFOLIA* (Griseb.) Stapf. Poaceae. Wild rice.

From Nanking, China. Seeds presented by Leslie Hancock, University of Nanking. Received November 15, 1926.

Seeds from plants growing in a swampy situation at Lotus Lake, near Nanking, China. (*Hancock*.)

For previous introduction see No. 62270.

69045. *CAESALPINIA CORIARIA* (Jacq.) Willd. Caesalpinaceae. Divi-divi.

From Moca, Dominican Republic. Seeds presented by Dr. R. Ciferri, Director, Estación Nacional Agronómica. Received November 18, 1926.

A small, handsome, spreading, tropical American tree or large shrub with feathery foliage and fragrant white flowers. The fruits, rich in tannic acid, are used in the United States in the manufacture of leather. A full-grown tree produces about 100 pounds of pods annually, and the yellow powdery substance filling these pods contains about 50 per cent of high-quality tannin, according to Record (Timbers of Tropical America, p. 251).

For previous introduction see No. 66650.

69046 to 69049. *GOSSYPIMUM* spp. Malvaceae. Cotton.

From Cairo, Egypt. Seeds presented by the Royal Agricultural Society, through T. H. Kearney, Bureau of Plant Industry. Received November 13, 1926.

Locally grown cotton strains.

69046. *GOSSYPIMUM* sp.

Maarad 87. M 26-21-8 strain.

69047. *GOSSYPIMUM* sp.

Maarad 104. M 10-400-18 strain.

69048. *GOSSYPIMUM* sp.

Maarad 18. M 26-33-17 strain.

69049. *GOSSYPIMUM* sp.

Maarad 120. M 31-268-14 strain.

69050. *MANGIFERA INDICA* L. Anacardiaceae. Mango.

From Port of Spain, Trinidad, British West Indies. Seeds presented by N. F. Graham. Received October 5, 1926.

Graham mango. A variety with large luscious fruits which often weigh 30 ounces.

69051 to 69055.

From Egypt. Seeds presented by Mahmoud Samy Pasha, Egyptian Minister, through C. R. Ball, Bureau of Plant Industry. Received October 4, 1926.

Locally grown seeds obtained from the Gabal Asfar farm, main drainage department, Ministry of Public Works, Egypt.

69051. *HORDEUM VULGARE PALLIDUM* Seringe. Poaceae. Six-rowed barley.

Baladi.

69052. *TRIFOLIUM ALEXANDRINUM* L. Fabaceae. Berseem.

Muscovi berseem.

69053. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceae. Common wheat.

Hindi.

69054. *VICIA FABA* L. Fabaceae. Broad bean.

Baladi.

69055. *ZEA MAYS* L. Poaceae. Corn.

69056 to 69059. *PRUNUS TOMENTOSA* Thunb. Amygdalaceae.

Manchu cherry.

From Geneva, N. Y. Bud wood selected in 1922 by George M. Darrow, Bureau of Plant Industry. Numbered October, 1926.

69056. A large bush producing fruits which are larger and less acid than the average. They make a fine sauce.

69057. A spreading bush 4 to 5 feet high, which produces an abundance of globose fruits.

69058. The fruits were still on this tree the middle of August. It is the second best tree of the collection.

69059. Selected from a superior strain.

69060. *JOANNESIA PRINCEPS* Vell. Euphorbiaceae.

From Minas Geraes, Brazil. Seeds obtained through the United States Federal Horticultural Board. Received May 11, 1922. Numbered October, 1926.

A large tropical American tree, with handsome digitately three-foliate to seven-foliate leaves about 4 inches long and coconutlike fruits about 5 inches in diameter with four large oily seeds. It is related to the tung-oil tree (*Aleurites fordii*).

69061. *ZEA MAYS* L. Poaceae. Corn.

From Egypt. Seeds presented by Mahmoud Samy Pasha, Egyptian Minister, through C. R. Ball, Bureau of Plant Industry. Received October 4, 1926.

Locally grown seeds obtained from the Gabal Asfar farm, main drainage department, Ministry of Public Works, Egypt.

69062. *TRIFOLIUM INCARNATUM* L. Fabaceae. Crimson clover.

From Bordeaux, France. Seeds presented by M. Catros Gerand, through Mrs. Robert Davis, Margaux, Gironde, France. Received October 1, 1926.

Locally grown seeds.

69063. ATTALEA COHUNE Mart. Phoeniceaceae. Cohune.

From Zacuapam, Huatusco, Vera Cruz, Mexico. Seeds presented by Dr. C. A. Purpus. Received October 9, 1926.

The cohune is a magnificent feather-leaved palm, native to the West Indies and Central America, which reaches a height of 40 feet, with leaves about 20 feet long, produced abundantly at the top of the trunk. The yellowish flowers are borne very freely, and the ovoid fruit, 2 to 3 inches long, contains the seed or nut which yields an oil of considerable value. According to Commerce Reports, May 9, 1919, this oil is of high quality, finds a ready sale for cooking purposes, and is suitable for any use to which a good cooking oil may be applied.

For previous introduction see No. 60984.

69064. LILIUM sp. Liliaceae. Lily.

From Hong Kong, China. Bulbs obtained by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received October 12, 1926.

No. 623. *Paak hop*. September 11, 1926. Purchased in the market and said to have been grown locally for the flowers. The bulbs are eaten as a special article of diet.

69065. CROTON ELUTERIA (L.) Swartz. Euphorbiaceae. Cascarilla.

From Nassau, Bahama Islands. Seeds purchased through William A. Smale, United States vice consul in charge. Received October 2, 1926.

An evergreen tropical shrub about 6 feet in height, native to the Bahama Islands. This shrub yields the "cascarilla bark" used in medicine.

69066. DIOSCOREA ALATA L. Dioscoreaceae. Yam.

From St. Croix, Virgin Islands. Tubers presented by W. M. Perry, horticulturist, Agricultural Experiment Station. Received March 23, 1926. Numbered October, 1926.

Sealtop yam. A distinct advantage of this variety is that it does not burrow its way deeply into the ground, hence it is easy to dig. It may be necessary to throw some soil over the roots if they push themselves upward out of the ground. We have harvested yams weighing 11 pounds each, but the average weight is 5 pounds. It is considered a superior yam. I do not know the origin of the word "Sealtop," as it appears to be purely a local name. (Note by Mr. Perry under No. 62866.)

69067 and 69068. DIOSCOREA spp. Dioscoreaceae. Yam.

From Mayaguez, Porto Rico. Tubers presented by T. B. McClelland, horticulturist, Agricultural Experiment Station. Received March 23, 1926. Numbered October, 1926.

69067. DIOSCOREA sp.

Mapuey blanco yam.

69068. DIOSCOREA sp.

Mapuey morado. The yampi is usually of even form and somewhat club-shaped and the tubers are commonly 4 to 10 ounces in weight; the inner skin is pink. The flesh is white but often becomes slightly grayish when cooked. The flavor

69067 and 69068—Continued.

is much like that of the white potato, but the yampi has in addition an agreeable sweetness. (Note by R. A. Young under No. 58662.)

69069 to 69071. DIOSCOREA spp. Dioscoreaceae. Yam.

From Jaffna, Ceylon. Tubers obtained by David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition. Received March 26, 1926. Numbered October, 1926.

69069. DIOSCOREA sp.

No. 402. Jaffna Experiment Station. February 6, 1926. The "King yam" of the sandy region of Jaffna, which is considered the best in that region. The tubers are purple fleshed, large, and of good flavor, though slightly gummy.

69070. DIOSCOREA sp.

No. 403. Jaffna Experiment Station. A variety peculiar in that it produces only a small underground tuber but many large aerial ones. These aerial tubers are boiled and eaten like ordinary yams, though the skin is bitter.

69071. DIOSCOREA sp.

No. 405. Jaffna Experiment Station. February 6, 1926. "Kombulvalli yam" of Jaffna. The tubers are large, irregularly shaped, and of good quality, but evidently inferior to the King yam in the estimation of the Singhalese.

69072 to 69077. DIOSCOREA spp. Dioscoreaceae. Yam.

From Kwangtung Province, China. Tubers obtained by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received February and April, 1926. Numbered October, 1926.

69072. DIOSCOREA sp.

No. 329. Chukkouen, Lohkongtung. December 27, 1925. *Noh mai shue, sham shue*. A commonly cultivated variety propagated by means of cuttings of the tubers which are rolled in straw ashes before planting. The tubers are long and smooth, cylindrical in shape, sometimes flattened at the tip, with a tuft of roots at the point of union with the stem; the flesh is white but not fibrous.

69073. DIOSCOREA sp.

No. 359. Yeunguk, Lungtau Mountain. January 13, 1926. *Hung shue*. The skin and outer portion of the flesh are red, therefore the variety is called "red yam."

69074. DIOSCOREA sp.

No. 360. Yeunguk, Lungtau Mountain. January 13, 1926. *To kei shue*. The skin and outer portion of the flesh are red. It is called "roundhead yam" because of its globular shape.

69075. DIOSCOREA sp.

No. 361. Yeunguk, Lungtau Mountain. January 13, 1926. *Ng chau shue, so pa shue, keuk paan shue*. A white-skinned, white-fleshed variety with flattened tubers.

69076. DIOSCOREA sp.

No. 362. Yeunguk, Lungtau Mountain. January 13, 1926. *To kei shue*. A white-skinned, white-fleshed variety.

69072 to 69077—Continued.

69077. *DIOSCOREA* sp.

No. 391. January 23, 1926. *Taai shue*. A large variety commonly cultivated in the vicinity of Shiu Chow, where these tubers were obtained.

69078. *PRUNUS MUME* Sieb. and Zucc. Amygdalaceae. Japanese apricot.

From North Chevy Chase, Md. Seeds collected by David Fairchild, agricultural explorer, Bureau of Plant Industry. Received October 14, 1926.

Variety *Megumi-no-miyako*. Seeds from the 1926 crop of fruits of a tree, growing at the residence of Doctor Fairchild, who obtained the original stock from Japan about 1906. The tree has given evidence, according to Doctor Fairchild, of being resistant to the attacks of the peach borer, and may therefore have value as a stock.

69079 to 69093. *PRUNUS* spp. Amygdalaceae. Japanese flowering cherry.

Potomac Park, Washington, D. C., and North Chevy Chase, Md. Bud wood collected by Paul Russell, Bureau of Plant Industry. Received July and September, 1925. Numbered October, 1926.

69079 to 69089. *PRUNUS SERRULATA* Lindl.

69079. "In the Woods," North Chevy Chase, Md., residence of David Fairchild. Tree 87. *Amanogawa*. Tree fastigiate in habit, about 20 feet high; bark dark gray; young foliage bronze green; flowers pale pink, semidouble, fragrant, about 1½ inches across, in erect clusters of three, blooming about midseason. The upright habit of this form, comparable to that of the Lombardy poplar, makes it of special value for certain architectural effects.

69080. Potomac Park. Tree 1120. *Ariake*. Tree spreading in habit, about 18 feet high; bark gray; flowers very pale pink, nearly single, 2 inches or more across, long stemmed, in clusters of two to four; blooming about midseason. The varietal name signifies "dawn" in Japanese, probably referring to the delicate pink tints of the flowers.

69081. Potomac Park. Tree 1143. *Fugenzo*. Tree large, spreading, and probably the most vigorous of the double-flowered forms, up to 25 feet high; young foliage bronze colored; buds deep pink, truncate; flowers double pink, nearly 2 inches across, in two-flowered to four-flowered clusters, blooming rather late.

69082. Potomac Park. Tree 1144. *Fukurokuju*. Tree erect, branching several feet from the ground and forming a rounded, compact head, about 20 feet high; bark reddish brown; young foliage brownish green; flowers pink, semidouble, about 1½ inches across, in clusters of three or four which are crowded toward the ends of the branches in a striking manner; blooming about midseason.

69083 and 69084. *Mikurumagaeishi*. Tree upright-spreading in habit, about 18 feet high, resembling *Ariake* (No. 69080) in general, but with pinker flowers and less wrinkled petals. Blooms about midseason.

69079 to 69093—Continued.

69083. Potomac Park. Tree 1169.

69084. "In the Woods," North Chevy Chase, Md., residence of David Fairchild. Tree 100.

69085. "In the Woods," North Chevy Chase, Md., residence of David Fairchild. Tree 105. *Senriko*. Tree upright ascending in habit, about 20 feet high; bark brownish gray; young foliage coppery green; flowers single or nearly so, white with a pink blush, fragrant, about 1½ inches across, usually three or four in a cluster; blooming about midseason.

For previous introduction see No. 67957.

69086. Potomac Park. Tree 1146. *Shirayuki*. Tree erect, branching within a few feet of the ground, about 18 feet high; bark dark gray; flowers pure white, often cup-shaped, about an inch across, in clusters of two to four. Blooms right after *Yoshino* (No. 69092), the earliest variety to flower.

69087. "In the Woods," North Chevy Chase, Md., residence of David Fairchild. Tree 90. *Shirofugen*. A variety closely resembling *Fugenzo* (No. 69081), from which it differs in having lighter colored flowers.

69088. Potomac Park. Tree 1140. *Takinioi*. Tree rather small and spreading, about 15 feet high; bark brownish gray; flowers pure white, single, very fragrant, about 1½ inches across, in clusters of three or four; blooming midseason. In Japanese the varietal name means "fragrant white cascade."

For previous introduction see No. 67956.

69089. "In the Woods," North Chevy Chase, Md., residence of David Fairchild. Trees 95 and 110. *Yae-murasaki*. Tree spreading in habit, about 20 feet high; vigorous; young foliage brownish green; buds deep pink, almost red; flowers deep pink, semidouble, about 1½ inches across; blooming about midseason. An excellent free-flowering variety.

69090. *PRUNUS SIEBOLDII* (Carr.) Wittmack.

"In the Woods," North Chevy Chase, Md., residence of David Fairchild. Tree 53. *Naden*. Tree upright spreading in habit, about 18 feet high; bark dark gray; flowers pink, semidouble, usually in clusters of three or four, about 1½ inches across, blooming in midseason.

69091. *PRUNUS SUBHIRTELLA AUTUMNALIS* Makino.

"In the Woods," North Chevy Chase, Md., residence of David Fairchild. Tree 92. *Jugatsuzakura*. Tree spreading with a rounded crown, about 20 feet high; flowers rosy pink, semidouble, about half an inch in diameter, produced freely early in the spring and also sparingly in October.

For previous introduction see No. 67960.

69092. *PRUNUS YEDOENSIS* Mats.

Potomac Park. Tree 1148. *Yoshino*. A handsome Japanese tree, ultimately

69079 to 69093—Continued.

about 40 feet in height, with smooth, pale-gray bark, thick, wide-spreading branches, and large, sharply toothed leaves which normally appear after the flowers have passed their prime. The flowers, borne in profusion in the spring, are single, pink, or nearly white, and about an inch across. The small black fruits are sometimes produced abundantly and afford an easy means of propagation.

For previous introduction see No. 67964.

69093. *PRUNUS YEDOENSIS* PERPENDENS Wilson.

"In the Woods," North Chevy Chase, Md., residence of David Fairchild. *Shidareyoshino*. A weeping form of the Yoshino variety, differing only in habit.

69094. *LOTUS ANGUSTISSIMUS* L. Fabaceae.

From Auckland, New Zealand. Seeds purchased from Arthur Yates & Co. Received October 9, 1926.

An upright or ascending leguminous annual, about a foot high, native to the Mediterranean countries. The golden-yellow flowers are often reddish at the tips.

For previous introduction see No. 51856.

69095 to 69101.

From Manchuria. Seeds obtained by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received October 11, 1926.

69095. *HYPERICUM ASCYRON* L. Hypericaceae.

No. 6462. Shitankhetsy. August 24, 1926. A hardy ornamental yellow-flowered shrub.

69096. *PHLEUM PRATENSE* L. Poaceae. Timothy.

No. 6456. Shitankhetsy. August 23, 1926.

69097. *PRUNUS ARMENIACA* L. Amygdalaceae. Apricot.

No. 6474. Ertsingtientze. August 30, 1926. A wild apricot of Manchuria, which becomes a good-sized tree. The fruits are edible.

69098. *PRUNUS GLANDULOSA* Thunb. Amygdalaceae. Cherry.

No. 6473. Shitankhetsy. August 27, 1926. This pink-flowered Chinese shrub, often grown as an ornamental, bears abundant fruits with a fresh acid flavor which make excellent preserves.

For previous introduction see No. 60983.

69099. *SPIRAEA* sp. Rosaceae. Spirea.

No. 6463. Shitankhetsy. August 24, 1926. An ornamental white-flowered bush, native to Manchuria.

69100. *TRIFOLIUM HYBRIDUM* L. Fabaceae. Alsike clover.

No. 6455. Shitankhetsy. August 23, 1926. A pink-headed clover, resembling our red variety though not so large.

69101. *TRIFOLIUM REPENS* L. Fabaceae. White clover.

No. 6454. Shitankhetsy. August 23, 1926. A small white clover resembling the one found in the United States.

69102. *OMPHALEA OLEIFERA* Hemsl. Euphorbiaceae.

From Moyuta, Guatemala. Seeds presented by F. Marcucci G. Received October 19, 1926.

This Central American tree, known in Guatemala as palo de queso, matasano cimarron, and hoja de queso, is called tambor in Salvador, according to P. C. Standley (Pharmaceutical Journal, vol. 110, p. 489). The main value of the tree lies in the fruit and seeds. From the latter is obtained an oil with the same properties as castor oil, but with an agreeable flavor. This oil is also used for making soap, for illumination, and in cooking. The immature fruits when boiled are said to have an excellent flavor, and the ripe seeds are eaten as a delicacy.

For previous introduction see No. 64811.

69103 to 69107.

From Stockholm, Sweden. Seeds obtained by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received October 19, 1926.

The following material was obtained at the Stockholm Botanic Gardens, September 30, 1926.

69103. *LARIX KURILENSIS* Mayr. Pinaceae. Larch.

No. 920. A distinctive and interesting species, originally from the Kurile Islands, Japan; said to grow 70 feet in height.

69104. *LIGULARIA SIBIRICA* (L.) Cass. Asteraceae.

No. 918. A northern Chinese hardy perennial with reddish flowers which seems to be peculiarly suited to conditions in Sweden and should be tried in the New England States.

For previous introduction see No. 36762.

69105 to 69107. *RHEUM* spp. Polygonaceae. Rhubarb.69105. *RHEUM FRANZENBACHII* Muentzer.

No. 919. A rapidly growing species of rhubarb, native to temperate Asia, which is a striking ornamental suitable for borders and possibly for breeding purposes.

69106. *RHEUM MACROPTERUM* Mart.

No. 921. A plant with handsome foliage and striking clusters of flowers and seeds, valuable perhaps for borders or breeding purposes. Country of origin unknown.

69107. *RHEUM WITTROCKII* Lundstroem.

No. 917. A tall broad-leaved European species with light-pink flowers and fruits.

69108. *PRUNUS YEDOENSIS* Mats. Amygdalaceae. Yoshino cherry.

From North Chevy Chase, Md. Seeds collected by Paul Russell, Bureau of Plant Industry. June 9, 1926. Numbered October, 1926.

For previous introduction and description see No. 69092.

69109 and 69110.

From Honolulu, Hawaii. Seeds presented by W. A. Setchell, through T. H. Kearney, Bureau of Plant Industry. Received October 18, 1926.

69109. *GOSSYPIUM TOMENTOSUM* Nutt.
Malvaceae. **Cotton.**

Hawaiian-grown seeds.

69110. *KOKIA ROCKII* Lewton. Malvaceae.
Kokio.

A handsome tree, native to the island of Molokai, Hawaii, which becomes about 20 feet high. The somewhat fleshy deep-green orbicular leaves are in whorls at the ends of the branches, and the bright-scarlet flowers, about 6 inches across, are freely produced.

69111. *DEGUELLIA DALBERGIOIDES* (Baker) Taub. (*Derris dalbergioides* Baker). Fabaceae.

From Dar es Salaam, Tanganyika Territory, East Africa. Seeds presented by A. H. Kirby, Director of Agriculture. Received October 26, 1926.

A small, spreading tree, described by Hooker (Flora of British India, vol. 2, p. 241) as being about 20 feet high, with rigid dark-green compound leaves and copious racemes of pink flowers. Native to eastern India and Java.

For previous introduction see No. 63768.

69112 to 69117.

From Manchuria. Seeds obtained by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received October 11, 1926.

69112. *ACER GINNALA* Maxim. Aceraceae.
Maple.

No. 6457. Shitankhetsy. August 23, 1926.

69113. *IMPATIENS NOLITANGERE* L. Impatiaceae.

No. 6459. Near Shitankhetsy. August 24, 1926. A yellow-flowered herb.

69114. *IMPATIENS* sp. Impatiaceae.

No. 6465. August 26, 1926. A creamy white-flowered herb from 17 Verst, a station on the new branch line of the Chinese Eastern Railway.

69115. *RUBUS CRATAEGIFOLIUS* Bunge. Rosaceae. **Red raspberry.**

No. 6461. Shitankhetsy. August 25, 1926. A large red raspberry which caps easily. It may be a wild species or perhaps a seedling from the many cultivated plants grown here.

69116. *TRIFOLIUM PRATENSE* L. Fabaceae. **Red clover.**

No. 6468. Shitankhetsy. August 27, 1926.

69117. *TRIFOLIUM LUPINASTER* L. Fabaceae. **Clover.**

No. 6469. Shitankhetsy. August 27, 1926.

69118 to 69125.

From Buitenzorg, Java. Seeds presented by Dr. L. Koch, Chief of the Plant-Breeding Station for Annual Crops. Received October 25, 1926.

69118 to 69125—Continued.

69118. *CALOPOGONIUM MUCCINOIDES* Desv. Fabaceae.

A tropical American plant which is said to be popular as a cover plant in Sumatra, according to J. N. Milsom and E. A. Curtler (Malayan Agricultural Journal, vol. 13, No. 8, August, 1925, pp. 271-72). These authorities state that a fair cover is obtained after three months from sowing, when flowering commences. The plant is a vigorous creeping herb which forms a mat of foliage $1\frac{1}{2}$ feet or so in thickness over the soil. The stems, 3 to 10 feet long, form roots at each node. The pale-blue flowers are in racemes 1 to 4 inches long.

For previous introduction see No. 66085.

69119. *CROTALARIA ANAGYROIDES* H. B. K. Fabaceae.

This species is now given preference here in Java as green manure; it produces more vegetation and does not pack down easily. It is especially satisfactory in higher altitudes and is in such great demand for the tea plantations in the higher mountains that we have to limit our seed distributions to small quantities. (Note by Dr. P. J. S. Cramer under No. 58366.)

For previous introduction see No. 66251.

69120. *CROTALARIA USARAMOENSIS* Baker f. Fabaceae.

This East African crotalaria has been tested in Java as a green manure, according to Dr. P. J. S. Cramer, Director of the Department of Agriculture, Buitenzorg, who also states that it has proved very successful as a green manure when grown in alternation with corn, producing large quantities of vegetation rich in nitrogen. In the cinchona plantations it is very satisfactory, as it endures partial shade and forms a dense low growth which keeps the edges of the terraces together.

For previous introduction see No. 64064.

69121. *SORGHUM VULGARE* Pers. Poaceae. **Sorghum.**

Variety *Gandroeng Degem* 22. A locally developed strain.

69122. *MIMOSA INVISA* Mart. Mimosa-ceae.

A prostrate or ascending tropical leguminous plant with sensitive feathery foliage and rose-colored flowers. In Java this has been used as a cover plant.

For previous introduction see No. 45618.

69123 to 69125. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceae. **Soy bean.**

Locally developed strains.

69123. Variety *Kedelee* 16.

69124. Variety *Kedelee* 27.

69125. Variety *Kedelee* 30.

69126 to 69142.

From Kotgarh, Simla Hills, India. Seeds presented by Richard B. Gregg. Received October 20, 1926.

Seeds collected in the Spiti region, western Tibet, in August, 1926.

69126 to 69142—Continued.

69126. *AVENA FATUA* L. Poaceae. Oats.*Kussam* or *Chak*.69127. *BRASSICA* sp. Brassicaceae. Mustard.*Yunker*. The leaves are eaten as green vegetables, and the seeds are made into oil.69128. *FAGOPYRUM TATARICUM* (L.) Gaertn. Polygonaceae.**Kangra buckwheat.***Dao*.

For previous introduction see No. 64366.

69129. *FAGOPYRUM VULGARE* Hill (*F. esculentum* Moench.). Polygonaceae. Buckwheat.*Gyamra*.69130 to 69133. *HORDEUM VULGARE COELESTE* L. Poaceae. Six-rowed barley.69130. *Na*. A white barley.69131. *Nahaver*. A red barley.69132. *Zammer*.

69133. No. 1.

69134 and 69135. *HORDEUM VULGARE PALIDUM* Seringet. Poaceae. Six-rowed barley.69134. *Sua*. 69135. No. 2.69136. *LENS ESCULENTA* (L.) Moench. Fabaceae. Lentil.*Kirzeh*. A variety of Dal.69137. *MEDICAGO FALCATA* L. Fabaceae. Alfalfa.*Ol* or *Bugsug*. A very good forage for cattle.69138. *PANICUM MILIACEUM* L. Poaceae. Proso.*Tscheke*.69139 and 69140. *PISUM SATIVUM* L. Fabaceae. Pea.69139. *Shamma*. This variety is said to give several yields per season and to be very nourishing.

69140. Though occasionally planted in the early spring, this variety is usually planted in late September or early October and is ready for cutting and harvesting in May. It grows to a height of about 1½ feet. By cutting off the tops in the early spring the farmers find that there is a higher yield. These cuttings are eaten as greens.

69141. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceae. Common wheat.*To*. A white variety.69142. *VICIA FABA* L. Fabaceae. Broad bean.*Changtan*. A large black variety.

69143 to 69165.

From Buitenzorg, Java. Seeds presented by Dr. W. M. Docters van Leeuwen, director, botanic gardens. Received October 18, 1926.

69143. *SESBANIA GRANDIFLORA* Poir. Fabaceae.

69143 to 69165—Continued.

A small rapid-growing soft-wooded tree, 15 to 20 feet high, with pinnate leaves and large pendulous white flowers, followed by long sickle-shaped pods. The fleshy petals are used in curries and soups in the Indian Archipelago, where this tree is native. The leaves and young shoots are sometimes used as fodder.

For previous introduction see No. 57079.

69144. *ALBIZZIA LUCIDA* (Roxb.) Benth. Mimosaceae.

A handsome spreading leguminous tree with attractive feathery leaves; native to the East Indies.

For previous introduction see No. 33553.

69145. *BRADBURYA PLUMIERI* (Turp.) Kuntze (*Centrosema plumieri* Turp.). Fabaceae.

An attractive tropical American leguminous vine, with red and white flowers and large numbers of smooth pods about 8 inches long. It is said to grow in dense shade in Brazil, climbing to the tops of trees to reach the sun.

For previous introduction see No. 48597.

69146. *BRADBURYA PUBESCENS* (Benth.) Kuntze (*Centrosema pubescens* Benth.). Fabaceae.

A slender leguminous vine, up to about 6 feet in length, with trifoliolate leaves and oval leaflets, the latter about 2 inches long, and white or yellowish small flowers. Native to tropical America.

For previous introduction see No. 65315.

69147 to 69151. *CASSIA* spp. Caesalpinia-ceae.69147. *CASSIA BICAPSULARIS* L.

An ornamental yellow-flowered evergreen shrub about 4 feet high, native to the West Indies.

69148. *CASSIA PAPUANA* Hort.

A tender ornamental yellow-flowered shrub.

69149. *CASSIA QUINQUANGULATA* Rich.

A handsome tropical evergreen shrub, about 7 feet high, with yellow flowers.

69150. *CASSIA ROTUNDIFOLIA* Pers.

An annual bushy leguminous plant, native to tropical America, with small hairy compound leaves and yellow flowers.

For previous introduction see No. 32333.

69151. *CASSIA TIMORIENSIS* DC.

A rather low tree with slender downy branches, pale-green leaves up to 9 inches in length, bright-yellow flowers, and thin glossy flexible pods sometimes 6 inches long. The tree is distributed throughout the Malay Archipelago and the Philippines.

For previous introduction see No. 55026.

69143 to 69165—Continued.

69152. *CLITORIA HETEROPHYLLA* Lam. Fabaceae.

As described by Lamarck (*Encyclopédie Méthodique Botanique*, vol. 2, p. 51), this East Indian plant is a climbing perennial with threadlike stems and compound leaves consisting of five small green leaflets which vary in form from orbicular to linear, borne on a winged axis. The blue flowers are borne singly in the leaf axils.

For previous introduction see No. 65298.

69153. *ELAEOCARPUS GRANDIFLORUS* J. E. Smith. Elaeocarpaceae.

An ornamental evergreen shrub about 20 feet high, with white and crimson flowers. Native to Mauritius.

69154. *ELAEOCARPUS TREUBII* Hochr. Elaeocarpaceae.

An East Indian evergreen shrub with white flowers. Of possible ornamental value.

69155. *ERYTHRINA FUSCA* Lour. Fabaceae.

A large handsome shrub up to 8 feet high, with brown bark, unarmed compound leaves, and terminal racemes of brown-red flowers. Native to Indo-China.

69156. *JATROPHA MULTIFIDA* L. Euphorbiaceae.

A tropical American shrub, 5 to 15 feet high, with deeply divided palmate leaves and scarlet flowers.

For previous introduction see No. 60398.

69157. *JATROPHA PODAGRICA* Hook. Euphorbiaceae.

A handsome Central American shrub 1 or 2 feet high, with peltate, three-lobed to five-lobed leaves, 4 to 8 inches wide, and orange flowers with scarlet petals.

69158. *MELIA CANDOLLEI* Juss. Meliaceae.

A tropical evergreen tree, native to the Dutch East Indies, with pinnate foliage resembling that of the ash.

69159. *PARKIA TIMORIANA* (DC.) Merr. Mimosaceae. Cupang.

A huge and remarkably handsome quick-growing tree, which attains a height of 120 feet or more, with a clear smooth trunk and beautiful fine-feathery pinnate leaves. Native to the Malay Peninsula, Burma, etc. It has been introduced into and become well established in Ceylon, thriving in the low moist country up to 2,000 feet. The long pods, which grow in clusters, contain a quantity of white powdery farinaceous substance. The tree is easily propagated by seed.

For previous introduction see No. 61064.

69160. *PITHECOLOBIUM JUNGHUHNIANUM* Benth. Mimosaceae.

A tropical Asiatic leguminous tree with handsome feathery foliage.

69161. *PITHECOLOBIUM UMBELLATUM* (Vahl) Benth. Mimosaceae.

A low ornamental tree with feathery foliage, native to the East Indies.

69162. *PONGAM PINNATUM* (L.) W. F. Wight (*P. glabra* Vent.). Fabaceae.

A tall erect tree or sometimes a climbing shrub, with compound leaves com-

69143 to 69165—Continued.

posed of five to seven pairs of oblong leaflets and simple racemes of white flowers. The woody pods are about one-fourth of an inch thick and an inch and a half long. Native to tropical Asia. Because of its bright handsome foliage this tree has been recommended as an ornamental for mild-wintered regions.

For previous introduction see No. 66152.

69163. *SARACA INDICA* L. Caesalpiniaceae.

One of the handsomest of Indian ornamental trees, producing large heads of the most brilliant scarlet flowers imaginable. While restricted to the tropical sections of India, it may be sufficiently hardy to succeed in southern Florida. (Note by Wilson Popenoe under No. 36092.)

For previous introduction see No. 66154.

69164. *SESBANIA PAULENSIS* Barb-Rodr. Fabaceae.

A leguminous shrub described by Rodrigues (*Plantas Novas Cultivadas Jardim Botânico do Rio de Janeiro*, vol. 2, p. 13) as of erect habit, about 10 feet high, with narrow angular branches, finely pinnate leaves, and handsome yellow flowers in few-flowered racemes.

For previous introduction see No. 65306.

69165. *SINDORA SUMATRANA* Miquel. Caesalpiniaceae.

An unarmed ornamental East Indian tree with panicles of small flowers and stiff pinnate leaves with few leaflets.

69166. *ASIMINA TRILOBA* (L.) Dunal. Annonaceae. Papaw.

From North Chevy Chase, Md. Seeds collected by David Fairchild, Bureau of Plant Industry. Received October 12, 1926.

A large-fruited strain of the papaw, a relative of the tropical *Annonas*, which is native to the eastern and southern United States. Collected at Doctor Fairchild's home, "In the Woods."

For previous introduction see No. 51703.

69167. *RUBUS ARTICUS* L. Rosaceae.

From Manchuria. Seeds obtained by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received October 7, 1926.

No. 6329. July 25, 1926. From the White River Valley, near Bariam. A Manchurian bramble with medium-sized red berries.

69168. *LAPAGERIA ROSEA* Ruiz and Pav. Liliaceae. Copihue.

From Angol, Chile. Plants presented by E. E. Reed, Instituto Agrícola Bunster. Received October 21, 1926.

Copihue. This, the national flower of Chile, has been occasionally grown in northern greenhouses. It is a climbing plant of slow growth, with slender wiry stems and bright tubular flowers about 3 inches long. The plant requires an acid soil. (Note by Wilson Popenoe under No. 58022.)

69169. JACQUINIA sp. Theophrastaceae.

From Ecuador. Seeds obtained by Waldo L. Schmitt, United States National Museum. Received October 28, 1926.

Seeds from San Jose de Amen, halfway between Guayaquil and Santa Elena. An ornamental tropical hollylike tree with deep-red flowers, native to eastern Ecuador, where the round fruits, resembling small oranges in color and shape, are used by the natives for stupefying fish.

69170. PSIDIUM GUAJAVA L. Myrta-ceae. Guava.

From Holguin, Cuba. Seeds presented by Thomas R. Towns. Received November 2, 1926.

A Trinidad variety, grown in Cuba, which produces fruits weighing as much as 10 ounces. These have a pale yellow surface and strawberry-red flesh, with few seeds and relatively large proportion of firm flesh of a very agreeable sweet taste.

69171 to 69227.

From Canton, China. Seeds obtained by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received October 29, 1926.

69171. FICUS sp. Moraceae.

No. 620. August 20, 1926. *Ngau nai tsai*. A shrub which grows in waste places on Honam Island. The leaves are glabrous and shiny green and the edible fruits, when ripe, are red to purple. The plant is very ornamental and may be of interest in connection with fig-breeding work.

69172 to 69226. ORYZA SATIVA L. Poa-ceae. Rice.

69172. No. 565. *In tsui hung kuk*. A first-crop, starchy variety originally from the Kwangtung Agricultural Experiment Station, Canton, which has been growing at the Canton Christian College for five years. The growing season is 116 days, and the average yield is 2,840 pounds per acre.

69173. No. 566. *Paak kuk noh*. A first-crop, glutinous variety originally from the Kwangtung Agricultural Experiment Station, Canton, which has been growing at the Canton Christian College for five years. The growing season is 118 days, and the average yield 2,590 pounds per acre.

69174. No. 567. *Sz chuen tsim kuk*. A first-crop, starchy variety originally from the Kwangtung Agricultural Experiment Station, Canton, which has been growing at the Canton Christian College for five years. The growing season is 121 days, and the average yield is 2,390 pounds per acre.

69175. No. 568. *Hoh kaau kuk*. A first crop, starchy variety originally from the Kwangtung Agricultural Experiment Station, Canton, which has been growing at the Canton Christian College for five years. The growing season is 121 days, and the average yield is 2,314 pounds per acre.

69176. No. 569. *Tsat kit miu kuk*. A first crop, starchy variety originally from the Kwangtung Agricultural Experiment Station, Canton, which

69171 to 69227—Continued.

has been growing at the Canton Christian College for five years. The growing season is 114 days, and the average yield is 2,225 pounds per acre.

69177. No. 570. *So lo paak kuk*. A first crop, starchy variety originally from the Kwangtung Agricultural Experiment Station, Canton, which has been growing at the Canton Christian College for five years. The growing season is 121 days, and the average yield is 2,530 pounds per acre.

69178. No. 571. *So shi paak kuk*. A first crop, starchy variety originally from the Kwangtung Agricultural Experiment Station, Canton, which has been growing at the Canton Christian College for five years. The growing season is 113 days, and the average yield is 1,935 pounds per acre.

69179. No. 572. *Tung tsz tsim kuk*. A first crop, starchy variety originally from the Lin district, Kwangtung, which has been growing at the Canton Christian College for the last year. The growing season is 120 days, and the yield per acre is 3,200 pounds.

69180. No. 573. *Tung koon paak kuk*. A first crop, starchy variety originally from the Tungkoon district and later grown at the Kwangtung Agricultural Experiment Station, Canton. It has been growing at the Canton Christian College for the last five years. The growing season is 121 days, and the average yield per acre is 2,290 pounds.

69181. No. 574. *Koi leung tung koon paak kuk*. An improved (selected) strain of *Tung koon paak kuk*, No. 573 [No. 69180] also from the Tungkoon district and later grown at the Kwangtung Agricultural Experiment Station. It has been growing for the last five years at the Canton Christian College. The growing season is 121 days, and the average yield per acre is 2,660 pounds. This is said to be the best first-crop variety from the point of quality and yield.

69182. No. 575. *Yung uen chim kuk*. A first crop, starchy variety originally from the Kwangtung Agricultural Experiment Station, Canton, which has been growing for the last five years at the Canton Christian College. The growing season is 113 days, and the average yield per acre is 2,020 pounds.

69183. No. 576. *Yung uen tsuen chim kuk*. A first crop, starchy variety originally from the Kwangtung Agricultural Experiment Station, Canton, which has been growing at the Canton Christian College for five years. The growing season is 113 days, and the average yield per acre is 1,900 pounds.

69184. No. 577. *Fa lo chik kuk*. A first-crop, starchy variety originally from the Kwangtung Agricultural Experiment Station, Canton, which has been growing at the Canton Christian College for the last five years. The growing season is 122 days, and the average yield per acre is 2,180 pounds.

69171 to 69227—Continued.

69185. No. 578. *Siu koo chim kuk*. A first-crop, starchy variety originally from the Kwangtung Agricultural Experiment Station, Canton, which has been growing at the Canton Christian College for the last five years. The growing season is 122 days, and the average yield per acre is 2,130 pounds.

69186. No. 579. *Ka ying tso kuk*. A first-crop, starchy variety originally from Kaying and later grown at the Kwangtung Agricultural Experiment Station, Canton. It has been grown for the last five years at the Canton Christian College. The growing season is 118 days, and the average yield per acre is 1,960 pounds.

69187. No. 580. *Ngan chim kuk*. A first-crop, starchy variety originally from the Kwangtung Agricultural Experiment Station, Canton, which has been grown for the last five years at the Canton Christian College. The growing season is 123 days, and the average yield per acre is 1,640 pounds. While the average yield of this variety is very low, it is highly esteemed for its splendid quality.

69188. No. 581. *Taai ip chim kuk*. A first-crop, starchy variety originally from the Kwangtung Agricultural Experiment Station, Canton, which has been grown for the last five years at the Canton Christian College. The growing season is 123 days, and the average yield per acre is 2,020 pounds.

69189. No. 582. *Kai chau shan kuk*. A first-crop, starchy variety originally from the Kwangtung Agricultural Experiment Station, Canton, which has been growing at the Canton Christian College for five years. The growing season is 118 days, and the average yield per acre is 2,030 pounds.

69190. No. 583. *On naam kong kuk*. A first-crop, starchy variety, introduced from Annam by the Kwangtung Agricultural Experiment Station, whence it was obtained by the Canton Christian College five years ago. The growing season is 121 days, and the average yield per acre is 2,590 pounds.

69191. No. 584. *Kong sai tso kuk*. A first-crop, starchy variety originally from the Kwangtung Agricultural Experiment Station, Canton, which has been growing at the Canton Christian College for five years. The growing season is 120 days, and the average yield per acre is 1,815 pounds.

69192. No. 585. *San hing paak kuk*. A first-crop, starchy variety originally from Poonue district, Kwangtung, which has been growing at the Canton Christian College for the last year. The growing season is 120 days, and the yield per acre is 2,395 pounds.

69193. No. 586. *Paak kuk tsai*. A first-crop, starchy variety, originally from Poonue district, Kwangtung, which has been growing at the Canton Christian College for the last year. The growing season is 120 days, and the yield per acre is 2,390 pounds.

69171 to 69227—Continued.

69194. No. 587. *Luk shap yau tso kuk*. A first-crop, starchy variety, originally from Poonue district, Kwangtung, which has been growing at the Canton Christian College for the last year. The growing season is 106 days, and the yield per acre is 2,060 pounds.

69195. No. 588. *Oo ip to kuk*. A first-crop, starchy variety, originally from Swatow, which has been growing at the Canton Christian College for the last year. The growing season is 106 days, and the yield per acre is 1,265 pounds.

69196. No. 589. *Tse koo tuen*. A first-crop, starchy variety, originally from Wanfaou district, Kwangtung, which has been growing at the Canton Christian College for the last year. The growing season is 120 days, and the yield per acre is 2,670 pounds.

69197. No. 590. *Ma mei tsai kuk*. A first-crop, starchy variety, originally from Wanfaou district, Kwangtung, which has been growing at the Canton Christian College for the last year. The growing season is 120 days, and the yield per acre is 2,215 pounds.

69198. No. 591. *San tsim kuk*. A first-crop, starchy variety, originally from Tsangsheng district, Kwangtung, which has been growing at the Canton Christian College for the last year. The growing season is 120 days, and the yield per acre is 2,420 pounds.

69199. No. 592. *Ha chi paak kuk*. A first-crop, starchy variety, originally from Tsangsheng district, Kwangtung, which has been growing for the last year at the Canton Christian College. The growing season is 106 days, and the yield per acre is 2,000 pounds. The Chinese name of this variety is that of the season in which it ripens.

69200. No. 593. *Ai keuk kuk shap yat tso kuk*. A first-crop, starchy variety, originally from Tungkoon, Kwangtung, which has been growing for the last year at the Canton Christian College. The growing season is 120 days, and the yield per acre is 790 pounds.

69201. No. 594. *Tso hing heung noh*. A first-crop, glutinous variety, conspicuous for its red-brown husks, originally from Tungkoon, Kwangtung, which has been growing at the Canton Christian College for the last year. The growing season is 120 days, and the yield per acre is 1,760 pounds.

69202. No. 595. *Poon us san hing paak*. A first-crop, starchy variety originally from Poonue district, Kwangtung, which has been growing at the Canton Christian College for the last year. The growing season is 120 days, and the yield per acre is 2,325 pounds.

69203. No. 596. *Kam fung suet kuk*. A first-crop, starchy variety originally from Poonue district, Kwangtung, which has been growing at the Canton Christian College for the last year. The growing season is 120 days, and the yield per acre is 2,440 pounds.

69171 to 69227—Continued.

69204. No. 597. *Kam shan tsim kuk*. A first-crop, starchy variety originally from Tungkoon, Kwangtung, which has been growing at the Canton Christian College for the last year. The growing season is 120 days, and the yield per acre is 2,260 pounds.

69205. No. 598. *Tso kaang paak kuk*. A first-crop, starchy variety originally from the Lin district, Kwangtung, which has been growing at the Canton Christian College for the last year. The growing season is 120 days, and the yield per acre is 2,590 pounds.

69206. No. 599. *Hung kuk*. A first-crop variety named "red" because of its red-brown husks; originally from Lin district, Kwangtung, which has been growing at the Canton Christian College for the last year. The growing season is 119 days, and the yield per acre is 2,625 pounds.

69207. No. 600. *Hung nga tso kuk*. An early, starchy variety of the first-crop group, originally from Poonue district, Kwangtung, which has been growing at the Canton Christian College for the last year. The growing season is 118 days, and the yield per acre is 2,360 pounds.

69208. No. 601. *Oo ip to kuk*. A first-crop, starchy variety originally from Omfau, Kwangtung, which has been growing at the Canton Christian College for the last year. The growing season is 120 days.

69209. No. 602. *Hung kuk*. A bearded red-grained, dark-brown husked, starchy variety of the first-crop group, originally from Hoppo, Kwangtung, which has been growing at the Canton Christian College for the last year. The growing season is 118 days.

69210. No. 603. *Tso shiu oo uk kuk*. A very early, first-crop, starchy variety originally from Toishaan, Kwangtung, which has been growing at the Canton Christian College for the last year. The growing season is 106 days, and the yield per acre is 1,415 pounds.

69211. No. 604. *Chi shui kuk*. A first-crop, starchy variety originally from Toishaan, Kwangtung, which has been growing at the Canton Christian College for the last year. The growing season is 120 days, and the yield per acre is 3,060 pounds.

69212. No. 605. *Paak mai tsai*. A first-crop, starchy variety originally from Toishaan, Kwangtung, which has been growing at the Canton Christian College for the last year. The growing season is 120 days.

69213. No. 606. *Lok cheung tso kuk*. A first-crop, starchy variety originally from Lokcheung, Kwangtung, which has been growing at the Canton Christian College for the last year. The growing season is 106 days, and the yield per acre is 2,355 pounds.

69171 to 69227—Continued.

69214. No. 607. *Ka hing tso kuk*. A first-crop, starchy variety originally from Ngwa, Kwangtung, which has been growing at the Canton Christian College for the last year. The growing season is 120 days, and the yield per acre is 3,060 pounds.

69215. No. 608. *Lok cheung hon woh*. A first-crop, starchy variety of upland rice originally from Lokcheung, Kwangtung, which has been growing for the last year at the Canton Christian College. The growing season is 110 days, and the yield per acre is 1,475 pounds.

69216. No. 609. *Po tei paak kuk*. A first-crop, starchy variety originally from the Kwangtung Agricultural Experiment Station, Canton, which has been growing for the last five years at the Canton Christian College. This is the most highly esteemed variety among this group of upland rices. The growing season is 110 days, and the yield per acre is 2,390 pounds.

69217. No. 610. *Po tei dhik kuk*. A first-crop, starchy variety of upland rice, originally from the Kwangtung Agricultural Experiment Station, Canton, which has been growing at the Canton Christian College for the last five years. The growing season is 110 days, and the yield per acre is 2,345 pounds.

69218. No. 611. *Chik kuk*. A first-crop, starchy variety of upland rice, originally from Shiuhing, Kwangtung, which has been growing for the last year at the Canton Christian College. The growing season is 110 days, and the yield per acre is 3,935 pounds.

69219. No. 612. *Ko chi to kuk*. A first-crop, starchy variety of upland rice, originally from Swatow, Kwangtung, which has been growing for the last year at the Canton Christian College. The growing season is 110 days, and the yield per acre is 1,835 pounds.

69220. No. 613. *Hiu pei kuk*. A first-crop, starchy variety of upland rice, originally from Tsangsheng, Kwangtung, which has been growing for the last year at the Canton Christian College. The growing season is 110 days, and the yield per acre is 1,850 pounds.

69221. No. 614. *Kai na poh kuk*. A first-crop, starchy variety of upland rice, originally from Tsangsheng, Kwangtung, which has been growing for the last year at the Canton Christian College. The growing season is 110 days, and the yield per acre is 2,220 pounds.

69222. No. 615. *On naam kaang kuk*. A first-crop, starchy variety of upland rice, originally from the Kwangtung Agricultural Experiment Station, Canton, which has been growing for the last year at the Canton Christian College. The growing season is 110 days, and the yield per acre is 1,140 pounds.

69171 to 69227—Continued.

69223. No. 616. *Hon woh*. A first-crop starchy variety of upland rice, originally from Tsangsheng, Kwangtung, which has been growing for the last year at the Canton Christian College. The growing season is 110 days, and the yield per acre is 1,280 pounds.

69224. No. 617. *San tsim kuk*. A first-crop, starchy variety of upland rice, originally from Tsangsheng, Kwangtung. The growing season is 110 days, and the yield per acre is 1,680 pounds.

69225. No. 618. *Toi shaan hon woh*. A first-crop, starchy variety of upland rice from Toishaan, Kwangtung, which has been grown for the last year at the Canton Christian College. The growing season is 110 days, and the yield per acre is 1,325 pounds.

69226. No. 619. *Pa woh*. A first-crop starchy variety of upland rice from Ngwa, Kwangtung, which has been growing at the Canton Christian College for the last year. The growing season is 110 days, and the yield per acre is 1,835 pounds.

69227. *ROSA* sp. *Rosaceae*. **Rose.**

No. 564. *Kam ying lak*. A wild rose found widely distributed throughout Kwangtung Province in hedgerows, on uncultivated lands, and on mountain sides. The plant is a rank grower and does well even on the poorest soil. I have not observed it, however, above an altitude of a few hundred feet. The dark-green shiny foliage is unusually fine, being beautifully clean and free from disease and insect injury. The single pure white flowers with yellow anthers are very large, about 9 centimeters in diameter, and are produced abundantly. I measured one flower last year which was 11 centimeters in diameter.

69228 and 69229. *PRUNUS* spp. *Amygdalaceae*. **Japanese flowering cherry.**

From Yokohama, Japan. Seedlings purchased from the Yokohama Nursery Co. Received March, 1925. Numbered December, 1926.

69228. *PRUNUS SERRULATA* Lindl.

Mazakura. This is a low, comparatively short-lived, much-branched tree with small single white or pinkish flowers, sparingly produced. It is the usual stock on which Japanese nurserymen graft the better varieties of Japanese flowering cherries and is said to root readily, in Japan, from hardwood cuttings planted in March.

69229. *PRUNUS SERRULATA SPONTANEA* (Maxim.) Wilson.

Yamasakura. A native Japanese cherry, common on mountain sides from the extreme southern part of Japan to about the central portion. It becomes a tree 80 feet high, of spreading habit, with single pink flowers, and is of value chiefly because of its use as a stock for the better varieties of flowering cherries.

For previous introduction see No. 67963.

69230 to 69353.

From Manchuria. Seeds obtained by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry, through D. McLorn, Postal Commissioner, Harbin. Received November, 1926.

69230 to 69288. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). *Poaceae*. **Common wheat.**

Locally grown seeds.

69351. No. 7263. From Chichachae, Kirin Province.
69352. No. 7274. From Wengchaengchiehtzu, Kirin Province.
69353. No. 7278. From Minchiatun, Kirin Province.

69354. *SACCHARUM SPONTANEUM* L. Poaceae. Grass.

From Santiago de las Vegas, Cuba. Plants presented by Gonzalo M. Fortun, Director, Estación Experimental Agronómica, through E. W. Brandes, Bureau of Plant Industry. Received November 22, 1926.

An ornamental tropical grass, with silvery panicles, which is related to the sugar cane.

For previous introduction see No. 55668.

69355 to 69357.

From Stockholm, Sweden. Seeds obtained by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received November 15, 1926.

69355. *CORNUS SUECICA* L. Cornaceae.

No. 924. Stockholm Botanic Gardens. July, 1926. A dwarf dogwood resembling *Cornus canadensis*. The beautiful white bracts make it very attractive.

69356. *EREMURUS HIMALAICUS* Baker. Liliaceae.

No. 923. Stockholm Botanic Gardens. November, 1926. A tall handsome bulbous plant, 3 to 6 feet high, with showy white flowers, native to the Himalayas.

For previous introduction see No. 43467.

69357. *MEDICAGO CARSTIENSIS* Wulf. Fabaceae.

No. 922. Stockholm Botanic Gardens. November, 1926. A herbaceous perennial with yellow flowers. Native to central Europe.

For previous introduction see No. 35156.

69358. *LILIUM PHILIPPINENSE* Baker. Liliaceae. Benguet lily.

From Tunbridge Wells, England. Seeds purchased from E. Wallace & Co. Received November 18, 1926.

Variety *formosanum*. A Philippine lily with a smooth slender green stem 1 or 2 feet high and 30 to 40 horizontal leaves 3 to 5 inches long. The fragrant flowers, usually solitary, are 4 to 6 inches wide and pure waxy white with yellow anthers.

69359 to 69361.

From Manchuria. Seeds obtained by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received November 11, 1926.

69359. *ACTINIDIA ARGUTA* (Sieb. and Zucc.) Planch. Dilleniaceae.

No. 6770. Obtained through the Manchurian Research Society, at Shitoukhetsy, Chinese Eastern Railway. September 19, 1926. A high-climbing hardy shrub, native to northeastern Asia, with broadly oval leaves about 4 inches long, white flowers about three-fourths of an inch across, and sweet edible greenish yellow fruits about an inch long.

For previous introduction see No. 65484.

69360. *TILIA AMURENSIS* Rupr. Tiliaceae. Linden.

No. 6769. Ertsendiantsy. September 27, 1926. A small-leaved linden, excellent as a bee-pasture tree. Honey made from it is considered here to be the best.

For previous introduction see No. 65551.

69361. *TRILLIUM* sp. Convallariaceae.

No. 6776. Obtained through the Manchurian Research Society in their forest concession at Shitoukhetsy. September 29, 1926. A hardy perennial, native to Manchuria, of possible value as an ornamental.

69362 to 69364. PRUNUS SERRULATA Lindl. Amygdalaceae.**Japanese flowering cherry.**

From North Chevy Chase, Md. Bud wood obtained by Paul Russell, Bureau of Plant Industry. Received July and September, 1925. Numbered October, 1926.

From "In the Woods," residence of David Fairchild.

69362. Tree 122. *Sumizone*. Tree upright in habit, about 18 feet high; flowers white flushed with pink, single or nearly so, about $1\frac{1}{2}$ inches across, fragrant, short-stemmed, usually in pairs, blooming about midseason. A pleasing variety.

69363. Tree 114. *Kwanzan*. Tree upright-spreading in habit, becoming about 25 feet high; bark dark brownish gray; young foliage bronze green; buds red; flowers deep pink double, nearly 2 inches across, in clusters of two to five, blooming late. This is considered by some horticulturists to be the finest of the flowering cherries.

69364. Tree 107. *Ichijo*. Tree of spreading habit, about 18 feet high; bark grayish; flowers pink, becoming almost white with age; semidouble to double, about $1\frac{3}{4}$ inches across, in clusters of three, blooming about midseason. A variety which ranks with the best of the flowering cherries.

69365. PRUNUS SERRULATA Lindl. Amygdalaceae.**Japanese flowering cherry.**

From Potomac Park, Washington, D. C. Bud wood obtained by Paul Russell, Bureau of Plant Industry. Received September 23, 1925. Numbered October, 1926.

Tree 465. *Kwanzan*.

For previous introduction and description see No. 69363.

69366. ACACIA sp. Mimosaceae.

From Sumatra. Seeds obtained by David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition. Received May 14, 1926. Numbered October, 1926.

No. 502. Sibolangit Botanic Gardens. February 25, 1926. A tree which bears thick, curiously shaped pods which are constricted between the seeds.

69367 to 69371.

From Florida. Trees growing at the Plant Introduction Garden, Miami. Numbered October, 1926.

69367. MANGIFERA INDICA L. Anacardiaceae. **Mango.**

Seedling of the Julie mango, No. 26125, growing under P. I. G. No. 1898. The fruits are like the parent in being decidedly flat, but differ in being less irregular. They are more nearly triangular, the ventral shoulder being very pronounced, and are about $3\frac{1}{2}$ inches long on the stem axis and $2\frac{1}{2}$ by 3 inches in diameter at right angles to the stem axis. The flesh is of excellent flavor, with very little fiber, and is superior to that of the

69367 to 69371—Continued.

Julie. The ripening season at Miami is from June 8 to July 10. The tree is 15 feet high in section F, near the walk.

69368 to 69371. PERSEA AMERICANA Mill. Lauraceae. **Avocado.**

69368. Seedling of the Winslow avocado, No. 10978, growing under P. I. G. No. 1892. Fruits of medium size, about 4 inches long, slightly oblique; skin blackish purple, hard, separating easily from the flesh; flesh yellow, of buttery consistency, varying from one-half to three-fourths of an inch in thickness, with little or no fiber and of excellent quality; cavity large; seed about $2\frac{1}{2}$ inches long. Ripens at Miami from late December to February. Tree 25 feet high, of compact habit, in section E.

69369. Seedling of the Colla avocado, No. 19058, growing under P. I. G. No. 1893. Fruit slightly oblique, about 4 inches long; skin dark green, slightly roughened; flesh yellow, of buttery consistency, varying from one-half to three-fourths of an inch in thickness, of excellent texture with little or no fiber; flavor good but not equal to that of the Collinson or Winslowson; cavity very large; seed about $2\frac{1}{2}$ inches long. Ripens at Miami in December. Tree about 25 feet high, spreading, with light-colored foliage in summer, in section E.

69370. Seedling of the Collins avocado, No. 19080, growing under P. I. G. No. 1891. Fruits large, about $5\frac{1}{2}$ inches long, pear-shaped, regular; skin light yellowish green, comparatively smooth with light-colored dots over most of the surface, medium thin, separating easily from the flesh; flesh creamy yellow, shading to light green near the skin, of soft buttery consistency with little or no fiber, of good texture and excellent quality, varying in thickness from three-fourths of an inch at the side to $1\frac{1}{2}$ inches at the stem end, cavity medium large. Tree in section F.

69371. Seedling of the Collins avocado, No. 19080, growing under P. I. G. No. 1902. Fruits large, pear-shaped, about 5 inches long; skin light green with slight undulations over entire surface, hard and easily separating from flesh; flesh rich creamy yellow, shading to dark green near skin, with little or no fiber and of a rich buttery consistency, of excellent flavor; seed cavity about $2\frac{1}{2}$ inches long. Ripens at Miami in January. Tree in section F. This avocado has a comparatively large amount of flesh and is equal or superior to such varieties as the Collinson and the Winslowson. It is worthy of extended propagation.

69372. DIOSPYROS KAKI L. f. Diospyraceae. **Kaki.**

From Nanking, China. Seeds purchased through J. H. Reisner, College of Agriculture and Forestry, University of Nanking. Received December 27, 1926.

Seeds of a wild Japanese persimmon from near Ichang, Hupeh, China.

69373. POSOQUERIA LATIFOLIA (Rudge)
Roem. and Schult. Rubiaceae.

From Summit, Canal Zone. Seeds presented by Holger Johansen, agronomist, Plant Introduction Garden. Received December 29, 1926.

A shrub, sometimes 25 feet high, native to the forests of northern Bahia, Brazil, where it grows in dry sandy soil with but little water. It flowers in February and its succulent fruits, which ripen in July, are sold in the native markets for making marmalade and jelly. The greatest value of the shrub, however, lies in the finely grooved rigid branches, which are highly prized for walking sticks. These are exported to England under the name of "Brazilian oak."

For previous introduction see No. 55921.

69374. GOSSYPIMUM STOCKSII Masters.
Malvaceae. Cotton.

From Sind, Karachi, India. Seeds presented by the Deputy Director of Agriculture, Sind. Received December 23, 1926.

A tropical shrub with small yellow flowers, which grows in rocky limestone soil on the western coast of India.

69375. PITHECOLOBIUM sp. Mimosa-
ceae.

From Summit, Canal Zone. Seeds presented by Holger Johansen, agronomist, Plant Introduction Garden. Received December 30, 1926.

A tropical American leguminous tree; to be grown to ascertain its horticultural value.

69376. COTONEASTER ROTUNDIFOLIA
LANATA C. Schneid. Malaceae.

From Chico, Calif. Plant growing at the Plant Introduction Garden. Numbered December, 1926.

This plant has been grown at the Chico garden, at the left side of the office steps, under No. 32935, *Cotoneaster microphylla thymifolia*, but is now identified as *C. rotundifolia lanata*. It is a low shrub, with elliptic or elliptic-oblong leaves, dark green above and white tomentose beneath, and bright-red berries about one-third of an inch in diameter. Native to the Himalayas.

69377 and 69378. CORYLUS MAXIMA
Mill. Betulaceae. Filbert.

From Paris, France. Seeds purchased from Vilmorin-Andrieux & Co. Received December 20, 1926.

European filbert varieties.

69377. Variety *N. Avelina de Provence*.

69378. Variety *N. Avelina de Sicile*.

69379. DEQUELIA TRIFOLIATA (Lour.)
Taub. (*Derris uliginosa* Benth.).
Fabaceae.

From Manila, Philippine Islands. Seeds presented by S. Youngberg, Director, Bureau of Agriculture. Received December 22, 1926.

A large, handsome, leguminous woody climber, native to Burma and the East Indies. The compound leaves are a foot or more long, with 9 to 13 leaflets, and the bright-red flowers, three-fourths of an inch long, are in lax racemes. The roots yield

an effective insecticide and are used as a fish poison.

For previous introduction see No. 64602.

69380 and 69381. SAXIFRAGA CRASSI-
FOLIA L. Saxifragaceae.

Leather saxifrage.

From Leningrad, Russia. Roots and seeds presented by A. Kol, chief of the bureau of introduction, Institute of Applied Botany. Received December 30, 1926.

A hardy herbaceous perennial, native to Siberia, with a woody rhizome and dense panicles of purplish flowers. The roots are said to be of value as an antiseptic.

69380. Roots.

69381. Seeds.

69382. SACCHARUM OFFICINARUM L. Po-
aceae. Sugar cane.

From Muzaffarpur, Bengal, India. Cuttings obtained from Noel Deerr, superintendent of factories, through E. W. Brandes, Bureau of Plant Industry. Received December 29, 1926.

Indian-grown sugar cane.

69383 and 69384.

From China. Seeds obtained by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received December 22, 1926.

69383. *PSEUDOLARIX AMABILIS* (Nelson) Rehder (*P. kaempferi* Gordon). Pinaceae.

No. 868. *Kam tsung*. Seeds from a large tree growing at Chinhwasan, Anhwei, November 9, 1926. An excellent ornamental as well as a valuable timber tree.

69384. *ARUNDINARIA BREVIPANICULATA* Hand.-Mzt. Poaceae. Bamboo.

No. 869. Chanhwasan. November 4, 1926. *Liu chin chuk*. This species flowered during 1923 and 1924 and produced an abundance of seeds which were gathered by the natives and used as food.

69385. DIOSCOREA ALATA L. Dioscorea-
ceae. Greater yam.

From Mayaguez, Porto Rico. Tubers presented by T. B. McClelland, horticulturist, Agricultural Experiment Station. Received March 17, 1926. Numbered October, 1926.

The Ceylon purple yam produces a roundish tuber which in Porto Rico sometimes reaches a weight of 5 pounds. The color of the flesh is deep purple, most of which is retained in cooking, and the quality is excellent. The variety does not yield as heavily as many others, and the shape of the tubers makes it difficult to utilize to advantage.

For previous introduction see No. 54900.

69386 to 69396. TRITICUM AESTIVUM L.
(*T. vulgare* Vill.). Poaceae.

Common wheat.

From Manchuria. Seeds obtained by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry, through the cooperation of D. McLorn, Postal Commissioner, Harbin. Received December, 1926.

69386. No. 7298. From Hsiachintai. September 14, 1926.

69386 to 69396—Continued.

69387. No. 7384. From Mishatzu, Kirin Province. September 11, 1926.

69388. No. 7388. From Yingchengtzu, Kirin Province. September 5, 1926.

69389. No. 8141. From Harbin. October 20, 1926.

69390. No. 8209. From Harbin. October 21, 1926.

69391. No. 8226. From Harbin. October 21, 1926.

69392. No. 8288. From Harbin. October 22, 1926.

69393. No. 8307. From Harbin. October 22, 1926.

69394. No. 8448. October 13, 1926. *Bulaohsiefka* No. 61. Obtained from the experimental field of the Chinese Eastern Railway land department.

69395. No. 8565. From Harbin. October 26, 1926.

69396. No. 8612. From Harbin. November 4, 1926.

69397. *CAESALPINIA CORIARIA* (Jacq.) Willd. *Caesalpiniaceae*. *Divi-divi*.

From Haina, Dominican Republic. Seeds presented by Dr. R. Ciferri, Director, Estación Agronómica de Haina. Received December 30, 1926.

For previous introduction and description see No. 69045.

69398 to 69535.

From Manchuria. Seeds and bulbs obtained by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received November and December, 1926.

Nos. 69398 and 69399 were received through the cooperation of D. McLorn, Postal Commissioner, Harbin.

69398. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). *Fabaceae*.
Soy bean.

No. 8380. From Hulanchichang, Kirin Province.

69399. *PHASEOLUS AUREUS* Roxb. *Fabaceae*.
Mung bean.

No. 6381. From Hulanchichang, Kirin Province.

Nos. 69400 to 69403 were received through the Manchurian Research Society, Harbin.

69400. *ACANTHOPANAX SENTICOSUM* (Rupr.) Harms. *Araliaceae*.

No. 6761. From the vicinity of Ertse-diantsy. September 28, 1926.

For previous introduction see No. 65907.

69401. *ACER TEGMENTOSUM* Maxim. *Aceraceae*.
Maple.

No. 6739. Vicinity of the fourteenth block in the forest concession of the Chinese Eastern Railway, Shitoukhetsy. September 14, 1926.

For previous introduction see No. 65481.

69402. *CIRCAEA CORDATA* Royle. *Onagraceae*.

69398 to 69535—Continued.

No. 6775. Vicinity of Shitoukhetsy in the forest concession of the Chinese Eastern Railway.

69403. *CORYLUS HETEROPHYLLA* Fisch. *Betulaceae*.
Hazel.

No. 6746. From Ertse-diantsy. September 25, 1926.

For previous introduction see No. 65622.

69404 to 69444. *HORDEUM VULGARE PAL-LIDUM* Seringe. *Poaceae*.
Six-rowed barley.

Locally grown seed, collected in September, 1926, and obtained through the cooperation of D. McLorn, Postal Commissioner, Harbin.

69404. No. 6929. From Angangki or Tsitsikar.

69405. No. 6933. From Lanhsipei, Heilungkiang Province.

No. 6766. September 29, 1926. A cultivated variety growing in Harbin.

69495. *PYRUS USSURIENSIS* Maxim. Malaceae.

No. 6773. A wild variety growing in the mountains near Ertsemdiantzy. September 29, 1926.

69496. *RUBIA CORDIFOLIA* L. Rubiaceae. Madder.

No. 6774. Obtained through the Manchurian Research Society in the forest concession of the Chinese Eastern Railway near Shitoukhetsy. September 29, 1926. The roots are said to yield a red dye.

For previous introduction see No. 49652.

69497 to 69533. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceae. Soy bean.

Locally grown seed collected in September, 1926, through the cooperation of D. McLorn, Postal Commissioner, Harbin.

69497. No. 6930. From Angangki or Tsitsikar.

69498. No. 6934. From Lanhsipei, Heilungkiang Province.

69499. No. 6938. From Wuchiatzu, Kirin Province.

69500. No. 6942. From Fenghuangling.

69501. No. 6946. From Tuchiatzu, Kirin Province.

69502. No. 6950. From Chaotung.

69503. No. 6954. From Pinhsien.

69504. No. 6962. From Tunghsingchen, Heilungkiang Province.

69505. No. 6966. From Hsintien, Kirin Province.

69506. No. 6970. From Yushen.

69507. No. 6974. From Shihtouching-tzu.

69508. No. 6978. From Wangchitun.

69509. No. 6982. From Huachun.

69510. No. 6986. From Tachen.

69511. No. 6990. From Changchun.

69512. No. 6996. From Chiehchen.

69513. No. 7000. From Hsiaoholung, Kirin Province.

69514. No. 7004. From Ssutaitzu, Kirin Province.

69515. No. 7008. From Takushan, Kirin Province.

69516. No. 7012. From Hallun.

69517. No. 7016. From Tifang.

69518. No. 7024. From Pingyangchen, Kirin Province.

69519. No. 7028. From Shuanghochien, Kirin Province.

69520. No. 7032. From Hulan.

69398 to 69535—Continued.

69521. No. 7036. From Chiachikou, Kirin Province.

69522. No. 7040. From Holung.

69523. No. 7044. From Tsitsikar.

69524. No. 7048. From Huatien.

69525. No. 7052. From Hokang, Heilungkiang Province.

69526. No. 7056. From Teyuanheng.

69527. No. 7060. From Chingcheng.

69528. No. 7064. From Taipingchuan.

69529. No. 7068. From Tungpin.

69530. No. 7072. From Hsiyingcheng-tzu.

69531. No. 7080. From Tawatun, Kirin Province.

69532. No. 7083a. From Rehuei.

69533. No. 7087. From Shuangcheng.

69534. *VICIA* sp. Fabaceae. Vetch.

No. 6451. From Harbin. September 12, 1926. A purple vetch.

69535. *VITIS AMURENSIS* Rupr. Vitaceae. Amur grape.

No. 6744. A wild Manchurian grape, obtained through the Manchurian Research Society in the vicinity of Shitoukhetsy.

For previous introduction see No. 65960.

69536 to 69547.

From China. Scions and cuttings collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Numbered December, 1926.

69536. *CASTANEA MOLLISSIMA* Blume. Fagaceae. Chinese hairy chestnut.

No. 315. Shuisai, Lohkongtung. December 25, 1925. *Tao woh lut*. This variety is ready to harvest in July or early August, hence its name "early-rice chestnut." The usual harvest time for the other varieties of chestnut common here is September.

69537 to 69540. *DIOSPYROS KAKI* L. f. Diospyraceae. Kaki.

69537. No. 189. Near Fohtsuen, Lohkongtung. November 1, 1925. *Sha hok tsz*. A medium-sized subglobular, orange-yellow seedless variety. It is characterized by a layer of granular material just under the skin which gives a slight grating sound when cut, hence the name "sandy-shelled persimmon."

69538. No. 193. Taaishaan, Lohkongtung. October 30, 1926. *Taii yuk tsz*. A variety with large, subconical, yellow fruits which are ripened by the limewater method.

69539. No. 424. Taaichong. February 22, 1926. *Taii shui tsz*. The fruits of this variety are said to be very large and globular but somewhat squarish in cross section.

69540. No. 427. Pakshaan. February 26, 1926. *Taii tsz*.

69541. *DIOSPYROS* sp. Diospyraceae. Persimmon.

No. 354. From wild trees in Tungtszhaang, Lungtaushaan. *Tung pei tsai*.

69536 to 69547—Continued.

This variety differs from other persimmons found in this vicinity in having inner layers of light-gray bark and dark-gray branchlets.

69542 to 69546. PYRUS CALLERYANA Decaisne. Malaceae. Pear.

69542. No. 203. Near Chukkouen, Loh-kongtung. October 31, 1925. *Taai leng tsoh sha lei*. A variety with very large rusty-colored fruits, which are one-sided globular in shape, with the large long stem inserted in a deep irregular depression. The fruits have rather astringent coarse flesh and are considered best when pickled in salted vinegar.

69543. No. 204. Near Chukkouen, Loh-kongtung. October 31, 1925. *Hung lei*. A red-fruited very sweet variety with little flavor, which is said to resemble No. 203 [No. 69542] in shape, but has a smaller stem.

69544. No. 205. Near Chukkouen, Loh-kongtung. October 31, 1925. *Taam shui sha lei*. A large yellow globular-fruited variety which is considered by the Chinese to be the best flavored and sweetest variety of the pears grown in this region. Most of the crop is consumed as fresh fruits.

69545. No. 207. Near Chukkouen, Loh-kongtung. October 31, 1925. *Taai tuk suet lei*. The fruits of this variety are said to be pear-shaped, yellow, with white flesh of excellent quality.

69546. No. 208. Near Chukkouen, Loh-kongtung. October 31, 1925. *Ye sam sha lei*. The fruits of this variety are said to be the smallest of any variety cultivated here. They are fine-grained, sweet, and of excellent texture. These fruits are used to make a drink called "ye sam chap," which is considered by the Chinese to have medicinal value. This drink is made by allowing the fruits to rot in covered jars for three years. The pulp is said to be entirely reduced by bacterial action and at the end of three years only a liquid remains.

69547. ZIZIPHUS sp. Rhamnaceae. Jujube.

No. 246. Cheungchow, Kwongsai. November 21, 1925. *Paak tso*. An especially small-seeded and prolific variety, considered here to be the best of the Chinese jujubes. It seems to be cultivated only on the silty soil of the flood plain of the West River, west of Tak-hing, which is annually inundated. The tree is deciduous, dropping its leaves in October and November, and is propagated here only by root sprouts which are taken up and transplanted during February or March. The fruits are prepared for consumption by slitting the skin and boiling them in a sugar solution after which they are dried in the sun. This product is called "mat tso," or honey dates.

69548 and 69549. MALUS spp. Malaceae. Crab apple.

From Manchuria. Scions collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received January 2, 1926. Numbered December, 1926.

69548 and 69549—Continued.

69548. MALUS sp.

No. 4722. Taluhua Temple, Kuangning. November 7, 1925. *Pin tze* (sour crab apple). A variety with red fruits, $1\frac{1}{2}$ to 2 inches in diameter, which ripens in September.

69549. MALUS sp.

No. 4725. Taluhua Temple, Kuangning. November 7, 1925. *Tai ping kuo* (peace-fruit crab apple). A small crab apple, half white and half red and 1 inch in diameter, which ripens early in August.

69550 to 69712.

From Manchuria. Seeds obtained by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry, through the cooperation of D. McLorn, Postal Commissioner, Harbin. Received November, 1926.

69550 to 69704. HORDEUM VULGARE PAL-LIDUM Seringe. Poaceae.

Six-rowed barley.

69550. No. 6781. From Mushihho, Kirin Province.

69551. No. 6785. From Ssuchatzu, Kirin Province.

69552. No. 6789. From Fuyuhshien, Kirin Province.

Numbers 69847 and 69848 were obtained through the cooperation of D. McLorn, Postal Commissioner, Harbin.

69847. PHASEOLUS AUREUS Roxb. Fabaceae. **Mung bean.**

No. 8615. From Santaokang, Kirin Province.

69848. HORDEUM VULGARE PALLIDUM Seringe. Poaceae. **Six-rowed barley.**

No. 8323. From Tungnanchen, Heilungkiang Province.

69849. PRUNUS CERASIFERA PISSARDI × **SALICINA.** Amygdalaceae.

From Chico, Calif. A hybrid originated by the late Walter Van Fleet at Little Silver, N. J., and grown at the Chico Plant Introduction Garden. Numbered December, 1926.

Tree 3, row 66, old test orchard. Tree small, fairly vigorous, prolific; fruits rounded, about 1¾ inches in diameter; skin dark red, overspread with bluish bloom, dots numerous and small; flesh light red, firm, very juicy, sweet, of fair quality; pit large, pointed, oval, flat, clinging to flesh. Fruits very attractive in appearance, good for home use. Ripens at Chico from late May until the middle of June.

69850 to 69864.

From Brignoles, France. Seeds presented by Dr. R. Salgues, Director, Brignoles Botanic Station. Received November 15, 1926.

69850. CORONILLA SCORPIOIDES (L.) Koch. Fabaceae.

An erect yellow-flowered herbaceous perennial, about 6 inches high, native to the Mediterranean countries.

For previous introduction see No. 37638.

69851. CRUPINA VULGARIS Pers. Astera-ceae.

A thistlelike herbaceous plant, about 3 feet high, with pinkish flowers. Native to the Mediterranean countries.

69852. CYNOSURUS ECHINATUS L. Poaceae. **Grass.**

An annual bushy grass, up to 2 feet high, with slender stems, native to southern Europe.

69853. EUPHORBIA SERRATA L. Euphorbiaceae. **Spurge.**

A herbaceous perennial, native to the warmer parts of southern Europe, with narrow serrate leaves.

69850 to 69864—Continued.

69854. GLADIOLUS SEGETUM Ker. Iridaceae.

A European gladiolus of free habit, fond of warm dry soil and a sunny situation, with rather small rose-purple flowers. It is an admirable species for mixed borders.

For previous introduction see No. 57858.

69855. JUNIPERUS PHOENICEA L. Pinaceae. **Phoenician juniper.**

A low ornamental evergreen tree about 20 feet high, native to dry places in the Mediterranean countries.

For previous introduction see No. 65020.

69856. LATHYRUS APHACA L. Fabaceae.

A semiprostrate or ascending yellow-flowered leguminous herb, native to Asia Minor.

For previous introduction see No. 40313.

69857. MEDICAGO MINIMA (L.) Grufberg. Fabaceae.

A prostrate leguminous annual, with stems about 2 feet long, native to dry situations in southern Europe.

For previous introduction see No. 57899.

69858. ONOBRYCHIS CAPUT-GALLI (L.) Lam. Fabaceae.

An annual or biennial, prostrate or ascending plant with stems up to 3 feet in length. Native to dry situations in the Mediterranean region.

For previous introduction see No. 64637.

69859. RUMEX BUCEPHALOPHORUS L. Polygonaceae.

A hardy European herbaceous plant, the leaves of which are used as greens.

69860. SCORZONERA HIRSUTA L. Cichoriaceae.

A hardy herbaceous thistlelike perennial, about 1½ feet high, with white flowers. Native to southern Europe.

69861. TAMUS COMMUNIS L. Dioscoreaceae.

A twining herbaceous perennial, belonging to the yam family, with a tuberous root and bearing small red berries. Native to Europe and Asia.

69862. THLASPI ALLIACEUM L. Brassicaceae.

A herbaceous plant, belonging to the mustard family; the seeds, which taste like garlic, are used medicinally for rheumatism.

69863. TRIFOLIUM STELLATUM L. Fabaceae. **Clover.**

An annual upright clover, up to a foot high, native to the Mediterranean region.

For previous introduction see No. 64645.

69864. CYNANCHUM VINETOXICUM (L.) Pers. Asclepiadaceae.

A hardy herbaceous perennial, 2 to 3 feet high, with white flowers. Native to Europe.

69865. *ILEX PARAGUARIENSIS* St. Hil.
Aquifoliaceae. Yerba maté.

From Asuncion, Paraguay. Seeds presented by Dr. C. Fiebrig, director, Botanic Garden. Received November 12, 1926.

A tender evergreen Paraguayan holly the leaves of which are dried and used to make the beverage called "maté," or Paraguay tea.

69866 to 69869. *SOLANUM TUBEROSUM* L.
Solanaceae. Potato.

From Wolverhampton, England. Tubers obtained from F. W. Keay, through William Stuart, Bureau of Plant Industry. Received November 24, 1926.

English varieties.

69866. *Keay's Champion*.

69867. *King Edward* × *Patterson's Champion*.

69868. *Magnum Bonum* × *Patterson's Victoria*.

69869. *Patterson's Victoria*.

69870. *PSIDIUM GUAJAYA* L. Myrtaceae. Guava.

From Holguin, Cuba. Seeds presented by Thomas R. Towns. Received November 15, 1926.

The red Peruvian guava is fully as prolific as the white variety, but the flesh is not so thick around the seed. The flavor is delicious, and the fruits average 5 or 6 ounces in weight.

69871. *SCHIZOPHRAGMA HYDRANGEOIDES* Sieb. and Zucc. Hydrangeaceae.

From Jamaica Plain, Mass. Cuttings presented by C. S. Sargent, Arnold Arboretum. Received November 19, 1926.

An ornamental climbing Japanese shrub, 30 feet or more long, with handsome bright-green rounded leaves and showy clusters of white flowers. Probably hardy throughout all but the extreme northern parts of the United States.

For previous introduction see No. 40068.

69872. *DAVIDIA INVOLUCRATA* Baill. Cornaceae.

From Paris, France. Seeds presented by A. Gerard. Received November 26, 1926.

The Chinese dove tree, as this is sometimes called, is a native of the mountain forests of central and western China. In its native home it becomes a tree 75 feet tall, with a shapely pyramidal crown. When in bloom the tree is unusually striking because of the two or three large, snow-white bracts which subtend each flower. These bracts are of unequal size, the larger being 4 to 8 inches long and 2 to 4 inches broad. The bright-green, oval, sharply toothed leaves are 3 to 6 inches long.

For previous introduction see No. 65489.

69873 and 69874. *PSIDIUM GUAJAYA* L. Myrtaceae. Guava.

From Holguin, Cuba. Seeds presented by Thomas R. Towns. Received November 24, 1926.

69873. For previous introduction and description see No. 69870.

69873 and 69874—Continued.

69874. The white Peruvian guava is more prolific and has thick sweet flesh of delicious flavor. The average weight is about 5 ounces, occasional fruits weighing 9 ounces.

69875. *EREMOCITRUS GLAUCA* (Lindl.) Swingle (*Atalantia glauca* Benth.). Rutaceae.

Australian desert kumquat.

From Dundas, New South Wales. Seeds presented by Herbert J. Rumsey. Received November 24, 1926.

A shrub or small tree about 14 feet high, native to the deserts of northeastern Australia. The small thick leathery leaves are gray green, and the fruits are about half an inch in diameter. The acid juice of the fruit forms the basis of an agreeable beverage, and the peel has the sweetish flavor of the kumquat. It is the hardiest of all the evergreen citrus fruits and is of promise to plant breeders.

For previous introduction see No. 66869.

69876 to 69895.

From Manchuria. Seeds obtained by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received November 17, 1926.

These seeds were collected by I. V. Kosloff, Manchurian Research Society, Harbin.

69876 to 69880. *ACER* spp. Aceraceae. Maple.

69876 and 69877. *ACER BARBINERVE* Maxim.

A shrubby maple, native to Manchuria, with coarsely toothed, 5-lobed leaves.

For previous introduction see No. 65909.

69876. No. 6738. September 14, 1926. Collected in the vicinity of Shitoukhsy in the forest concession of the Chinese Eastern Railway.

69877. No. 6740. September 10, 1926. Collected in the vicinity of Shitoukhsy in the forest concession of the Chinese Eastern Railway.

69878. *ACER GINNALA* Maxim.

No. 6750. September 28, 1926. Vicinity of Ertseendiantzy. A small tree, or large shrub, of bushy habit, with 3-lobed, slightly heart-shaped leaves and very fragrant white flowers in short panicles, which appear in May. This maple is closely allied to *Acer tataricum*, but differs markedly in shape of leaf. The foliage turns a beautiful red before falling, the species being one of the best for autumnal coloring. It is native to Manchuria and Japan.

For previous introduction see No. 65910.

69879. *ACER MANDSHURICUM* Maxim.

No. 6743. September 19, 1926. Vicinity of Shitoukhsy in the forest concession of the Chinese Eastern Railway. A small hardy tree or large shrub, with leaves composed of three leaflets, the terminal one 3 inches long and the lateral ones shorter. Native to eastern Siberia and Manchuria.

For previous introduction see No. 65480.

69876 to 69895—Continued.

69880. *ACER CAUDATUM* UKURUNDUENSE (Trautv. and Meyer) Rehder.

No. 6741. September 19, 1926. Vicinity of Shitoukhetsy, in the forest concession of the Chinese Eastern Railway. A small hardy Manchurian tree with coarsely toothed, 5-lobed or 7-lobed leaves.

For previous introduction see No. 65911.

69881. *ACTINIDIA KOLOMIKTA* (Maxim.) Rupr. Dilleniaceae.

No. 6736. September 14, 1926. Shitoukhetsy, in the forest concession of the Chinese Eastern Railway. A hardy ornamental deciduous vine, up to 15 feet long, with oval serrate leaves blotched with white, creamy white flowers three-fourths of an inch across, and ovoid blue fruits. Native to northeastern Asia.

For previous introduction see No. 65612.

69882. *ARALIA ELATA* Seem. Araliaceae.

No. 6757. September, 1926. Vicinity of Ertsemdiantsty. A small hardy Manchurian tree, resembling *Aralia spinosa* (Hercules club), but more treelike, with few spines. It does not form many branches, but the large bipinnate leaves cast a good shade. The greenish white flowers are borne in large panicles, and the berries are dark red when ripe, producing a very pleasing effect.

For previous introduction see No. 65913.

69883. *CITRULLUS VULGARIS* Schrad. Cucurbitaceae. Watermelon.

No. 6584. September 4, 1926. A locally grown variety obtained in the market by one of the Chinese boys. This watermelon is of good size, with the rind about half an inch thick. The melting juicy flesh, golden or orange colored, is of very good quality.

69884. *CORYLUS HETEROPHYLLA* Fisch. Betulaceae. Hazel.

No. 6747. September 28, 1926. Ertsemdiantsty. A hardy shrubby hazel, 12 feet or less high, with nuts about one-fourth of an inch long. Native to Manchuria.

For previous introduction see No. 65622.

69885. *CORYLUS SIEBOLDIANA* MANDSHURICA (Maxim.) C. Schneid. Betulaceae. Hazel.

No. 6745. September 25, 1926. Ertsemdiantsty. A hardy shrub up to 15 feet high, with nuts about one-fourth of an inch long. Native to Manchuria.

For previous introduction see No. 65520.

69886 and 69887. *CRATAEGUS PINNATIFIDA* Bunge. Malaceae. Hawthorn.

A handsome hardy thorny shrub, native to northern China, with edible dark-red fruits.

69886. No. 6748. September 28, 1926. Ertsemdiantsty.

69887. No. 6754. September 28, 1926. Ertsemdiantsty.

69876 to 69895—Continued.

69888. *LONICERA MAACKII* (Rupr.) Herd. Caprifoliaceae. Honeysuckle.

No. 6759. September 28, 1926. Vicinity of Ertsemdiantsty. A bush honeysuckle, native to northeastern China, becoming about 10 feet high with widely spreading branches and dark-green leaves which are downy on both surfaces. The pure white flowers, an inch in diameter, are produced in pairs on the upper side of the branchlets. The fruits are red.

For previous introduction see No. 65937.

69889. *RHAMNUS DAVURICA* Pall. Rhamnaceae. Dahurian buckthorn.

No. 6753. September 28, 1926. Vicinity of Ertsemdiantsty. A large hardy spreading shrub or small tree, up to 30 feet high, with oblong leaves 2 to 4 inches long, greenish flowers, and black berries about three-eighths of an inch in diameter. Native to northeastern Asia.

For previous introduction see No. 65677.

69890. *RHAMNUS PARVIFOLIA* Bunge. Rhamnaceae.

No. 6755. September 28, 1926. Vicinity of Ertsemdiantsty. A *Rhamnus* of dense growth, having small foliage and bearing large jet-black berries. The shrub does not grow tall but assumes a well-rounded form when not mutilated. Of value as a garden and park shrub and as material for medium-sized hedges, especially for the drier sections of the United States. (Note by Frank N. Meyer under No. 36735.)

69891. *RIBES MANSHURICUM* (Maxim.) Komarov. Grossulariaceae. Currant.

No. 6742. September 17, 1926. At Shitoukhetsy in the forest concession of the Chinese Eastern Railway. A hardy Manchurian shrub about 6 feet high, which bears pendent racemes of red, sub-acid fruits.

For previous introduction see No. 65504.

69892. *SCHIZANDRA CHINENSIS* (Turcz.) Baill. Magnoliaceae.

No. 6734. September 25, 1926. At Shitoukhetsy in the forest concession of the Chinese Eastern Railway. A hardy ornamental woody vine, native to northeastern China, with shining dark-green oval leaves and compact clusters of small scarlet berries.

For previous introduction see No. 65287.

69893. *TILIA MANDSHURICA* Rupr. and Maxim. Tiliaceae. Linden.

No. 6751. September 28, 1926. Vicinity of Ertsemdiantsty. A hardy Manchurian tree, up to 60 feet high, with rounded-oval, coarsely toothed leaves, white-hairy beneath, and 4 to 6 inches long.

For previous introduction see No. 57346.

69894. *VIBURNUM SARGENTI* Koehne. Caprifoliaceae.

No. 6760. September 28, 1926. Vicinity of Ertsemdiantsty. An upright, compact hardy shrub, up to 15 feet high, generally similar to the American cranberry bush (*Viburnum americanum*), but with thicker leaves, hairy beneath, and larger sterile flowers, sometimes 1 1/4 inches across. The globose red berries are in upright cymes.

69876 to 69895—Continued.

For previous introduction see No. 56612.

69895. *VITIS AMURENSIS* Rupr. Vitaceae.
Amur grape.

No. 6758. September 28, 1926. Vicinity of Ertsemdiantzy. A local wild variety which is the best we have ever seen. The vine is a very strong grower; the bunches are larger and some of them very compact. The deep-blue or black grapes are of good size but contain large seeds and very little flesh, though there is a considerable amount of well-flavored juice which is made into wine. (Note by P. H. Dorsett under No. 65515.)

69896. *TROPAEOLUM TUBEROSUM* Ruiz and Pav. Tropaeolaceae.

From Edinburgh, Scotland. Tubers purchased from Dobbie & Co., The Royal Scottish Seed Establishment. Received November 30, 1926.

A tuberous-rooted herbaceous climber, with red and yellow flowers, native to the highlands of northern South America, where the tubers are boiled and eaten as a vegetable. The plant is said to be able to withstand a slight frost.

For previous introduction see No. 46625.

69897. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceae.

Common wheat.

From Manchuria. Seeds obtained by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry, through the cooperation of D. McLorn, Postal Commissioner, Harbin. Received December 12, 1926.

No. 8095. From Hueitzusanching, Heilungkiang Province.

69898. *GLADIOLUS* sp. Iridaceae.

From Vicosia, Minas Geraes, Brazil. Bulbs presented by Miss C. Rolfs, Escola Superior de Agricultura e Veterinaria. Received May 7, 1926. Numbered December, 1926.

From near the Pico das Bandeiras, one of the peaks of the Serra de Caparaó, at an altitude of about 2,000 meters. The flower is deep rose, more pinkish than red, with a darker throat and though not so large as the ordinary cultivated variety, the fact of there being 10 flowers out at the same time on the one stalk seems rather unusual. In cultivation every spike has three spikelets, with a varying number of blooms on a main spike and on the spikelets, a feature which would seem to make it good for breeding purposes. The first flowers on the side spikes were opening when the earliest ones of the main spike were past. (Miss Rolfs.)

69899 to 69931.

From Edinburgh, Scotland. Seeds presented by William Wright Smith, Regius Keeper, Royal Botanic Gardens. Received November 13, 1926.

69899 to 69906. *ALLIUM* spp. Liliaceae.

69899. *ALLIUM ALBOPILOSUM* C. H. Wright.

A trans-Caspian species which has probably the largest flowers of the genus. The bulbs are large, and the strap-shaped leaves, 18 inches long, have longitudinal lines of white hairs

69899 to 69931—Continued.

beneath and on the edges. The scape is nearly 2 feet high and bears large heads 9 inches across, each composed of from 60 to 80 deep-lilac flowers.

For previous introduction see No. 58868.

69900. *ALLIUM BEESIANUM* W. W. Smith.

A western Chinese onion, 9 to 18 inches high, with pendulous blue flowers.

69901. *ALLIUM CARDIOSTEMON* Fisch. and Mey.

A bulbous plant, 1½ feet high, with small purplish flowers. Native to Transcaucasia.

69902. *ALLIUM KANSUENSE* Regel.

A blue-flowered bulbous plant, native to northwestern China.

69903. *ALLIUM MOLY* L.

A bulbous species with broad, glaucous leaves and scapes 10 to 15 inches high. The bright-yellow flowers are in compact heads. Native to southern Europe.

For previous introduction see No. 58681.

69904. *ALLIUM NARCISSIFLORUM* Vill.

An elegant Italian species, about 9 inches high, with nodding heads of beautiful rose-colored flowers.

For previous introduction see No. 58682.

69905. *ALLIUM OSTROWSKIANUM* Regel.

This species, native to Turkestan, has rose-colored flowers produced freely in many-flowered umbels on scapes 6 inches high.

For previous introduction see No. 66533.

69906. *ALLIUM YUNNANENSE* Diels.

A caespitose onion, native to southwestern China, with linear leaves about 6 inches long and pink or purplish flowers on a scape 4 to 16 inches long.

For previous introduction see No. 66535.

69907 to 69909. *ASTRAGALUS* spp. Fabaceae.

69907. *ASTRAGALUS FRIGIDUS* (L.) A. Gray. Milk vetch.

A perennial upright or ascending plant, entirely unbranched or with very few branches. Native to alpine slopes throughout northern Europe and Asia.

For previous introduction see No. 66518.

69908. *ASTRAGALUS PENDULIFLORUS* Lam.

A hardy herbaceous perennial up to 20 inches high, native to the alpine regions of central Europe.

69909. *ASTRAGALUS WULFENI* Koch.

An erect hardy herbaceous perennial, native to southwestern Europe.

69910. *BETA PATELLARIS* Moq. Chenopodiaceae.

69899 to 69931—Continued.

A Canary Island relative of the common beet (*Beta vulgaris*); it grows in sandy places along the shores of the islands.

For previous introduction see No. 30977.

69911. CHIONODOXA LUCILIAE Boiss. Liliaceae. **Glory-of-the-snow.**

Locally-grown seeds from Edinburgh, Scotland.

For previous introduction see No. 66458.

69912. CORYDALIS CHEILANTHIFOLIA Hemsl. Papaveraceae.

A tuberous-rooted perennial, with pale-yellow flowers. Native to central China.

69913. CRAMBE CORDIFOLIA Stev. Brassicaceae.

A herbaceous, white-flowered perennial, native to desert places in the mountainous regions of the Caucasus.

For previous introduction see No. 30771.

69914 to 69916. DODECATHEON spp. Primulaceae.

69914. DODECATHEON JEFFREYI Van Houtte.

A hardy herbaceous perennial, with purple, yellow, and brown flowers, native to the wet alpine meadows of the northwestern Pacific States.

69915. DODECATHEON LEMOLNEI Hort.

Variety *excelsum*. A hardy herbaceous perennial, a hybrid between *Dodecatheon ellipticum* and *D. jeffreyi*.

69916. DODECATHEON PAUCIFLORUM Greene.

A hardy herbaceous perennial, about 7 inches high, with oval or oblong leaves and purple flowers. Native to the northwestern United States and British Columbia.

69917. ERODIUM WILKOMIANUM Hort. Geraniaceae.

69918 to 69920. IRIS spp. Iridaceae.

69918. IRIS DELAVAYI Micheli.

An iris, 2 to 4 feet high, with violet and white flowers. Native to southwestern China.

69919. IRIS SIBIRICA L.

A compact tufted iris, native to central Europe and eastern Siberia. It has narrow green leaves 1 to 2 feet long, which are not rigid, and small clusters of violet and blue flowers borne on a tall slender stem.

69920. IRIS VERSICOLOR L.

A stout-stemmed iris, up to 2 feet high, native to Canada and the northwestern United States. It has sword-shaped leaves and violet-blue flowers variegated with green, yellow, and white toward the center.

69921. LEUCOJUM TRICHOPHYLLUM Schousb. Amaryllidaceae.

This graceful, bulbous plant, 2 feet high, with its white, hanging flowers, three or four on each stem, gives a delicate touch to the border. (Note under No. 64987 by David Fairchild.)

69899 to 69931—Continued.

For previous introduction see No. 64937.

69922 to 69927. LILIUM spp. Liliaceae.

69922. LILIUM DUCHARTREI Franch.

A western Chinese lily, 2 to 3 feet high, having white flowers tinged with rose.

69923 to 69925. LILIUM MARTAGON L. **Martagon lily.**

For previous introduction see No. 66470.

69923. Locally grown seeds.

69924. Var. album. A white-flowered form.

69925. Var. album punctatum. A white-flowered form with spots.

69926. LILIUM PYRENAICUM Gouan. **Lily.**

A European lily about 2 feet high, with dark-yellow flowers. Native to the Pyrenees.

69927. LILIUM WILLMOTTIAE Wilson.

A Chinese lily, 3 to 4 feet high, with orange-red, dark-spotted flowers.

69928 to 69930. ORNITHOGALUM spp. Liliaceae.

69928. ORNITHOGALUM NARBONENSE L.

Variety *pyramidale*. A bulbous plant, 2 to 3 feet high, with white and green flowers.

69929. ORNITHOGALUM OLIGOPHYLLUM Clarke.

A bulbous plant, about 5 inches high, with white and green flowers. Native to Asia Minor.

69930. ORNITHOGALUM PYRENAICUM L. **Star of Bethlehem.**

A bulbous plant, about 2 feet high, with greenish flowers, native to Europe.

69931. TRITOMA NATALENSIS (Baker) Skeels (*Kniphofia natalensis* Baker). Liliaceae. **Torch lily.**

A South African torch lily 2 to 3 feet high, with linear leaves and yellow flowers in a rather loose raceme about 7 inches long.

For previous introduction see No. 32971.

69932 to 70253.

From Manchuria. Seeds obtained by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry, through the cooperation of D. McLorn, Postal Commissioner, Harbin. Received November and December, 1926.

69932 to 70038. PHASEOLUS spp. Fabaceae.

69932. PHASEOLUS ANGULARIS (Willd.) W. F. Wight. **Adzuki bean.**

No. 7139. From Tienpaoshan, Kirin Province. September, 1926.

69933 to 69935. PHASEOLUS AUREUS Roxb. **Mung bean.**

Locally grown seeds collected in September, 1926.

69932 to 70253—Continued.

69933. No. 6780. From Mushihho, Kirin Province.
 69934. No. 6784. From Ssuchatzu, Kirin Province.
 69935. No. 6788. From Fuyuhshien, Kirin Province.
 69936. No. 6792. From Shulanpaitun, Kirin Province.
 69937. No. 6796. From Wuchangchu.
 69938. No. 6800. From Ahcheng.
 69939. No. 6904. From Hsiangyangpao, Kirin Province.
 69940. No. 6808. From Wangching.
 69941. No. 6812. From Ching kang.
 69942. No. 6816. From Kirin, Kirin Province.
 69943. No. 6820. From Malienkensang, Heilungkiang Province.
 69944. No. 6822. From Mahao, Kirin Province.
 69945. No. 6826. From Chiamussu.
 69946. No. 6830. From Hailar. Mung beans are said not to be grown in Hailar. Probably these seeds originally came from some other section.
 69947. No. 6833. From Mishan.
 69948. No. 6837. From Shulan.
 69949. No. 6841. From Kuanmashan.
 69950. No. 6845. From Lungchingtsun.
 69951. No. 6849. From Tatzuching.
 69952. No. 6852. From Chaochusiehtang, Heilungkiang Province.
 69953. No. 6856. From Chungshingchen, Heilungkiang Province.
 69954. No. 6860. From Wukeshu, Kirin Province.
 69955. No. 6864. From Pachitieh.
 69956. No. 6868. From Hsinlichen-shulan, Kirin Province.
 69957. No. 6872. From Heiershu.
 69958. No. 6875. From Tanguang.
 69959. No. 6879. From Wangtechuchingtzu.
 69960. No. 6914. From Chihshienchen, Kirin Province.
 69961. No. 6925. From Shengpingchen, Heilungkiang Province.
 69962. No. 7094. From Yungtsingyuan, Kirin Province.
 69963. No. 7102. From Shanhowan, Kirin Province.
 69964. No. 7106. From Hsiaosan-chakon, Kirin Province. Seeds of the 1925 crop.
 69965. No. 7110. From Hsiaoshuangchingpu, Kirin Province.
 69966. No. 7114. From Chaochou.
 69967. No. 7118. From Tailaichi.
 69968. No. 7122. From Chaoyangshan, Kirin Province.

69932 to 70253—Continued.

69969. No. 7126. From Ningkuta.
 69970. No. 7130. From Hsingjenchen, Heilungkiang Province.
 69971. No. 7134. From Hsiao-ching-tzu, Kirin Province.

70254 to 70281.

From China. Seeds and scions collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received December 22, 1926.

70254. *CASTANEA HENRI* Rehd. and Wils. Fagaceae. Chestnut.

No. 867. *Tuk lut tsz* (solitary chestnut seed). Seeds obtained from a tree at Chinghwa-shaan, Anhwei Province. November 2, 1926. A Chinese chestnut which, as described in *Plantae Wilsonianae* (vol. 3, p. 196), is a deciduous tree 25 to 90 feet tall, with oblong-lanceolate, long-acuminate leaves, green on both sides. The burs are either solitary or two or three in a bunch and contain usually but one nut.

For previous introduction see No. 66036.

70255. *CITRUS ICHANGENSIS* Swingle. Rutaceae. Ichang lemon.

No. 871. Seeds from fruits obtained in the market at Nanking and said to have originally come from Kinkiang. November, 1926. *Heung iuen*. A spiny shrub or small tree 5 to 15 feet high, native to central and southwestern China. It differs from other members of the genus chiefly in its large, thick seeds and its slender leaves, which are four to six times longer than broad. It is also one of the hardest species of *Citrus* known. The fruits are very seedy and quite acid.

For previous introduction see No. 62349.

70256 to 70275. *DIOSPYROS KAKI* L. f. Diospyraceae. Kaki.

Scions of locally-grown varieties from Anhwei Province.

70256 to 70258. Mission Hospital Compound, Luchowfu. October 9, 1926.

70256. No. 731. Tree No. 6.

70257. No. 732. Tree No. 7.

70258. No. 733. Tree No. 12.

70259 to 70262. Seedless varieties from the garden of A. C. Bro, Luchowfu. October 10, 1926.

70259. No. 734. Tree No. 1.

70260. No. 735. Tree No. 2.

70261. No. 736. Tree No. 4.

70262. No. 737. Tree No. 5.

70263. No. 739. Shuching. October 13, 1926. *Hung shiu laat tsu*. A small, subglobular, seedless or few-seeded early variety with sweet flesh fairly free from fibers. The fruits are ripened artificially, becoming bright red.

70264. No. 740. Shuching. October 13, 1926. *Shiu sz paan tsz tsz*. A seedless squarish variety.

70265. No. 741. Shuching. October 13, 1926. *Hop tsz, kuan hop tsz*. The very large, flattened, squarish fruits are ripened artificially, becoming pale yellow. They are seedless or few-seeded and the flesh is very coarse and stringy, but of fair flavor. This variety is characterized by a constriction about the middle of the fruit.

70254 to 70281—Continued.

70266. No. 742. Shuching. October 13, 1926. *Maan tau tsz tsz.* A large midseason variety with sub-globular fruits which are few-seeded to seedless and have flesh of good flavor and quality. They are deep orange when ripe, rather squarish, and the apex is full to slightly raised or sometimes a little depressed. Near the calyx end of the fruits the pith is large and there appears an irregular depressed collar.

70267. No. 743. Shuching. October 13, 1926. *Pin tsz tsz.* A midseason variety producing large flattened, squarish few-seeded fruits, red-orange when ripe, with flesh of good quality and flavor.

70268. No. 744. Shuching. October 13, 1926. *Taai tso hang tsz tsz.* A variety with medium-sized, oval fruits, seedless or few-seeded, which must be ripened artificially. The flesh is of excellent flavor and quality, and the skin is thin and bright red when ripe. Another name for this variety is "big red-pepper persimmon."

70269. No. 751. Chungmuhihoh. October 17, 1926. *Shui paan tsz tsz.*

70270. No. 752. Chungmuhihoh. *Pin tsz tsz.* A late variety producing flattened, squarish fruits with the apex slightly depressed. They are seedless or few-seeded, with flesh of fine quality and flavor. At the time this bud wood was collected, October 17, 1926, the foliage of the tree was fresh and green, free from all disease, and had not commenced to fall.

70271. No. 755. Taaihohhan. October 19, 1926. *Hop tsz tsz.* The fruits of this variety are the same as those described under No. 741 [No. 70265]. They attain large dimensions, one specimen being over 4 inches in diameter. The tree is also larger than the varieties commonly found.

70272. No. 756. Taaihohhan, near the Tin River. October 22, 1926. *Paan ting tsz tsz.* A very late variety, free from disease, which keeps until April in this latitude if the branches with the fruit attached are hung up indoors. The large, square fruits, with a long-pointed square apex, are seedless, and the firm mealy flesh is of fine flavor.

70273. No. 765. Chinhwashaan. November 3, 1926. A small wild tree about 3 meters high, apparently pistillate, though the fruits were not seen.

70274. No. 766. Chinhwashaan. November 3, 1926. A small wild tree which apparently bears some staminate flowers.

70275. No. 767. Chinhwashaan. November 3, 1926. A small wild tree about 3 meters high which is apparently purely staminate.

70276. *Diospyros lotus* L. *Diospyraceae.* **Persimmon.**

No. 757. Near Taaihohhan, Anhwei Province. October 24, 1926. *Tsz tso.* Scions of a large tree, apparently a seed-

70254 to 70281—Continued.

ling, 15 meters high and 25 centimeters in diameter. The seedless fruits, with which the branches were heavily laden, are dried for winter use. The action of frost removes the astringency, and the flavor is very good. The local name means "persimmon date."

70277 to 70280. *SALIX* spp. *Salicaceae.* **Willow.**

Scions of trees growing in Anhwei Province.

70277. *SALIX* sp.

No. 761. Near Cannon Base Peak. October 27, 1926. *Tsing ning lan, pa to lan.* An ornamental tree with slender, slightly drooping branchlets and narrow leaves, growing along the streams in this locality and sometimes cultivated near ponds.

70278. *SALIX* sp.

No. 762. Cannon Base Rock. October 27, 1926. *Hung nga lan.* A rather rare willow, distinguished by red buds.

70279. *SALIX* sp.

No. 763. Pawongkaai. October 27, 1926. *Paak yeung lan.* Trees cultivated near a pond. Willow branches are extensively used in Anhwei Province to make baskets, and this species is said to be the one used.

70280. *SALIX* sp.

No. 764. Near Tungchen. October 28, 1926. *Mo yeung lan.* An uncommon willow, 3 meters high, growing wild on the bank of a pond. The young twigs are heavy and covered with a dense pale bluff tomentum.

70281. *ZIZIPHUS* sp. *Rhamnaceae.* **Jujube.**

No. 715. Shuching, Anhwei Province. October 13, 1926. Plants of a variety said to be the only one in Shuching which produces large fruits.

70282 to 70313.

From Manchuria. Seeds and scions obtained by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received December, 1926. Locality notes by Mr. Dorsett.

70282 to 70295. *HORDEUM VULGARE* PAL-LIDUM Seringe. *Poaceae.*

Six-rowed barley.

Received through the cooperation of D. McLorn, Postal Commissioner, Harbin. September, 1926.

70282. No. 7280. From Santaokan, Kirin Province.

70283. No. 7284. From Andachan.

70284. No. 7331. From Manchiatien, Kirin Province.

70285. No. 7339. From Heishihchen, Kirin Province.

70286. No. 7359. From Lanhsi.

70287. No. 8259. From Fuchin, Kirin Province.

70288. No. 8314. From Taerha, Heilungkiang Province.

70289. No. 8317. From Shihchienfang, Heilungkiang Province.

70282 to 70313—Continued.

70290, No. 8330. From Sanchienfang.

70291, No. 8339. From Suchiawapu.

70292, No. 8382. From Hulauchichang, Kirin Province.

70293, No. 8573. From Shiherchingtzu, Heilungkiang Province.

70294, No. 8583. From Maohsing, Heilungkiang Province.

70295, No. 8611. From Chingchilai.

70296 to 70307, *ORYZA SATIVA* L. Poaceae. Rice.

Seeds obtained from the experimental field of the Chinese Eastern Railway, through F. F. Terentief, director of the land department, Chinese Eastern Railway.

70296, No. 8487. *Hao tao tzu* No. 19 (good rice No. 19).70297, No. 8488. *Su ping shih yie*.70298, No. 8489. *Ta shengomaow*.70299, No. 8490. *Kuangtung tao tzu* (Canton rice).70300, No. 8491. *Hung gomaow* No. 2.70301, No. 8492. *Hao tao tzu* No. 32 (good rice No. 32).70302, No. 8493. *Shui shih yen tao*.70303, No. 8494. *Hao tao tzu* No. 41 (good rice No. 41).70304, No. 8495. *Chang chun ah wulssu*.70305, No. 8496. *Hao tao tzu* No. 13 (good rice No. 13).70306, No. 8497. *Chieh lin ko*.70307, No. 8498. *Hung gomaow* No. 1.70308, *MALUS* sp. Malaceae. Crab apple.

No. 4813. Scions obtained from the agricultural experiment station, Harbin, through the Chinese Eastern Railway. Originally from Hudranoff. November 22, 1925.

70309 to 70313, *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceae.

Common wheat.

Received through the cooperation of D. McLorn, Postal Commissioner, Harbin.

70309, No. 7387. From Shihchuanchen, Heilungkiang Province.

70310, No. 8198. From Kemiba.

70311, No. 8204. From Tetuchen, Heilungkiang Province.

70312, No. 8254. From Tuipochan, Kirin Province.

70313, No. 8384. From Lopei, Heilungkiang Province.

70314 to 70316.

From Nanking, China. Seeds purchased through J. H. Reisner, College of Agriculture and Forestry, University of Nanking. Received December 27, 1926.

70314 and 70315, *CASTANEA MOLLISSIMA* Blume. Fagaceae. Hairy chestnut.

Hardy trees, native to northeastern China, which bear edible nuts.

70314, No. 1.

70315, No. 2.

70314 to 70316—Continued.

70316, *JUGLANS REGIA* L. Juglandaceae. Walnut.

Chinese-grown nuts from Nanking.

70317, *CASTANEA SEGUINII* Dode. Fagaceae. Chestnut.

From China. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received December 27, 1926.

No. 700. Chihwashaan, Anhwei. November, 1926. *Mo lut tsz*. A Chinese chestnut, native to east-central China, which is usually a bush or low tree, but occasionally a shapely tree up to 40 feet in height, with deep-green leaves, paler beneath, and small nuts of sweet agreeable flavor.

For previous introduction see No. 66038.

70318, *CAJANUS INDICUS* Spreng. Fabaceae. Pigeon pea.

From St. Croix, Virgin Islands. Seeds presented by J. B. Thompson, director, Agricultural Experiment Station. Received December 20, 1926.

Locally grown seeds.

70319 to 70321, *CASTANEA* spp. Fagaceae. Chestnut.

From Nanking, China. Seeds purchased through J. H. Reisner, College of Agriculture and Forestry, University of Nanking. Received December 27, 1926.

70319 and 70320, *CASTANEA HENRYI* (Skan) Rehd. and Wils.

For previous introduction and description see No. 70254.

70319, No. 1. 70320, No. 2.

70321, *CASTANEA SEGUINII* Dode.

For previous introduction and description see No. 70317.

70322 to 70336, *PRUNUS AVIUM* L. Amygdalaceae. Sweet cherry.

From Milan, Italy. Plants purchased from Fratelli Ingegnoli. Received December 30, 1926.

Italian sweet-cherry varieties, not in the trade in the United States.

70322, *Bella di Barbanti*.70323, *Bella di Toscana*.70324, *Bianco Grosso*.70325, *Bianco rosato di Piemonte*.70326, *Morreau*.70327, *Napolitana*.70328, *Nero di Tarcento*.70329, *Nero di Winkler*.70330, *Olivo*.70331, *Ciliegio duracino gigante (Nuovo)*.70332, *Bicenfenaria*.70333, *Inglese precoce*.70334, *Nera grossa di Piemonte*.70335, *Regina ortensia*.70336, *Rossa grossa di Piemonte*.

70337 to 70638.

From Manchuria. Seeds obtained by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received December, 1926.

Nos. 70337 to 70437 were received through the cooperation of D. McLorn, Postal Commissioner, Harbin.

70337 to 70339. PHASEOLUS ANGULARIS (Willd.) W. F. Wight. Fabaceae.
Adzuki bean.

70337. No. 8304. From Huapichang, Kirin Province.

70338. No. 8580. From Lienhuachen, Heilungkiang Province.

70339. No. 8593. From Tahuangti, Kirin Province.

70340 to 70412. PHASEOLUS AUREUS Roxb. Fabaceae.
Mung bean.

70740. BAMBUSA VULGARIS Schrad. Poaceae. Bamboo.

From San Gabriel, Calif. Root presented by William Herrich, San Marino ranch. Received February 7, 1920. Numbered December, 1926.

A handsome yellow-striped form of the well-known *Bambusa vulgaris*, grown throughout central Florida. It is more tender than *B. vulgaris* and will likely not withstand more than 2 or 3 degrees of frost. It should be grown in rather dry soil to secure the highest coloration.

70741. PHYLLOSTACHYS sp. Poaceae. Bamboo.

From Brooksville, Fla. Plants collected by R. A. Young, Bureau of Plant Industry. Received December 10, 1924. Numbered December, 1926.

A bamboo showing a peculiar zigzag growth of culms, found at the Plant Introduction Garden, Brooksville, Fla. It may be merely a freak, but has some potential interest as furnishing a possible source of walking sticks or canes.

70742. CLEMATIS FREMONTI S. Wats. Ranunculaceae. Fremont clematis.

From Paris, France. Plants presented by Vilmorin-Andrieux & Co. Received February 20, 1924. Numbered December, 1926.

A hardy herbaceous perennial up to 2 feet high, with oval sessile leaves 4 inches long and drooping purple flowers. Native to the western United States.

70743. CLEMATIS CHRYSOCOMA SERICEA
(Franch.) C. Schneid. Ranunculaceae.

From Paris, France. Plant obtained from Vilmorin-Andrieux & Co., through David Fairchild, agricultural explorer, Bureau of Plant Industry. Received April 26, 1926. Numbered December, 1926.

Variety *rosea*. An ornamental Chinese vine, about 20 feet high, with silky-hairy, rounded leaves and solitary or paired pinkish flowers, 3 to 4 inches in diameter.

For previous introduction see No. 63394.

70744 and 70745.

Bamboos growing on the grounds of the United States Department of Agriculture, Washington, D. C. Numbered December, 1926.

70744. PHYLLOSTACHYS AUREA Carr. Poaceae. **Golden Japanese bamboo.**

This bamboo has proved hardy in Washington for nearly 50 years. It has never reached more than 6 feet in height, probably because it is growing in poor soil. Under favorable conditions *Phyllostachys aurea* will grow to a height of 15 to 20 feet. The culms are yellowish and small, and the leaves are also small. It is a rather handsome ornamental but does not hold its green foliage in winter as well as some others.

70745. SASA JAPONICA (Sieb. and Zucc.). Makino. Poaceae. **Bamboo.**

This bamboo has flourished for nearly 50 years in Washington. It is one of the hardiest of all the bamboos, and is used extensively in landscape work as far north as Philadelphia. In parts of the South it is sometimes grown for light stakes. The plant has rather heavy foliage, the leaves being 8 to 12 inches long and 1 to 2 inches wide. It holds its green color well into the winter.

For previous introduction see No. 42651.

70746. RAPHA VINIFERA Beauv. Phoenicaceae. **Palm.**

From Peradeniya, Ceylon. Seeds collected by David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition. Received February 26, 1926. Numbered December, 1926.

No. 259. Botanic gardens, Peradeniya, January 1, 1926. The sugar or wine palm of West Tropical Africa. It is a large handsome palm with immense pinnate leaves and ornamental fruits in enormous pendent bunches 10 to 12 feet long. This is a striking species for large parks.

70747. STERCULIA DIVERSIFOLIA Don. Sterculiaceae. **Black kurrajong.**

From East Melbourne, Victoria, Australia. Seeds presented by M. Medson. Received July 17, 1920. Numbered December, 1926.

A tall evergreen ornamental tree with shining green foliage. In some parts of Australia, where the tree is native, the leaves are fed to cattle.

For previous introduction see No. 64001.

70748. CHRYSALIDOCARPUS LUCUBENSIS Beccari. Phoenicaceae. **Palm.**

From Buitenzorg, Java. Seeds presented by Dr. W. M. Docters van Leeuwen, director, botanic gardens. Received August 13, 1926. Numbered December, 1926.

A rather tall palm native to Madagascar, with elongated pinnate leaves composed of rigid swordlike segments up to 3 feet in length. The obovate fruits are about half an inch long.

For previous introduction see No. 51711.

70749. ACOKANTHERA SPECTABILIS (Sond.) Benth. Apocynaceae.

From Las Palmas, Canary Islands. Seeds collected by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received August 19, 1925. Numbered December, 1926.

July 22, 1925. A tropical tree with beautiful foliage, cultivated on seashores in regions where there is no frost. The purple fruits contain a gum which may be valuable.

For previous introduction see No. 45748.

70750. ALEURITES FORDII Hemsl. Euphorbiaceae. **Tung-oil tree.**

From Anhwei Province, China. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received December 27, 1926.

No. 702. Chungmuhoh. October 17, 1926. *Tung yau*. From a tree growing on a wooded slope. It receives little attention, and the yield is correspondingly poor.

70751 to 70753. ARACHIS HYPOGAEA L. Fabaceae. **Peanut.**

From Buitenzorg, Java. Seeds presented by Dr. L. Koch, Chief, Plant-Breeding Station for Annual Crops. Received October 25, 1926.

Locally grown seeds.

70751. Variety Toeban.

70752. Pure line No. 21.

70753. White hybrid No. 3.

70754. THYSANOLAENA MAXIMA (Roxb.) Kuntze (*T. agrostis* Nees). Poaceae. **Grass.**

From Peradeniya, Ceylon. Plants collected by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received July 19, 1926. Numbered December, 1926.

No. 873. Botanic gardens. June 9, 1926. A tropical ornamental grass 10 feet high.

70755 and 70756. CASTANEA spp. Fagaceae.

From the United States Plant Field Station, Bell, Md. Scions grafted on *Castanea crenata* seedlings.

70755. CASTANEA HENRYI (Skan) Rehd. and Wils. Chinese timber chinquapin.

70755 and 70756—Continued.

A native of central and western China, where it attains a height of 75 to 100 feet or more. It is reported as a fine timber tree, producing a nut much like our native chinquapin, but a little larger. The trees are from scions taken from a tree planted by the late Dr. Walter Van Fleet, Bell, Md., about 10 years ago. Doctor Van Fleet propagated the tree from a scion obtained from the Arnold Arboretum. All stock of this number is grafted on seedlings of the Japanese chestnut, *Castanea crenata*. The original tree of *C. henryi* at Bell has proved susceptible to blight. There is no record of blight on any of this species in China.

For previous introduction see No. 67173.

70756. *CASTANEA MOLLISSIMA* × *PUMILA*. Chestnut.

Van Fleet hybrid chestnut (S. S.). A hybrid between *Castanea mollissima*, the Chinese hairy chestnut, and *C. pumila*, the American chinquapin, produced by the late Dr. Walter Van Fleet, about 1915. The original and only tree is growing in the chestnut-tree orchard at Bell, Md. The tree is upright, vigorous, and healthy, never having shown any signs of blight. The nuts are about double the size of our native chestnut, very sweet, and palatable. Stock is from scions taken from the original tree and grafted on Japanese seedlings, *C. crenata*. Of the many chestnuts tested, including hybrids, this number is an outstanding one on account of the size and quality of its nuts and the large annual yields. It is especially promising for orchard plantings in the blight-affected districts.

70757. *ATTALEA MACROCARPA* Linden. *Phoenicaceae*. Palm.

From Buitenzorg, Java. Seeds presented by Dr. W. M. Docters van Leeuwen, director, botanic gardens. Received August 13, 1926. Numbered December, 1926.

A lofty South American palm with a spineless trunk, large pinnate leaves, and large clusters of fruits.

70758 to 70764.

From Peradeniya, Ceylon, and Singapore, Straits Settlements. Plants collected by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received July 19, 1926. Numbered December, 1926.

70758. *BROWNEA MACROPHYLLA* Masters. *Caesalpiniaceae*.

No. 886. Botanic gardens, Peradeniya. June 9, 1926. An ornamental tree whose limp flaccid pale yellowish young leaves and bright-rose flowers make it suitable for parks and gardens in the Tropics.

70759. *GARCINIA CAMBOGIA* (Gaertn.) Desr. *Clusiaceae*.

No. 895. Botanic gardens, Peradeniya. June 9, 1926. *Goraka*. During June and July the large orange-yellow fruits of this species are gathered and the segments into which the rind splits are dried in the sun, becoming black and very sour. These black segments are used to preserve fish, being made into a brine with salt and are also used instead of limes in curries. This may be valuable as a stock for the mangosteen.

70758 to 70764—Continued.

70760. *GARCINIA NIGRO-LINEATA* Planch. *Clusiaceae*.

No. 818. Botanic gardens, Singapore. May 31, 1926. A handsome park tree 40 feet high, with large leaves 6 to 8 inches long and small edible fruits.

For previous introduction see No. 68034.

70761. *IXORA MACROTHYRSA* Teysm. and Binn. *Rubiaceae*.

No. 832. Botanic gardens, Singapore. May 31, 1926. A shrub with corymbs of attractive scarlet flowers. It is accustomed to 100 inches of rainfall in this region.

70762. *MESUA FERREA* L. *Clusiaceae*.

No. 889. Botanic gardens, Peradeniya. June 9, 1926. The ironwood tree of Ceylon. A handsome street tree which produces large white magnoliolike flowers and twice a year young leaves that are extremely attractive because of their brilliant deep-pink color.

For previous introduction see No. 54687.

70763. *MONODORA TENUIFOLIA* Benth. *Anonaceae*.

No. 882. Botanic gardens, Peradeniya. June 9, 1926. *Orchid flower tree*. A tropical tree which before its leaves are fully formed produces an abundance of strangely beautiful spotted fragrant blossoms, reminding one of orchids. These blossoms quickly fade when picked and are therefore not suitable for household decoration, but the tree would grace any private garden in southern Florida.

70764. *STERCULIA LANCEOLATA* Cav. *Sterculiaceae*. Bottle tree.

No. 880. Botanic gardens, Peradeniya. June 9, 1926. A small tree with handsome bright orange-scarlet fruits.

70765. *CHAYOTA EDULIS* Jacq. (*Sechium edule* Swartz). *Cucurbitaceae*.

Chayote.

From Summit, Canal Zone. Fruits presented by Holger Johansen, Plant Introduction Garden. Received November 16, 1926.

Locally grown fruits.

70766 and 70767. *CHAYOTA EDULIS* Jacq. (*Sechium edule* Swartz). *Cucurbitaceae*. Chayote.

From Kingston, Jamaica. Fruits presented by E. Downes, acting superintendent, Hope gardens. Received December 27, 1926.

Locally grown fruits.

70766. Green variety.

70767. White variety.

70768. *CHAYOTA EDULIS* Jacq. (*Sechium edule* Swartz). *Cucurbitaceae*. Chayote.

From Moca, Dominican Republic. Fruits presented by Dr. R. Ciferri, Director, Estación Nacional Agronómica y Colegio de Agricultura. Received December 30, 1926.

Fruits grown in the Dominican Republic.

70769 and 70770. DIOSCOREA spp. Dioscoreaceae. Yam.

From Soerabaya, Java. Tubers obtained by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received July 29, 1926. Numbered October, 1926.

70769. DIOSCOREA sp.

No. 788. May 17, 1926. Small, thin-skinned tubers obtained in the native market.

70770. DIOSCOREA sp.

No. 790. Obtained in the native market, May 17, 1926.

70771 and 70772. DIOSCOREA spp. Dioscoreaceae. Yam.

From San Pedro, Honduras. Tubers presented by H. A. Dike. Received November 17, 1926.

70771. DIOSCOREA sp.

A variety with prickly stems.

70772. DIOSCOREA sp.

A variety with yellow-fleshed tubers.

70773 to 70776. IPOMOEA BATATAS (L.) Poir. Convolvulaceae. Sweet potato.

From Buitenzorg, Java. Tubers presented by Dr. L. Koch, Chief, Plant-Breeding Station for Annual Crops. Received October 25, 1926.

Locally developed varieties.

70773. Variety Oebi Saboelan.**70774. Variety Oebi Samarinda.****70775. Variety Oebi Tandjoeng kait.****70776. Variety Oebi Menes bodas.****70777 and 70778.**

From Ceylon. Seeds collected by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received February 26, 1926. Numbered December, 1926.

70777. ARECA TRIANDRA Roxb. Phoenicaceae. Palm.

No. 258. Peradeniya gardens. January 1, 1926. A pinnate slender-stemmed graceful palm 40 feet tall.

70778. PTYCHOSPERMA sp. Phoenicaceae. Palm.

No. 251. Peradeniya gardens. January 1, 1926. A fan palm, not over 20 or 25 feet high, with clusters of graceful slender stems.

70779 and 70780.

From Sumatra. Seeds collected by David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition. Received April and May, 1926. Numbered December, 1926.

70779. (Undetermined.)

No. 689. Between Kabandjahe and Koto Tchane. March 20, 1926. A stunning ornamental, a foot and a half high, bearing red flower clusters the shape of a large club, with rows of coarse liplike scales. The flowers have the appearance of orchids.

70779 and 70780—Continued.**70780. (Undetermined.)**

No. 400. Berstagi. February 21, 1926. A small tree with small, rather narrow, long leaves and yellow fruits about the size of a pecan, with bright-red flesh surrounding an acornlike seed.

70781 to 70783.

From Ceylon and the Straits Settlements. Seeds collected by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received July, 1926. Numbered December, 1926.

70781. AMOMUM MAGNIFICUM (Roscoe) Benth. and Hook. Zinziberaceae.

No. 897. Peradeniya Botanic Gardens. June 9, 1926. A handsome plant with immense green pinnate leaves, 8 to 10 feet long, rising from a rhizome. The large pink flower heads are borne on erect stalks $2\frac{1}{2}$ to 3 feet high.

70782. STROMANTHE SANGUINEA Sond. Marantaceae.

No. 900. Peradeniya Botanic Gardens. A crimson-flowered plant from Brazil with broad leaves about a foot long, purple beneath. The flowers are borne on a scape up to 20 inches high.

70783. ARTOCARPUS GOMEZIANA Wall. Moraceae.

No. 842. Singapore Botanic Gardens. May 31, 1926. A handsome shade tree with large glossy leaves and very sour fruits, about 2 inches in diameter, which are red inside.

70784. ZANONIA sp. Cucurbitaceae.

From Sumatra. Plant collected by David Fairchild and P. H. Dorsett, agricultural explorers, Bureau of Plant Industry, with the Allison V. Armour expedition. Received May 20, 1926. Numbered December, 1926.

No. 714. Sibolangit Botanic Gardens. March 26, 1926. A large ornamental tropical vine with large fleshy leaves, white flowers, and gourdlike fruits. Native to Sumatra.

70785. EUGENIA GRANDIS Wight. Myrtaceae.

From Straits Settlements. Seeds collected by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received July 29, 1926. Numbered December, 1926.

No. 837. Singapore Botanic Gardens. May 31, 1926. A very handsome street tree with grassy green foliage, straight stems, and a dense crown.

70786. EREMOCHLOA OPHIUROIDES (Munro) Hack. Poaceae.

Centipede grass.

From China. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received October 29, 1926.

No. 621. Collected on the island of Honam, near the Canton Christian College, Canton, during July and August, 1926. This variety was growing on rolling land not under cultivation, but constantly pastured and cut over by hunters of fuel. The

grass has never been grown artificially here by means of seed, but it can doubtless be grown by following the usual practices observed in sowing lawn grasses.

For previous introduction see No. 65839.

70787. PRUNUS SUBHIRELLA PENDULA
(Sieb.) Tanaka. Amygdalaceae.

Rosebud cherry.

From California. Seedling trees, originally from the residence of David Fairchild, North Chery Chase, Md., now growing at the Plant Introduction Garden, Chico, Calif. Numbered December, 1926.

A hardy ornamental Japanese tree, usually not more than 9 meters high, with slender pendulous branches, narrowly oval leaves up to 7 centimeters long, and single flowers up to 2.5 centimeters across, and varying in color from deep pink to almost white. The black fruits are about 7 millimeters in diameter. There are two trees at Chico, one north of cottage No. 1 and one in row 20, tree 21, new test orchard.

70788 to 70867.

From Manchuria. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received November and December, 1926.

70788. QUERCUS MONGOLICA Fisch. Fagaceae. Oak.

No. 6756. Originally from the vicinity of Ertseandiantzy. September 28, 1926. A hardy Manchurian oak, up to 100 feet in height, with dark-green coarsely toothed leaves. Obtained through the Manchurian Research Society.

For previous introduction see No. 65676.

70789 to 70867. HORDEUM VULGARE PAL-LIDUM Seringe. Poaceae.

Six-rowed barley.

Numbers 70789 to 70855 were received through the cooperation of D. McLorn, Postal Commissioner, Harbin.

70789. No. 7288. From Anda, Heilungkiang Province.

70790. No. 7292. From Chalukoupei.

70815. No. 8166. From Keshan.

70816. No. 8168. From Lintien.

70817. No. 8175. From Kouchientun, Kirin Province.

70818. No. 8176. From Hala, Heilungkiang Province.

70819. No. 8183. From Omru, Kirin Province.

70820. No. 8188. From Motzusan-ching, Heilungkiang Province.

70821. No. 8193. From Chulien, Heilungkiang Province.

70822. No. 8195. From Paiyangmu, Heilungkiang Province.

70823. No. 8199. From Kemiha.

70824. No. 8207. From Tetuchen, Heilungkiang Province.

70825. No. 8212. From Kayaho, Kirin Province.

70826. No. 8215. From Feikotu, Kirin Province.

70827. No. 8222. From Huashullutzu, Kirin Province.

70828. No. 8227. From Changling, Kirin Province.

70829. No. 8230. From Mulingchan, Kirin Province.

70830. No. 8243. From Haifengchen, Heilungkiang Province.

70831. No. 8246. From Peichengchen, Kirin Province.

70832. No. 8252. From Talai, Heilungkiang Province.

70833. No. 8256. From Tuipochan, Kirin Province.

70834. No. 8264. From Mulan, Heilungkiang Province.

70835. No. 8271. From Chinyinpieh-kuotzu, Kirin Province.

70836. No. 8273. From Hsiaoehingtzu, Kirin Province.

70837. No. 8276. From Huma, Heilungkiang Province.

70838. No. 8280. From Chialuho, Kirin Province.

70788 to 70867—Continued.

70839. No. 8286. From Changchunling, Kirin Province.
70840. No. 8289. From Tasanchiatzu.
70841. No. 8291. From Piahokoutzu, Kirin Province.
70842. No. 8295. From Ertaihan, Heilungkiang Province.
70843. No. 8301. From Lafachen, Kirin Province.
70844. No. 8308. From Liaotientzu, Kirin Province.
70845. No. 8334. From Changchiati-yingtzu, Heilungkiang Province.
70846. No. 8344. From Sanlingtun, Kirin Province.
70847. No. 8345. From Maoershan.
70848. No. 8364. From Chiuchan, Kirin Province.
70849. No. 8369. From Hoyen, Kirin Province.
70850. No. 8372. From Kuanyinshan, Heilungkiang Province.
70851. No. 8376. From Chaoyangchen, Heilungkiang Province.
70852. No. 8383. From Lopei, Heilungkiang Province.
70853. No. 8389. From Kaoshantung, Kirin Province.

70788 to 70867—Continued.

70854. No. 8393. From Mingshiuhsien.
70855. No. 8395. From Tungkuanchen, Heilungkiang Province.

Nos. 70856 to 70859 were obtained from the experimental field of the Chinese Eastern Railway through F. F. Terentieff, director of the land department.

70856. No. 8460. *Gonashichiha* No. 9.
70857. No. 8461. *Gonashichi* No. 8.
70858. No. 8462. *Malaweiha*.
70859. No. 8467. *Shiwalitsenpolako* No. 20.

Nos. 70860 to 70867 were obtained through the cooperation of D. McLorn, Postal Commissioner, Harbin.

70860. No. 8564. From Waupaochan, Kirin Province.
70861. No. 8567. From Wauchinta.
70862. No. 8576. From Lohushan.
70863. No. 8598. From Hsiaoyushu, Heilungkiang Province.
70864. No. 8602. From Shihermachiatze, Kirin Province.
70865. No. 8604. From Chihsingho.
70866. No. 8608. From Tachiakou, Kirin Province.
70867. No. 8618. From Sautakang, Kirin Province.

INDEX OF COMMON AND SCIENTIFIC NAMES

- Acacia* sp., 69366.
Acanthopanax senticosum, 69400.
Acer barbinerve, 69876, 69877.
 caudatum ukurunduense, 69880.
 ginnala, 69112, 69878.
 mandshuricum, 69879.
 segmentosum, 69401.
Acokanthera spectabilis, 70749.
Actinidia arguta, 69359.
 kolomikta, 69881.
Albizia lucida, 69144.
Aleurites fordii, 70750.
 Alfalfa. See *Medicago falcata*.
Allium albopilosum, 69899.
 beesianum, 69900.
 cardiostemon, 69901.
 kansuense, 69902.
 moly, 69903.
 narcissiflorum, 69904.
 ostrowskianum, 69905.
 yunnanense, 69906.
Anomum magnificum, 70781.
Amygdalus kansuensis, 68976.
 Apricot. See *Prunus armeniaca*.
 Japanese. See *P. mume*.
Arachis hypogaea, 68961, 70751-70753.
Aralia elata, 69882.
Arca triandra, 70777.
Aristolochia sp., 68962.
Artocarpus gomeziana, 70783.
Arundinaria brevipaniculata, 69384.
Asimina triloba, 69166.
Astragalus frigidus, 69907.
 penduliflorus, 69908.
 wulfenii, 69909.
Atalantia glauca. See *Eremocitrus glauca*.
Attalea cohune, 69063.
 macrocarpa, 70757.
Avena fatua, 69126.
 sativa, 69823-69827, 70039.
 Avocado. See *Persea americana*.

 Bamboo. See *Arundinaria brevipaniculata*,
 Bambusa vulgaris, *Phyllostachys* sp.,
 and *Sasa japonica*.
 Golden Japanese. See *Phyllostachys aurea*.
Bambusa vulgaris, 70740.
 Barley. See *Hordeum* spp.
 Bean, adzuki. See *Phaseolus angularis*.
 common. See *P. vulgaris*.
 mung. See *P. aureus*.
 Scarlet Runner. See *P. coccineus*.
 Berseem. See *Trifolium alexandrinum*.
Beta patellaris, 69910.
Borassus flabellifer, 68996.
 Bottle tree. See *Sterculia lanceolata*.
Bradburyi plumieri, 69145.
 pubescens, 69146.
Brassica sp., 69127.
 Broad bean. See *Vicia faba*.
Brounea macrophylla, 70758.
 Buckthorn, Dahurian. See *Rhamnus davurica*.
 Buckwheat. See *Fagopyrum vulgare*.
 Kangra. See *F. tataricum*.
 Bush clover, shrub. See *Lepedeza bicolor*.

Caesalpinia coriaria, 69045, 69397.
Cajanus indicus, 70318.
Calopogonium mucunoides, 69118.
Calyptracalyx spicata, 69001.
 Cascarilla. See *Croton eluteria*.
Cassia bicapsularis, 69147.
 papuana, 69148.
 quinquangulata, 69149.
 rotundifolia, 69150.
 timoriensis, 69151.

Castanea henryi, 70254, 70319, 70320, 70755.
 mollissima, 69536, 70314, 70315.
 mollissima × *pumila*, 70756.
 seguinii, 70317, 70321.
Centrosema plumieri. See *Bradburya plumieri*.
 pubescens. See *B. pubescens*.
Chaetochloa italica, 69779-69788, 69828, 69829, 70040.
Chamaedorea tepejilote, 68975.
Chayota edulis, 69713, 70765-70768.
 Chayote. See *Chayota edulis*.
 Cherry. See *Prunus glandulosa*.
 Japanese flowering. See *Prunus serotata*, *P. sieboldii*, *P. subhirtella*, and *P. yedoensis*.
 Manchu. See *P. tomentosa*.
 rosebud. See *P. subhirtella pendula*.
 sweet. See *P. avium*.
 Yoshino. See *P. yedoensis*.
 Chestnut. See *Castanea* spp.
 Chinese hairy. See *C. mollissima*.
Chionodoxa lucilae, 69911.
Chrysaliocarpus lucubensis, 70748.
Circaea cordata, 69402.
Citrullus vulgaris, 69883.
Citrus sp., 68978.
 aurantifolia, 69022.
 decumana. See *C. grandis*.
 grandis, 68998, 68999.
 ichangensis, 70255.
 Clematis, Fremont. See *Clematis fremonti*.
Clematis chrysocoma sericea, 70743.
 fremonti, 70742.
Clitoria heterophylla, 69152.
 Clover. See *Trifolium* spp.
 alsike. See *T. hybridum*.
 crimson. See *T. incarnatum*.
 red. See *T. pratense*.
 white. See *T. repens*.
 Cohune. See *Attalea cohune*.
 Cophue. See *Lapageria rosea*.
 Corn. See *Zea mays*.
Cornus suecica, 69355.
Coronilla scorpioides, 69850.
Corydalis cheilanthifolia, 69912.
Corylus heterophylla, 69877, 69403, 69884.
 maxima, 69377, 69378.
 sieboldiana mandshurica, 69885.
Cotoneaster rotundifolia lanata, 69376.
 Cotton. See *Gossypium* spp.
 Crab apple. See *Malus* spp.
Cracca vogelii, 68963.
Crambe cordifolia, 69913.
Crataegus pinnatifida, 69886, 69887.
Crotalaria anagyroides, 69119.
 usaramoensis, 69120.
Croton eluteria, 69065.
Crupina vulgaris, 69851.
 Cupang. See *Parkia timoriana*.
 Currant. See *Ribes manshuricum*.
Cynanchum vincetoxicum, 69864.
Cynosurus echinatus, 69852.

Davidia involucrata, 69872.
 Day lily. See *Hemerocallis* sp.
Deguelia dalbergioides, 69111.
 trifoliata, 69379.
Derris dalbergioides. See *Deguelia dalbergioides*.
 uliginosa. See *Deguelia trifoliata*.
 Desert candle. See *Eremurus himalaicus* × *robustus*.
Dioscorea spp., 69067-69077, 70769-70772.
 alata, 69066, 69385.
Diospyros sp., 69541.
 kaki, 69372, 69537-69540, 70256-70275.
 lotus, 70276.

- Divi-divi. See *Caesalpinia coriaria*.
Dodecatheon jeffreyi, 69914.
lemoinei, 69915.
pauciflorum, 69916.
Elaeocarpus grandiflorus, 69153.
treubii, 69154.
Ephedra fragilis, 69035.
helvetica, 69036.
Eremochloa ophiuroides, 70786.
Eremocitrus glauca, 69875.
Eremurus himalaicus, 69356.
himalaicus \times *robustus*, 68979.
Erodium wilkomianum, 69917.
Erythrina fusca, 69155.
Eugenia grandis, 70785.
Euonymus sp., 68981.
Euphorbia serrata, 69853.
Fagopyrum esculentum. See *F. vulgare*.
tataricum, 69128.
vulgare, 69129.
Ficus sp., 69171.
carica, 69009-69019.
 Fig. See *Ficus carica*.
 Filbert. See *Corylus maxima*.
Franklinia alatamaha, 69037.
Garcinia cambogia, 70759.
nigro-lineata, 70760.
Gladiolus sp., 69898.
segetum, 69854.
 Glory-of-the-snow. See *Chionodoxa lucillae*.
Glycine hispida. See *Soja max*.
Gordonia pubescens. See *Franklinia alatamaha*.
Gossypium spp., 69007, 69046-69049.
hirsutum, 68958-68960.
stocksii, 69374.
tomentosum, 69109.
 Grape, Amur. See *Vitis amurensis*.
 Grapefruit. See *Citrus grandis*.
 Grass. See *Cynosurus echinatus*, *Eremochloa ophiuroides*, *Manisuris exaltata*, and *Thysanolaena maxima*.
 Guava. See *Psidium guajava*.
 Hawthorn. See *Crataegus pinnatifida*.
 Hazel. See *Corylus* spp.
Hemerocallis sp., 68982.
 Honeysuckle. See *Lonicera maackii*.
Hordeum vulgare coeleste, 69130-69133, 69844.
vulgare nigrum, 69845.
vulgare pallidum, 69027, 69028, 69051, 69134, 69135, 69289, 69404-69444, 69550-69704, 69789-69811, 69848, 70282-70295, 70789-70867.
Hypericum ascyron, 69095.
Ilex paraguariensis, 69865.
Impatiens sp., 69114.
nolitangere, 69113.
 Indigo. See *Indigofera* sp.
Indigofera sp., 68965.
Ipomoea batatas, 70773-70776.
Iris spp., 68983, 69445.
delavayi, 69918.
sibirica, 69919.
versicolor, 69920.
Itea yunnanensis, 69000.
Izora macrothyrso, 70761.
Jacquinia sp., 69169.
Jatropha curcas, 68966.
multifida, 69156.
podagrica, 69157.
Joannesia princeps, 69060.
 Joint fir. See *Ephedra* spp.
Juglans mandshurica, 69446.
regia, 70316.
 Jujube. See *Ziziphus* sp.
 Juniper, Phoenician. See *Juniperus phoenicea*.
Juniperus phoenicea, 69855.
 Kaki. See *Diospyros kaki*.

Introductory statement.....	1
Inventory.....	3
Index of common and scientific names.....	65

INTRODUCTORY STATEMENT ¹

Two agricultural explorers were in the foreign field during the period covered by this inventory, David Fairchild and F. A. McClure. Doctor Fairchild visited a number of places in northern Africa, the Canary Islands, and West Africa, while Mr. McClure continued his explorations in southeastern China. General collections were made by both in the areas visited.

As a result of the contacts established by P. H. Dorsett in Manchuria during his travels there in 1926, plant material continued to be sent in by correspondents in that Province.

W. T. Swingle, of this bureau, returned from an extensive collecting trip in China and Japan, bringing with him a large lot of living material, chiefly of citrus plants.

The botanical determinations of introductions have been made and the nomenclature determined by H. C. Skeels, and the descriptive matter has been prepared under the direction of Paul Russell, who has had general supervision of this inventory.

KNOWLES A. RYERSON,
Principal Horticulturist, in Charge.

OFFICE OF FOREIGN PLANT INTRODUCTION,
Washington, D. C., July 30, 1928.

¹ It should be understood that the names of horticultural varieties of fruits, vegetables, cereals, and other plants used in this inventory are those under which the material was received when introduced by the Office of Foreign Plant Introduction and, further, that the printing of such names here does not constitute their official publication and adoption in this country. As the different varieties are studied, their entrance into the American trade forecast, and the use of varietal names for them in American literature becomes necessary, the foreign varietal designations appearing in this inventory will be subject to change with a view to bringing the forms of the names into harmony with recognized horticultural nomenclature.

It is a well-known fact that botanical descriptions, both technical and economic, seldom mention the seeds at all and rarely describe them in such a way as to make possible identification from the seeds alone. Many of the unusual plants listed in these inventories are appearing in this country for the first time, and there are no seed samples or herbarium specimens with ripe seeds with which the new arrivals may be compared. The only identification possible is to see that the sample received resembles seeds of other species of the same genus or of related genera. The responsibility for the identifications therefore must necessarily often rest with the person sending the material. If there is any question regarding the correctness of the identification of any plant received from this office, herbarium specimens of leaves and flowers should be sent in so that definite identification can be made.

INVENTORY

70868 to 70876.

From Manchuria. Seeds obtained by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received February, 1927.

70868 to 70870. PHASEOLUS AUREUS Roxb. Fabaceae. **Mung bean.**

Obtained through the cooperation of D. McLorn, Postal Commissioner, Harbin.

70868. No. 8988. From Neugtshotzu.

70869. No. 8994. From Yunglochen.

70870. No. 8995. From Tuichingshan.

Numbers 70871 to 70873 were obtained through I. V. Kosloff, Manchurian Research Society, Harbin.

70871. PINUS SINENSIS Lambert. Pinaceae. **Chinese pine.**

No. 9045. From the station at Irecte.

For previous introduction see No. 62472.

70872. PRUNUS JAPONICA Thunb. Amygdalaceae.

No. 9046.

For previous introduction see No. 65078.

70873. PRUNUS sp. Amygdalaceae. **Plum.**

No. 9044. From the station at Siaoling.

70874 to 70876. SOJA MAX (L.) Piper (*Glycine hispida* Maxim.) Fabaceae. **Soy bean.**

Numbers 70874 and 70875 were obtained through the cooperation of D. McLorn, Postal Commissioner, Harbin.

70874. No. 8990. From Neugtshotzu.

70875. No. 8997. From Tuichingshan.

70876. No. 9015. Obtained at Foudiadiang through the Chinese Eastern Railway.

70877 and 70878. PHYLLOSTACHYS spp. Poaceae. **Bamboo.**

From Avery Island, La. Plants presented by E. A. McIlhenny, jungle gardens, through R. A. Young, Bureau of Plant Industry. Numbered March, 1927.

70877. PHYLLOSTACHYS sp.

This bamboo grows from 20 to 25 feet high and spreads by means of creeping rootstocks similar to those of the giant timber bamboo. It is somewhat cold resistant and will probably be hardy throughout Florida, southern Mississippi, Alabama, and Louisiana. These plants are from stock introduced by the late Frank N. Meyer in 1908. They were collected by him near Tangsi, China, and sent to Chico, Calif. Some of the plants were sent to E. A. McIlhenny, Avery Island, La., who has grown the stock for nearly 20 years. All other plantings appear to have been lost. It is a useful species chiefly on account of its edible shoots, which Mr. McIlhenny considers superior to any other form grown by him.

70878. PHYLLOSTACHYS EDULIS (Carr.) H. de Lehaie.

70877 and 70878—Continued.

A strong-growing, beautiful bamboo with culms 60 to 70 feet in height. It does best in rich soil and will be hardy in most of the South Atlantic and Gulf Coast States. Groves are already established at several places in this country, notably Anderson, S. C., and Avery Island, La. It is more difficult to propagate than the giant timber bamboo, but it is worthy of widespread use for its beauty, its fine poles, and its edible shoots.

70879 to 70883. TRIFOLIUM PRATENSE L. Fabaceae. **Red clover.**

From Ipswich, England. Seeds purchased from A. H. Sadd, Eastern Counties Farmers' Cooperative Association. Received March 3, 1927.

Locally grown seeds.

70879. No. 217. Special stock, broad-leaved red clover.

70880. No. 218. "Clover-sick" resisting red clover.

70881. No. 675. Finest perennial red clover.

70882. No. 677. Fine, late-flowering red clover.

70883. No. 684. Genuine single cut cowgrass.

70884 to 70890. CAJANUS INDICUS Spreng. Fabaceae. **Pigeon pea.**

From San Juan, Porto Rico. Seeds presented by O. W. Barrett, agricultural director, Department of Agriculture and Labor. Received March 2, 1927.

Locally grown varieties.

70884. No. 107. *India.*

70885. No. 278. *Blanco Pequeno.*

70886. No. 280. *Colmeno.*

70887. No. 282. *Blanco grande.*

70888. No. 285. *Chagaro.*

70889. No. 813. *Dominica.*

70890. No. 4258. *Salvador.*

70891. PYRUS sp. Malaceae. **Pear.**

From Manchuria. Scions collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received January 2, 1926. Numbered March, 1927.

No. 4718. Ta Lu Hua Temple, Kuangning. November 7, 1925. *Pa li hsiang li* (8 miles fragrant pear). Scions of one of the four pears which are said to be the best and most blight resistant of the Chinese pears. The fruits, 1½ to 2 inches in diameter, are half red and half yellow and ripen in September.

70892. CAJANUS INDICUS Spreng. Fabaceae. **Pigeon pea.**

From Lyallpur, India. Seeds presented by R. S. L. Jai Chan Luthra, associate professor of botany, Punjab Agricultural College. Received March 4, 1927.

Locally grown seeds.

70893. SYRINGA VELUTINA Komarow.
Oleaceae. Lilac.

From Dropmore, Manitoba, Canada. Seeds presented by F. L. Skinner. Received January 23, 1927.

A charming shrub with pale-pink, deliciously fragrant flowers. In height it ranges from 4 to 8 feet. It is native to Chosen and is very hardy.

For previous introduction see No. 63385.

70894. ERICA MULTIFLORA L. Erica-
ceae. Heath.

From Brignoles, France. Seeds presented by R. Salgues, director, botanic station. Received February 28, 1927.

An ornamental European shrub which probably requires an acid soil.

70895 to 70927.

From Africa and the Canary Islands. Seeds collected by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received February, 1927.

70895. ADANSONIA DIGITATA L. Bombacaceae.
Baobab.

No. 960. Georgetown, McCarthy Island, Gambia. January 6, 1927. The famous baobab tree of West Africa which at one time held the record for being the largest in diameter, 30 feet or so, and which grows to a very old age. The bark is used in making fiber for ropes, and the white arillus around the seeds has a cream-of-tartar taste.

For previous introduction see No. 59673.

70896. ALBIZZIA CHEVALIERI Harms. Mimosaceae.

No. 989. Near Kudang, Gambia River. January 7, 1927. A small but handsome tree with attractive feathery foliage. It endures very dry weather.

70897. AMARALLIA BIGNONIAEFLOREA Welw.
Rubiaceae.

No. 1129. Jala, Sierra Leone. January 20, 1927. A rather rare scandent shrub or tree with white and purple flowers or orange variegated with purple. The stems are used for tying material; the edible fruits are called gumatetei.

70898. CASSIA LAEVIGATA Willd. Caesalpiniaceae.
Smooth senna.

No. 1127. Jala, Sierra Leone. January 21, 1927. A smooth senna used at the Jala Experiment Station as a cover crop.

For previous introduction see No. 67681.

70899. CASSIA SIEBERIANA DC. Caesalpiniaceae.

No. 998. En route from Konakry to Fore Carial, French Guinea, January 16, 1927. A drought-resistant tree about 25 feet high, with attractive foliage and long slender black pods.

70900. CISTUS SYMPHYTIFOLIUS Lam. Cistaceae.
Rockrose.

No. 929. December 24, 1926. Orotava, Teneriffe, Canary Islands. A handsome native shrub. The abundance of rich rose-red flowers makes this a very striking ornamental. It can be propagated by cuttings.

70901. CONVULVULUS FLORIDUS L. f. Convolvulaceae.

No. 928. Orotava, Teneriffe, Canary Islands. December 24, 1926. A very attractive bushy shrub which produces large clusters of small white flowers. It probably requires an acid soil, but grows in fairly dry situations.

70895 to 70927—Continued.**70902. CROTALARIA RETUSA L. Fabaceae.**

No. 987. Bathurst, Gambia. January 10, 1927. A plant which grows wild in this section.

For previous introduction see No. 64061.

70903. CROTALARIA sp. Fabaceae.

No. 1120. Jala, Sierra Leone. A large-podded species.

70904. DETARIUM SENEGALENSE Gmel. Caesalpiniaceae.

No. 1107. Near Abuko, Gambia. January 10, 1927. A leguminous fruit tree with green-fleshed fibrous fruits about 1½ inches in diameter.

70905. ERAGROSTIS sp. Poaceae. Grass.

No. 984. A grass growing in a dried rice field in Georgetown, Gambia, which appeared promising as a hay crop for similar clay soils in the South.

70906. GOSSYPIUM sp. Malvaceae. Cotton.

No. 974. En route from Georgetown to Kuntaur. January 10, 1927. A cultivated cotton of the Gambia region.

70907. GOSSYPIUM sp. Malvaceae. Cotton.

No. 1103. Obtained at the market at Bathurst, Gambia. January 10, 1927. This cotton may be a native species.

70908. HAKEA LAURINA R. Br. Proteaceae.
Sea-urchin hakea.

No. 927. A handsome Australian species with brilliant wine-red flower heads; found growing on dry volcanic soil near the sea.

For previous introduction see No. 65719.

70909. INDIGOFERA sp. Fabaceae. Indigo.

No. 1114. Taimai, near Jala, Sierra Leone. January 20, 1927. A tall-growing, heavy-seeding species which may have been introduced here.

70910. LAGENARIA LEUCANTHA (Duchesne) Rusby (L. vulgaris Seringe). Cucurbitaceae.
Gourd.

No. 993. Near Cape St. Mary, Gambia. January 10, 1927. An enormous calabash gourd used extensively in Gambia as a household utensil. The fruits must be mature before they are picked, and the half gourds must be dried out slowly or they will crack.

70911. LANDOLPHIA sp. Apocynaceae.

No. 1113. Near Jala, Sierra Leone. January 21, 1927. A species found in lateritic sand, which may be of value for its rubber. The yellow fruits, 1½ inches in diameter, have white flesh with a rather refreshing flavor.

70912. MIMOSA DINKLAGEI Harms. Mimosaceae.

No. 1123. Jala, Sierra Leone. January 20, 1927. A forest tree, 60 feet in height, with a spreading habit and typical mimosalike leaves. It should make a splendid shade tree, but probably requires a good deal of moisture.

70913. OLYRA LATIFOLIA L. Poaceae. Grass.

No. 1119. Jala, Sierra Leone. January 21, 1927. A handsome broad-leaved bamboosike perennial grass, sometimes 15 feet high, with panicles 4 to 6 inches long.

For previous introduction see No. 47028.

70914 to 70917. PANICUM spp. Poaceae. Grass.**70914. PANICUM APHANONEURUM Stapf.**

No. 982. En route from Cape St. Mary to Abuko, Gambia. January 11, 1927. A perennial grass, 6 feet high, which is extremely beautiful when in flower. It is a little coarse

70895 to 70927—Continued.

for hay, but of some value as green forage. This grass makes a pure stand in fields which are flooded in the rainy season.

70915. *PANICUM* sp.

No. 983. Georgetown, McCarthy Island, Gambia.

70916. *PANICUM* sp.

No. 1104. Konakry, French Guinea. January 15, 1927. A grass, probably an annual, which is handsome when in bloom. It seems very promising for hay and is used in this region for cattle.

70917. *PANICUM* sp.

No. 1125. En route from Cape St. May to Abuko, Gambia. January 10, 1927. A grass from cultivated fields, abandoned for a season, which may make a good hay crop because of its stooing habit, soft foliage, and tender stems.

70918 and 70919. *PENNISETUM SETOSUM* (Swartz) L. Rich. Poaceae. Grass.

A stout perennial grass, 2 to 4 feet high, distributed throughout the Tropics and often used as forage.

For previous introduction see No. 58037.

70918. No. 999. Konakry, French Guinea. January 15, 1927.

70919. No. 999a. Konakry, French Guinea. January 15, 1927.

70920. *PROSOPIS OBLONGA* Benth. Mimosaceae.

No. 988. From dry land opposite Georgetown, on the Gambia River. January 9, 1927. A hard-wooded leguminous tree, 70 feet high, which appears of promise as an avenue tree because of its attractive habit.

70921. *RHYNCHOSIA CALYCINA* Guill. and Perr. (*Dolicholus calycinus* Hiern). Fabaceae.

No. 1124. Jala, Sierra Leone. January 21, 1927. An attractive climbing shrub with masses of bright-red flowers in dense racemes 3 to 4 inches long.

70922. *STERCULIA TRAGACANTHA* Lindl. Sterculiaceae.

No. 992. Between Fore Carial and Konakry, French Guinea. January 16, 1927. A tree 40 to 50 feet high with attractive leathery leaves and clusters of brilliant scarlet fruits containing smooth black seeds.

70923. *STIZOLOBIUM CINEREUM* Piper and Tracy. Fabaceae.

No. 1115. Jala, Sierra Leone. January 21, 1927. The "stringless" velvet bean of South Africa.

70924. *STRYCHNOS* sp. Loganiaceae.

No. 964. Between Georgetown and Kuntaur, Gambia. January 10, 1927. "Kafir orange." An erect and nearly spineless tree 10 feet high, growing on dry clay soil.

70925. *TERMINALIA MACROPTERA* Guill. and Perr. Combretaceae.

No. 991. Sankuli Kunda, near Georgetown, Gambia. January 9, 1927. A spreading tree, 60 feet high, which withstands long periods of drought and hot weather.

70926. *PHYSEDRA EGLANDULOSA* Hutchins. and Dalziel. Curcubitaceae.

No. 1118. Near the Taia River, Jala. January 21, 1927. A vine producing attractive red gourdlike fruits which are said to be eaten only by cattle.

70895 to 70927—Continued.

70927. *PENTACLETHRA MACROPHYLLA* Benth. Mimosaceae.

No. 994. En route from Konakry to Fore Carial, French Guinea. January 16, 1927. A handsome tropical tree which is promising as a shade and avenue tree for the warmer parts of the United States. The seeds are used to make a green dye. This tree is said to grow in large numbers on the plateau of Futa Jalon, at an altitude of 4,000 feet.

For previous introduction see No. 62916.

70928. *ULMUS PARVIFOLIA* Jacq. Ulmaceae.

From Woodward, Okla. Plants presented by E. F. Chilcott, Bureau of Plant Industry. Received March 4, 1927.

A small handsome semievergreen tree, 15 meters or less high, with small glossy green leaves. Native to northern China, Chosen, and Japan. These plants are from seeds of trees that have been growing for 12 years under adverse conditions at Tucumcari, N. Mex., and have proved entirely hardy.

70929. *GOSSYPIUM* sp. Malvaceae. Cotton.

From Raiatea, Society Islands. Seeds presented by Dr. J. Arthur Harris, department of botany, University of Minnesota, University Farm, St. Paul, Minn., through T. H. Kearney, Bureau of Plant Industry. Received March 2, 1927.

A variety cultivated by the Chinese inhabitants of Utoroa, Raiatea. Collected October 11, 1926.

70930 to 70932.

From Luchowfu, Anhwei, China. Scions obtained by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received March 10, 1927.

70930 and 70931. *DIOSPYROS KAKI* L. f. Diospyraceae. Kaki.

70930. No. 769. Tree No. 2. A tree about 5 or 6 years old, which is probably grafted, though the union of the scion and stock is not visible above the ground. It is a superior variety and should receive unusual attention. The sweet-fleshed fruits are large, somewhat cylindrical though sometimes slightly squarish, with a flat calyx and rounded apex and seedless or few seeded. The core is somewhat pithy, not large, and separates from the surrounding flesh. The fruits ripen at midseason, the skin becoming red-orange, and they are good keepers. The astringency disappears when the fruits are allowed to ripen by themselves. Artificial methods are necessary only when it is desired to ripen the fruit early.

70931. No. 771. Tree No. 3. A tree about 5 or 6 years old, probably grafted, though the union of the scion and stock is not visible above the ground. The fruits are large, flattened, sometimes very slightly squarish in section, and sometimes with more or less distinct grooves running from the tips of the calyx lobes. They are seedless or few seeded, with soft flesh when ripe, and keep well. In most points they are very similar to those of the variety commonly cultivated around Luchowfu, but superior in quality and sweetness. If allowed to ripen naturally they are without astringency.

70932. *MALUS* sp. Malaceae. Apple.

Hwa hong (red flower). An exceptionally hardy small species of special value because it stands the hot humid climate of this part of China. The tree, which is drought and cold resistant, produces rather small, hard, sour fruits of little value.

70933 to 70954.

From Africa. Seeds collected by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received February 11, 1927.

70933. ACACIA SCORPIOIDES (L.) W. F. Wight (*A. arabica* Willd.). Mimosaceae.

No. 943. Bathurst, Gambia. January 6, 1927. A rapid-growing variety used as a hedge at the Bathurst Experiment Station and which should be tried as a drought-resistant hedge plant in the Southwest. The pods are said to furnish a very superior tannin.

70934. AEOLANTHUS BUETTNERI Guérke. Menthaceae.

No. 952. Georgetown, McCarthy Island, Gambia. January 8, 1927. An aromatic erect-growing perennial which seeds very freely. It may prove of use as a new fragrant herb in the gardens of the South.

70935. BAUHINIA RETICULATA DC. Caesalpiniaceae.

No. 963. En route from Georgetown to Kuntaur, Gambia. January 10, 1927. A small tree found in very dry lateritic soil and which is subjected to extremely long periods of drought. The rather small flowers are in compound racemes not much longer than the leaves and are not very showy.

For previous introduction see No. 50126.

70936. CASSIA sp. Caesalpiniaceae.

No. 956. En route from Georgetown to Kuntaur, Gambia. January 10, 1927. The pods of this species are slightly gummy, but not at all sweet as those of some other cassias.

70937. COMBRETUM sp. Combretaceae.

No. 978. En route from Georgetown to Kuntaur, Gambia. January 10, 1927. A climbing shrubby vine.

70938 to 70940. CROTALARIA spp. Fabaceae.

70938. CROTALARIA sp.

No. 949. Kudang, Gambia. January 7, 1927. A tall-growing vigorous species which should make a good cover crop.

70939. CROTALARIA sp.

No. 955. McCarthy Island, Gambia. January 9, 1927. A medium-sized wild species found in lateritic soil. It should stand long droughts.

70940. CROTALARIA sp.

No. 975. Georgetown, McCarthy Island, Gambia. January 10, 1927. A plant not over 18 inches high, which may prove useful as a cover crop.

70941. DIOSPYROS SENEGALENSIS Perr. Diospyraceae.

No. 961. Georgetown, McCarthy Island, Gambia. January 8, 1927. A small-fruited variety which is said to have a good flavor.

For previous introduction see No. 49587.

70942. ENTADA SUDANICA Schweinf. Mimosaceae.

No. 962. Found in lateritic soil between Georgetown and Kuntaur, Gambia. January 10, 1927. A small tree with curiously shaped brown pods, a foot or more long and 3 inches across, which split up and leave the edges of the pods intact.

70943. ERAGROSTIS sp. Poaceae. Grass.

No. 944. January 6, 1927. An ornamental grass, growing in sandy soil along the Gambia

70933 to 70954—Continued.

River at Kerewan, near Bathurst, where the rainfall is about 40 inches. It covers low land which is extremely dry during the dry season, December to April, and flooded during the wet season. This may prove valuable as a hay grass of rapid growth for the Southwest.

70944. ERYTHROPHLOEUM GUINEENSE Don. Caesalpiniaceae.

No. 971. Georgetown, McCarthy Island, Gambia. "Ordeal" tree of Africa. January 10, 1927. A very handsome stately tree with poisonous bark, which is found on banks of streams and in dry regions. This tree may contain a valuable alkaloid.

For previous introduction see No. 48457.

70945 to 70947. FICUS spp. Moraceae.

70945. FICUS CAPENSIS Thunb.

No. 953. Near Georgetown, McCarthy Island, Gambia. January 8, 1927. A tree with very large attractive leaves and immense clusters of edible fruits, 1½ inches in diameter, which are borne on the trunk and the large branches. It may be immune from nematode infestation.

For previous introduction see No. 56533.

70946. FICUS VOGELII Miquel.

No. 959. Bathurst, Gambia. January 4, 1927. A beautiful shade tree with large oblong elliptic leaves which are mostly gathered at the ends of the twigs. The small fruits are attractively grouped on the branches and produce many viable seeds.

70947. FICUS SPRAGUEANA Mildbr. and Burret.

No. 951. Georgetown, McCarthy Island, Gambia. January 8, 1927. A handsome shade tree with edible fruits.

70948. MEIBOMIA sp. (*Desmodium* sp.). Fabaceae.

No. 946. Kudang, Gambia. January 7, 1927. A heavy seeding species found in moist sandy soil. It may prove valuable as a cover crop.

70949. PARINARI MACROPHYLLUM Sabine. Rosaceae.

No. 945. From Kerewan, Gambia River, near Bathurst, where the fruits of this tree are called komba. A small or medium-size tree of picturesque habit with attractive large leaves, 8 inches long, and velvety brown young shoots. The rather dry fruit, the size of a goose egg and containing a large rough seed, is brown with many rough lenticels. This is eaten when ripe and has a distinctive flavor hard to describe.

70950. PENNISETUM GLAUCUM (L.) R. Br. (*P. typhoides* Rich.). Poaceae. Pearl millet.

No. 973. Gambia. January 10, 1927. The Mandingo name is *sanyour* or *sannio*. A millet grown on dry land in this region.

70951. STERCULIA TOMENTOSA Guill. and Perr. Sterculiaceae.

No. 976. En route from Georgetown to Kuntaur, Gambia. January 10, 1927. A handsome light-barked tree, 35 feet high, of spreading habit, which produces an abundance of faintly odoriferous greenish pink flowers. The pods are covered with brittle hairs which irritate the skin, but are not poisonous.

70952. VIGNA sp. Fabaceae.

No. 950. Kudang, Gambia. January 7, 1927. A legume growing in moist soil near small watercourses.

70933 to 70954—Continued.

70953. *ZEA MAYS* L. Poaceae. Corn.

No. 965. Georgetown, McCarthy Island, Gambia. January 9, 1927. A corn found on McCarthy Island and lands bordering the Gambia River where there is a 40-inch rainfall and a drought lasting from October to June with high temperatures from April to June. The seeds are planted at the beginning of the rainy season.

70954. *ZIZIPHUS SPINA-CHRISTI* (L.) Willd. Rhamnaceae.

No. 979. Near Kudang, Gambia. January 7, 1927. A bush or small tree with round fruits which when ripe are sweetish and remind one of the true Chinese jujube. It should be grown for stock and comparison purposes.

For previous introduction see No. 51741.

70955 and 70956. *SACCHARUM OFFICINARUM* L. Poaceae. Sugar cane.

From Ryam, Darbhanga, Bihar and Orissa, India. Cuttings obtained from Noel Deerr, Superintendent of Factories, Muzaffarpur, Bengal, through E. W. Brandes, Bureau of Plant Industry. Received March 14, 1927.

It is reported that these varieties grow in swampy land or land that has been flooded.

70955. *Kewali*.70956. *Semari*.70957. *SACCHARUM OFFICINARUM* L. Poaceae. Sugar cane.

From Freetown, Sierra Leone, West Africa. Cuttings obtained by H. H. McKinney, Bureau of Plant Industry, with the Allison V. Armour expedition. Received March 12, 1927.

No. 1132. January 25, 1927. A Liberian strain.

70958. *HYPHAENE THEBAICA* (L.) Mart. Phoenicaceae. Doum palm.

From Kerewan, Gambia, West Africa. Fruits collected by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received March 1, 1927.

No. 980. January 10, 1927. A palm about 30 feet high which is noted as the only branching palm. It grows in sandy and clay soils and is distributed from Upper Egypt to central Africa. The stems of old trees are sometimes forked three or four times. The beautiful yellowish brown fruits are borne in long clusters of one to two hundred. In Upper Egypt the poorer classes eat the fibrous fruit husk, which tastes much like gingerbread but is rather hard. The hard tough wood is used for domestic utensils. It is one of the most striking and picturesque of the palms and is capable of withstanding severe droughts.

For previous introduction see No. 66656.

70959 to 70965.

From China. Scions obtained by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received February 23, 1927.

70959 and 70960. *DIOSPYROS KAKI* L. f. Diospyraceae. Kaki.

70959. No. 962. Kanchow, Kiangsi. December 15, 1926. A variety producing medium large, somewhat flattened, squarish fruits with few seeds which are orange-red when ripe. They are usually ripened artificially to remove the astringency.

70960. No. 963. Kanchow, Kiangsi. December 15, 1926. The same as No. 962 [No. 70969], but from a different tree.

70959 to 70965—Continued.

70961 to 70964. *PRUNUS MUME* Sieb. and Zucc. Amygdalaceae. Japanese apricot.

Bud wood from trees growing in the orchards of Lingnan University, Canton. January, 1927.

70961. No. 982. *Hang mui*. A variety characterized by its distinctly upward-pointing branching habit and golden-yellow fruits.

For previous introduction see No. 62316.

70962. No. 983. *Wang wat mui*. A variety said to have especially large flowers.

For previous introduction see No. 62314.

70963. No. 986. *Hung mui*. A variety distinguished by reddish bark, rather slender branches, pink flowers, and red fruits.

For previous introduction see No. 62315.

70964. No. 990. *Taii mui*. A variety said to have large fruits.

For previous introduction see No. 62312.

70965. *PYRUS* sp. Malaceae. Pear.

No. 965. Kanchow, Kiangsi. December 15, 1926. *Chan paak lei*. A variety widely cultivated in China, with medium-sized subglobular fruits of fair quality.

70966. *BERBERIS BERGMANNIAE* ACANTHOPHYLLA C. Schneid. Berberidaceae. Barberry.

From San Francisco, Calif. Seeds presented by Eric Walther, Golden Gate Park. Received March 4, 1927.

An evergreen bush, up to 6 feet high, with leathery spiny leaves 2 inches long and black berries. Native to western China.

For previous introduction see No. 34552.

70967 to 70993.

From China. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received February 24, 1927.

70967. *ACACIA CONFUSA* Merr. Mimosaceae.

No. 992. Collected during the autumn of 1926 from trees growing on the Lingnan University Campus, Canton. *Toi waan seung sz*. A very rapid-growing, ornamental tree with ball-like clusters of fragrant yellow flowers which appear twice a year.

70968. *ACTINIDIA* sp. Dilleniaceae.

No. 979. *Yeung to*. From a plant apparently half under cultivation, north of Kanchow, Kiangsi Province. December 14, 1926. A scandent shrub, 3 to 4 meters high, bearing large dense clusters of brownish oblong fruits, the size of guinea eggs, which have green flesh of a pleasant subacid flavor.

70969. *ASTRAGALUS SINICUS* L. Fabaceae.

No. 533. *Hung fa tsz tsoi*, *Chong uen fa*. A low-growing legume native to Kwanton Province and cultivated as a green-manure crop in the Linchow district. It is also eaten as a green vegetable by the natives, though in small quantities. Livestock, particularly cows and horses, are not allowed to graze in it, because it is said to be fatal to them if large quantities are eaten.

70970. *BAUHINIA* sp. Caesalpiniaceae.

No. 975. Obtained near Wanan, Kiangsi Province. December 12, 1926. A climber, 3 to 4 meters in length, with tough hooks which are its means of clinging to support.

70967 to 70993—Continued.

70971. *BOEHMERIA NIVEA* (L.) Gaud. Urticaceae. Ramie.

No. 967. Piushan, Kiangsi Province. December 12, 1926. *Chue ma*. A variety cultivated on a small scale throughout this part of China. It is sometimes propagated by seeds, but usually by dividing the old plants.

For previous introduction see No. 65825.

70972. *BRASSICA* sp. Brassicaceae.

No. 981. Linchow, Kwantung Province. *Yautsoi*. A plant grown extensively in northern Kwantung and as far north as central China as a winter crop for the oil contained in the seeds.

70973. *CORNUS* sp. Cornaceae.

No. 954. En route from Kian to Wanan, Kiangsi Province. A shrub 2 meters high, the leaves of which change to brilliant colors in the fall. It produces an abundance of bright-red berries in dense clusters, and is a fine winter ornamental for this latitude.

70974. *CUPRESSUS FUNEBRIS* Endl. Pinaceae. Mourning cypress.

No. 956. En route from Kian to Wanan, Kiangsi Province. December, 1926. *Tiu paak*. An ornamental evergreen tree up to 10 meters high, with drooping branches and flat seeds. When young the tree is cone-shaped, becoming scraggly as it grows older.

For previous introduction see No. 61489.

70975. *EUGENIA* sp. Myrtaceae.

No. 949. En route from Kian to Wanan, Kiangsi Province. December, 1926. *Kwa tsz cha*. A low boxlike evergreen plant which has possibilities as an ornamental. During the winter it produces large purple-black berries.

70976. *FICUS REPENS* Rottl. Moraceae.

No. 959. En route from Kian to Taihop, Kiangsi Province. December 10, 1926. An ornamental creeper the leaves of which are small when young, but increase in size as the plant becomes older. In the vicinity of Kwangtung it is not known to produce seeds, though the fruits are common.

70977. *HOLBOELLIA* sp. Lardizabaleaceae.

No. 969. En route from Sunfung to Lungnan, Kiangsi Province. December 18, 1926. *Na*. A plant with fruits resembling the papaw in size, shape, and color. This plant is said to be a vine, and may be interesting botanically.

70978. *SORGHUM VULGARE* Pers. Poaceae. Sorghum.

No. 993. December 14, 1926. *Suk tsz*. A red variety of nonsaccharine sorghum obtained near Kanchow, Kiangsi Province.

70979 to 70983. *ILEX* spp. Aquifoliaceae. Holly.

70979. *ILEX CORNUTA* Lindl. and Paxt. Chinese holly.

No. 948. Near Kian, Kiangsi Province. December 8, 1926. *Lak kok*. A splendid evergreen with dark-green shiny leathery leaves which are thorny and crinkled. It produces an abundance of bright-red berries during the winter.

For previous introduction see No. 65860.

70980. *ILEX* sp.

No. 953. En route from Kian to Taihop, Kiangsi Province. December, 1926. *Hung tung tsing*. An ornamental 5 to 6 meters high, with fine dark-green foliage and bright-red berries.

70967 to 70993—Continued.

70981. *ILEX* sp.

No. 955. En route from Kian to Wanan, Kiangsi Province. December, 1926. *Lak kok*. A yellow-fruited shrub about 2 meters high, which is very attractive.

70982. *ILEX* sp.

No. 961. En route from Kian to Wanan, Kiangsi Province. December, 1926. *Hung tung tsing*. A shrub or small tree with splendid evergreen foliage, entire lanceolate leaves 8 centimeters long, and abundant clusters of bright-red berries which are produced during the winter. It is a splendid ornamental for this latitude, and grows wild here.

70983. *ILEX* sp.

No. 994. Near Kanchow, Kiangsi Province. December 16, 1926. *Laap shue*. A large tree, apparently wild, with fine evergreen foliage, which is very attractive in winter when the abundant crop of red berries is produced. These berries are said to yield a sort of wax, sometimes used in making candles.

70984. *JUNIPERUS* sp. Pinaceae. Juniper.

No. 952. En route from Kian to Taihop, Kiangsi Province. December, 1926. *Loh hon paak*. A weeping evergreen 2 to 3 meters high, with small, lanceolate leaves which have white stripes beneath.

70985. *KRAUNHIA* sp. (*Wisteria* sp.). Fabaceae.

No. 970. En route from Sunfung to Lungnan, Kiangsi Province. December 18, 1926. A wild vine with smooth pods in clusters of three to six.

70986. *LITSEA* sp. Lauraceae.

No. 958. En route from Kian to Taihop, Kiangsi Province. December 10, 1926. *Laap heung*. An ornamental tree, about 10 meters high, with shiny evergreen leaves and a sprinkling of red berries produced in the winter.

70987. *NICOTIANA* sp. Solanaceae. Tobacco.

No. 950. En route from Kian to Taihop, Kiangsi Province. December 10, 1926. A variety of tobacco which is grown to a limited extent in this region.

70988 to 70990. *PHOTINIA* spp. Malaceae.

70988. *PHOTINIA* sp.

No. 957. Near Kian, Kiangsi Province. December 9, 1926. *To tsz*. A small evergreen tree bearing large clusters of purple, edible fruits. It is a fine ornamental tree for this latitude.

70989. *PHOTINIA* sp.

No. 976. Near Tunchow, Kiangsi Province. December 13, 1926. An ornamental shrub or small tree found in fertile clay loam, with ovate-lanceolate serrulate foliage and red fruits, produced in large terminal panicles.

70990. *PHOTINIA* sp.

No. 978. December, 1926. The same as No. 976 [No. 70989], but from Kanchow Kiangsi Province.

70991. *SCHIMA* sp. Theaceae.

No. 951. En route from Kian to Taihop, Kiangsi Province. December 9, 1926. *Hoh wak*. An evergreen, 8 to 10 meters high and 15 to 20 centimeters in diameter, which is highly valued as a timber tree.

70967 to 70993—Continued.70992. *EURYA CHINENSIS* R. Br. Theaceae.

No. 971. En route from Sunfung to Lungnan, Kiangsi Province. December 18, 1926. *Inkberry*. A very ornamental evergreen shrub with small, dentate leaves of tough texture and small white, drooping fragrant flowers which are borne along the whole length of the branches. Although not striking, this shrub should make a pleasing ornament. It grows well on poor dry soil.

70993. (Undetermined.)

No. 974. Near Shinkwaantung. December 23, 1926. A shrub 2 to 3 meters high, with fine foliage, which grows well on poor soil. It produces bright-red berries in terminal cymes.

70994. CUCURBITA MOSCHATA Duchesne. Cucurbitaceae. Cushaw.

From San Remo, Italy. Seeds presented by Dr. Mario Calvino. Received March 9, 1927.

A locally developed variety.

70995 to 70997. SOLANUM spp. Solanaceae.

From Reading, England. Tubers obtained from Sutton & Sons, through William Stuart, Bureau of Plant Industry. Received March 15, 1927.

70995. *SOLANUM ETUBEROSUM* Lindl.

A wild Chilean potato, closely resembling the cultivated potato.

70996. *SOLANUM MAGLIA* Schlecht.

A wild potato, native to Chile, with oblong tubers about an inch and a half long.

For previous introduction see No. 57219.

70997. *SOLANUM TUBEROSUM* L.

English-grown tubers.

70998. (Undetermined.)

From Jala, Sierra Leone, West Africa. Seeds collected by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received March 12, 1927.

No. 1122. January 21, 1927. An ornamental tropical tree with large dark-green leaves and bright-red velvety fruits, the size and shape of a horse-chestnut, which split open and reveal crimson seeds each with a golden-yellow aril.

70999. HEDYSARUM SEMENOWII Regel and Herd. Fabaceae.

From Ottawa, Canada. Seeds presented by J. Adams, botanist, Central Experimental Farm. Received March 10, 1927.

An erect hardy herbaceous perennial with purplish flowers. Native to Turkestan.

For previous introduction see No. 42193.

71000 to 71016. FRAGARIA spp. Rosaceae. Strawberry.

From Caen, Calvados, France. Plants presented by Roland Chapron. Received January 3, 1927.

French strawberry varieties.

71000. *FRAGARIA* sp.

Général de Castelnau.

71001. *FRAGARIA* sp.

Louis Gauthier.

71002. *FRAGARIA* sp.

Ministre Henry Cheron.

71000 to 71016—Continued.71003. *FRAGARIA* sp.

Pie X.

71004. *FRAGARIA* sp.

President Poincaré.

71005. *FRAGARIA* sp.

Princesse Marie Clotilde.

71006. *FRAGARIA* sp.

St. Fiacre.

71007. *FRAGARIA* sp.

Soleil d'Austerlitz.

71008. *FRAGARIA* sp.

Suavis.

71009. *FRAGARIA* sp.

Belle Alliance.

71010. *FRAGARIA* sp.

Tardive de Leopold.

71011. *FRAGARIA* sp.

Empereur du Maroc.

71012. *FRAGARIA* sp.

Emp. Nicolas.

71013. *FRAGARIA* sp.

Hatives de Caen.

71014. *FRAGARIA* sp.

Mme. Moutot.

71015. *FRAGARIA* sp.

Reine Louise.

71016. *FRAGARIA* sp.

Ville de Caen.

71017. NYPA FRUTICANS Wurmbr. Phoenicaceae. Nipa palm.

From Manila, Philippine Islands. Seeds presented by S. Youngberg, Director of Agriculture. Received January 3, 1927.

From an economic standpoint, this palm is one of the most important in the Philippines. It occurs along tidal streams throughout the archipelago and thrives only in brackish swamps. The *nipa*, as it is called, has a stout creeping underground stem, and the pinnate leaves, which are in erect clusters, are 23 feet or more in length. The flat fruits, 5 inches long, 4 inches wide, and 2 inches thick, are crowded in a large round head which is borne on a special erect stalk. The juice obtained by cutting this stalk just below the fruiting head is a source of sugar and alcohol. Probably 85 per cent of the 3,000,000 gallons of proof alcohol produced annually in the Philippines comes from the *nipa* palm. The leaves are extensively used for thatching and for making baskets and mats, and the immature seeds are boiled in sugar to form a confection. In addition to the above the tree is also a pleasing ornamental.

For previous introduction see No. 57940.

71018. CASTANOPSIS TRIBULOIDES (J. E. Smith) A. DC. Fagaceae.**Evergreen chinquapin.**

From Maymyo, Burma, India. Seeds presented by C. E. Parkinson, Forest Botanist. Received January 3, 1927.

An evergreen chinquapin from the subtropical Himalayas, with small narrow leaves and solitary nuts. The tree is usually 40 to 60 feet high. The bark is said to yield a relatively large amount of tannin.

71019 to 71026. PRUNUS AVIUM L.
Amygdalaceae. Sweet cherry.

From Saonara, Padova, Italy. Plants purchased from Fratelli Sgaravatti. Received January 4, 1927.

Italian sweet-cherry varieties, not in the trade in the United States.

71019. *Napoleone (Imbrian)*.

71020. *Del Nord*.

71021. *Imperiale*.

71022. *Lodgiana*.

71023. *Marasca di Ostheim*.

71024. *Marasca moscata*.

71025. *Marasca olandese*.

71026. *Ministro Podbielski*.

71027 to 71029. CASTANEA MOLLISSIMA
Blume. Fagaceae. Hairy chestnut.

From Chihli Province, China. Seeds obtained by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received January 5, 1927.

From the Fa Hua Ssu Temple, near Peking. November 20, 1926.

71027. No. 8868. *Han luli tze* (cold dew chestnut). This variety ripens between the first and the middle of October.

71028. No. 8869. *Erh luli tze* (second crop chestnut). This variety ripens about the last of September.

71029. No. 8870. *Hue hao li tze* (tiger paw chestnut). A large fine-looking chestnut.

71030. CASTANOPSIS TRIBULOIDES (J. E. Smith) A. DC. Fagaceae.

Evergreen chinquapin.

From Shillong, Assam, India. Seeds presented by the conservator of forests. Received January 3, 1927.

For previous introduction and description see No. 71018.

71031 to 71033. ALLIUM CEPA L.
Liliaceae. Onion.

From Santa Cruz, Teneriffe, Canary Islands. Seeds presented by C. Garcia Dorta. Received January 4, 1927.

Canary Island onion varieties.

71031. *Crystal war* onion.

71032. *Red Bermuda* onion.

71033. *Yellow Bermuda* onion.

71034 to 71036. ALLIUM CEPA L.
Liliaceae. Onion.

From Santa Cruz, Teneriffe, Canary Islands. Seeds presented by Luis M. Díaz Sansón. Received January 4, 1927.

Canary Island onion varieties.

71034. *Crystal war* onion.

71035. *Red Bermuda* onion.

71036. *Yellow Bermuda* onion.

71037. CASTANOPSIS SCLEROPHYLLA
(Lindl.) Schottky. Fagaceae.

Evergreen chinquapin.

From Nanking, China. Seeds purchased through Prof. J. H. Reinsner, College of Agriculture and Forestry, University of Nanking. Received January 4, 1927.

A hardy evergreen tree, up to 65 feet high, with edible nuts having a flavor like that of the chinquapin. Native of south-central China.

For previous introduction see No. 44663.

71038. QUERCUS sp. Fagaceae. Oak.

From Chihli Province, China. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received January 5, 1927.

No. 8773. Ming Tombs. November 18, 1926. One of the white oaks, 1½ to 2 feet in diameter and about 50 feet high.

71039. CRATAEGUS sp. Malaceae.

Hawthorn.

From China. Seeds collected by J. F. Rock, Arnold Arboretum, Jamaica Plain, Mass. Received January 5, 1927.

Pezhu, on the Chulungapu River, Kansu-Tibet border. September, 1926. A very handsome plant 15 to 18 feet in height with stiff rich-green leaves which are deeply and coarsely serrate and slightly three lobed. The brilliant red fruits, in drooping cymes, are smaller than a cherry. This tree is found in loess loamy soil usually near the banks of streams, at altitudes of 7,500 to 8,500 feet. (Rock.)

71040 to 71043.

From Winchester, England. Plants purchased from Hillier & Sons, West Hill Nurseries. Received January 10, 1927.

71040 to 71042. CRATAEGOMESFILUS spp. Malaceae.

Graft hybrids between *Crataegus* and *Mespilus*.

71040. CRATAEGOMESFILUS ASNIERESI C. Schneid.

The young branches and leaves of this plant are white with a woolly down, and the flowers and fruits are showy.

71041. CRATAEGOMESFILUS DARDARI Simon-Louis.

The leaves and fruits are similar to those of *Mespilus*, but the branches are spiny, and the flowers are 1.5 centimeters across and in corymbs. The fruit with persistent calyx lobes is 1.5 centimeters in diameter and contains one to three seeds.

71042. CRATAEGOMESFILUS GRANDIFLORA (J. E. Smith) Bean.

A distinctly vigorous tree with leaves, flowers, and fruit which resemble small medlars.

71043. DAVIDIA INVOLUCRATA Baill. Cornaceae. Dove-tree.

The Chinese dove-tree, as this is sometimes called, is a native of the mountain forests of central and western China. In its native home it becomes a large tree 75 feet tall, with a shapely pyramidal crown. When in bloom the tree is unusually striking because of the two or three large snow-white bracts which subtend each flower. These bracts are of unequal size, the largest being 4 to 8 inches long and 2 to 4 inches broad. The bright-green, oval, sharply toothed leaves are 3 to 6 inches long.

For previous introduction see No. 65439.

71044. CITRUS AURANTIFOLIA
(Christm.) Swingle. Rutaceae. Lime.

From Los Banos, Philippine Islands. Seeds presented by J. D. Bigarino, through Walter T. Swingle, Bureau of Plant Industry. Received January 12, 1927.

The native Philippine lime, known there as the "dayap." It is an arborescent, thorny shrub, 10 to 15 feet high, with greenish yellow, rounded fruits of pleasant acid flavor, excellent for making limeade. The wild Philippine lime is distributed generally throughout the archipelago, but the fruits are mostly of poor quality.

For previous introduction see No. 69022.

71045. SOJA MAX (L.) Piper (*Glycine hispida* Maxim.). Fabaceae.**Soy bean.**

From Manchuria. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received January 12, 1927.

No. 8624. November 9, 1926. From the botanical garden in Harbin.

71046. PINUS KORAIENSIS Sieb. and Zucc. Pinaceae. Korean pine.

From Nanking, China. Seeds purchased through Prof. J. H. Reisner, College of Agriculture and Forestry, University of Nanking. Received January 4, 1927.

A hardy pyramidal tree up to 30 meters high, with gray-brown bark and straight, dark-green needles, 6 to 12 centimeters long. Native to Chosen. This pine grows slowly and is of dense habit.

For previous introduction see No. 65875.

71047 and 71048.

From China. Seeds and scions collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received January 14, 1927.

71047. CITRUS sp. Rutaceae.

No. 946. Near Soamoo, Kiangsi Province. December 5, 1926. *Fa hung*. Seeds of a smooth-barked, thrifty tree, producing an abundance of ornamental fruits, which is widely grown in this region. It is propagated from seeds, and is said to be used as stock for other varieties of citrus. The seedy fruits are large, somewhat flattened, with the apex depressed; the red-orange skin is about a centimeter thick and rough; the acid flesh is high in juice, but low in rag. The fruits are used by the Chinese as table ornaments.

71048. DIOSPYROS KAKI L. f. Diospyraceae. Kaki.

No. 944. Near Shawu, Kiangsi Province. December 5, 1926. *Tung tsz* (winter persimmon). Scions of a very large seedling tree, producing an abundance of subconical, medium-sized fruits which are very seedy, but of excellent flavor when ripe. The fruits are ripened artificially in this region by thrusting small sticks into the fruits near the calyx. It requires from two to four days to ripen the fruits this way.

71049 and 71050. ALLIUM CEPA L. Liliaceae. Onion.

From Laredo, Tex. Seeds presented by Dan F. Pue, President, T. M. Reid Tenerife Onion Seed Co., at the request of T. M. Reid, Puerto Orotava, Teneriffe, Canary Islands. Received January 11, 1927.

Canary Island onion varieties.

71049. *Crystal wax* onion.

71050. *Yellow Bermuda* onion.

71051 to 71122.

From Leningrad, Russia. Seeds presented by A. Kol, chief, bureau of introduction, Institute of Applied Botany. Received January 4, 1927. Russian-grown seeds.

71051 to 71057. AVENA SATIVA L. Poaceae. Oats.

71051. No. 25536. Variety *aurea*. "Khoroshavsky." From the Beriosotchonnay Experiment Station, Poltava Government. Originally from the Detskoe Selo Plant-Breeding Station.

71052. No. 25537. Variety *aurea*. "Ryhlík." From the Sabeshinsk Experiment Station.

71053. No. 25538. Variety *aurea*. No. 4192. From the Moscow Plant-Breeding Station. Originally from the Detskoe Selo Plant-Breeding Station.

71051 to 71122—Continued.

71054. No. 25548. Variety *aurea*. No. 4114. From the Moscow Plant-Breeding Station. Originally from the Detskoe Selo Plant-Breeding Station.

71055. No. 25566. Variety *mutica*. No. 18. "Mironovsky." From the Mironovsk Experiment Station, Kiev Government. Originally from the Detskoe Selo Plant-Breeding Station.

71056. No. 25567. Variety *mutica*. "Shatilovsky Neulutchenny." From the Shatilov Experiment Station, Tula Government. Originally from the Detskoe Selo Plant-Breeding Station.

71057. No. 25583. Variety *aristata*. "Vitis." From the Vjatka Government. Originally from the Detskoe Selo Plant-Breeding Station.

71058 and 71059. CANNABIS SATIVA L. Moraceae. Hemp.

71058. No. 10232. Jakut District, Siberia.

71059. No. 10233. From the Orel Government.

71060 to 71063. CITRULLUS VULGARIS Schrad. Cucurbitaceae. Watermelon.

71060. No. 10207. "Azhinovsky." Vicinity of Rostov, Don.

71061. No. 10208. "Liubimetz Khutora Pitagorska." From the Kharkov Government.

71062. No. 10210. "Kubansky Korolj." Kuban region.

71063. No. 10214. "Kormovoj." Ekaterinoslav Exhibition, North Caucasian section.

71064 to 71066. CUCUMIS MELO L. Cucurbitaceae. Melon.

71064. No. 10215. "Kubovka." Stalingrad Government.

71065. No. 10216. "Tzaritzia Dynj." Kharkov Government.

71066. No. 10219. "Kubanskaya Kantalupa." Kuban District.

71067 to 71073. CUCURBITA spp. Cucurbitaceae.

71067 to 71069. *CUCURBITA MAXIMA* Duchesne. Squash.

71067. No. 10221. "Volzhanka." Saratov Government.

71068. No. 10223. "Kit." Obtained by the All-Russian Exhibition, Moscow, during 1923.

71069. No. 10224. "Stolovaja Tchalmovaja." Saratov Government.

71070. CUCURBITA MOSCHATA Duchesne. Cuslaw.

No. 10230. "Perekhvatka." Astrakhan Government.

71071 to 71073. CUCURBITA PEPO L. Pumpkin.

71071. No. 10226. "Medovaja." Saratov Government.

71072. No. 10227. "Golossemiannaja." Ekaterinoslav Government.

71073. No. 10228. "Kabatchok gretchsky." Astrakhan Government.

71074. HEMEROCALLIS sp. Liliaceae. Day lily.

No. 26257. A yellow lily.

71075 and 71076. HORDEUM VULGARE NIGRUM (Willd.) Beaven. Poaceae. Six-rowed barley.

71051 to 71122—Continued.

71075. No. 10247. Variety *tanoticum*. No. 029, A VII. From the Don region. Originally from the Turkestan Experiment Station.
71076. No. 10248. Variety *leiorrynchum*. Subvariety *nekludowi*. No. 07CX. From the Turkestan Experiment Station.
- 71077 to 71079. *HORDEUM VULGARE PALLIDUM* Seringe. Poaceae. Six-rowed barley.
71077. No. 10246. A selected variety. No. 0815 A II. From the vicinity of Turkestan.
71078. No. 10281. "Vjatka." From the Vjatka Experiment Station.
71079. No. 10284. A selected variety. No. 1164. From the Vjatka Experiment Station.
71080. *LAGENARIA LEUCANTHA* (Duchesne) Rusby (*L. vulgaris* Seringe). Cucurbitaceae. **Gourd.**
- No. 10231. "Gorlianka" or "Butylotch-naha." From the Astrakhan Government.
71081. *LATHYRUS SATIVUS* L. Fabaceae. **Bitter vetch.**
- No. 10255. Tashkent, Turkestan.
- 71082 to 71083. *LENS ESCULENTA* Moench. Fabaceae. **Lentil.**
71082. No. 3460. Variety *Pulmani*. "Dymtchataja." Bogoroditsky Experiment Station, Kursk Government. Originally from the Stepnaya Experiment Station.
71083. No. 10043. From Persia. Originally from the Kuban section. No. 6. A pure-line variety.
71084. No. 10046. Variety *nummularia*. No. 62. A pure-line variety from the Saratov Government. Originally from Turkestan.
71085. No. 10051. Variety *nummularia*. No. 62. A pure-line variety from the Saratov Government. Originally from Turkestan.
71086. No. 10052. Variety *nummularia*. No. 62. A pure-line variety from the Penza Government. Originally from Turkestan.
71087. *LILIUM DAURICUM* Ker. Liliaceae. **Candlestick lily.**
- No. 36358.
71088. *LILIUM MARTAGON* L. Liliaceae. **Martagon lily.**
- No. 36359. A lily found growing wild from central and southern Europe to southwestern Siberia. The stem is 3 to 6 feet high, often purple spotted, with horizontal deep-green leaves 3 to 6 inches long and dull claret-purple flowers, spotted purplish black, and red anthers. Three to 20 flowers are produced at one time, usually in late June and July.
- For previous introduction see No. 63828.
- 71089 to 71096. *PHASEOLUS VULGARIS* L. Fabaceae. **Common bean.**
71089. No. 2899. Variety *ellipticus*. "Bomba." From the Voronezh Government. Originally from the Stepnaya Experiment Station.
71090. No. 2900. Variety *ellipticus*. "Japonskaia." From the Kursk Government. Originally from the Stepnaya Experiment Station.

71051 to 71122—Continued.

71091. No. 2303. Variety *compressus* \times *ellipticus*. From the Kharkof Government. Originally from the Stepnaya Experiment Station.
71092. No. 10107. Variety *oblonga*. "Sparzhavaja." From the Voronezh Government. Originally from the Stepnaya Experiment Station.
71093. No. 10110. Variety *ellipticus*. "Belaja." From Rostov, Don. Originally from the Stepnaya Experiment Station.
71094. No. 10122. Variety *ellipticus*. "Stepnaja." From the Voronezh Government. Originally from the Stepnaya Experiment Station.
71095. No. 10130. Variety *oblongus*. "Pranitchki." From the Kiev Government. Originally from the Stepnaya Experiment Station.
71096. No. 10131. Variety *oblongus compressus*. "Isumrudnaja." From the Voronezh Government. Originally from the Stepnaya Experiment Station.
- 71097 to 71100. *PISUM SATIVUM* L. Fabaceae. **Pea.**
71097. No. 1092. "Victoria Rosovosemian-naia." A pink-grained variety from Turkestan. Originally from the Stepnaya Experiment Station.
71098. No. 10154. "Ranny Seliony." An early green variety from Turkestan. Originally from the Stepnaya Experiment Station.
71099. No. 10296. Variety *maculatum*. "Gorokh Mestny No. 1." From the Severo-Dvinsk Government. Originally from the Stepnaya Experiment Station.
71100. No. 10307. Variety *umbellatum*. From the Moscow Plant-Breeding Station. Originally from the Stepnaya Experiment Station.
- 71101 and 71102. *SECALE CEREALE* L. Poaceae. **Rye.**
71101. No. 3005. A yellow-grained winter variety from the Bogoroditsky Experiment Station, Kursk Government.
71102. No. 6765. "Vjatka." From the Vjatka Experiment Station.
- 71103 to 71105. *SPINACIA OLERACEA* L. Chenopodiaceae. **Spinach.**
71103. No. 9273. Variety *glabra*. From Afghanistan. Originally from the Stepnaya Experiment Station.
71104. No. 9274. Variety *glabra*. From Afghanistan. Originally from the Stepnaya Experiment Station.
71105. No. 9275. Variety *glabra*. From Afghanistan. Originally from the Stepnaya Experiment Station.
- 71106 to 71114. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceae. **Common wheat.**
71106. No. 2999. Variety *lutescens*. "Belokoska." No. 62. A selected variety of spring wheat from an experiment station in the Saratov region.
71107. No. 3000. Variety *aibidum*. No. 604. A selected variety of white-grained wheat from an experiment station in the Saratov region.
71108. No. 6985. Variety *millurum*. No. 040. A selected variety of winter wheat from the Ekaterinoslav Government.

711051 to 711122—Continued.

71109. No. 9447. Variety *lutescens*. No. 0479. A selected variety from the Western Siberian Experiment Station, Omsk.

71110. No. 9448. Variety *miturum*. No. 0321. A selected variety from the Western Siberian Experiment Station, Omsk.

71111. No. 10162. Variety *ferrugineum*. No. 2411. A selected variety of winter wheat from the plant-breeding station of the Timiriasev Agricultural Academy, Moscow.

71112. No. 10163. Variety *ferrugineum*. No. 2453. A selected variety of winter wheat from the plant-breeding station of the Timiriasev Agricultural Academy, Moscow.

71113. No. 10167. Variety *alborubrum*. No. 2671. A selected variety from the plant-breeding station of the Timiriasev Agricultural Academy, Moscow.

71114. No. 10244. Variety *graecum*. "Sary Maghis." No. 0289 A IV. Tashkent Turkistan.

71115 to 71122. *VICIA* spp. Fabaceae.

71115 to 71120. *VICIA SATIVA* L. Common vetch.

71115. No. 1073. A pure-line variety from the Saratov Government. Originally from the Stepnya Experiment Station. No. 112.

71116. No. 3463. A pure-line variety from the Saratov Government. Originally from the Stepnya Experiment Station. No. 90.

71117. No. 3464. Obtained from Sernobank, through the Saratov Seed-Testing Station.

71118. No. 10062. A pure-line variety from the Penza Government. Originally from the Stepnya Experiment Station. No. 138.

71119. No. 10063. A pure-line variety from the Saratov Government. Originally from the Stepnya Experiment Station. No. 150.

71120. No. 10068. From the Saratov Government. Originally from the Stepnya Experiment Station.

71121. *VICIA SATIVA LEUCOSPERMA* (Moench) Seringe.

No. 10075. From the Kharkof Government. Originally from the Stepnya Experiment Station.

For previous introduction see No. 52277.

71122. *VICIA VILLOSA* Roth. Hairy vetch. No. 10029. From the Homel Government.

71123 to 71127.

From Keiyo, Chosen, Japan. Seeds presented by Dr. M. Tozawa, director, forestry experiment station. Received January 4, 1927.

71123. *LARIX DAURICA PRINCIPIS-RUPPRECHTII* (Mayr) Rehd. and Wils. Pinaceae. Larch.

A hardy Chinese larch which makes a handsome tree, sometimes 70 feet high, with attractive bright-green foliage and shiny cones over an inch long.

For previous introduction see No. 62682.

71124. *PINUS DENSIFLORA* Sieb. and Zucc. Pinaceae. Japanese red pine.

An ornamental Japanese pine, sometimes 120 feet high, with reddish bark and dull blue-green leaves in pairs.

71123 to 71127—Continued.

71125. *PINUS KORAIENSIS* Sieb. and Zucc. Pinaceae. Korean pine.

A hardy, slow-growing pyramidal tree, up to 100 feet in height. The leaves are glossy dark green. Native to Korea and Japan.

71126. *RHODODENDRON DAURICUM MUCRONULATUM* (Turcz.) Maxim. Ericaceae.

A hardy upright Manchurian shrub, up to 6 feet high. The rose-colored flowers appear very early in spring and the leaves turn scarlet in autumn.

71127. *RHODODENDRON SCHLIPPENBACHII* Maxim. Ericaceae.

A deciduous Japanese shrub, 3 to 5 feet high, with broadly oval pubescent leaves 2 to 5 inches long and pale pink flowers, which appear with the leaves in late spring.

71128. *CORYLUS CHINENSIS* Franch. Betulaceae. Chinese hazel.

From Nanking, China. Seeds purchased through Prof. J. H. Reizner, College of Agriculture and Forestry, University of Nanking. Received January 4, 1927.

A handsome spreading tree, 40 meters or less high, native to central and western China. The oval-oblong leaves are up to 18 centimeters long, and the edible nuts are about 1.5 centimeters in diameter.

For previous introduction see No. 62680.

71129. *CHAMAEDOREA* sp. Phoeniceaceae. Palm.

From Tela, Honduras, Central America. Seeds presented by Wilson Popenoe, United Fruit Co. Received January 10, 1927.

A tropical pinnate-leaved palm, native to Honduras. Of possible value as an ornamental house plant.

71130. *ERYTHRINA POEPPIGIANA* (Walp.) O. F. Cook (*E. micropteryx* Poepp.). Fabaceae. Bucare.

From Avon Park, Fla. Seeds presented by C. S. Donaldson. Received January 4, 1927.

A handsome tender leguminous tree with red flowers; native to Peru.

For previous introduction see No. 55040.

71131. *CITRUS SINENSIS* (L.) Osbeck. Rutaceae. Sweet orange.

From Talde, Grand Canary, Canary Islands. Scions collected by David Fairchild, agricultural explorer, with the Allison V. Armour expedition. Received January 21, 1927.

No. 939. December 29, 1926. The fruits of this variety have very little rag and a large amount of juice. They have rather thick skin of peculiar softness, and are shipped to the London market where they bring the top price.

71132 to 71167.

From China. Seeds obtained by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received January, 1927.

71132. *ACER TEGMENTOSUM* Maxim. Aceraceae. Maple.

No. 8742. Collected by I. V. Kosloff, Manchurian Research Society, Harbin, in the vicinity of Shitoukhetsy, Manchuria. October, 1926. An interesting green-barked maple with seeds in long racemes.

For previous introduction see No. 65481.

71132 to 71167—Continued.

71133. *ACER CAUDATUM UKURUNDENSE* (Trautv. and Meyer) Rehder. Aceraceae.
Maple.

No. 8736. Collected by I. V. Kosloff, Manchurian Research Society, Harbin, in the vicinity of Shitoukhetsy, Manchuria. October, 1926. A small Manchurian tree with coarsely toothed five-lobed or seven-lobed leaves.

For previous introduction see No. 65911.

71134. *AMYGDALUS DAVIDIANA* (Carr.) Zabel (*Prunus davidiana* Franch.). Amygdalaceae.
Chinese wild peach.

No. 8839. Fa Hua Ssu Temple, Chihli Province. November 19, 1926. A hardy wild peach used for stock only. It is native to northern China.

- 71135 to 71138. *AMYGDALUS PERSICA* L. (*Prunus persica* Stokes). Amygdalaceae. Peach.

Collected at the Fa Hua Ssu Temple, near Peking. November 19, 1926.

71135. No. 8860.

71136. No. 8861. *Ma nao hung tao* (red agate peach). The freestone fruits, 3 to 4 inches in diameter, are red outside and white within, and ripen during the early part of August. They are grafted on the wild peach.

For previous introduction see No. 62600.

71137. No. 8862. *Pa tao* (flowering peach). The twigs of blossoms, which fade from pink to white and then turn red, are sold here. The fruits, about 1½ inches in diameter and resembling apricots in shape, are freestone and ripen in September, becoming pink.

For previous introduction see No. 62602.

71138. No. 8863. Mixed peach seeds.

Numbers 71139 to 71141 were collected by I. V. Kosloff, of the Manchurian Research Society, Harbin, in the vicinity of Shitoukhetsy, Manchuria. October, 1926.

71139. *ANGELICA* sp. Apiaceae.

No. 8735. A hardy herbaceous plant belonging to the celery family, which may be ornamental. Native to Manchuria.

71140. *BETULA FRUTICOSA* Pall. Betulaceae.
Birch.

No. 8739. A shrub about 15 feet high, with oval-elliptic leaves about 2 inches long. Native to Manchuria and Siberia.

For previous introduction see No. 65917.

71141. *CARPINUS CORDATA* Blume. Betulaceae.
Hornbeam.

No. 8740. A handsome hardy tree 40 feet or less high, with oval-oblong, acuminate leaves 3 to 6 inches long. Native to Japan and Manchuria.

For previous introduction see No. 65920.

71142. *CELASTRUS* sp. Celastraceae.

No. 8828. From the Fa Hua Ssu Temple, Chihli Province. November 19, 1926. A small woody pendulous or climbing ornamental plant which is exceptionally attractive. The seed pod breaks into three parts and is golden yellow. In the center is a cluster of about three white seeds in a red receptacle.

Nos. 71143 to 71145 were collected by I. V. Kosloff, of the Manchurian Research Society, Harbin, in the vicinity of Shitoukhetsy. October, 1926.

71132 to 71167—Continued.

71143. *CLEMATIS BREVICAUDATA* DC. Ranunculaceae.

No. 8731. A vigorous climbing vine, native to China, with pinnate or bipinnate, coarsely toothed leaves and axillary panicles of white flowers.

For previous introduction see No. 65925.

71144. *CODONOPSIS* sp. Campanulaceae.

No. 8732. A hardy herbaceous perennial with showy flowers. Native to Manchuria.

71145. *DEUTZIA PARVIFLORA* Bunge. Hydrangeaceae.

No. 8729. A hardy ornamental shrub 6 feet high, with corymbs of white flowers. Native to northern China.

71146. *GREWIA PARVIFLORA* Bunge. Tiliaceae.

No. 8775. En route from the Ming Tombs to the Fa Hua Ssu Temple, Chihli Province. November 18, 1926. A hardy ornamental woody shrub with dull-green foliage, inconspicuous greenish flowers, and good-sized clusters of black fruits. Native to northern China.

For previous introduction see No. 62229.

71147. *IRIS DICHOTOMA* Pall. Iridaceae.
Vesper iris.

No. 8833. Fa Hua Ssu Temple, Chihli Province. November 19, 1926. A tall iris, said to have white flowers, found on a very dry rocky mountain side. It is native to northern China.

For previous introduction see No. 65526.

71148. *JUGLANS MANDSHURICA* Maxim. Juglandaceae.

No. 8733. Collected in the vicinity of Shitoukhetsy, by I. V. Kosloff, Manchurian Research Society, Harbin. October, 1926. A hardy Manchurian walnut tree up to 60 feet high, the nuts of which have eight ridges.

For previous introduction see No. 63527.

71149. *JUGLANS REGIA* L. Juglandaceae.
Walnut.

No. 8871. Fa Hua Ssu Temple, Chihli Province. November 20, 1926. *Pao pi ho tao* (thin-shelled walnut). Seeds from a tree 50 or 60 years old with large nuts which are edible in early September. It is said that these walnuts will break if allowed to fall from the trees.

For previous introduction see No. 62614.

71150. *LONICERA MAACKII* (Rupr.) Herd. Caprifoliaceae.
Amur honeysuckle.

No. 8741. Collected in the vicinity of Shitoukhetsy, Manchuria, by I. V. Kosloff, Manchurian Research Society, Harbin. October, 1926. A bush honeysuckle, native to northeastern China, becoming about 10 feet high, with widely spreading branches, dark-green leaves which are downy on both surfaces, and red fruits. The pure-white flowers, an inch in diameter, are produced in pairs on the upper side of the branchlets.

For previous introduction see No. 65937.

71151. *MALUS BACCATA* (L.) Moench (*Pyrus baccata* L.). Malaceae.
Crab apple.

No. 8772. Imianpo, Manchuria. November 11, 1926. A small round-headed hardy handsome tree with white flowers and small fruits which are yellow and red. Native to northeastern Asia.

71132 to 71167—Continued.

71152. *MISCANTHUS SACCHARIFLORUS* (Maxim.) Hack. Poaceae. Grass.

No. 8730. Collected by I. V. Kosloff, Manchurian Research Society, Harbin, in the vicinity of Shitoukhetsy. October, 1926. A tall perennial Chinese grass with large feathery fan-shaped panicles, which is related to the sugar cane.

For previous introduction see No. 66395.

71153. *PHASEOLUS AUREUS* Roxb. Fabaceae. Mung bean.

No. 8750. Obtained from the village of Fouyusiang, Budoune region, through the Manchurian Research Society, Harbin. November 11, 1926.

71154. *PHASEOLUS VULGARIS* L. Fabaceae. Common bean.

No. 8874. Fa Hua Ssu Temple, Chihli Province. November 20, 1926. A northern Chinese climbing variety with black shining seeds.

71155. *PINUS SINENSIS* Lambert. Pinaceae. Chinese pine.

No. 8774. Ming Tombs. November 18, 1926. A tall Chinese tree, up to 70 feet high, with a dark-gray trunk.

For previous introduction see No. 62472.

71156 and 71157. *PRUNUS ARMENIACA* L. Amygdalaceae. Apricot.

Fa Hua Ssu Temple, Chihli Province. November, 1926.

71156. No. 8864. *Ta pien tzu hsing* (flat apricot). Under good conditions the fruits of this variety become 2 or 3 inches in diameter. The kernels are of greater value than the fruits.

71157. No. 8865. A yellow pocket apricot about 2 inches in diameter, which ripens the end of June.

71158. *RHAMNUS* sp. Rhamnaceae.

No. 8831. Fa Hua Ssu Temple, Chihli Province. November 19, 1926. A small hardy, very thorny bush growing in dry soil.

71159. *RIBES MANSHURICUM* (Maxim.) Komarov. Grossulariaceae. Currant.

No. 8738. Collected in the vicinity of Shitoukhetsy, Manchuria, by I. V. Kosloff, Manchurian Research Society, Harbin. A variety producing good-sized bunches of red fruits which are large and of good quality.

For previous introduction see No. 65504.

71160 and 71161. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceae. Soy bean.

Obtained through the Manchurian Research Society, Harbin. November 11, 1926.

71160. No. 8748. From Fouyusiang, Rudoune region.

71161. No. 8749. From Oukieshou, Fushonsiang.

71162. *SPIRAEA* sp. Rosaceae. Spirea.

No. 8743. Collected by I. V. Kosloff, Manchurian Research Society, Harbin. October, 1926. A hardy shrub which is probably an ornamental. Native to Manchuria.

71163 to 71166. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceae. Common wheat.

Obtained through the Manchurian Research Society, Harbin. November 11, 1926.

71132 to 71167—Continued.

71163. No. 8744. From Changchunling.

71164. No. 8745. From Kungpingtzu.

71165. No. 8746. From Ertaskou, Fuyuhshien District.

71166. No. 8747. From Fouyusiang, Budoune region.

71167. *VIBURNUM SARGENTI* Koehne. Caprifoliaceae. Sargent cranberry bush.

No. 8734. Collected by I. V. Kosloff, Manchurian Research Society, Harbin, in the vicinity of Shitoukhetsy, Manchuria. October, 1926. A strong-growing shrub up to 12 or 15 feet high, with large clusters of bright-red fruits which are very attractive.

For previous introduction see No. 65512.

71168 to 71173.

From China. Seeds and scions collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received January 13, 1927.

71168. *CUCUMIS SATIVUS* L. Cucurbitaceae. Cucumber.

No. 794. Chungmuhihoh, Anhwei Province. October 17, 1926. *Wongkwa tsz.*

71169. *DIOSPYROS KAKI* L. f. Diospyraceae. Kaki.

No. 870. Nanking. An unusual variety, probably a seedling, with hairy leaves and fruits which remain green in color when ripe.

71170. *DOLICHOS LABLAB* L. Fabaceae. Hyacinth bean.

No. 652. Nanking. September, 1926. *Pin tan.* An uncommon bean which is brown with a conspicuous white hilum. It is planted in April or May, and the green pods and seeds are eaten from August to October, though the seeds are not eaten when ripe.

71171 and 71172. *ROSA* spp. Rosaceae. Rose

71171. *ROSA* sp.

No. 818. Near Shuching, Anhwei Province. October 16, 1926. A wild rose.

71172. *ROSA* sp.

No. 843. Chileng Mountain, Anhwei Province. October 27, 1926. A wild rose with small very dense clusters of many flowers. The young sprouts are tomentose.

71173. *DIOSPYROS KAKI* L. f. Diospyraceae. Kaki.

For previous introduction and description see No. 71048.

71174. *MACADAMIA TERNIFOLIA* F. Muell. Proteaceae.

From Brisbane, Queensland, Australia. Seeds presented by W. Ewart, honorary secretary, Queensland Acclimatisation Society. Received January 17, 1927.

A thin-shelled form of the macadamia, a handsome evergreen Australian tree which produces large clusters of edible nuts rich in an edible oil similar to olive oil.

71175. *COFFEA* sp. Rubiaceae. Coffee.

From Tananarive, Madagascar. Seeds presented by Paul Dean Thompson, American vice consul. Received January 17, 1927.

Montsaka, a local variety.

71176 to 71256.

From Japan and China. Collected by W. T. Swingle, Bureau of Plant Industry. Received January 12, 1927.

Plants, unless otherwise mentioned.

71176. *ACER DAVIDI* Franch. Aceraceae. **Maple.**

No. 807. A native Chinese maple, 50 to 60 feet high, with large oval heart-shaped coarsely toothed leaves and long pendent clusters of samaras.

For previous introduction see No. 65288.

71177. *ALEURITES MONTANA* (Lour.) Wilson. Euphorbiaceae. **Mu-oil tree.**

No. 802. Chekiang, China. A variety with oil-producing nuts which is allied to the tung-oil tree. Native to southern China.

For previous introduction see No. 66064.

71178. *BUXUS* sp. Buxaceae. **Box.**

No. 857. An ornamental hardy shrub, native to Japan.

71179. *CAMPTOTHECA ACUMINATA* Decaisne. Cornaceae.

No. 803. A handsome quick-growing hardy ornamental tree, related to the dogwood. It becomes 20 meters high with smooth gray bark, and produces numerous heads of white flowers in midsummer. Native to central and southwestern China.

71180 to 71186. *CITRUS* spp. Rutaceae.

71180. *CITRUS DEPRESSA* Hayata.

No. 936. From the Citrus Experiment Station, near Tanushimaru, Japan. A citrus tree native to Taiwan.

71181 to 71185. *CITRUS ICHANGENSIS* Swingle. **Ichang lemon.**

Fruits of a spiny shrub or small tree 5 to 15 feet high, native to central and southwestern China. It differs from other members of the genus chiefly in its very large, thick seeds and its slender leaves, which are four to six times longer than broad. It is also one of the hardest species of citrus known.

For previous introduction see No. 62349.

71181. No. 823. 71184. No. 826.

71182. No. 824. 71185. No. 827.

71183. No. 825.

71186. *CITRUS ICHANGENSIS* × ?
Hybrid Ichang lemon.

No. 863. From Nanking, China.

71187 to 71236. *CITRUS NOBILIS* UNSHIU Swingle. Rutaceae. **Satsuma orange.**

Numbers 71187 to 71215 are Japanese varieties presented by the Imperial Horticultural Station, Okitsu.

71187. No. 865. *Miyasaki.*

71237. *CITRUS SINENSIS* (L.) Osbeck.
Sweet orange.

No. 864. A small round tender variety from the Nanking University, China.

71238. *CITRUS TAIWANICA* Tanaka and Shimada.

No. 935. From the Citrus Experiment Station near Tanushimaru, Japan.

71239. *FORTUNEARIA SINENSIS* Rehd. and Wils. Hamamelidaceae.

No. 860. A hardy ornamental shrub, related to the witch-hazel, up to 7 meters high, with oblong-oval leaves 7 to 15 centimeters long and inconspicuous flowers. Native to China.

71176 to 71256—Continued.

71240 to 71243. *FORTUNELLA HINDSII* (Champ.) Swingle (*Atalantia hindsii* Oliver). Rutaceae.

A small shrub with oval-elliptic leathery leaves and small orange fruits. Native to southeastern China.

71240 and 71241. From Wakayama, Japan.

71240. No. 906. 71241. No. 907.

71242 and 71243. From Saitama, Japan.

71242. No. 908. 71243. No. 909.

71244. *KETELEERIA DAVIDIANA* (Bertrand) Beissner. Pinaceae.

No. 861. A coniferous tree native to western China which is closely allied to the firs. It sometimes becomes 100 feet tall, is of pyramidal habit, and has handsome, glossy green, firlike foliage. The tree is said to be somewhat tender to frost, and therefore probably adapted for growing only in the southern half of the United States.

For previous introduction see No. 62254.

71245 to 71248. *MORUS* spp. Moraceae. **Mulberry.**

Cuttings.

71245. *MORUS* sp.

No. 804 a-c. A variety with green bark.

71246. *MORUS* sp.

No. 805-b.

71247. *MORUS* sp.

No. 806-b.

71248. *MORUS* sp.

No. 808 a-c.

71249. *NAGEIA NAGI* (Thunb.) Kuntze (*Podocarpus nagi* Pilger.). Taxaceae.

No. 859. From China. Originally grown in Japan. An evergreen subtropical tree 30 to 60 feet high, with very narrow, bluish green sharp-pointed leaves about 3 inches long and arranged in two rows on the branches. The fruit is a small fleshy purplish black drupe, which emits a balsamlike fragrance when cut. In Japan the white, fine-grained wood is used for furniture and general building. Propagation is easily carried on by seeds of which the tree produces an abundance.

For previous introduction see No. 55477.

71250. *PHOTINIA SERRULATA* Lindl. Malaceae.

No. 856. An ornamental shrub with dark evergreen leaves and red berries.

71251. *PONCIRUS* sp. Rutaceae.

No. 949. *Kikoku* (*Sappan kikoku*). A small citrus tree from the Citrus Experiment Station near Tanushimaru, Japan.

71252. *POUPARTIA AXILLARIS* (Roxb.) King and Prain. Anacardiaceae.

No. 801. From Chekiang Province (?). A very rapid-growing tree which is quite large and bears yellow edible fruits an inch long. Native to western China.

For previous introduction see No. 44519.

71253. *TAIWANIA CRYPTOMERIOIDES* Hayata. Pinaceae. **Taiwania.**

No. 862. From the botanic garden, Tokyo, Japan. As described in the Journal of the Arnold Arboretum (vol. 2, p. 35), this is the loftiest tree in the forests of Taiwan, where it rears its small moplike crown well above all its

71176 to 71256—Continued.

neighbors. The average height of this tree is 160 feet, but specimens exceeding 200 feet are known. The trunk is sometimes 30 feet in girth, quite straight, and bare of branches for 100 to 150 feet. It is a strikingly distinct tree, singularly like an old *Cryptomeria*; both trees suggest gigantic lycopods. In the dense forests the crown is small, dome-shaped or flattened, the branches few and short, and one wonders how so little leafage can support so large a tree. When the top is broken by storms, the lateral branches assume an erect position. In the more open forest the branches are massive and wide-spreading, the crown is oval or flattened, and on small trees the branchlets are often pendent. *Taiwania* sheds its small branchlets as do species of *Cryptomeria*, *Cunninghamia*, and *Sequoia*.

For previous introduction see No. 52570.

71254. *THEA SINENSIS* L. Theaceae. **Tea.**

No. 855. Seeds of Japanese tea.

71255. *VIBURNUM HUPEHENSE* Rehd. Caprifoliaceae. **Hupeh viburnum.**

No. 858. A fairly hardy, deciduous shrubby species, allied to *Viburnum urightii*, with coarsely toothed, long-pointed, dark-green leaves, and ovoid, dark-red fruits. Native to central China.

For previous introduction see No. 63687.

71256. *CITRUS ICHANGENSIS* Swingle. Rutaceae. **Ichang lemon.**

For previous introduction and description see No. 71871-84.

71257. *JUGLANS MANDSHURICA* Maxim. Juglandaceae.

From China. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received January 14, 1927.

No. 864. Chiuwashaan, Anhwei Province, November 4, 1926. *Hak to*. Black "English" walnuts, said to grow wild in this region.

For previous introduction see No. 62611.

71258. *GIGANTOCHLOA ASPERA* Hort. Poaceae. **Bamboo.**

From Peradeniya, Ceylon. Plants collected by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received July 19, 1926. Numbered March, 1927.

No. 867. Botanic Gardens. June 9, 1926. A clump bamboo.

71259. *DIOSPYROS KAKI* L. f. Diospyraceae. **Kaki.**

From China. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received December 27, 1926. Numbered January, 1927.

No. 701. Chiuwashaan, Anhwei Province, November, 1926. Seeds from several types of fruits. The largest plants seen were from 2 to 3 meters in height, and they were very rare.

71260. *SACCHARUM SPONTANEUM* L. Poaceae. **Grass.**

From Santiago de las Vegas, Cuba. Cuttings presented by Dr. Gonzalo M. Fortun, Director, Estacion Experimental Agronomica, through E. W. Brandes, Bureau of Plant Industry. Received January 22, 1927.

A tall coarse ornamental tropical grass, related to sugar cane.

71261 to 71387.

From China. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received January, 1927.

71261. *ALLIUM* sp. Liliaceae. Onion.

No. 659. Nanking. September, 1926. *Lung chau tsung*. A set-forming onion which is also often grown in pots as an ornamental.

71262 and 71263. *ALNUS* spp. Betulaceae. Alder.

71262. *ALNUS* sp.

No. 841-a. Shihohhan, Mongmoshaan, Anhwei Province. October 26, 1926. *Shui tung kwa*. A fine large straight tree with smooth bark, growing on a river bank.

71263. *ALNUS* sp.

No. 854. Yeungkokpeng, Anhwei Province. October 28, 1926. *Laan tung kwa*.

71264 to 71266. *AMARANTHUS GANGETICUS* L. Amaranthaceae.

71264. No. 667. Nanking. September, 1926. *In tsai*. A widely grown vegetable said to mature more slowly, ripen later, and remain tender longer than any other variety of spinach grown here.

71265. No. 782. Luchowfu, Anhwei Province. October 10, 1926. *Hsun tsai*. A variety planted here in March and ready for use in May.

71266. No. 800. Chungmuhihoh, Anhwei Province. October 17, 1926. *Hsin tsai*.

71267. *APIUM GRAVEOLENS* L. Apiaceae. Celery.

No. 662. Nanking, September, 1926. *Heung kan*. A variety grown abundantly in this region. The seeds are sown during April in very carefully prepared soil, covered with mats, and watered. The plants, when 4 or 5 inches high, are transplanted into trenches which are 8 to 10 inches deep and 2 feet apart. The trenches are filled with soil about two weeks before harvesting, which is during August and September. The plants are sometimes set out in close order in the beds, to avoid the work of hilling up for blanching.

71268. *ASTER* sp. Asteraceae.

No. 844. Chileng Mountain, Anhwei Province. October 27, 1926. *Paak kuk fa*. A wild aster with an abundance of large pale-blue flowers.

71269 and 71270. *BENINCASA HISPIDA* (Thunb.) Cogn. Cucurbitaceae. Wax gourd.

71269. No. 660. Nanking. September, 1926. *Tung kwa*. A small variety commonly grown in this vicinity. The seeds are sown during March and April and the vines are generally grown on bamboo trellises near ponds. Sometimes they are grown in beds, the rows being 6 or 7 feet apart. The fruits have a tough skin and are easily stored. They become available during July and August and continue to bear until frost, which is generally about November.

71270. No. 665. Nanking. September, 1926. *Tung kwa*. A large late variety, with long, cylindrical fruits, which requires a long growing season.

71271. *BOERHMERIA NIVEA* (L.) Gand. Urticaceae. Ramie.

No. 858. Near Poonpinkasi, Anhwei Province. November 1, 1926. *Chu ma*. An erect, branched, monoecious shrubby perennial, 1 to 2 meters high, with hairy branches and petioles, which is propagated here, as a rule, by means of

71261 to 71387—Continued.

rooted suckers springing up from the base of the plant. It is cultivated in Kwangtung for the excellent fibers which the stems yield, and the well-known Chinese grass cloth is said to be made from selected fibers.

For previous introduction see No. 65825.

71272. *BOERHMERIA* sp. Urticaceae.

No. 860. Chiehwhashaan, Anhwei Province. November 3, 1926. *Ye chue ma*. Seeds of a wild ramie.

71273 to 71291. *BRASSICA* spp. Brassicaceae.

71273. *BRASSICA* sp.

No. 655. Nanking. September, 1926. *Shi li hung*. An annual plant with leaves said to be large, somewhat hairy, and curly like endive (*savoy*). It is grown abundantly in this region, and stands cold weather and snow well. The seeds are sown between the months of September and November and are ready for harvesting between February and April. It is utilized almost entirely as a salt vegetable.

71274. *BRASSICA* sp.

No. 658. Nanking. September, 1926. *Paak tsai*. A plant grown extensively here. The seeds are sown during June and July or September and October and are transplanted within about two weeks.

71275. *BRASSICA* sp.

No. 666. Nanking. September, 1926. *Paak tsai*. The seeds are sown during August and September, and the plants are ready for use late in October and November.

71276. *BRASSICA* sp.

No. 668. Nanking. September, 1926. *Tsing tsai*. The earliest variety of this type of vegetable which is grown in this vicinity. It does not stand cold weather.

71277. *BRASSICA* sp.

No. 670. Nanking. September, 1926. *Piu yi tsai*. A vegetable with green petioles and very dark-green leaves which does not form a head. It is highly esteemed by the Chinese and is said to be improved in flavor by frost.

71278. *BRASSICA* sp.

No. 699. Luchowfu, Anhwei Province. October, 1926. *Yau tsai*. A common and very important winter crop in this region, the seeds of which yield an oil called *tsai yau*.

71279. *BRASSICA* sp.

No. 651. Nanking. September, 1926. *Tsing tsai*. A variety, with edible stems and leaves, which does not form a head. The seeds are sown during August and September, and the plants are available on the market in November and December.

71280. *BRASSICA* sp.

No. 775. Shuching, Anhwei Province. October 15, 1926. *Yau tsai*.

71281. *BRASSICA* sp.

No. 776. Shuching, Anhwei Province. October 15, 1926. *Oo ip tsai*. A vegetable, characterized by the very dark-green leaves, which does not form a head. It is the most common vegetable cultivated in this region.

71282. *BRASSICA* sp.

No. 778. Luchowfu, Anhwei Province. October, 1926. *Oo tsai*. A vegetable planted here in early spring, developing very rapidly.

71261 to 71387—Continued.

71283. BRASSICA sp.

No. 780. Luchowfu, Anhwei Province. October 10, 1926. *Jaai ip paak tsoi*. A large-leaved variety which does not form a head. It is planted here in August and is ready for use in December.

71284. BRASSICA sp.

No. 781. Luchowfu, Anhwei Province. October 10, 1926. *Haak tsaai*. A vegetable planted here during December and ready for use in May.

71285. BRASSICA sp.

No. 784. Luchowfu, Anhwei Province. October 11, 1926. *Siu ip paak tsoi*. A small-leaved variety planted in September and ready for use in December.

71286. BRASSICA sp.

No. 797. Chungmuihoh, Anhwei Province. October 17, 1926. *Fa tsoi*. A variety with crinkled leaves.

71287. BRASSICA sp.

No. 798. Chungmuihoh, Anhwei Province. October 17, 1926. *Wong tsoi tsz*.

71288. BRASSICA sp.

No. 804. Chungmuihoh, Anhwei Province. October 17, 1926. *Suen tsoi tsz*.

71289. BRASSICA sp.

No. 805. Chungmuihoh, Anhwei Province. October 17, 1926. *Uen kwang paak tsoi*.

71290. BRASSICA sp.

No. 806. Chungmuihoh, Anhwei Province. October 17, 1926. *Paak oo tsoi*.

71291. BRASSICA sp.

No. 777. Luchowfu, Anhwei Province. October, 1926. *Luet lei hung*.

71292 and 71293. CAPSICUM ANNUUM L. Solanaceae. Red pepper.

71292. No. 650. Nanking. September, 1926. *Laat chiu*. A small, pointed variety which is a very prominent article in the diet of the people in this part of China, especially the poorer classes.

71293. No. 786. Luchowfu, Anhwei Province. October 11, 1926. *Tso foo laat tsui*. An early variety.

71294 and 71295. CHAETOCLOA ITALICA (L.) Scribn. (*Setaria italica* Beauv.). Poaceae. Millet.

71294. No. 696. Luchowfu, Anhwei Province. October, 1926. *Siu mai tsz*. The common "foxtail" millet which is used as birdseed and also for human consumption when ground into flour.

71295. No. 823. Taaihohhau, Anhwei Province. October, 1926. *Siu mai*.

71296 to 71298. CHRYSANTHEMUM CORONARIUM L. Asteraceae.

For previous introduction see No. 64352.

71296. No. 653. Nanking. September, 1926. *Pung ho*. A semivining plant, with a spicy flavor which is characteristic of the genus. It is sown here during the months of November, December, and January. The young stems, leaves, and tips are eaten as a vegetable.

71297. No. 757. Nanking. September, 1926. *Tai ip tang ho*. A very common plant whose leaves and young shoots are eaten as a vegetable. It is marked by a pungent

71261 to 71387—Continued.

flavor characteristic of the genus. This variety is thinly sown in beds during October and November and ready for use in February and March. In the meantime the tips may be cut off while the plants are very young and fried, boiled in salt water, or eaten cold as a salad.

71298. No. 793. Chungmuihoh, Anhwei Province. October 17, 1926. *Tong ho tsoi*.

71299. CLERODENDRUM sp. Verbenaceae.

No. 656. Nanking. October 2, 1926. A strikingly ornamental shrub with fragrant white flowers in large rather loose corymbs followed by blue-green fruits. The persistent red calyxes add to the attractiveness of the shrub.

71300. CUCUMIS MELO L. Cucurbitaceae. Melon.

No. 664. Nanking. September, 1926. *Wong kwa*. A local variety producing slender fruits 10 inches long, with green skin and yellow tips, which are eaten either fresh or cooked. It is planted from the latter part of February until April and is ready to use between May and July. It is sometimes planted in August as a winter crop, and the fruits are then ready to use late in September and October.

71301 and 71302. CUCURBITA MOSCHATA Duchesne. Cucurbitaceae. Cushman.

71301. No. 779. Luchowfu, Anhwei Province. October, 1926. *Naam kwa*. A common flat pumpkin mottled yellow and green.

71302. No. 799. Chungmuihoh, Anhwei Province. October 17, 1926. *Naan kwa tsz*.

71303. LUFFA CYLINDRICA (L.) Roemer (L. aegyptiaca Mill.). Cucurbitaceae.

No. 669. Nanking. September, 1926. *Sz kwa*. A plant with fruits said to reach a length of 5 or 6 feet. The flesh is eaten as a vegetable while young. The Chinese are said to hang a stone on the tip of the fruits in order to make them grow straight, making them easy to peel.

For previous introduction see No. 53903.

71304. CUDRANIA TRICUSPIDATA (Carr.) Bureau. Moraceae.

No. 787. En route from Shuching to Chungmuihoh, Anhwei Province. October 16, 1926. *Cham shue*. A thorny tree 5 to 6 meters high, which apparently grows very slowly. The extremely hard wood is used for tools. In this vicinity the leaves are used to feed silkworms.

For previous introduction see No. 45448.

71305. DAUCUS CAROTA L. Apiaceae. Carrot.

No. 773. Luchowfu, Anhwei Province. October 10, 1926. *Wong lo paak*. A long-rooted carrot grown to a limited extent here.

71306 and 71307. DIOSPYROS LOTUS L. Diospyraceae. Persimmon.

Wild forms growing near Chungmuihoh, Anhwei Province. October, 1926.

71306. No. 814. A flat-calyx form slightly larger in size than the average. These seeds are from a tree about 3 meters high.

71307. No. 816. A high-calyx form with subglobular fruits.

71308. HELIANTHUS ANNUUS L. Asteraceae. Sunflower.

No. 685. Luchowfu, Anhwei Province. October, 1926. *Kwai fa*. The giant sunflower, cultivated throughout this region on the edges of fields and as a companion crop with beans, sweet potatoes, etc.

71261 to 71387—Continued.

71309 to 71311. *SORGHUM VULGARE* Pers. Poaceae. Sorghum.

71309. No. 694. Luchowfu, Anhwei Province. October, 1926. *Ko leung mai*. A nonsaccharine sorghum commonly cultivated throughout this region, along the borders of fields and as a companion crop with soy beans and sweet potatoes. The seeds are ground and used as food, and the empty flower stalks are used to make small brooms.

71310. No. 810. En route from Chungmuihoh to Taaihohhau, Anhwei Province. October 18, 1926. *Paak ko leung*. A white-seeded variety of nonsaccharine sorghum.

71311. No. 811. En route from Chungmuihoh to Taaihohhau, Anhwei Province. October 18, 1926. *Hung ko leung*. A red-seeded variety of nonsaccharine sorghum.

71312. *LILIUM* sp. Liliaceae. Lily.

No. 826. Wild plants growing at Taaihohhau, Anhwei Province. October, 1926.

71313. *LILIUM* sp. Liliaceae. Lily.

No. 861. Chihuwashaan, Anhwei Province. November 4, 1926.

71314. *LILIUM* sp. Liliaceae. Lily.

No. 863. Wild plants growing at Chihuwashaan, Anhwei Province. November 3, 1926.

71315. *LIQUIDAMBAR FORMOSANA* Hance. Hamamelidaceae.

No. 827. Taaihohhau, Anhwei Province. October, 1926. *Fung heung shue*. A handsome tree, 20 to 40 meters high, with a straight trunk, a much-branched head, and frequently buttressed roots. The leaves turn to a chestnut-brown or red in the autumn and are retained late into the winter. The leaves of the young plants are five-lobed, while those of adult trees are only three-lobed and smaller. In Kiangsi the wood is used for making tea chests. This is one of the most widely distributed trees in China, being particularly abundant in western Hupeh. It is also cultivated in Japan.

For previous introduction see No. 44666.

71316. *LONICERA* sp. Caprifoliaceae. Honeysuckle.

No. 857. A wild climber growing at the foot of Chileng Mountain, Anhwei Province. October 27, 1926.

71317. *LYCORIS* sp. Amaryllidaceae.

No. 697. Luchowfu, Anhwei Province. October 10, 1926. A small tender bulbous plant with an abundance of scarlet flowers. It is grown extensively in Shanghai for cut flowers.

71318 to 71350. *ORYZA SATIVA* L. Poaceae. Rice.

71318 to 71337. Starchy wet-land varieties obtained through C. M. Heh, acting head, department of agronomy, College of Agriculture and Forestry, University of Nanking. The Nanking field numbers are represented by the letters N. U.

71318. No. 624. N. U. No. 3.

71319. No. 625. N. U. No. 5. The so-called black variety.

71320. No. 626. N. U. No. 6.

71321. No. 627. N. U. No. 7.

71322. No. 628. N. U. No. 9.

71323. No. 629. N. U. No. 10.

71324. No. 630. N. U. No. 11.

71261 to 71387—Continued.

71325. No. 631. N. U. No. 12.

71328. No. 632. N. U. No. 14.

Numbers 71327 to 71332 were originally from Luntang, Kiangsu.

71327. No. 633. 71330. No. 636.

71328. No. 634. 71331. No. 637.

71329. No. 635. 71332. No. 638.

Numbers 71333 to 71336 were originally from Chinkiang, Kiangsu.

71333. No. 639. 71335. No. 641.

71334. No. 640. 71336. No. 642.

71337. No. 643. A purple-chaffed variety, originally from Luntang, Kiangsu.

Numbers 71338 to 71344 are from Luchowfu, Anhwei.

71338. No. 686. *Cheung lau siu*. A beardless variety of starchy, wet-land rice planted in March and harvested in August.

71339. No. 687. *Paak tau*. A white, starchy variety of wet-land rice.

71340. No. 589. *Lau tiu noh*, *Tai paak*. A glutinous variety of wet-land rice.

71341. No. 690. *Waan shiu noh*. A bearded variety of glutinous wet-land rice used locally to make puffed rice.

71342. No. 691. *Oo chu luk*. A black-hulled variety of glutinous rice.

71343. No. 692. *Hau yau noh*. A very late variety of wet-land rice with dark grains inside, which is considered to be of excellent quality. It is used locally to make cakes and candy.

71344. No. 785. *Hak hok tau*. A black-hulled, starchy variety of wet-land rice.

71345. No. 788. Near Chungmuihoh, Anhwei. *Siu tiu siu tau*.

71346. No. 819. From Taaihohhau, Anhwei. *Hoh chuen tau*.

71347. No. 821. From Taaihohhau, Anhwei. *Tai paak kwoh tau*.

71348. No. 855. From Tunghohhau, Anhwei. *Noh mai*. A late variety of wet-land glutinous rice.

71349. No. 856. From Aoptszoo, Anhwei. *Chi noh mai* (late glutinous rice). A late variety of wet-land glutinous rice.

71350. No. 934. Agricultural Experiment Station, Nanchang, Kiangsi. *Ko chuan noh kuk*. A glutinous rice used for making wine.

71351 to 71353. *PISUM SATIVUM* L. Fabaceae. Pea.

71351. No. 654. Nanking. September, 1926. *Waan tau*. A pole pea over a meter high, producing an abundance of small pods, each containing three or four small seeds. The pods and seeds may be eaten when green, though when ripe the seeds are usually cooked with glutinous rice. This variety is planted during October and November and is ready for use in April and May.

71352. No. 683. Luchowfu, Anhwei Province. October, 1926. *Waan tau*. A smooth yellow field pea used in the form of noodles and in soup.

71261 to 71387—Continued.

71353. No. 684. Luchowfu, Anhwei Province. October, 1926. *Liao tau*. A rather small green, somewhat wrinkled variety of field pea which is eaten green, though used chiefly for stock feed after it has become ripe. It is planted in October and harvested in June.

71354 and 71355. RAPHANUS SATIVUS L. Brassicaceae. Radish.

71354. No. 661. Nanking. September, 1926. *Hung loh paak*. A tender radish with red skin and white flesh, which is 6 to 8 centimeters in diameter and subglobular. It is eaten raw and shredded in soy sauce as a summer relish. This is a summer variety grown extensively in Nanking.

71355. No. 796. Chungmuihoh, Anhwei Province. October 17, 1926. *Lo fu tsz*.

71356. RHODODENDRON sp. Ericaceae.

No. 853. Yeungkokteng, Anhwei Province. October 29, 1926. *Yeung shaan hung*. A handsome rhododendron with flame-colored flowers.

71357 to 71360. ROSA spp. Rosaceae. Rose.

71357. *ROSA* sp.

No. 698. Luchowfu, Anhwei Province. October 11, 1926. A scandent rose which may be of interest to rose breeders. The flowers are said to be pink, and the fruits are brick red, oval, and about a centimeter in diameter.

71358. *ROSA* sp.

No. 812. October 18, 1926. *Kam kon tsz*. A wild rose found en route from Chungmuihoh to Taaihohhan, Anhwei Province.

71359. *ROSA* sp.

No. 846. Chileng Mountain, Anhwei Province. October 27, 1926. A wild clamoring rose with red elongated fruits which are solitary or in few-flowered clusters.

71360. *ROSA* sp.

No. 847. Tungchen, Anhwei Province. October 28, 1926. *Cheung miu*. A rank-growing wild rose with dense clusters of small fruits.

71361. RUBUS sp. Rosaceae. Raspberry.

No. 845. Chileng Mountain, Anhwei Province. October 27, 1926. A rambling scandent raspberry which may be of interest to raspberry breeders. The leaves, tomentose beneath, are lobed and rugose, and the small red fruits borne in large clusters are rather seedy but of pleasant flavor.

71362 to 71366. SESAMUM ORIENTALE L. Pedaliaceae. Sesame.

71362. No. 695. Luchowfu, Anhwei Province. October, 1926. *Paak chue ma*. A white sesame the seeds of which yield an oil used in cooking. They are also used in confections. This species is planted in May and harvested in August and September. It is usually grown along with some other crop, such as beans.

71363. No. 795. Chungmuihoh, Anhwei Province. October 17, 1926. *Wong chue ma*. A white sesame.

71364. No. 803. Chungmuihoh, Anhwei Province. October 17, 1926. *Hak chue ma*.

71365. No. 808. Chungmuihoh, Anhwei Province. October 17, 1926. *Paak chue ma*.

71366. No. 851. Tungchan, Anhwei Province. October 28, 1926. *Hak chue ma*. A black sesame.

71261 to 71387—Continued.

71367. SMILAX sp. Smilacaceae.

No. 859. Chiuwashaan, Anhwei Province. November 2, 1926. *Tang tung kwah*. A vine with large leaves and bright-red berries which keep their fresh color far into the autumn.

71368 to 71370. SOLANUM MELONGENA L. Solanaceae. Eggplant.

71368. No. 645. Nanking. September, 1926. *Ke tsz*. A variety with subglobular purple fruits, commonly cultivated in this region.

71369. No. 646. Vicinity of Nanking. September, 1926. *Ke tsz, paak ke tsz*. A variety of eggplant with elongated, white-skinned fruits, commonly cultivated in this vicinity. The fruits of this variety are smaller, but of better flavor than No. 645 [No. 71368].

71370. No. 807. Chungmuihoh, Anhwei Province. October 17, 1926. *Ke tsz*.

71371. SPINACIA OLERACEA L. Chenopodiaceae. Spinach.

No. 671. Nanking. September, 1926. *Poh tsoi*. A common Chinese spinach cultivated in this region.

71372. VICIA FABA L. Fabaceae. Broad bean.

No. 678. Luchowfu, Anhwei Province. October, 1926. *Chaan tau*. A very coarse bean of bush habit, the seeds of which are roasted as a confection. The plants are said to be used as a green-manure crop, for which use the seeds are planted in August after the rice has been harvested, and the young plants are plowed under the following spring.

71373 to 71376. VIGNA SESQUIPEDALIS (L.) Fruwirth. Fabaceae. Yard long bean.

71373. No. 649. Nanking. September 30, 1926. *Tsz kaan tau*. A variety of Chinese long bean with long brownish red seeds, which is commonly cultivated in this region. It is planted in June and is ready to eat as green beans by August. The pods are said to be purplish in color before they are ripe.

71374. No. 663. Nanking. September, 1926. *Ng uet kaan tau*. A Chinese pole bean with red seeds, planted in March and April and ready for use as green beans in June and July. It is rarely eaten as mature beans.

71375. No. 681. Luchowfu, Anhwei Province. October, 1926. *Chaan (?) tau*. A variety with solid red seeds, used either when green or mature; it has a vining habit.

71376. No. 828. Taaihohhau, Anhwei Province. October, 1926. *Tsung kaan tau*.

71377 to 71380. VIGNA SINENSIS (Torner) Savi. Fabaceae. Cowpea.

71377. No. 647. Nanking. September, 1926. *Fa kaan tau*. A commonly cultivated variety of long bean which is mottled red and white.

71378. No. 648. Nanking. September, 1926. *Oo kan tau*. A variety of the Chinese long bean which is mottled black and white. The seeds are not commonly eaten when green, but are cooked with rice when mature.

71379. No. 675. Luchowfu, Anhwei Province. October, 1926. *Taii hung tau*. A climbing variety which is planted in May and harvested in September.

71380. No. 676. Luchowfu, Anhwei Province. October, 1926. *Fa tau tsz*. A mottled variety of climbing habit.

71261 to 71387—Continued.

71381 to 71386. *ZEA MAYS* L. Poaceae. Corn.71381. No. 792. En route from Shuching to Chungmuhoh, Anhwei Province. October 16, 1926. *Pau luk*. A semident variety.71382. No. 809. En route from Chungmuhoh and Taaihohhau, Anhwei Province. October 18, 1926. *Luk kok*. A variegated variety with a flinty endosperm.71383. No. 830. Taaihohhau, Anhwei Province. October, 1926. *Luk kok*. A pale-yellow flint variety.71384. No. 840. Taaihohhau, Anhwei Province. October, 1926. *Hung kuk kok*. A red sport which occurs very frequently in the corn in this vicinity.71385. No. 841. Taaihohhau, Anhwei Province. October 22, 1926. *Paak luk kok*. A white dent variety with a white cob.71386. No. 652. Tungchan, Anhwei Province. October 28, 1926. *Ue tso luk*. An early variety of flint corn.71387. *TRICYRTISPILOSA* Wall. Melanthiaceae.71388. *IXOPHORUS UNISETUS* (Presl.) Schlecht. Poaceae. Grass.

From Honolulu, Hawaii. Seeds presented by J. M. Westgate, Director, Hawaii Agricultural Experiment Station, through H. N. Vinall, Bureau of Plant Industry. Received January 21, 1927.

A coarse perennial tropical grass, 2½ to 4 feet high, which is excellent stock feed. In Hawaii it yields about 45 tons of green feed per acre. (Westgate.)

For previous introduction see No. 50650.

71389. *CAJANUS INDICUS* Spreng. Fabaceae. Pigeon pea.

From Antigua, British West Indies. Seeds presented by the Superintendent of Agriculture. Received January 22, 1927.

Locally grown seeds.

71390. *FRAXINUS MANDSHURICA* Rupr. Oleaceae. Ash.

From Manchuria. Seeds obtained by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received January 22, 1927.

No. 8703. Slinkins Forest Concession. October, 1926. Collected by I. V. Kosloff, Manchurian Research Society, Harbin. A tall handsome tree with dull-green foliage, native to northeastern Asia.

For previous introduction see No. 64235.

71391 and 71392. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceae. Soy bean.

From Cawnpore, United Provinces, India. Seeds presented by D. Youngman, economic botanist. Received January 23, 1927.

Locally grown varieties.

71391. Black-seeded variety.

71392. White-seeded variety.

71393. *ECDEIOCOLEA MONOSTACHYA* F. Muell. Baloskionaceae.

From Perth, Western Australia. Seeds presented by W. M. Carne, botanist and plant pathologist, Department of Agriculture. Received January 21, 1927.

Collected at Marchagee, Western Australia, November 25, 1926. Locally known as "Sandplain." (Carne.)

A perennial rushlike herbaceous plant, introduced for testing as a possible source of paper-making material. It is native to Western Australia, where it grows in deep sand.

For previous introduction see No. 62232.

71394 to 71403.

From Kharkof, Ukrania, Russia. Seeds presented by All-Ukrainian Seed-Producing Association, through J. W. Pincus, Amtorg Trading Corporation, New York City, N. Y. Received January 22, 1927.

Locally developed varieties.

71394. *ANETHUM GRAVEOLENS* L. Apiaceae. Dill.

For previous introduction see No. 64340.

71395. *CITRULLUS VULGARIS* Schrad. Cucurbitaceae. Watermelon.*Piatogorski* (favorite).71396 to 71398. *CUCUMIS SATIVUS* L. Cucurbitaceae. Cucumber.71396. *Nejiski*.71397. *Zelenka* (green).71398. *Viaznikovski*.71399. *CUCURBITA PEPO* L. Cucurbitaceae. Pumpkin.*Greek squash*.71400 and 71401. *PHASEOLUS VULGARIS* L. Fabaceae. Common bean.71400. *Wonder of France*.71401. *Emperor William*. A Russian bush bean.71402 and 71403. *TRIFOLIUM PRATENSE* L. Fabaceae. Red clover.

A southern Russian variety which gives two crops a year.

71402. No. 1.

71403. No. 2.

71404. *JUGLANS REGIA* L. Juglandaceae. Walnut.

From Gibraltar, Spain. Seeds obtained by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received January 22, 1927.

No 926. December, 1926. A large variety of the English walnut sold in a single shop in Gibraltar and which is said to be grown around Ronda, Spain. The quality of the meat is very fine.

71405. *CORMONEMA OVALIFOLIUM* Donn. Smith. Rhamnaceae.

From the city of Guatemala, Guatemala. Seeds presented by Jorge Garcia Salas, Director General of Agriculture, through Paul C. Standley, United States National Museum. Received January 12, 1927.

A small tropical tree, native to Guatemala, where it is planted as an ornamental in parks and used as a shade tree for coffee. In Guatemala it is known as *corte*.

71406. SYAGRUS FLEXUOSA (Mart.)
Beccari (Cocos flexuosa Mart.). Phoeniceae. **Palm.**

From St. Leo, Fla. Seeds presented by Father Jerome, St. Leo Academy, through R. A. Young, Bureau of Plant Industry. Received January 22, 1927.

A low Brazilian palm, 9 to 12 feet high, with lax terminal pinnate leaves, 3 to 6 feet long, having 70 to 90 pairs of rigid leaflets.

71407 to 71413. DIOSPYROS KAKI L. f.
Diospyraceae. Kaki.

From Anhwei Province, China. Scions obtained by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received February 1, 1927.

71407 and 71408. *Shui sz paan tsz tsz.* From the Mission Hospital Compound, Luchowfu. October, 1926. A seedless or few-seeded variety with fruits 5 to 7 centimeters in diameter, having eight seed pockets composed of very thin transparent flesh. In shape the fruits are squarish, somewhat flattened, and with a more or less distinct groove on each side proceeding downward from the points of the calyx lobes. The center of the calyx end has a slight depression, and the apex is flat and sometimes rather depressed. The core is pithy only at the very base, just below the calyx, otherwise the flesh is intermediate in nature between that of the seed pocket and that without. When ripe the flesh is soft and sweet with little fiber. The fruits, which must be ripened artificially, are good for shipping. This variety appears on the market early in September and constitutes a large percentage of the supply which is sold in the Nanking market.

71407. No. 731. Tree No. 6.

71408. No. 732. Tree No. 7.

71409. No. 739. Shuching. October 13, 1926. *Hung shiu laat tsiu.* A small, subglobular, seedless or few-seeded, early variety which is conspicuous for its bright-red color when ripe. The flesh is sweet and fairly free from fibers. It must be ripened artificially.

71410 to 71412. Scions from trees growing in the garden of O. J. Goulter, Luchowfu.

71410. No. 768. Tree No. 1. This tree is 5 or 6 years old, apparently a seedling, though possibly grafted below the soil line, as often occurs in this region. The seedless fruits probably belong to the variety commonly grown in this vicinity, but are usually abnormal, having five and sometimes six calyx lobes instead of the usual four. The lobes of the fruits correspond in number, the seed pockets are much branched and aborted, and the core is almost without pith. This variety, of more interest than promise, is of unknown origin.

71411. No. 770. Tree No. 5. This tree and the fruits are apparently identical with No. 769 [No. 70930].

71412. No. 772. Tree No. 4. This tree and the fruits are apparently identical with No. 771 [No. 70931].

71413. These scions were received at the same time as Nos. 731 and 732 [Nos. 71407 and 71408] and were marked tree No. 8, so they are probably from the Mission Hospital Compound, Luchowfu.

71414 to 71432. CAJANUS INDICUS
Spreng. Fabaceae. Pigeon pea.

From Honolulu, Hawaii. Seeds presented by Dr. F. G. Krauss, University of Hawaii, through J. M. Westgate, Director, Hawaii Agricultural Experiment Station. Received January 11, 1927.

71414 to 71432—Continued.

Locally developed varieties.

71414. No. 1. Early drug red.

71415. No. 11. Early Bilaspur red.

71416. No. 15. Early Chanda red.

71417. No. 25. Early Betul red.

71418. No. 29. Early Seoni red.

71419. No. 32. Early Chindwara red.

71420. No. 38. Early Hoshangabad red.

71421. No. 49. Early Khandwa red.

71422. No. 50. Early Burhanspur red.

71423. No. 61. Late Sohagpur red.

71424. No. 84. Early yeotmal white.

71425. No. 143. Early Amraotic red.

71426. No. 147. Early Bhandara white.

71427. Crimson.

71428. Mottled black (sport).

71429. New era strain D.

71430. White Madiad (sport).

71431. No. 2.

71432. No. 3.

71433 to 71796. SOJA MAX (L.) Piper
(Glycine hispida Maxim.). Fabaceae.
Soy bean.

From Nanking, China. Seeds presented by C. M. Hehm, acting head, department of agronomy, College of Agriculture and Forestry, University of Nanking, through Prof. J. H. Reisner, University of Nanking. Received January, 1927.

These soy beans have been planted for at least three years in the experimental plots at the University of Nanking.

71433. No. 1. 71480. No. 28.

71434. No. 2. 71481. No. 29.

71742. No. 226.	71788. No. 363.
71743. No. 229.	

Numbers 71789 and 71790 are early varieties.

71789. No. 2. 71790. No. 8.

Numbers 71791 to 71796 are from farmers' fields.

71791. No. 1. 71794. No. 5.

71792. No. 2. 71795. No. 15.

71793. No. 4. 71796. No. 18.

71797. CAJANUS INDICUS Spreng. Fabaceae. Pigeon pea.

From St. Thomas, Virgin Islands. Seeds presented by F. Quinones, agricultural assistant, Department of Agriculture, Commerce, and Labor. Received January 28, 1927.

Locally grown seeds.

71798. CAJANUS INDICUS Spreng. Fabaceae. Pigeon pea.

From Giza, Egypt. Seeds presented by Mah Abaza, director, horticultural section, Ministry of Agriculture. Received January 28, 1927.

Locally grown seeds; this is the only type in our gardens. (Abaza.)

71799 and 71800. GARCINIA DULCIS (Roxb.) Kurz. Clusiaceae.

From Pasaeroean, Java. Seeds presented by Dr. J. de Vries, Government horticulturist. Received January 29, 1927.

An East Indian evergreen tree, up to 40 feet high, with yellow fruits the size of a lime. Of possible use as stock for the mangosteen.

For previous introduction see No. 68028.

71799. No. 4. 71800. No. 5.

71801. PRUNUS ARMENIACA L. Amygdalaceae. Apricot.

From Fez, Morocco, North Africa. Seeds obtained through H. Earle Russell, American consul, Casa Blanca, Morocco. Received January 28, 1927.

A native Moroccan variety. The tree becomes unusually large and flowers and fruits several weeks earlier than the French apricot.

71802. TRITICUM AESTIVUM L. (T. vulgare Vill.). Poaceae.

Common wheat.

From Kotgarh, Simla Hills, India. Seeds presented by Richard B. Gregg. Received January 21, 1927.

A winter variety of white wheat.

71803 to 71820.

From Luchenza, Nyasaland Protectorate, Africa. Seeds presented by L. S. Norman. Received January 22, 1927.

71803. ALYSICARPUS RUGOSUS (Willd.) DC. Fabaceae.

An erect annual legume, native to southern Asia and Africa. The tough stems are 3 to 4 feet high, and the roots bear nitrogen nodules.

For previous introduction see No. 41884.

71804. BRASSICA sp. Brassicaceae.

Piro No. 1. The leaves of this plant are boiled and eaten as a vegetable by the natives of Nyasaland.

71805. BRASSICA sp. Brassicaceae.

Piro No. 2. A rapidly growing plant the leaves of which are boiled and eaten as a vegetable by the natives of Nyasaland.

71806 to 71810. CROTALARIA spp. Fabaceae.

Native leguminous plants, of possible use as cover plants.

71806. CROTALARIA sp.

A yellow-flowered shrub.

71803 to 71820—Continued.

71807. *CROTALARIA* sp.71808. *CROTALARIA* sp.

A deep-rooted, low-growing bushy plant!

71809. *CROTALARIA* sp.

An alfalfalike plant.

71810. *CROTALARIA* sp.71811. *DOLICHOS LABLAB* L. Fabaceae.

Hyacinth bean.

A local variety grown for human food in Nyasaland.

71812 and 71813. *NICOTIANA TABACUM* L. Solanaceae.

Tobacco.

71812. Possibly a cross with *Nicotiana rustica*.71813. *Chobo giant*.71814. *OXALIS* sp. Oxalidaceae.

A wild sorrel eaten as a vegetable by the natives of Nyasaland.

71815 to 71817. *STROPHANTHUS* spp. Apocynaceae.

Woody climbing plants, native to tropical Africa. Possibly sources of strophanthin, an alkaloid used in medicine.

71815. *STROPHANTHUS* sp.A. *Mbobo*. The most valuable kind; it grows in rich soil.71816. *STROPHANTHUS* sp.B. *Manji matubi*. This plant is said to grow well in stony soil.817. *STROPHANTHUS* sp.

C. A plant found in low damp hot places near sea level.

71818 and 71819. *VIGNA SINENSIS* (Torneo) Savi. Fabaceae.

Cowpea.

Local varieties.

71818. A native bush type said to mature quickly.

71819. A creeping variety.

71820. *VIGNA VEXILLATA* (L.) Rich. Fabaceae.

A South American yellow-flowered climber, growing spontaneously in Nyasaland.

For previous introduction see No. 48607.

71821 and 71822.

From Zacuapam, Huatusco, Vera Cruz, Mexico. Seeds presented by Dr. C. A. Purpus. Received January 28, 1927.

Locally grown seeds.

71821. *CAJANUS INDICUS* Spreng. Fabaceae.

Pigeon pea.

71822. *VIGNA SINENSIS* (Torneo) Savi. Fabaceae.

Cowpea.

71823. *CHAYOTA EDULIS* Jacq. (*Sechium edule* Swartz). Cucurbitaceae.

Chayote.

From Summit, Canal Zone. Seeds presented by Holger Johansen, plant introduction garden. Received January 22, 1927.

Locally grown fruits from the Canal Zone.

71824. *CAJANUS INDICUS* Spreng. Fabaceae.

Pigeon pea.

From Central Baragua, Baragusa, Cuba. Seeds presented by Dr. D. L. Van Dine, local director, Tropical Plant Research Foundation. Received January 12, 1927.

So far as we know we have only one strain of the pigeon pea or Congo bean. (*Van Dine*.)71825. *PHASEOLUS ANGULARIS* (Willd.) W. F. Wight. Fabaceae.

Adsuki bean.

From China. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received January 22, 1927.

No. 839. Shiutin, Anhwei Province. October 24, 1926. *Maitan*. A locally grown variety.

71826 to 71855.

From Manchuria. Seeds obtained by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received January 26, 1927.

71826. *LILIU* sp. Liliaceae.

Lily.

No. 8711. October, 1926. Collected by I. V. Kosloff, Manchurian Research Society, Harbin, in the forest concession of the Chinese Eastern Railway, near Shitoukhetsy.

71827 to 71840. *PHASEOLUS AUREUS* Roxb. Fabaceae.

Mung bean.

Seeds obtained through the cooperation of D. McLorn, Postal Commissioner, Harbin.

71827. No. 8628. From Huolunchuan, Kirin Province.

71828. No. 8632. From Changchiawa, Kirin Province.

71829. No. 8643. From Tanantun.

71830. No. 8634. [No other data.]

71831. No. 8639. From Hsinglungchen, Kirin Province.

71832. No. 8646. From Haosechan.

71833. No. 8649. From Ershihchiatzu.

71834. No. 8654. From Tassuchan, Kirin Province.

71835. No. 8658. From Kuorlaschienchi.

71836. No. 8665. From Chikete.

71837. No. 8668. From Muhing.

71838. No. 8679. From Chanan.

71839. No. 8683. From Hsianglanchisantso.

71840. No. 8685. [No other data.]

71841 to 71855. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceae.

Soy bean.

Obtained through the cooperation of D. McLorn, Postal Commissioner, Harbin.

71841. No. 8625. From Huolunchuan, Kirin Province.

71842. No. 8630. From Changchiawa, Kirin Province.

71843. No. 8636. [No other data.]

71844. No. 8638. From Hsinglungchen, Kirin Province.

71845. No. 8642. From Tanantun.

71846. No. 8647. From Haosechan.

71847. No. 8651. From Ershihchiatzu.

71848. No. 8653. From Chelu.

71849. No. 8655. From Tassuchau, Kirin Province.

71850. No. 8660. From Kuorlaschienchi.

71851. No. 8670. From Aisimen.

71852. No. 8676. From Chikete.

71826 to 71855—Continued.

71853. No. 8680. From Chauan.

71854. No. 8684. From Hsianglanchisantso.

71855. No. 8688. [No other data.]

71856 to 71865.

From the Balearic Islands, Canary Islands, and Morocco. Seeds obtained by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received January, 1927.

71856. *CITRULLUS VULGARIS* Schrad. Cucurbitaceae. **Watermelon.**

August, 1925. A perfectly round, dark-green, thin-skinned watermelon of delicious flavor, obtained in the market at Iviza, Balearic Islands.

71857 and 71858. *CUCUMIS MELO* L. Cucurbitaceae. **Melon.**

71857. Iviza, Balearic Islands, August, 1925. A delicious variety which ripens during the summer.

71858. No. 228-a. Iviza, Balearic Islands. August 17, 1925. A variety with netted fruits $10\frac{1}{2}$ inches long and of exquisite musky flavor.

71859. *ILEX CANARIENSIS* Poir. Aquifoliaceae.

No. 931. Orotava Botanic Gardens, Tenerife, Canary Islands. December 23, 1926. A local distinct variety of the Canary Island holly, an evergreen tree 20 feet high, with oval entire leaves. It thrives in a mild cool climate.

71860. *MIMOSA* sp. Mimosaceae.

No. 936. Orotava Botanic Gardens, Tenerife, Canary Islands. December 23, 1926. A strikingly ornamental climbing species with fernlike leaves and light-yellow flowers.

71861. *MYRICA FAYA* Ait. Myricaceae.

No. 933. Orotava Botanic Gardens, Tenerife, Canary Islands. December 23, 1926. A tree 6 to 8 meters high, common in the Canary and Madeira Islands. It produces small wine-red fruits which are edible like the Japanese *Myrica rubra*.

71862. *POLYCARPÆA NIVEA* (Ait.) Webb. Silenaceae.

No. 925. Mogador, Morocco. June, 1925. A low-growing hairy perennial plant, used extensively and successfully in the sand-binding experiments on the sand dunes.

For previous introduction see No. 68152.

71863. *SEMPERVIVUM ARBOREUM* L. Crassulaceae. **Houseleek.**

No. 934. Orotava, Tenerife, Canary Islands. A handsome plant, 2 feet high, with striking rosettes of leaves and attractive yellow flowers.

71864. *SEMPERVIVUM TABULAEFORME* Haw. Crassulaceae. **Houseleek.**

No. 935. Near Icod, Tenerife, Canary Islands. December 23, 1926. An ornamental plant with the leaves in flat rosettes 16 inches in diameter, which resemble green dinner plates on the perpendicular cliffs. This is a rare variety in the Canary Islands, occurring in only two places.

71865. *SONCHUS LEPTOCEPHALUS* Cass. Cichoriaceae.

No. 930. Orotava, Tenerife, Canary Islands. December 24, 1926. A shrubby ornamental composite with finely lacinate leaves which have a strong odor of mice. This plant is found on the driest rockiest places in the barrancas of Tenerife. The goats are very fond of it.

71866. FRAGARIA sp. Rosaceae.**Strawberry.**

From Saint Jean le Blanc, Orleans, Loiret, France. Plants presented by Edmond Versin. Received February 23, 1927.

*Ideal.***71867 to 72007.**

From China, Japan, and Hawaii. Seeds, scions, and plants collected by W. T. Swingle, Bureau of Plant Industry. Received January, 1927.

Seeds unless otherwise mentioned.

71867 to 71916. *CITRUS* spp. Rutaceae.71867 to 71870. *CITRUS GRANDIS* (L.) Osbeck (*C. decumana* Murr.). **Grapefruit.**

71867. No. 841. From China.

71868. No. 842. From China.

71869. No. 846. From Formosa, Japan.

71870. No. 853. From Honolulu, Hawaii.

71871 to 71884. *CITRUS ICHANGENSIS* Swingle. **Ichang lemon.**

For previous introduction and description see No. 71256.

71871. No. 821.

71872. No. 822 a-b.

71873. No. 823 a-z.

71874. No. 824 a-f.

71875. No. 825 a-b.

71876. No. 826 a-d.

71877. No. 827 a-z.

71878. No. 828 a.

71879. No. 829 a-z.

71880. No. 830 b.

71881. No. 831 a-d.

71882. No. 832 a-b.

71883. No. 834. A small-fruited variety.

71884. No. 834-a. A large-fruited variety.

71885 to 71899. *CITRUS NOBILIS DELICIOSA* (Ten.) Swingle. **Mandarin orange.**

From China.

71885. No. 837.

71886. No. 838.

71887. No. 843. From Nanking.

71888. No. 844. From Nanking.

71889. No. 845. From Nanking.

71890 to 71905. *CITRUS NOBILIS UNSHUI* Swingle. **Satsuma orange.**

71890 to 71901. Bud wood from Mikkabi, Shizuoka, Japan.

71890. No. 894. *Takegami*.71891. No. 895. *Sato*.71892. No. 896. *Suzuki*.71893. No. 897. *Morita*.71894. No. 898. *Horio*.71895. No. 899. *Morito*.71896. No. 900. *Nagata*.71897. 71912. No. 849. *Keragi*. Collected in Japan.

71913. *CITRUS* sp.

No. 846. Collected in China.

71914. *CITRUS* sp.

No. 847. *Natsumikan*. Collected in Pzu, Japan.

71915. *CITRUS* sp.

No. 850. *Mato buntan*. Collected in Japan.

71916. *CITRUS* sp.

No. 851. From the agricultural farm, Kagoshima, Japan.

71917. *COPERNICIA CERIFERA* Mart. Phoeniceaceae. Carnauba palm.

No. 854. From Honolulu, Hawaii. The wax palm of Brazil, which has fan-shaped leaves and grows to a height of 25 feet. From the leaves is obtained caranauba wax which is used in making phonograph records.

71918 to 71965. *DIOSPYROS KAKI* L. f. Diospyraceae. Kaki.

Scions of Japanese varieties of kaki, collected in Japan. The astringent varieties of this series are marked with an asterisk (*), the nonastringent with a dagger (†).

71918. No. 12410. *Goban*.*

71919. No. 12411. *Yemon*.*

71965. No. 12461. *Yotsumizo*, No. 39.†

71968. *FICUS CARICA* L. Moraceae. Fig.

No. 12426. *Omaruba*. Rooted cuttings from Japan.

71967. *HALESIA MACGREGORII* Chun. Styracaceae.

No. 810. From southern Chekiang, China. An ornamental deciduous tree, native to east-central China, with white flowers which appear in the spring.

71968 to 71971. *MORUS* spp. Moraceae. Mulberry.

Plants of locally developed varieties from Japan.

71968. *MORUS* sp.

Nos. 804 and 804 a-c. A mulberry with green bark.

71969. *MORUS* sp.

Nos. 805 and 805-a.

71970. *MORUS* sp.

Nos. 806 and 806-a.

71971. *MORUS* sp.

Nos. 808 and 808 a-b.

71972 to 71976. *MYRICA RUBRA* Sieb. and Zucc. Myricaceae.

Plants of different varieties of a handsome tree, about 20 feet in height, with dark-green, glossy foliage. The globular fruits are quite

71867 to 72007—Continued.

acid, and owing to their fragility and peculiar structure they do not ship well, but the small leafy branches distributed among them as they are packed in the baskets are said to protect them somewhat. The fruits are salted and dried because the fresh fruits are too soft to appeal to the Chinese palate.

For previous introduction see No. 64568.

71972. No. 798. From Yika, near Ningpo, China. A variety with purple fruits about $1\frac{1}{2}$ inches in diameter.

71973. No. 799. From Golden Valley, Shampo, near Ningpo, China. A variety with purple fruits about $1\frac{1}{2}$ inches in diameter.

71974. No. 800. From Golden Valley, Shampo, near Ningpo, China.

71975. No. 12457. *Kamezo shiro*. Scions of a white variety from Japan.

71976. No. 12459. *Kamezo aka*. Scions of a red variety from Japan.

71977. PHOENIX HANCEANA Naud. Phoeniceaceae. Palm.

No. 814. From Taihoku, Taiwan. A Chinese relative of the date palm; it has short tufted stems and pinnate foliage.

71978 and 71979. PHOENIX SYLVESTRIS (L.) Roxb. Phoeniceaceae. Palm.

A pinnate-leaved palm, 25 to 40 feet high, with leaves about 15 feet long and orange-yellow fruits. Native to India.

71978. No. 815. From Honolulu, Hawaii.

71979. No. 816. From Honolulu, Hawaii.

71980. PISTACIA sp. Anacardiaceae. Pistache.

No. 813. From Miyazaki, Japan. A hardy tree which may be of ornamental value.

71981. PSEUDOLARIX AMABILIS (Nelson) Rehder (*P. kaempferi* Gordon). Pinaceae. Golden larch.

No. 812. From China. An ornamental evergreen coniferous tree up to 130 feet high. Native to China and Japan.

71982 to 71984. PYRUS spp. Malaceae. Pear. Plants of local varieties.

71982. PYRUS sp.

No. 12436. *Imamura aki nashi*. From Japan.

71983. PYRUS sp.

No. 12462. *Tai yang*. From Japan.

71984. PYRUS sp.

No. 12463. *Yabi li*. From Japan.

71985. SKIMMIA JAPONICA Thunb. Rutaceae.

No. 817. An evergreen Japanese shrub, 5 feet high, which is densely branched and produces round scarlet fruits.

71986 and 71987. SOJA MAX (L.) Piper (*Glycine hispida* Maxim.). Fabaceae. Soy bean.

71986. No. 819. An unselected common variety from Nanking, China.

71987. No. 820. Seeds of a variety from Nanking, China.

71988. TORREYA JACKII Chun. Taxaceae.

No. 809. Southern Chekiang, China. A small ornamental evergreen tree, 30 feet high, the leaves of which are aromatic when bruised.

71989. XYLOSMA sp. Flacourtiaceae.

Plants of a tropical evergreen Chinese tree which may be of ornamental value.

71867 to 72007—Continued.

71990 to 72007. GOSSYPIMUM spp. Malvaceae.

Cotton.

71990 to 71995. GOSSYPIMUM HIRSUTUM L.

71990. No. 787. From the College of Agriculture, National Southeastern University, Nanking, China. *Chicken-foot* cotton. A long staple variety.

71991. No. 790. *Million-dollar* cotton. Progeny No. S. T. M. 1-1.

71992. No. 791. *Million-dollar* cotton. S. T. M. 196.

71993. No. 793. *Million-dollar* cotton. Progeny No. 90.

71994. No. 794. *Acala*. Progeny No. 105-42-1.

71995. No. 795. *Acala*. Progeny 10-5-40-5.

71996 to 72006. GOSSYPIMUM NANKING Meyen.

Numbers 71996 to 72005 are from the College of Agriculture, National Southeastern University, Nanking, China.

71996. No. 779. *Chicken-foot* cotton.

71997. No. 780. A small, white-flowered cotton.

71998. No. 781. *Putung*. A brown variety.

71999. No. 782. *Kiang yung*. A white-seeded cotton.

72000. No. 783. *Chinding*. A long-staple variety.

72001. No. 784. *Chin ching*. A brown variety.

72002. No. 785. *Yiwu*. A black-seeded cotton.

72003. No. 786. *Shiokun*. A long-staple cotton.

72004. No. 788. *Pehsan*. A brown variety.

72005. No. 789. *Hing hwa*. A white-seeded variety.

72006. No. 796. Asiatic cotton collected near Miyazaki, Japan.

72007. GOSSYPIMUM sp.

No. 797. A Hawaiian tree cotton from the Federal Experiment Station, Honolulu.

72008 and 72009. PRUNUS SERRULATA Lindl. Amygdalaceae.

Oriental cherry.

From Benenden, Kent, England. Scions presented by Capt. Collingwood Ingram. Received February 4, 1927. Descriptions from Ingram, Notes on Japanese Cherries, Journal of the Royal Horticultural Society, vol. 50, pt. 1, 1925.

72008. *Daikoku*. A variety introduced into England about 1905 with large purplish pink double flowers up to 5.5 centimeters wide. The thick purplish red buds are truncated at the end, and the young foliage is yellowish green. The Japanese name signifies "god of prosperity."

72009. *Oriental Weeping* cherry. It is probable that this form is Chinese in origin, since it does not appear ever to have been cultivated in Japan. The deep-pink, double flowers are borne in close fascicles along the pendulous branches.

72010. *ERAGROSTIS* sp. Poaceae.

Grass.

From Bathurst, Gambia, West Africa. Seeds collected by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received March 12, 1927.

No. 1117. Near Cape St. May. A grass, 2 feet high, growing abundantly on cultivated land near the sea.

72011. *JULOSTYLIS ANGUSTIFOLIA* (Arn.) Thwaites. Malvaceae.

From Peradeniya, Ceylon. Seeds presented by F. A. Stockdale, Director of Agriculture. Received January 28, 1927.

A low tree, related to cotton (*Gossypium* spp.), native to Ceylon. The flowers, pale yellow with red centers, are about half an inch across.

72012. *HORDEUM VULGARE PALLIDUM* Seringe. Poaceae. Six-rowed barley.

From China. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received January 13, 1927.

No. 688. Luchowfu, Anhwei Province. October, 1926. A local variety.

72013 to 72066. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceae. Soy bean.

From Nanking, China. Seeds presented by C. M. Hehm, acting head, department of agronomy, College of Agriculture and Forestry, University of Nanking, through Prof. J. H. Reisner, University of Nanking. Received January, 1927.

These soy beans have been planted for at least three years in the experimental plots at the University of Nanking.

72075. No. 8681.	From Hsianglanchisantso.
72076. No. 8687.	[No other data.]

72077 to 72086. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceae. Common wheat.

72077. No. 8629.	From Changchiawa, Kirin Province.
72078. No. 8635.	[No other data.]
72079. No. 8641.	From Tanantun.
72080. No. 8650.	From Ershihchiatzu.
72081. No. 8657.	From Tassuchan, Kirin Province.
72082. No. 8664.	From Aisimen.
72083. No. 8669.	From Muhing.
72084. No. 8673.	[No other data.]
72085. No. 8674.	From Bienshuho.
72086. No. 8682.	From Hsianglanchisantso.

Numbers 72087 to 72165 are scions which were collected at the Fa Hua Ssu Temple near Haitzu, Chihli Province, in November, 1926.

72087 to 72095. *AMYGDALUS PERSICA* L. (*Prunus persica* Stokes). Amygdalaceae. Peach.

72087. No. 8810.	<i>Ma nao hung tao</i> (red agate peach). A freestone variety producing fruits about 3 inches in diameter, which have red skin and white flesh. They ripen the first part of August.
72088. No. 8811.	<i>Ho yieh hung tao</i> (red lotus leaf peach). A clingstone variety with red-skinned fruits about 2 inches in diameter, which ripen the first part of August.
72089. No. 8836.	<i>White jar</i> peach. A freestone variety with fruits $1\frac{1}{2}$ to 2 inches in diameter, which ripen the last of July and are white with a pink blush.
72090. No. 8837.	<i>Sweet eagle bill</i> peach. The freestone fruits, 1 to $1\frac{1}{2}$ inches in diameter, are pink and ripen the middle of July.
72091. Nos. 2611 and 8844.	<i>Chu yih ching tao</i> (green bamboo leaf peach). The fruits, 3 to $3\frac{1}{2}$ inches in diameter, have pink skin and pale-pink flesh. They ripen in August.
72092. No. 8854.	<i>White hairy</i> peach. The freestone fruits, about $1\frac{1}{2}$ inches in diameter, are white and ripen the middle of August.
72093. No. 8855.	<i>Yellow hairy</i> peach. The freestone fruits, about an inch in diameter, are light yellow and ripen the middle of August.

72067 to 72165—Continued.

72094. No. 8882. *Hsueh tao* (bloody peach). A freestone variety with fruits 2 to 3 inches in diameter, which have pink skin and red flesh and ripen in August. They are rather sour and do not have a very good flavor.

72095. No. 8883. *Chiukang tse tao* (autumn jar peach). A freestone variety producing pink or dull-red fruits, 3 or more inches in diameter, which ripen the last of August.

72096 to 72098. *CASTANEA MOLLISSIMA* Blume. Fagaceae. Hairy chestnut.

72096. No. 8776. *Pai lu li tze* (white dew chestnut). A variety with nuts less than an inch in diameter, which ripen the first of September.

For previous introduction see No. 65858.

72097. No. 8885. *Erh lu li tze* (second crop chestnut).

For previous introduction and description see No. 71028.

72098. No. 8886. *Han lu li tze* (cold dew chestnut).

For previous introduction and description see No. 71027.

72099. *CORYLUS* sp. Betulaceae. Hazel.

No. 8893. Scions from plants growing on the mountain side.

72100. *CRATAEGUS PINNATIFIDA* Bunge. Malaceae. Chinese hawthorn.

No. 8797. A red hawthorn with white-fleshed, edible fruits about an inch in diameter, which ripen the middle of October.

72101. *DIOSPYROS LOTUS* L. Diospyraceae. Persimmon.

No. 8876. Scions of a seedless black "date."

72102 and 72103. *JUGLANS REGIA* L. Juglandaceae. Walnut.

72102. No. 8846. *Pao pi ho tao* (thin-shelled walnut). Scions from a tree 50 or 60 years old. The nuts ripen in early September, and it is said that they will break if they are allowed to fall from the trees.

For previous introduction see No. 62614.

72103. No. 8880. *Ying pi ho tao* (thick-shelled walnut). Scions from a tree 10 years old that has been bearing for three years.

For previous introduction see No. 62613.

72104 to 72112. *MALUS* spp. Malaceae.

72104 to 72107. *MALUS* spp. Crab apple.
72104. *MALUS* sp.

No. 8788. A flat red crab apple about an inch in diameter, which ripens the first of October.

72105. *MALUS* sp.

No. 8794. An oblong sweet pink crab apple 2 to 3 inches in diameter, which ripens the middle of August.

72106. *MALUS* sp.

No. 8795. *Ching mien sha kuo* (red crab apple). A variety with red and light-green fruits, 1½ inches in diameter, which ripen the last of August.

72107. *MALUS* sp.

No. 8819. *Hung hai tung* (red small crab apple). The fruits are one-half to three-fourths of an inch in diameter and ripen the middle of August.

72067 to 72165—Continued.

72108 to 72111. *MALUS SYLVESTRIS* Mill. (Pyrus malus L.). Apple.

72108. No. 8821. *Ta ping kuo* (large apple). A summer apple, 2½ to 4½ inches in diameter, which is green with a pink or red blush. The fruits ripen from about the middle of July to the middle of August. This variety grows on terraced mountain sides and in lower levels, but the quality and color of the fruits are best when grown on hillsides.

72109. No. 8822. *Ta pai ping kuo* (large white apple). A summer apple, about 3 inches in diameter, which is greenish white. The fruits ripen in August.

72110. No. 8823. *Hsiang kuo* (fragrant apple). A very sweet apple 2½ to 3 inches in diameter. It had been grafted on the wild mountain crab apple, *Shan ting tzu*, rooted shoots of which were sent in under No. 1734 [No. 62618].

72111. No. 8824. *Cha hua hsiang kuo* (spotted fragrant apple). A variety with green and pink fruits, 2½ to 3 inches in diameter, which ripen in August.

72112. *MALUS* sp. Crab apple.

No. 8835. *Cha hua sha kuo* (spotted red crab apple). A variety with fruits 1½ inches in diameter, which are light green and red and ripen in August.

72113 to 72127. *PRUNUS ARMENIACA* L. Amygdalaceae. Apricot.

Scions collected at the Fa Hua Ssu Temple, in November, 1926.

72113. No. 8780. *Red flat apricot*. A variety with red fruits, 2½ inches in diameter, which ripen the last of June.

72114. No. 8786. *Hung lao yieh lien hsing* (red face apricot). A freestone variety with sweet kernels. The fruits are 1 to 1½ inches in diameter, white-fleshed, and ripen the last of June.

72115. No. 8799. *White water apricot*. A freestone variety with white fruits, 1½ to 2 inches in diameter, which ripen the last of June.

72116. No. 8800. *Red sea apricot*. Red, freestone fruits 2 inches in diameter, which ripen the first of July.

72117. No. 8801. *Huang pien tze hsing* (yellow-flat-seeded apricot). A clingstone variety with sweet kernels. The fruits are 1½ to 2 inches in diameter and ripen the last of June, becoming yellow.

72118. No. 8802. A red, freestone variety, about 1½ inches in diameter, which ripens about the first of June. This is the earliest of all the varieties.

72119. No. 8803. *Hsiao pai hsing* (small white apricot). A freestone variety, 1 to 1½ inches in diameter, which ripens the middle of June.

72120. No. 8804. *Ta pai hsing* (large white apricot, white god-faced apricot). A white-fleshed freestone variety, 1½ to 2 inches in diameter, with sweet kernels. The fruits ripen the last of June.

72121. Nos. 8798 and 8805. *Tieh pa ta hsing* (iron rod apricot). A freestone variety with red fruits about 1½ to 2 inches in diameter, which ripen the first of July. Both the fruit and kernel are sweet.

72067 to 72165—Continued.

72122. No. 8812. *Ta pien tzu hsing* (flat apricot). A variety 2 to 3 inches in diameter, which is grown more for the kernels than the fruits. The kernels are shipped to the southern part of China, and the people in this region keep a few in their mouths to keep away disease.

72123. No. 8843. For previous introduction and description see No. 71157.

72124. No. 8887. *Pai yu pa ta hsing* (white jade rod apricot). A white freestone variety 2 or more inches in diameter, with sweet kernels. The fruits ripen the last of June.

72125. No. 8888. *Tze pien tze hsing* (red-throned apricot). Red, freestone fruits $1\frac{1}{2}$ inches in diameter, with sweet kernels. The fruits ripen during June.

72126. No. 8889. *Pa ta hsing* (red rod apricot). Dark-yellow clingstone fruits, 1 to $1\frac{1}{2}$ inches in diameter, with sweet kernels. The fruits ripen the last of June.

72127. No. 8890. *Ta huang hsing* (large yellow apricot). A variety producing sweet-kernelled fruits which are yellow blushed with red and ripen the last of June.

72128 to 72141. PRUNUS spp. Amygdalaceae. Plum.

Scions collected at the Fa Hua Ssu Temple, in November, 1926.

72128. PRUNUS sp.

No. 8789. *Niu hsin hung li tze* (ox heart red plum). A variety growing on the sides of mountains and canyons at an altitude of 6,000 to 12,000 feet. The fruits, 2 to 3 inches in diameter, are purple or red and ripen the last of July.

72129. PRUNUS sp.

No. 8790. *Shé li tze* (puckery plum). A variety which may be useful for plant breeding. The fruits, about an inch in diameter, are red or purple and ripen the middle of July.

72130. PRUNUS sp.

No. 8791. A variety with red fruits the size of a grape, which ripen the middle of June.

72131. PRUNUS sp.

No. 8796. An autumn plum which ripens the middle of August. The fruits are yellow, freestone, and 2 inches in diameter.

72132. PRUNUS sp.

No. 8807. *Ta huang li tze* (large yellow plum). A variety which is grafted on the wild peach. The small trees do not produce good crops every year. The fruits are $1\frac{1}{2}$ to 2 inches in diameter, covered with a bloom, and ripen the first of August.

72133. PRUNUS sp.

No. 8816. *San pien hung li tze* (three-color change plum). A very late variety, ripening the last of September; it is not extensively grown. The pink fruits are about $1\frac{1}{2}$ inches in diameter.

72134. PRUNUS sp.

No. 8817. *Fo chien hsi li tze* (Buddha happiness plum). Red fruits 1 to $1\frac{1}{2}$ inches in diameter, which ripen the last of August. This is one of the best varieties.

72135. PRUNUS sp.

No. 8820. *Yao tze hung li tze* (liver red plum). A purple-red, freestone variety, 1 to $1\frac{1}{2}$ inches in diameter, which ripens in August.

72067 to 72165—Continued.

72136. PRUNUS sp.

No. 8839. *Chiao er tan li tze* (bird's-egg plum). A sweet freestone variety with yellow fruits, an inch in diameter, which ripen in July. The trees grow on hillsides. This variety is the smallest of any of the plums.

72137. PRUNUS sp.

No. 8840. *Chang pa li tze* (long-stemmed red plum). Round, purple-red fruits, $1\frac{1}{2}$ to 2 inches in diameter, which ripen about the first of July. The trees were growing in decomposed granite.

72138. PRUNUS sp.

No. 8841. A small freestone plum about an inch in diameter, which ripens the last of July, becoming purple.

72139. PRUNUS sp.

No. 8848. *Ching pi tsui li tze* (green-skinned brittle plum). Freestone fruits which are green when ripe. This is also a late variety, ripening about the last of September.

72140. PRUNUS sp.

No. 8853. *Hsiao huang li tze* (small yellow plum). Seedling trees growing on hillsides. The fruits are about an inch in diameter and ripen in July.

72141. PRUNUS sp.

No. 8891. *Ta tze li tze* (large purple plum). Fruits 1 to $1\frac{1}{2}$ inches in diameter, purple and red, ripening in July. It is considered a very good variety.

72142 to 72161. PYRUS spp. Malaceae. Pear.

Scions collected at the Fa Hua Ssu Temple, November, 1926.

72142. PYRUS sp.

No. 8779. *Ya li* (duck pear). Light yellow fruits about 3 inches in diameter, which ripen in September.

72143. PYRUS sp.

No. 8781. *Chiu chin pa li* (autumn golden handle pear). A variety with fruits about 2 inches in diameter, which ripen the middle of September.

72144. PYRUS sp.

No. 8782. *Ta tang li* (large sugar pear). A variety with dark-brown fruits 3 inches in diameter, which ripen the last of September.

72145. PYRUS sp.

No. 8784. *Ta tzu hsiang li* (fragrant pear). A variety with fruits 2 to 3 inches in diameter, which ripen the last of August.

For previous introduction see No. 62642.

72146. PYRUS sp.

No. 8785. *Large vase* pear. The yellow fruits, 3 inches in diameter, ripen about the middle of October.

72147. PYRUS sp.

No. 8806. *Pai tang li* (white sugar pear). The fruits are about 2 inches in diameter, yellowish white and ripen in September.

72148. PYRUS sp.

No. 8808. *Ta tu tzu li* (big stomach pear). A variety with yellow fruits 3 to 4 inches in diameter, which ripen the last of August.

72067 to 72165—Continued.

72149. PYRUS sp.

No. 8809. *Sha kuo li* (crab-apple pear). A summer pear, $1\frac{1}{2}$ to 2 inches in diameter, which ripens the last of August, becoming light yellow blushed with red.

For previous introduction see No. 54837.

72150. PYRUS sp.

No. 8813. *Pai suan li* (white sour pear). A variety producing white or pale-pink fruits from which a yellow vinegar is made. The average fruits are 2 inches in diameter, but when the trees are grown in good soil the fruits are 3 to 4 inches in diameter.

72151. PYRUS sp.

No. 8814. *Hung suan li* (red sour pear). A variety with fruits about $1\frac{1}{2}$ to 2 inches in diameter, from which vinegar is made.

72152. PYRUS sp.

No. 8827. *Honey vase* pear. The yellow fruits, $1\frac{1}{2}$ to 2 inches in diameter, ripen the last of September.

72153. PYRUS sp.

No. 8834. *Pao pi chieh li* (thin-skinned festival pear). A yellow summer pear about 2 inches in diameter, which ripens the last of September.

72154. PYRUS sp.

No. 8842. *Rough-skinned festival* pear. A variety producing fruits which are 2 inches in diameter, white with a pink blush, ripening the middle of September.

72155. PYRUS sp.

No. 8847. *Summer golden handle* pear. The fruits are 2 inches in diameter, and ripen the middle of August, becoming yellow.

72156. PYRUS sp.

No. 8849. *Ma ti huang li* (horseshoe yellow pear). A variety with yellow fruits, 3 to $3\frac{1}{2}$ inches in diameter, which ripen in October.

72157. PYRUS sp.

No. 8852. *Shih li hsiang li* (three miles fragrant pear). A variety which is said to be the earliest. The yellow fruits are about an inch in diameter and $1\frac{1}{2}$ inches long, ripening the first of August.

72158. PYRUS sp.

No. 8856. *Summer white* pear. A variety producing white fruits about 2 inches in diameter, which ripen the middle of August.

72159. PYRUS sp.

No. 8857. *Mien chiu li* (autumn soft pear). A variety with yellow fruits, 2 to 3 inches in diameter, which ripen in September.

72160. PYRUS sp.

No. 8881. *Glorious sugar* pear. A variety with brown fruits about 2 inches in diameter, which ripen the first of October.

72161. PYRUS sp.

No. 8892. *Huang suan li* (yellow sour pear). A variety producing fruits 1 to $1\frac{1}{2}$ inches in diameter, which ripen the last of August. They are of good quality and are used for vinegar.

72162 to 72164. QUERCUS spp. Fagaceae. Oak.

Scions collected at the Fa Hua Ssu Temple, November, 1926.

72067 to 72165—Continued.

72162. QUERCUS DENTATA Thunb.

No. 8873. A broad-leaved oak growing on the mountain side.

72163. QUERCUS sp.

No. 8878. A tall-growing chestnut-leaved oak the bark of which looks different from that of the other oaks. It appears to be an interesting variety.

72164. QUERCUS sp.

No. 8879. *Cold dew* acorn.

72165. (Undetermined.)

No. 8829. A hardy vine with black berries which are not edible.

72166 to 72249.

From China. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received December, 1926, and January, 1927.

72166 and 72167. ALEURITES FORDII Hemsl. Euphorbiaceae. Tung-oil tree.

72166. No. 703. From Taaihohhau, Anhwei Province, October 20, 1926. These fruits are from the crop harvested early in September. There is apparently only one variety of wood-oil tree here, although three names are used. *Ng chau tung* (five-clawed) is given to trees which bear lobed leaves. This condition occurs only on rapidly growing young trees or branches, and does not appear to be a permanent character. *Tsao nin tung* is a name said to be applied to those trees which come into bearing very early, within a year or so, but which are short-lived. *Maan nin tung* is given to the trees which come into bearing at the normal time and live to a normal age.

72167. No. 704. Poonpinkaa, southern Anhwei Province. Fruits obtained from a specially prolific 12-year-old tree 6 meters in height, with leaves and bark very clean and free from disease. The fruits were in clusters of 6 to 10. The trees were growing in fertile silt in a river valley, and their thriving condition contrasted sharply with the unhealthy appearance of most of the trees in central Anhwei. For some reason the nuts are not harvested as early in this region as in central Anhwei.

72168. ALLIUM sp. Liliaceae. Onion.

No. 892. From the market at Hankow, Hupeh Province. November 29, 1926. *Chung tsz.*

72169. ALLIUM sp. Liliaceae. Onion.

No. 926. Agricultural Experiment Station, Nanchang, Kiangsi Province. December 2, 1926. *Kan tsoi.*

72170 and 72171. AMARANTHUS GANGETICUS L. Amaranthaceae.

Market at Hankow, Hupeh Province. November 29, 1926. Annual vegetables whose leaves are used as food in China.

For previous introduction see No. 58461.

72170. No. 894. *Hung kai tsoi.*72171. No. 895. *Paak kai tsoi.*

72172. APUM GRAVEOLENS L. Apiaceae. Celery

No. 899. Market at Hankow, Hupeh Province. November 29, 1926. *Kan tsoi tsz.*

72166 to 72249—Continued.

72173 and 72174. *BETA VULGARIS* L. Chenopodiaceae. Beet.

From the agricultural experiment station, Nanchang, Kiangsi Province. December 2, 1926.

72173. No. 929. *Hung tim tsoi*.

72174. No. 933. *Kwan taat tsoi*.

72175 to 72187. *BRASSICA* spp. Brassicaceae.

Numbers 72175 to 72179 were obtained in Hankow, Hupeh Province. November 29, 1926.

72175. *BRASSICA* sp.

No. 890. *Kin kaan paak tsoi*.

72176. *BRASSICA* sp.

No. 891. *Paak yau tsz*.

72177. *BRASSICA* sp.

No. 896. *Haak paak tsoi*.

72178. *BRASSICA* sp.

No. 902. *Laat tsai tsz*.

72179. *BRASSICA* sp.

No. 903. *Paak paak tsoi*.

72180. *BRASSICA* sp.

No. 931. *Paak tsoi*. From the agricultural experiment station, Nanchang, Kiangsi Province. December 2, 1926.

72181. *BRASSICA* sp.

No. 932. [No other data.]

Numbers 72182 to 72187 are from the agricultural experiment station, Nanchang, Kiangsi Province. December 2, 1926.

72182. *BRASSICA* sp.

No. 936. *Taat tei paak tsoi*.

72183. *BRASSICA* sp.

No. 938. *Kai tsoi*.

72184. *BRASSICA* sp.

No. 939. *Uen ip suet lei hung*.

72185. *BRASSICA* sp.

No. 940. *Kan chow tsing pat lo*.

72186. *BRASSICA* sp.

No. 942. *Fa ip suet lei hung*.

72187. *BRASSICA* sp.

No. 943. *Haak to wan paak tsoi*.

72188 and 72189. *CHAETOCLOA ITALICA* (L.) Scribn. (*Setaria italica* Beauv.). Poaceae. Millet.

Agricultural experiment station, Nanchang, Kiangsi Province. December 2, 1926.

72188. No. 935. *To cheung miu suk*.

72189. No. 941. *To cheung kan suk*.

72190 and 72191. *CHRYSANTHEMUM CORONARIUM* L. Asteraceae.

Hardy annual plants used as a green vegetable in southeastern China.

For previous introduction see No. 64352.

72190. No. 900. Market at Hankow, Hupeh Province. November 29, 1926. *Tong ho tsz*.

72191. No. 930. Agricultural experiment station, Nanchang, Kiangsi Province. December 2, 1926. *Tong ho*.

72166 to 72249—Continued.

72192. *CITRULLUS VULGARIS* Schrad. Cucurbitaceae. Watermelon.

No. 920. Agricultural experiment station, Nanchang, Kiangsi Province. December 2, 1926. *Haak kwa*.

72193 and 72194. *CUCURBITA MOSCHATA* Duchesne. Cucurbitaceae. Cushaw.

72193. No. 905. Market at Hankow, Hupeh Province. November 29, 1926. *Naam kwa tsz*.

72194. No. 928. Agricultural experiment station, Nanchang, Kiangsi Province. December 2, 1926. *Ting tai naam kwa*.

72195. *DAUCUS CAROTA* L. Apiaceae. Carrot.

No. 925. Agricultural experiment station, Nanchang, Kiangsi Province. December 2, 1926. *Hung loh puk*.

72196. *DIOSPYROS KAKI* L. f. Diospyraceae. Kaki.

No. 945. Near Shawu, Kiangsi Province. December 5, 1926. *Tung tsz*. A large, prolific seedling tree, 15 meters high and 40 centimeters in diameter, which is free from disease and looks promising for stock.

72197 and 72198. *DIOSPYROS LOTUS* L. Diospyraceae. Persimmon.

Wild trees 2 to 3 meters high, growing near Chungmuioh, Anhwei Province. October, 1926.

72197. No. 815. Flat-topped, globular fruits.

72198. No. 817. A medium-high calyx form with globular fruits.

72199. *HELIANTHUS ANNUUS* L. Asteraceae. Sunflower.

No. 901. *Kwai fa tsz*. [No other data.]

72200. *SORGHUM VULGARE* Pers. Poaceae. Sorghum.

No. 893. Market at Hankow, Hupeh Province. November 29, 1926. *Ko leung tsz*.

72201. *LACTUCA SATIVA* L. Cichoriaceae. Lettuce.

No. 897. Market at Nankow, Hupeh Province. November 29, 1926. *Ko chue tsz*.

72202 to 72204. *PHASEOLUS ANGULARIS* (Willd.) W. F. Wight. Fabaceae. Adzuki bean.

72202. No. 832. Taaihohhau, Anhwei Province. October 23, 1926. *Hung mai tau tsz*.

72203. No. 842. Lengkeuk, Anhwei Province. October 27, 1926. *Faan tau*. A small white variety extensively used in this locality to make noodles.

72204. No. 849. Tungchen, Anhwei Province. October 28, 1926. *Hung tau*. A red variety.

72205 to 72210. *PHASEOLUS AUREUS* Roxb. Fabaceae. Mung bean.

72205. No. 673-a. Luchowfu, Anhwei Province. October 10, 1926. *Shiu luk tau*. A bushy plant producing small green beans which are eaten cooked with rice or used in cakes made of glutinous rice. They are also made into flour.

72206. No. 674. Luchowfu, Anhwei Province. October, 1926. *Tai tsing tau*. A bushy variety planted in May and harvested in October. The large green beans are used for human food.

72207. No. 801. Chungmuioh, Anhwei Province. October 17, 1926.

72166 to 72249—Continued.

72208. No. 825. Taaihohhau, Anhwei Province. October, 1926. A variety with small green beans.

72209. No. 831. Taaihohhau, Anhwei Province. October, 1926. *Yewng luk tau*. A variety with small green beans.

72210. No. 907. Market at Hankow, Hupeh Province. November 29, 1926. *Tsoi tau*. Small green beans.

72211 to 72215. *PISUM SATIVUM* L. Fabaceae. Pea.

72211. No. 789. En route from Shuching to Chungmuihoh, Anhwei Province. October 16, 1926. *Wong tau*. A smooth yellow variety.

72212. No. 820. Taaihohhau, Anhwei Province. October, 1926. *Paak wong tau*. A small white variety.

72213. No. 833. Taaihohhau, Anhwei Province. October 24, 1926. *Yewng waan tau*. A small red and green mottled variety.

72214. No. 909. Market at Hankow, Hupeh Province. November 29, 1926. *Paak waan tau*.

72215. No. 923. Agricultural experiment station, Nanchang, Kiangsi Province. December 2, 1926. *Waan tau*.

72216. *RAPHANUS SATIVUS* L. Brassicaceae. Radish.

No. 937. Agricultural experiment station, Nanchang, Kiangsi Province. December 2, 1926. *Wung siu loh paak*.

72217 to 72232. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceae. Soy bean.

72217. No. 673-b. Luchowfu, Anhwei Province. October 10, 1926. *Ming luk tau*. A bushy variety planted in June and harvested in August. The seeds are used to make flour, noodles, and soup.

72218. No. 677. Luchowfu, Anhwei Province. October, 1926. *Siu wong tau*. A bushy variety with small yellow beans which have a pink-margined hilum.

Numbers 72219 to 72222 are from Taaihohhau, Anhwei Province. October, 1926.

72219. No. 829. *Oo tau*.

72220. No. 834. *Tsing tau*. A large green variety.

72221. No. 836. *Siu wong tau*. A small white bean.

72222. No. 837. *Wong tau*. A large yellow soy bean.

72223. No. 850. Tungchan, Anhwei Province. October 28, 1926. *Wong tau*. Yellow soy beans.

Numbers 72224 to 72228 are from a market at Hankow, Hupeh Province. November 29, 1926.

72224. No. 908. *Tsing pei siu tau*.

72225. No. 912. *Taai tsing pei tau*.

72226. No. 913. *Haak wong tau*.

72227. No. 914. *Siu wong tau*.

72228. No. 917. *Taai wong tau*.

Numbers 72229 to 72232 are from Nanchang, Kiangsi Province. December 2, 1926.

72229. No. 918. *Tsing tau*.

72230. No. 919. *Oo tau*.

72231. No. 921. *Cha tau*.

72232. No. 922. *Wong tau*.

72166 to 72249—Continued.

72233. *SPINACIA OLERACEA* L. Chenopodiaceae. Spinach.

No. 898. Market at Hankow, Hupeh Province. November 29, 1926. *Poh tsoi tsz*.

72234 and 72235. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceae. Common wheat.

72234. No. 693. Luchowfu, Anhwei Province. October, 1926. A widely planted winter crop in this region. It is planted by hand in hills during October and November, with a handful of compost in each hill.

72235. No. 822. Taaihohhau, Anhwei Province. October, 1926.

72236 to 72239. *VICIA FABA* L. Fabaceae. Broad bean.

72236. No. 906. Market at Hankow, Hupeh Province. November 29, 1926. *Taai haai chaan tau*.

72237. No. 911. Market at Hankow, Hupeh Province. November 29, 1926. *Tsing pei chaan tau*.

72238. No. 915. Market at Hankow, Hupeh Province. November 29, 1926. *Siu chaan tau*.

72239. No. 924. Nanchang, Kiangsi Province. December 2, 1926. *Chaan tau*.

72240. *VIGNA SESQUIPEDALIS* (L.) Frawirth. Fabaceae. Yard Long bean.

No. 927. Agricultural experiment station, Nanchang, Kiangsi Province. December 2, 1926. *Tsoi tau*.

72241 to 72249. *VIGNA SINENSIS* (Torner) Savi. Fabaceae. Cowpea.

72241. No. 679. Luchowfu, Anhwei Province. October, 1926. *Paak mei chaan tau*. Seeds white with a black eye, used for human consumption, chiefly to make noodles.

72242. No. 680. Luchowfu, Anhwei Province. October, 1926. *Ma tso tau tau*. A climber producing mottled pink and tan seeds which are used for human consumption.

72243. No. 790. Chungmuihoh, Anhwei Province. October 17, 1926. *Taai fan tau tau*. A climber with light-brown seeds.

72244. No. 791. Chungmuihoh, Anhwei Province. October 17, 1926. *Taai ue uen paak tau tsz*. White seeds with a black eye.

72245. No. 824. Taaihohhau, Anhwei Province. October, 1926. *Taai kaan tau tsz*.

72246. No. 835. Taaihohhau, Anhwei Province. October, 1926. *Siu kang tau tsz*.

72247. No. 838. Taaihohhau, Anhwei Province. October, 1926. *Wong kaan tsz tau*.

72248. No. 848. Tungchen, Anhwei Province. October 28, 1926. *Kaan tau*. A white variety with a purple eye.

72249. No. 910. Market at Hankow, Hupeh Province. November 29, 1926. *Paak faan tau*. Mixed seeds.

72250. *CRYPTOSTEGIA MADAGASCARIENSIS* Bojer. Asclepiadaceae.

From Port au Prince, Haiti. Seeds collected by Alfred Keys, Bureau of Plant Industry. Received January 31, 1927.

A climbing shrubby vine, native to Madagascar, which is grown as an ornamental in South Africa and elsewhere. The leaves are short and leathery and the whitish or pink flowers are 2 to 3 inches wide.

For previous introduction see No. 64655.

72251 and 72252.

From Edinburgh, Scotland. Seeds presented by William Wright Smith, Regius Keeper, Royal Botanic Gardens. Received January 22, 1927.

72251. COROKIA COTONEASTER Raoul. Corn-aceae.

An evergreen shrub, native to New Zealand, with curiously interlacing branches and small yellow flowers.

For previous introduction see No. 66283.

72252. PISUM SATIVUM L. Fabaceae. **Pea.**

Locally grown seeds.

72253 to 72255. ZEA MAYS L. Poaceae. Corn.

From China. Seeds obtained by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received January 1, 1927.

72253. No. 644. An improved variety of Chinese yellow flint corn obtained through the department of agronomy, Nanking University, September 24, 1926.

72254. No. 682. Luchowfu, Anhwei Province. October, 1926. *Luk kok tsz.* An inferior variety of flint corn which is commonly grown here.

72255. No. 916. Market at Hankow, Hupeh Province. November 29, 1926. *Paan suk.* Mixed yellow and white corn.

72256 to 72259. CAJANUS INDICUS Spreng. Fabaceae. Pigeon pea.

From Georgetown, Demerara, British Guiana. Seeds presented by the acting director, Science and Agricultural Department. Received February 1, 1927.

Locally developed varieties.

72256. An ash-colored variety.

72257. An uncommon purple variety.

72258. A common brown-colored variety.

72259. A cacao-brown variety.

72260. EREMOCHLOA OPHIUROIDES (Munro) Hack. Poaceae. Grass.

From China. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received January 14, 1927.

No. 813. Taaihohhau, Anhwei Province. October, 1926. *Paan kan tso.* A stoloniferous lawn grass about 4 inches high, which keeps its deep green color during the winter. It seeds very sparsely and is propagated by runners. This grass is found chiefly in sandy river bottom land where it often forms pure stands and is apparently an excellent soil binder.

For previous introduction see No. 65839.

72261 to 72387.

From Manchuria. Seeds obtained by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received January, 1927.

72261. AVENA SATIVA L. Poaceae. **Oats.**

No. 8662. From Aisimen. Received through the cooperation of D. McLorn, Postal Commissioner, Harbin.

72262. SORGHUM VULGARE Pers. Poaceae. **Sorghum.**

No. 8952. From Pinganpu, Kirin Province. Received through the cooperation of D. McLorn, Postal Commissioner, Harbin.

72261 to 72387—Continued.

72263 to 72297. HORDEUM VULGARE PALLIDUM Seringe. Poaceae. **Six-rowed barley.**

Numbers 72263 to 72268 are seeds obtained through D. McLorn, Postal Commissioner, Harbin.

72263. No. 8648. From Ershihchiatzu.

72264. No. 8656. From Tassuchan, Kirin Province.

72265. No. 8663. From Aisimen.

72266. No. 8667. From Chikete.

72267. No. 8671. From Muhing.

72268. No. 8675. From Bienshubo.

Numbers 72269 to 72274 are seeds obtained through the Manchurian Research Society, Harbin.

72269. No. 8753. From the vicinity of Old Harbin.

72270. No. 8754. From the Ashpkheski region.

72271. No. 8756. From Sansintunp South (Lekke?), near Harbin.

72272. No. 8762. From the vicinity of Siantiakhan.

72273. No. 8763. From near Sinleedir.

72274. No. 8766. From the vicinity of Dunin.

Numbers 72275 to 72297 are seeds obtained through D. McLorn, Postal Commissioner, Harbin.

72275. No. 8894. From Matita.

72276. No. 8897. From Taipingchen, Kirin Province.

72277. No. 8901. From Heitingtzu, Kirin Province.

72278. No. 8904. From Shihtouhtze, Heilungkiang Province.

72279. No. 8908. From Hunchun.

72280. No. 8912. From Hsiaertai, Kirin Province.

72281. No. 8915. From Michiang.

72282. No. 8919. From Poli, Kirin Province.

72283. No. 8923. [No data.]

72284. No. 8927. From Tumentze, Kirin Province.

72285. No. 8932. From Chunghochen, Heilungkiang Province.

72286. No. 8936. From Huilungfeng, Kirin Province.

72287. No. 8939. From Chunghochen, Kirin Province.

72288. No. 8943. From Hsiaoshantze, Kirin Province.

72289. No. 8946. From Shihjenchengtze.

72290. No. 8954. From Paochuanchen, Heilungkiang Province.

72291. No. 8958. From Shuangho, Heilungkiang Province.

72292. No. 8962. From Erkosshan, Heilungkiang Province.

72293. No. 8966. From Kaochiatien, Kirin Province.

72294. No. 8970. From Loanchen, Heilungkiang Province.

72261 to 72387—Continued.

72295. No. 8975. From Ssutaokou.

72296. No. 8979. From Machiaoho.

72297. No. 8983. From Liangshiuchuantze, Kirin Province.

72298 to 72324. *PHASEOLUS* spp. Fabaceae.

Seeds obtained through D. McLorn, Postal Commissioner, Harbin.

72299. *PHASEOLUS ANGULARIS* (Willd.) W. F. Adzuki bean.

No. 8953. From Pinganpu, Kirin Province. A small white variety.

72299 to 72321. *PHASEOLUS AUREUS* Roxb. Mung bean.

72299. No. 8895. From Matita.

72300. No. 8899. From Taipingschen, Kirin Province.

72301. No. 8902. From Heitingtzu, Kirin Province.

72302. No. 8906. From Shihtouhotze, Heilungkiang Province.

72303. No. 8910. From Hunchun.

72304. No. 8914. From Hsiaertai, Kirin Province.

72305. No. 8917. From Michiang.

72306. No. 8921. From Poli, Kirin Province.

72307. No. 8925. [No other data.]

72308. No. 8930. From Tumentze, Kirin Province.

72309. No. 8934. From Chunghochen, Heilungkiang Province.

72310. No. 8937. From Huilungfeng, Kirin Province.

72311. No. 8941. From Chunghochen, Kirin Province.

72312. No. 8948. From Shihjenchengtze.

72313. No. 8950. From Pinganpu, Kirin Province.

72314. No. 8956. From Paochuanchen, Heilungkiang Province.

72315. No. 8960. From Shuangho, Heilungkiang Province.

72316. No. 8964. From Erkoshan, Heilungkiang Province.

72317. No. 8968. From Kaochiatien, Kirin Province.

72318. No. 8972. From Loanchen, Heilungkiang Province.

72319. No. 8977. From Ssutaokou.

72320. No. 8981. From Machiaoho.

72321. No. 8985. From Liangshiuchuantze, Kirin Province.

72322 to 72324. *PHASEOLUS VULGARIS* L. Common bean.

72322. No. 8918. From Michiang.

72323. No. 8935. From Chunghochun, Heilungkiang Province.

72324. No. 8949. From Shihjenchengtze.

72325 to 72345. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceae. Soy bean.

Seeds received through D. McLorn, Postal Commissioner, Harbin.

72261 to 72387—Continued.

72325. No. 8896. From Matita, near Hunchun, Korea.

72326. No. 8900. From Taipingschen, Kirin Province.

72327. No. 8903. From Heitingtzu, Kirin Province, near Hunchun.

72328. No. 8907. From Shihtouhotze, Heilungkiang Province, near Mulan.

72329. No. 8911. From Hunchun.

72330. No. 8914. From Hsiaertai, Kirin Province.

72331. No. 8922. From Poli, Kirin Province.

72332. No. 8926. [No data.]

72333. No. 8931. From Tumentze, Kirin Province, near Hunchun.

72334. No. 8938. From Huilungfeng, Kirin Province, near Hunchun.

72335. No. 8942. From Chunghochen, Kirin Province.

72336. No. 8945. From Hsiaoshantze, Kirin Province.

72337. No. 8951. From Pinganpu, Kirin Province.

72338. No. 8957. From Paochuanchen, Heilungkiang Province.

72339. No. 8961. From Shuangho, Heilungkiang Province.

72340. No. 8965. From Erkoshan, Heilungkiang Province.

72341. No. 8969. From Kaochiatien, Kirin Province.

72342. No. 8973. From Loanchen, Heilungkiang Province.

72343. No. 8978. From Ssutaokou.

72344. No. 8982. From Machiaoho.

72345. No. 8986. From Liangshiuchuantze, Kirin Province.

72346 to 72387. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceae. Common wheat.

Numbers 72346 to 72353 were obtained through D. McLorn, Postal Commissioner, Harbin.

72346. No. 8626. From Huolunchuan, Kirin Province.

72347. No. 8640. From Hsinglungchem, Kirin Province.

72348. No. 8645. From Haosechan.

72349. No. 8652. From Chelu.

72350. No. 8659. From Kueralaschienchi.

72351. No. 8666. From Chikete.

72352. No. 8677. From Chanan.

72353. No. 8686. [No other data.]

Numbers 72354 to 72368 were obtained through the Manchurian Research Society, Harbin.

72354. No. 8751. From Fanchen.

72355. No. 8752. From Tulbosian.

72356. No. 8755. A variety called *Stari Kharbinsu*.72357. No. 8757. A variety called *Stari Kharbin*, obtained at Old Harbin.

72358. No. 8758. [No other data.]

72261 to 72387—Continued.

72359. No. 8759. Vicinity of Echo.
 72360. No. 8760. From near Fannowsuy.
 72361. No. 8761. From Usiantsi.
 72362. No. 8764. From near Seitsiankou.
 72363. No. 8765. From the vicinity of Dunien.
 72364. No. 8767. From the vicinity of Tsitzkari.
 72365. No. 8768. From the vicinity of Tskr.
 72366. No. 8769. [No other data.]
 72367. No. 8770. From the vicinity of Sunviagarr.
 72368. No. 8771. From the vicinity of Chjatzsikan.

Numbers 72369 to 72387 were obtained through D. McLorn, Postal Commissioner, Harbin.

72369. No. 8898. From Taipingchen, Kirin Province.
 72370. No. 8905. From Shihtouhotze, Heilungkiang Province.
 72371. No. 8909. From Hunchun.
 72372. No. 8916. From Michiang.
 72373. No. 8920. From Poli, Kirin Province.
 72374. No. 8924. [No other data.]
 72375. No. 8929. From Tumentze, Kirin Province.
 72376. No. 8933. From Chunghochun, Heilungkiang Province.
 72377. No. 8940. From Chunghochen, Kirin Province.
 72378. No. 8944. From Hsiaoshantze, Kirin Province.
 72379. No. 8947. From Shihjenchengtze.
 72380. No. 8955. From Paochuanchen, Heilungkiang Province.
 72381. No. 8959. From Shuangho, Heilungkiang Province.
 72382. No. 8963. From Erkoshan, Heilungkiang Province.
 72383. No. 8967. From Kaochiatien, Kirin Province.
 72384. No. 8971. From Loanchen, Heilungkiang Province.
 72385. No. 8976. From Ssutaokou.
 72386. No. 8980. From Machiaoho.
 72387. No. 8984. From Liangshiuchuantze, Kirin Province.

72388. CORYLUS COLUMNATA L. Betulaceae. Turkish hazel.

From Paris, France. Seeds purchased from Vilmorin-Andrieux & Co. Received January 31, 1927.

The Turkish hazel is a vigorous, free-growing tree, up to 60 feet in height, with a stout trunk, more or less horizontal branches, heart-shaped, glossy green leaves 5 inches long, and small hard-shelled nuts inclosed in fleshy hairy green involucre.

For previous introduction see No. 51779.

72389 to 72393. BRASSICA OLERACEA CAPITATA L. Brassicaceae. Cabbage.

From Ukraina, Russia. Seeds presented by the Poltova Experiment Station through J. W. Pincus, Amtorg Trading Corporation, New York, N. Y. Received February 1, 1927.

72389. No. 287. *Bulgarian*. A late variety.
 72390. No. 288. *Levetka*. A late variety.
 72391. No. 290. *Perfection*. An early variety.
 72392. No. 293. *Zavorakianskaja*. A late variety.
 72393. No. 1298. *Erfurt*. An early variety.

72394 to 72397.

From Catania, Sicily. Plants purchased from Giardino Allegra. Received February 9, 1927. Italian varieties.

72394 to 72396. CORYLUS AVELLANA L. Betulaceae. Filbert.

72394. *d'Inghilterra*.
 72395. *Precoce de Frauendorf*.
 72396. *Principessa reale*.

72397. PRUNUS AVIUM L. Amygdalaceae. Sweet cherry.

Marascona di Verona No. 31.

72398 to 72423.

From Manchuria. Seeds obtained by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received January, 1927.

These seeds were collected by I. V. Kosloff, Manchurian Research Society, Harbin.

Numbers 72398 to 72400 are seeds collected in the forest concession of the Chinese Eastern Railway, in the vicinity of Shitoukhetsy.

72398. ACANTHOPANAX SENTICOSUM (Rupr.) Harms. Araliaceae.

No. 8719. A hardy, spiny shrub native to northern China, with large palmate leaves and umbels of black berries.

For previous introduction see No. 65907.

72399. ACANTHOPANAX SESSILIFLORUM (Rupr. and Maxim.) Seem. Araliaceae.

No. 8705. A hardy deciduous shrub 10 feet high, with three-lobed to five-lobed leaves, brownish flowers, and black berries.

For previous introduction see No. 65908.

72400 to 72402. ACER spp. Aceraceae. Maple.

72400. ACER BARBINERVE Maxim.

No. 8701. A shrubby maple, native to Manchuria, with coarsely toothed five-lobed leaves.

For previous introduction see No. 65909.

72401. ACER MANDSHURICUM Maxim.

No. 8727. Slinkins forest concession. A hardy Manchurian maple which forms a shrub or small tree.

For previous introduction see No. 65480.

72402. ACER PICTUM MONO (Maxim.) Pax.

No. 8720. Collected in the forest concession of the Chinese Eastern Railway, in the vicinity of Shitoukhetsy. A hardy Manchurian tree up to 60 feet high, with leaves somewhat heart-shaped.

72398 to 72423—Continued.

72403. *ACONITUM ALBO-VIOACEUM* Komarov. Ranunculaceae.

No. 8712. Collected in the forest concession of the Chinese Eastern Railway in the vicinity of Shitoukhetsy. An ornamental hardy herbaceous perennial with white and violet flowers. Native to northeastern Asia.

72404. *ACONITUM VOLUBILE* Koelle. Ranunculaceae.

No. 8713. Collected in the forest concession of the Chinese Eastern Railway, in the vicinity of Shitoukhetsy. A blue-flowered hardy herbaceous perennial up to 6 feet high.

72405. *ACTAEA SPICATA* L. Ranunculaceae. **Black baneberry.**

No. 8709. Collected in the Tiger forest of the Chinese Eastern Railway, in the vicinity of Shitoukhetsy. A tall, hardy, herbaceous perennial, with a long spike of purple-black fruits, resembling that of the pokeberry.

For previous introduction see No. 65483.

Numbers 72406 to 72411 were collected in the forest concession of the Chinese Eastern Railway, in the vicinity of Shitoukhetsy.

72406. *BERBERIS AMURENSIS* Rupr. Berberidaceae. **Amur barberry.**

No. 8716. A hardy handsome shrub up to 8 feet high, with racemes of scarlet berries.

For previous introduction see No. 54062.

72407. *BETULA JAPONICA* Siebold. Betulaceae. **Birch.**

No. 8704. A hardy Japanese tree up to 60 feet high, with broadly oval leaves, which is closely related to *Betula pendula*.

For previous introduction see No. 65062.

72408. *CIMICIFUGA FOETIDA* L. Ranunculaceae.

No. 8722a. A hardy herbaceous perennial 4 feet high, with light-yellow flowers.

72409. *EUONYMUS MACROPTERUS* Rupr. Celastraceae.

No. 8700. A shrub or small tree, about 20 feet high, with narrowly oval, wedge-shaped leaves, dense clusters of yellowish flowers, and pink fruits. Native to northeastern Asia.

For previous introduction see No. 66367.

72410. *LONICERA MAACKII* (Rupr.) Herd. Caprifoliaceae. **Amur honeysuckle.**

No. 8699. A bush honeysuckle, native to northeastern China, becoming about 10 feet high, with widely spreading branches and dark-green leaves which are downy on both surfaces. The pure white flowers, an inch in diameter, are produced on the upper side of the branchlets. The fruits are red.

For previous introduction see No. 57300.

72411. *PHILADELPHUS* sp. Hydrangeaceae.

No. 8717. A hardy shrub, probably an ornamental, allied to the mock orange.

72412. *PLECTRANTHUS* sp. Menthaceae.

No. 8724. Collected in Slinkins forest concession. A hardy herbaceous plant which may have attractive flowers.

Numbers 72413 to 72417 were collected in the forest concession of the Chinese Eastern Railway, in the vicinity of Shitoukhetsy.

72413. *ROSA ACICULARIS* Lindl. Rosaceae.

No. 8706. A low hardy shrub native to northern America, Europe, and Asia, with deep-pink flowers, followed by pear-shaped fruits.

For previous introduction see No. 54165.

72398 to 72423—Continued.

72414. *RUBIA CORDIFOLIA* L. Rubiaceae. **Madder.**

No. 8721. A hardy herbaceous perennial 9 inches high with white flowers which appear in July. Native to Siberia.

For previous introduction see No. 49652.

72415. *SCHIZANDRA CHINENSIS* (Turcz.) Baill. Magnoliaceae.

No. 8726. A very handsome vine with masses of compact bunches of small, bright-red berries.

For previous introduction see No. 65287.

72416. *SORBARIA SORBIFOLIA* A. Br. Rosaceae.

No. 8702. A hardy ornamental shrub 3 to 6 feet high, with attractive panicles of creamy white flowers.

72417. *SPIRAEA SALICIFOLIA* L. Rosaceae.

No. 8725. A hardy upright shrub 5 feet high, with white or pink flowers. Native to northeastern Europe, Asia, and Alaska.

72418. *SPIRAEA* sp. Rosaceae. **Spirea.**

No. 8721-a. A hardy Manchurian shrub which may be of ornamental value.

Numbers 72419 to 72423 are seeds collected by I. V. Kosloff, Manchurian Research Society, Harbin, in the forest concession of the Chinese Eastern Railway, in the vicinity of Shitoukhetsy.

72419. *SPODIOPOGON SIBIRICUS* Trin. Poaceae. **Grass.**

No. 8722-b. A perennial grass 3 feet high, native to eastern Asia.

For previous introduction see No. 66419.

72420. *SYRINGA AMURENSIS* Rupr. Oleaceae. **Manchurian lilac.**

No. 8697. A hardy lilac, native to Manchuria, up to 12 feet high, with yellowish white flowers.

For previous introduction see No. 57344.

72421. *SYRINGA WOLFI* C. Schneid. Oleaceae. **Lilac.**

No. 8718. A hardy Manchurian lilac.

72422. *TILIA AMURENSIS* Rupr. Tiliaceae. **Linden.**

No. 8707. A hardy Manchurian linden which has a habit similar to that of the small-leaved linden, *Tilia cordata*, with ovate, papery, long-pointed leaves which are dark-green above and blue green below. It is distinguished from the small-leaved linden by its coarser dentations.

For previous introduction see No. 64243.

72423. *TILIA MANDSHURICA* Rupr. and Maxim. Tiliaceae. **Linden.**

No. 8710. A very large-leaved linden of ornamental appearance.

For previous introduction see No. 57346.

72424 to 72439.

From Buitenzorg, Java. Seeds presented by Dr. W. M. Docters van Leeuwen, director, botanic garden. Received January 3, 1927.

72424. *ANNONA MONTANA* Macfad. Annonaceae.

West Indian tree, up to 15 meters high, with shining dark-green leaves and subglobose fruits, about the size of an orange, with yellowish pulp.

For previous introduction see No. 43265.

72424 to 72439—Continued.

72425. *ARTOCARPUS POMIFORMIS* Teysm. and Binn. Moraceae.

A tropical evergreen tree, with leaves up to 10 inches long. It is native to the East Indies and closely related to the breadfruit tree (*Artocarpus communis*).

72426. *BARYXYLUM DASYRACHIS* (Miquel) Pierre (*Peltophorum dasyrachis* Kurz.). Caesalpiniaceae.

A tall unarmed East Indian tree, described by Hooker (Flora of British India, vol. 2, p. 257) as having rigid pinnate leaves up to a foot long and showy yellow flowers produced in terminal and axillary clusters 6 to 9 inches long.

For previous introduction see No. 63760.

72427. *BAUHINIA ROSEA* Miquel. Caesalpiniaceae.

A tropical leguminous climber, with leaves 3 to 5 inches long and wide and slit halfway. The pink flowers are in terminal racemes. Native to tropical Asia.

72428. *BAUHINIA VIOLACEA* Hort. Caesalpiniaceae.

Probably a tropical woody plant with violet flowers.

72429. *BRADBURYA PLUMIERI* (Turp.) Kuntze (*Centrosema plumieri* Turp.). Fabaceae.

An ornamental tropical vine with white and red flowers. It thrives in shady places in southern Brazil, where it is native.

For previous introduction see No. 48597.

72430. *BRADBURYA PUBESCENS* (Benth.) Kuntze (*Centrosema pubescens* Benth.). Fabaceae.

A creeping tropical vine used as a cover crop in the East Indies.

72431 to 72433. *CASSIA* spp. Caesalpiniaceae.

72431. *CASSIA MOSCHATA* H. B. K.

A medium-sized tropical South American tree with leaves composed of 14 to 18 pairs of leaflets and yellow flowers in axillary racemes.

72432. *CASSIA QUINQUANGULATA* L. Rich.

A yellow-flowered tropical evergreen shrub 3 feet high.

72433. *CASSIA TIMORIENSIS* DC.

A rather low tree with slender downy branches, pale-green leaves up to 9 inches in length, bright-yellow flowers, and thin glossy, flexible pods sometimes 6 inches long. The tree is distributed throughout the Malay Archipelago and the Philippines.

For previous introduction see No. 55026.

72434. *CROTALARIA ANAGYROIDES* H. B. K. Fabaceae.

A rank-growing leguminous evergreen shrub with large clusters of yellow flowers.

For previous introduction see No. 66251.

72435. *CROTALARIA MYSORENSIS* Roth. Fabaceae.

A much-branched tropical leguminous annual, 2 feet high, with yellow flowers. Native to tropical Asia.

72436. *ERYTHRINA FUSCA* Lour. Fabaceae.

A tropical shrub 8 feet high, with prickly bark, narrow leaflets, and brown-red flowers in terminal racemes.

72424 to 72439—Continued.

72437. *MONODORA TENUIFOLIA* Benth. Annonaceae.

A small ornamental deciduous tropical Asiatic tree, with dull-yellow orchidlike flowers which appear when the tree is leafless.

72438. *PARKIA TIMORIANA* (DC.) Merr. (*P. rozburghii* G. Don.). Mimosaceae. Cupang.

A huge and remarkably handsome, quick-growing tree, attaining a height of 120 feet or more, with a clear smooth trunk and beautiful fine-feathery pinnate leaves. Native to the Malay Peninsula, Burma, etc. It has been introduced into and become well established in Ceylon, thriving in the moist low country up to 2,000 feet. The long pods, which grow in clusters, contain a quantity of white powdery farinaceous substance. The tree is easily propagated by seed.

For previous introduction see No. 61064.

72439. *TOLUIFERA BALSAMUM* L. (*Myrozyllon toluiferum* H. B. K.). Fabaceae.

A small handsome tree, native to northern South America, with odd-pinnate leaves and cream-colored flowers in axillary or terminal clusters.

For previous introduction see No. 66244.

72440. *CUCUMIS MELO* L. Cucurbitaceae. Melon.

From Valencia, Spain. Seeds presented by Donald M. Liddell, Baltimore, Md. Received February 4, 1927.

The rind of this variety resembles a watermelon in appearance, and the pulp is like the honeydew. I believe it will stand shipping a little better than the honeydew melon, as the rind is heavier. (Liddell.)

72441. *CAJANUS INDICUS* Spreng. Fabaceae. Pigeon pea.

From Port of Spain, Trinidad, British West Indies. Seeds presented by W. G. Freeman, Director of Agriculture. Received February 4, 1927.

Arhar. A local small-seeded variety.

72442 to 72449. *VITIS VINIFERA* L. Vitaceae. European grape.

From Leningrad, Russia. Cuttings presented by A. Kol, chief, bureau of introduction, Institute of Applied Botany, through J. W. Pincus, Amtorg Trading Corporation, New York, N. Y. Received February 11, 1927.

Varieties developed in Turkestan.

72442. No. 35332. *Nimrang*.

72443. No. 35333. *Charas*.

72444. No. 35334. *Khasseyne*.

72445. No. 35335. *Chiliaki Krasnaya*.

72446. No. 35336. *Tanfi Rose*.

72447. No. 35337. *Sabza*.

72448. No. 35338. *Khusseyne*.

72449. No. 35339. *Katta Kurgan*.

72450. *CITRUS SINENSIS* (L.) Osbeck. Rutaceae. Sweet orange.

From Telde, Grand Canary, Canary Islands. Seeds collected by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received February 11, 1927.

No. 977. December 29, 1926. These seeds were found in an especially fine fruit, 4 inches in diameter, which came from the same tree as the scions under No. 939 [No. 71131].

72451. CISSUS QUADRANGULA L. (*Vitis quadrangularis* Wall.). Vitaceae.

From Georgetown, McCarthy Island, Gambia, West Africa. Cuttings obtained by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received February 11, 1927.

No. 981. January 8, 1927. A vigorous drought-resistant climber, forming great masses of green stems which would be excellent for use on stone walls. (Fairchild.)

For previous introduction see No. 66653.

72452. ELAEOCARPUS ANGUSTIFOLIUS Blume. Elaeocarpaceae.

From Dominica, British West Indies. Seeds presented by C. N. Field, Boston, Mass. Received February 9, 1927.

From the Dominica Botanic Gardens.

A tall, handsome tree with a lofty crown, from the primeval evergreen forests of Java where it is found from sea level to an altitude of about 4,000 feet. The narrow, partly evergreen leaves become brilliant orange red before they drop, and the clusters of greenish, silky fringed flowers appear in December. In the late summer the tree bears beautiful blue fruits the size of marbles; the fleshy portion is thin but pleasant flavored and is eaten by the natives. The knobby, grooved stones are exported in large quantities for rosaries.

For previous introduction see No. 54890.

72453 to 72570.

From northeastern Burma. Seeds collected by Capt. F. Kingdon Ward and presented by Maj. Lionel de Rothschild, London, England. Received January, 1927.

72453. ABIES sp. Pinaceae. Fir.

No. 7634. A medium-sized tree with small cones, growing at altitudes between 12,000 and 13,000 feet, on the flanks of a valley.

72454. ACER sp. Aceraceae. Maple.

No. 7265. A bushy shrub or small tree with entire leaves and scarlet fruits in pendent festoons 6 inches long. It grows on exposed rocky ridges at an altitude of 7,000 feet (where it is dwarfed) or in the lowest alpine meadows at an altitude of about 9,000 feet. It resembles *Acer henryi*, but has simple leaves.

72455. ANEMONE sp. Ranunculaceae.

No. 6931. A large woolly alpine species with several flowering stems bearing heads of white or purplish flowers.

72456. ANEMONE sp. Ranunculaceae.

No. 6956. *Golden anemone*. This species resembles No. 6931 [No. 72455], but the flowers are golden yellow, and the plant is confined to limestone situations.

72457. ANEMONE sp. Ranunculaceae.

No. 6956 (?).

72458. ARISTOLOCHIA sp. Aristolochiaceae.

No. 6810. A species with large leaves and dull-colored flowers having an unpleasant odor. It is found in the upper rain forest at altitudes between 8,000 and 9,000 feet, and is probably quite hardy. It is an interesting freak plant, but is not recommended for general culture.

72459. BERBERIS sp. Berberidaceae. Barberry.

No. 6787. A many-branched shrub forming rather spreading clumps, with stems 2 to 3 feet high. The large hollylike leathery leaves are dark-green above, the pale veins showing as inlaid work, and the under surface is brilliant silver. The bunches of pear-shaped, blue-violet

72453 to 72570—Continued.

berries are rather inconspicuous. This shrub is found in rhododendron thickets or in the open on limestone ridges at altitudes between 9,000 and 10,000 feet.

72460. BETULA sp. Betulaceae. Birch.

No. 7637. A fine red-barked tree, ascending to the limit of deciduous trees, where it grows with Abies and Rhododendron.

72461. CLEMATIS sp. Ranunculaceae.

No. 7615. A clematis growing in thickets on a limestone ridge.

72462. CODONOPSIS sp. Campanulaceae.

No. 7531. This alpine form is semierect, but in its meadow form it is semitwining. It grows on open meadow slopes up to 14,000 feet altitude. The tubular, fragrant flowers are yellow, speckled with purple.

72463. COTONEASTER sp. Malaceae.

No. 6788. A red-berried shrub 3 to 4 feet high, with flattened branches spreading out fanwise, but in an angular way. It grows on open gneiss or limestone ridges, and should be given plenty of room on top of rock gardens.

72464. ENKIANTHUS sp. Ericaceae.

No. 6789. A shrub 6 to 10 feet high, growing in dense rhododendron thickets, on the sheltered flank of limestone ridges. The leaves are scarlet in the autumn, and the cherry-red globular, solitary flowers are produced on long stalks.

72465. GENTIANA sp. Gentianaceae.

No. 7592. A mat plant weaving itself into the alpine turf at altitudes between 14,000 and 15,000 feet. The flowers are Prussian blue, fading with age.

72466. HYPERICUM sp. Hypericaceae.

No. 7224. A dwarf plant forming dense clumps a yard through on steep gravel scree facing south and confined to igneous rock. The flowers are golden yellow and an inch in diameter.

72467. ILEX sp. Aquifoliaceae. Holly.

No. 6925. A dwarf prostrate or ascending undershrub, forming tightly compressed carpets and cushions on granite cliffs, and among boulders and rocks which are covered with dwarf rhododendrons. The shoots are 2 to 3 inches high and covered with an abundance of bright-scarlet berries, making the species very attractive.

72468. IRIS sp. Iridaceae.

No. 7063. A species 6 to 8 inches high, found in bogs and on meadow slopes. The flowers are bright violet with a network of old gold and white on the falls.

72469. LILUM sp. Liliaceae. Lily.

No. 7143. A species 1 to 3 feet high, found on dry pine and bracken-clad slopes or higher up the valley among boulders and shrubs, in the open. The flowers are pink, speckled with purple, the pink ground turning darker with age.

72470. LINDENBERGIA sp. Scrophulariaceae.

No. 7165. A cool house plant 6 inches high, found among granite rocks and spear-grass, on dry pine-clad slopes. The flowers are brilliant yellow.

72471 to 72474. LONICERA spp. Caprifoliaceae.**72471. LONICERA sp.**

No. 6946. An undershrub 2 to 3 feet high, with outspread branches, found in thickets or on alpine slopes. The pendent flowers are yellow with papery bracts, and the berries are rather large and blue.

72453 to 72570—Continued.

72472. LONICERA sp.

No. 7113. A bushy shrub 6 to 8 feet high, found in mixed forests; it is allied to *Lonicera webbiana*. The flowers are maroon and the fruits are like small cherries, dangling on long stalks.

72473. LONICERA sp.

No. 7510. A small-leaved prostrate plant forming mats on steep earth and gravel slopes, facing south, or draping gneiss rocks with a curtain of foliage. The fairly large, glaucous berries are Prussian blue, and the flowers are said to be pink.

72474. LONICERA sp.

No. 7529. A small bushy shrub apparently confined to steep gravelly slopes below the limestone cliffs, on the more sheltered side of the valley. The berries are rather large, bright reddish orange, peeping from papery bracts, and the flowers are said to be yellow.

72475 to 72479. MECONOPSIS spp. Papaveraceae.

72475. MECONOPSIS sp.

No. 6862. A plant 3 feet high, with sky-blue flowers, found in open meadows on stony slopes. It is like *Meconopsis baileyi*, but is a plant of the open hillside.

72476. MECONOPSIS sp.

No. 6974. A plant 6 to 8 inches high, resembling a red-flowered *Meconopsis impedita*, found on earth banks, cliffs, screes, limestone, or igneous rock in full sunshine. It is a splendid species and should be grown high up on rock gardens. The flowers are wine-colored or almost scarlet with the sunlight shining through them.

72477. MECONOPSIS sp.

No. 7098 or 7099.

72478. MECONOPSIS sp.

No. 7200. A plant 1 to 3 feet high, bearing a dozen blooms. It is found in open rocky situations, preferring limestone. The flowers are dark blue with yellow anthers.

72479. MECONOPSIS sp.

No. 7207. A biennial plant found in open situations on steep meadow slopes or among bushes or boulders. The leaves and stem are covered with silken golden hairs, as are those of *Meconopsis wallichii*. The flowers are bluish violet with orange anthers and are borne in an immense simple raceme 4 to 6 feet high. This plant recalls *M. robusta* except that the flowers are violet instead of yellow.

72480 to 72483. NOMOCHARIS spp. Liliaceae.

72480. NOMOCHARIS sp.

No. 6876.

72481. NOMOCHARIS sp.

No. 7006. A plant about a foot high, with wine-red nodding flowers, found on open meadow slopes with *Nomocharis pardanthina*, but much rarer. The bulb is deep, about 6 inches below the surface, in a very tenacious gravelly clay, derived from the disintegration of feldspathic rocks, at the foot of which it grows.

72482. NOMOCHARIS sp.

No. 7030. A dwarf form of No. 7006 [No. 72481]. This plant, 3 to 4 inches high, grows on sheltered earth slopes and granitic sandy or gravelly soil in precipitous gullies.

72483. NOMOCHARIS sp.

No. 7049.

72453 to 72570—Continued.

72484 to 72497. PRIMULA spp. Primulaceae.

Primrose.

72484. PRIMULA sp.

No. 6820. *Tea rose* primrose. A plant 6 to 8 inches high, found on very steep stony rubble banks and gneiss cliffs, up to an altitude of 10,000 feet. The very large fragrant flowers in heads of four to eight are first carmine, later changing to pure pink.

72485. PRIMULA sp.

No. 6821. A plant 2 to 4 inches high when in flower and 6 to 10 inches when in fruit, growing in large clumps. The flowers are very large and bright violet with creamy bands down the interior.

72486. PRIMULA sp.

No. 6875. A plant 3 to 6 inches high, growing on sheltered banks in the alpine region or in boggy ground by streams. The small, golden-yellow flowers are in drooping heads.

72487. PRIMULA sp.

No. 6901. A common species of primula 6 to 9 inches high, growing chiefly on wet alpine turf slopes, in granitic grit and loam, at altitudes between 9,000 and 12,000 feet. The fragrant flowers, usually in one whorl, sometimes in two, are dark yellow in the center, gradually fading to pale yellow on the lobes.

72488. PRIMULA sp.

No. 6902. A species 8 to 12 inches high, growing in clumps along the banks of streams, on alpine turf slopes, and in moist loam. The fragrant flowers are pale sulphur, coated with snow-white meal.

72489. PRIMULA sp.

No. 6928. A species forming immense clumps on steep alpine grass slopes, in rich glutinous loam, at altitudes between 13,000 and 14,000 feet. The flowers are bright violet, though occasionally white, with a yellow eye. This plant rather recalls *Primula sonchifolia*, though it is not such a rare color; on the other hand this is a true alpine species while *P. sonchifolia* is not.

72490. PRIMULA sp.

No. 6975. A plant 4 to 6 inches high, found on sheltered loam and gravel banks among bushes. The fragrant flowers are blue powdered white.

72491. PRIMULA sp.

No. 6981. A primrose about a foot high, found in open meadows, on gravel slopes, earth banks, or by streams. The flowers are dark purple, almost black.

72492. PRIMULA sp.

No. 7002. *Claret cup*. A beautiful plant a foot high, found on steep alpine turf rocky slopes. The nodding flowers, one to three on the scape, are claret colored.

72493. PRIMULA sp.

No. 7004. A small, drab edition of No. 6821 [No. 72485], confined to a few sheltered grassy alpine slopes and gravel gullies.

72494. PRIMULA sp.

No. 7021. A handsome plant 3 to 4 inches high, growing on gneiss rocks and grassy ledges of gneiss escarpments. The large mauve or pinkish mauve flowers are in handsome heads. This species recalls the alpine forms of *Primula calliantha*, but is quite distinct.

72453 to 72570—Continued.

72495. PRIMULA sp.

No. 7054. A robust, bright-yellow-flowered plant 12 to 15 inches in diameter, growing on meadow-clad slopes.

72496. PRIMULA sp.

No. 7226. A species growing on open banks and alpine grass slopes. The fragrant flowers are rich violet, with an orange tube.

72497. PRIMULA sp.

No. 7228. A local plant 6 inches or less in height, growing on gneiss rocks and gravel slopes, facing south. It recalls *Primula caudoriana*, but is paler in color and altogether more slight. The frail, pale-violet flowers are often reduced to one, but sometimes there are three or four.

72498. PYRUS sp. Malaceae. Pear.

No. 6851. A spreading tree 30 feet high, growing in the uppermost rain forest, up to an altitude of 10,000 feet. The large glossy leaves make it an acquisition as a foliage tree. The fruits and inconspicuous flowers are white.

72499. RHEUM sp. Polygonaceae. Rhubarb.

No. 7101. A giant herb growing in stony wet ground, along the courses of alpine streams. The flowering stem, a stately column of maroon sorrellike flowers, grows from the center of a mass of rhubarblike leaves, reaching a height of 12 feet.

72500 to 72565. RHODODENDRON spp. Ericaceae.

Numbers 72500 to 72544 are from the Seinghku Valley.

72500. RHODODENDRON sp.

No. 6735. An epiphytic bushy undershrub, more or less confined to trees growing on exposed ridges, found at an altitude of 6,000 feet. The young foliage is crimson, and the flowers are bright orange with red anthers.

72501. RHODODENDRON sp.

No. 6735 or 6801.

72502. RHODODENDRON sp.

No. 6736. A stout bush 10 or 12 feet high, densely clothing an exposed cliff at an altitude of 9,000 feet.

72503. RHODODENDRON sp.

No. 6751 or 6794.

72504. RHODODENDRON sp.

No. 6752. A large shrub or small gnarled tree about 20 feet high, wedged in the tanglewood on precipitous cliffs or growing more freely in the upper mixed forest, at altitudes between 9,000 and 10,000 feet. The flowers, 6 to 10 in a truss, are flushed purplish rose, with a deep-crimson flash at the extreme base; the calyx and pedicel are a rusty pink, and the whole inflorescence is bristly.

72505. RHODODENDRON sp.

No. 6753. A small erect tree 30 feet high, growing in the tanglewood at an altitude of 9,000 feet. The leaves are brilliantly silvered beneath with a metallic sheen, and the rounded truss contains many cream flowers with twin violet spots at the base.

72506. RHODODENDRON sp.

No. 6782. A magnificent tree, with a straight trunk, 60 to 80 feet high, found at altitudes between 8,000 and 9,000 feet.

72453 to 72570—Continued.

72507. RHODODENDRON sp.

No. 6792. A bush 10 to 15 feet high, growing in thin tanglewood on the limestone ridge or on the more sheltered flank, at altitudes between 9,000 and 10,000 feet. The flowers are sulphur colored with an aurora of crimson purple at the base. This may be a dwarf form of No. 6753 [No. 72505].

72508. RHODODENDRON sp.

No. 6793. An epiphytic leggy undershrub, found at altitudes between 9,000 and 10,000 feet. It grows on the scattered moss-bound *Tsuga* and juniper trees which rise above the tanglewood. The flowers are large, bright canary-yellow with red-brown anthers.

72509. RHODODENDRON sp.

No. 6794. A small compact bush 3 to 5 feet high, at an altitude of 10,000 feet, in the dense tanglewood thickets which cover the side of a ridge. The leaves are smoke-gray beneath and closely lepidote. The flowers, five in a truss, are flesh pink or pink and white, with a long crimson style; the calyx is large, leafy, and persistent.

72510. RHODODENDRON sp.

No. 6795. An undershrub 2 to 3 feet high, with leaves like a dwarf *thomsoni*, growing in low tanglewood on a ridge at an altitude of 10,000 feet.

72511. RHODODENDRON sp.

No. 6829. A bushy undershrub, lining the steep granite gullies or forming prostrate tufts on alpine slopes, at altitudes between 10,000 and 11,000 feet. The waxy flowers are bright blood red, with five coal-black pit glands at the base. Sometimes there is little or no pigment, and the flowers vary from carmine to flesh-pink tints, with blood-red glands. When in full bloom it is like sheets of red-hot lava.

72512. RHODODENDRON sp.

No. 6806. A small shrub 5 feet high, growing on steep grass slopes and in thickets, at altitudes between 9,000 and 10,000 feet. The pendent flowers are bright yellow.

72513. RHODODENDRON sp.

No. 6809. An epiphytic shrub growing at an altitude of 7,000 feet.

72514. RHODODENDRON sp.

No. 6818. A small tree or gnarled bushy shrub forming a dense undergrowth on steep faces clothed with *Abies* forest, or forming thickets by itself at altitudes between 10,000 and 11,000 feet. The leaves are dark green above and covered beneath with a cinnamon-colored wool. The flowers, in large trusses, are first pink, later turning cream, with a flash of crimson purple at the base.

72515. RHODODENDRON sp.

No. 6819. A small rather straggling undershrub liking deep shade, sometimes epiphytic on *Abies*, more usually on cliffs where water is always dripping. It is found at an altitude of 10,000 feet. The pale-yellow flowers are in trusses of two to three.

72516. RHODODENDRON sp.

No. 6831. A compact shrub 2 to 3 feet high, forming dense scrub thickets in the alpine region, often growing with No. 6829 [No. 72511], at altitudes between 10,000 and 12,000 feet. The leaves are at first woolly beneath, the thin wool eventually coming away and exposing the silvery surface. The flowers are in sheets of scarlet to carmine.

72453 to 72570—Continued.

72517. RHODODENDRON sp.

No. 6832. A creeping plant with scarlet flowers, forming fair-sized mats on rocks and steep talus slopes in very exposed situations, at an altitude of 11,000 feet.

72518. RHODODENDRON sp.

No. 6833. A bold tree 30 to 40 feet high, growing at altitudes between 10,000 and 11,000 feet in Abies forest, becoming more compact and smaller on open slopes. It is easily recognized by its irregularly angular branching and smooth shining tawny trunks, with peery bark hanging in tatters from the under surface when horizontal. The flowers are pink, with five purple pit glands at the base and beadlike strings of darker spots.

72519. RHODODENDRON sp.

No. 6834. A rather small thin sparingly branched shrub scattered on steep sheltered rocky faces in dense rhododendron scrub, at an altitude of 11,000 feet. The branches are virgate, the leaves smoke gray, and the bright rose-purple flowers are in nodding trusses.

72520. RHODODENDRON sp.

No. 6848. A small epiphytic undershrub growing at altitudes between 9,000 and 10,000 feet. The loose trusses contain three to five glistering pale-yellow flowers through which shines a delicate network of veins.

72521. RHODODENDRON sp.

No. 6854. A medium-sized bushy shrub growing in thickets on steep faces, on the sheltered side of the valley, at an altitude of 10,000 feet. The trunk is ascending and rarely erect. The flowers are in nodding trusses of about five, the light-orange corolla rimmed and streaked with brick red giving a general effect of tawny orange.

72522. RHODODENDRON sp.

No. 6855. A small tree with horizontal-ascending trunk, branching freely above and bearing large leaves at the ends of shoots which are shaggy with the persistent bud scales of several years. It grows at an altitude of 10,000 feet, only in the tanglewood of precipitous broken rock faces, where water drips continuously and everything is moss bound. The bright-red foliage bud scales are very striking when the leaves are breaking in June.

72523. RHODODENDRON sp.

No. 6856. A slim tree scattered here and there on steep forested slopes with No. 6818 [No. 72514], in half tanglewood and half Abies and rhododendron forests, at an altitude of 10,000 feet. The flowers, in large trusses, are pinkish purple splashed with dusky purple at the base.

72524. RHODODENDRON sp.

No. 6868. A stout tangled bush forming dense thickets on exposed alpine slopes from the upper limit of Abies forest upward, at altitudes between 11,000 and 12,000 feet. The leaves are rounded and glaucous, and the flowers are a delicate shade of sulphur, usually brick red in bud, ultimately retaining only a bright crimson-purple flash at the base.

72525. RHODODENDRON sp.

No. 6869. A shrub 3 to 5 feet high, with usually an ascending habit, growing in dense thickets on precipitous alpine slopes, at altitudes between 11,000 and 12,000 feet. The leaves are leathery and not glaucous, and the flowers, four to six in a truss, are pure white with five small crimson honey spots at the base. Sometimes the corolla is finely peppered with crimson or purple spots.

72453 to 72570—Continued.

72526. RHODODENDRON sp.

No. 6903. A small bushy undershrub, forming tufts on the steep scrub-clad slopes, at altitudes between 11,000 and 12,000 feet. The leaves are pale green above, and the flowers are bright purple with darker spots.

72527. RHODODENDRON sp.

No. 6923. *Cherry brandy*. A stout thick-set bush 8 to 10 feet high, growing at an altitude of 11,000 feet on the sheltered side of the valley, in thickets or on the edge of the Abies forest, but not inside where the Falconeri rhododendron is found. The buds are carmine, and the corolla is creamy white with a broad cherry-red band around the summit, including the lobes, and at the base there are five dusky purple pit glands. Sometimes the flowers are cherry red all through. There are six flowers in a truss.

72528. RHODODENDRON sp.

No. 6924. A small bushy undershrub 1 to 3 feet high, growing on steep sheltered slopes, in the general rhododendron scrub, at altitudes between 11,000 and 12,000 feet. The flowers are in loose corymbose trusses of six or eight, rather small, and plum purple with darker spots. They are very showy only when the sunlight shines through the flowers, when they glow a deep wine red.

72529. RHODODENDRON sp.

No. 6930. A bush 6 feet high growing in the dips of alpine turf slopes at altitudes between 12,000 and 13,000 feet. The flowers are bright sulphur yellow with a purple flash at the base. They are larger and darker than No. 6868 [No. 72524], and the leaves are not so rounded.

72530. RHODODENDRON sp.

No. 6953. A shrub 10 to 12 feet high, with an ascending trunk, forming thickets on steep sheltered slopes at an altitude of 12,000 feet. The flowers in large tight trusses are white or pink with a flash of crimson at the base.

72531. RHODODENDRON sp.

No. 6954. A small gnarled shrub with interlacing knobby branches, forming tanglements 2 or 3 feet deep on broken sheltered slopes at an altitude of 12,000 feet. The flowers are white with an extensive pattern of crimson spots on the upper half.

72532. RHODODENDRON sp.

No. 6955. *Scarlet letter*. A plant forming wide flat tanglements, not 2 feet deep, and paved with the rosetted leaves, on steep broken sheltered faces, at an altitude of 12,000 feet. The flowers, in large trusses, are of the most glowing scarlet.

72533. RHODODENDRON sp.

No. 6960. A twiggy undershrub, forming stout 1-foot brooms, growing socially or mixed with other species among gneiss bowlders on broken slopes, or on steep alpine moorland slopes, at altitudes between 12,000 and 13,000 feet. The leaves are a beautiful bronze below, with silver scales above, and the fragrant flowers are violet with purple styles.

72534. RHODODENDRON sp.

No. 6961. *Pink baby*. A minute tufted undershrub, about 3 inches high, carrying solitary or paired flowers of a delicate shell pink, hoisted above crowded leaves on long crimson stalks, and when in fruit, these exceed 2 inches. This plant is found on steep rather bare gravelly chutes, limestone or gneiss, at an altitude of 12,000 feet.

72453 to 72570—Continued.

72535. RHODODENDRON sp.

No. 6962. A stout gnarled scrubby bush 2 to 3 feet high, growing among gneiss boulders on broken slopes, at an altitude of 12,000 feet. The buds are purplish pink, changing to milk white, flushed purple without and splashed dark reddish purple at the base within. The leaves are not so rounded as No. 6868 [No. 72524]. This plant is one of the many species or varieties of this type found in the Seinghku Valley.

72536. RHODODENDRON sp.

No. 6967. A dwarf twiggy undershrub, not rising more than 6 or 8 inches above the general level of the carpet into which it is woven, on precipitous broken slopes, at an altitude of 13,000 feet. The leaf indumentum is orange, and the few rather large flowers are white with a touch of pink.

72537. RHODODENDRON sp.

No. 6984. *Limestone rose*. A beautiful plant found only on limestone rubble slopes and rocks where in sheltered situations it may form tufts 6 inches high, at an altitude of 13,000 feet. The bright rosy purple flowers appear about a month later than No. 6903 [No. 72526], from which this plant differs in many technical points, besides the obvious ones of habit and flower color.

72538. RHODODENDRON sp.

No. 6991. A scrub plant forming extensive colonies on the steep rubbly flank of the sheltered slope, not extending far up the face, at an altitude of 13,000 feet. The leaf has a layer of chocolate-colored hairs on a closely woven silver warp and the flowers are blood red.

72539. RHODODENDRON sp.

No. 7012. An early-flowering specimen from a sheltered steep earth bank, at an altitude of 11,000 feet. The rich magenta-purple flowers are considerably larger than those of No. 6903 [No. 72526]. The back of the corolla is paved with broad bands of shining scales.

72540. RHODODENDRON sp.

No. 7038. A compact dwarfed shrub, not exceeding a foot in height, scattered among scrub on steep granite slabs and cliffs, fully exposed, at an altitude of 12,000 feet. The flowers are cream or salmon pink, without any of the bluish tinge seen in No. 6924 [No. 72528].

72541. RHODODENDRON sp.

No. 7046. A yellow-flowered species with foliage waxy beneath and pleasantly aromatic, growing at an altitude of 10,500 feet.

72542. RHODODENDRON sp.

No. 7048. A small bush 1 to 2 feet high, but smaller in exposed situations, found at an altitude of 12,000 feet. It grows on turf slopes, high alpine moorland, and among boulders on broken scrub-clad slopes. The leaves are covered above with silvery-gray scales and below with reddish brown scales. The flowers are very dark purple magenta. This is a late-flowering species characterized by its crisp grayish mat foliage and dusky flowers. It looks best in the sunshine.

72543. RHODODENDRON sp.

No. 7048. A small fastigiate undershrub, growing in colonies on open moorland slopes at an altitude of 14,000 feet. The leaves are very small and the flowers are purple.

72453 to 72570—Continued.

72544. RHODODENDRON sp.

No. 7062. A bushy undershrub 12 to 18 inches high, growing in the hollows among boulders on broken rock-strewn slopes at an altitude of 12,000 feet.

Numbers 72545 to 72561 are from the Dichu Valley.

72545. RHODODENDRON sp.

No. 7108. A plant forming a small tight bush on open slopes and a shrub 8 to 10 feet high in the forest. The abundant flowers are white or flushed pink with a large purplish crimson blotch over most of the upper half. The leaves are strongly aromatic.

72546. RHODODENDRON sp.

No. 7121. A loose shrub 6 feet high, forming thickets in fairly open places on the edge of the forest, at an altitude of 10,000 feet.

72547. RHODODENDRON sp.

No. 7122. A small gnarled tree 20 to 25 feet high, growing scattered in mixed forests at an altitude of 10,000 feet. The leaves are long and narrow.

72548. RHODODENDRON sp.

No. 7123. A large shrub 12 to 15 feet high, growing in mixed forest on bowlder slopes and in thickets of *Larix* and *rhododendron*, at an altitude of 10,000 feet. It sometimes forms a small gnarled tree 20 feet high on the granite cliffs, at altitudes between 11,000 and 12,000 feet.

72549. RHODODENDRON sp.

No. 7124. A spreading tangled shrub, or sometimes a small tree, scattered in mixed forest with No. 7122 [No. 72547], at altitudes between 9,000 and 10,000 feet.

72550. RHODODENDRON sp.

No. 7125. A tree 40 to 50 feet high, with a smooth polished reddish purple trunk and large shiny leaves, with bright-red petiole and midrib. It flowers as a comparatively small bush and is found at an altitude of 10,000 feet.

72551. RHODODENDRON sp.

No. 7136. A spreading bushy shrub, growing socially in thickets or on boulders in the river bed, preferring shade, at altitudes between 8,000 and 9,000 feet. The pure white flowers with orange-red anthers are fragrant and in trusses of four to six.

72552. RHODODENDRON sp.

No. 7137. An undershrub growing in massive tangles on large boulders with No. 7136 [No. 72551], at altitudes between 8,000 and 10,000 feet.

72553. RHODODENDRON sp.

No. 7138. A small wiry shrub growing in thickets on the edge of the mixed forest, but keeping in the open, at altitudes between 8,000 and 9,000 feet.

72554. RHODODENDRON sp.

No. 7139. A tall slender loosely knit shrub growing with No. 7136 [No. 72551], on a huge granite bowlder in the river bed, at altitudes between 8,000 and 9,000 feet.

72555. RHODODENDRON sp.

No. 7140. A medium-sized tree scattered in mixed forest among *rhododendron*, *Pinus*, *Quercus*, etc., at altitudes between 7,000 and 8,000 feet. The very small flowers are cherry red with darker spots.

72453 to 72570—Continued.

72556. RHODODENDRON sp.

No. 7171. A low-growing shrub with ascending branches forming sprawling tangles in rather swampy ground in well-shaded thickets, at altitudes between 8,000 and 9,000 feet.

72557. RHODODENDRON sp.

No. 7184. A small compact bushy shrub, sometimes 4 or 5 feet high, but more often less than 2 feet, scattered on the sunniest slope of steep granite scree, at an altitude of 11,000 feet. The quite tiny plants have been a mass of flowers which were borne very freely in trusses of four to seven. This species is quite distinct from No. 7123 [No. 72548], but may be seen growing within a few feet of it, the latter in the shelter of the Abies and Larix forests, the former in the open.

72558. RHODODENDRON sp.

No. 7188. A small compact bushy under-shrub 1 to 2 feet high in open places, but taller and lankier in the Abies forest, found at altitudes between 10,000 and 11,000 feet. The flowers are plum purple or inclining to crimson on the one hand and to violet on the other.

72559. RHODODENDRON sp.

No. 7189. A bush 4 to 6 feet high, forming dense thickets on steep rocky slopes, at altitudes between 10,000 and 11,000 feet. In the Abies forest it forms much of the underbrush, growing very rank.

72560. RHODODENDRON sp.

No. 7190. A shrub 5 feet high, growing at altitudes between 10,000 and 11,000 feet. It was growing on a steep boulder scree among thickets of Nos. 7184, 7189, and 7108 [Nos. 72557, 72559, and 72545]. It has the fruits of No. 7184 [No. 72557], but the foliage is more like No. 7189 [No. 72559]. This may be a hybrid.

72561. RHODODENDRON sp.

No. 7196. A large shrub, growing socially in the uppermost Abies forest. The flowers are snow white with a touch of purple at the base. This species has not the hairy petioles of No. 7189 [No. 72559].

Numbers 72562 to 72564 are from the Seinghku Valley.

72562. RHODODENDRON sp.

No. 7427. A slim solitary tree about 30 feet high, growing on the ridge in the midst of the rhododendron forest, at an altitude of 6,000 feet. The leaves, 12 inches long and 6 inches wide, hang down and the truss is many-flowered.

72563. RHODODENDRON sp.

No. 7455. A bushy shrub, growing on an alder tree in the river bed, at an altitude of 7,000 feet. It is usually epiphytic and invisible in the forest. The bright-yellow flowers are borne freely in trusses of four to six.

72564. RHODODENDRON sp.

No. 7625. A small tree scattered in the forest on a rocky precipitous ridge, with *Pinus longifolia*, rhododendron, etc., at altitudes between 7,000 and 8,000 feet.

72565. RHODODENDRON sp.

No. 7642. Dichu Valley. A small or medium-sized tree between 30 and 40 feet high, growing at an altitude of 8,000 feet. The young foliage is very long and narrow, and when matured it is dull dark green above, with conspicuous yellow midrib and primary veins, and the under surface is silver bronze. The fruits, about 16 in number, are in a long

72453 to 72570—Continued.

lax truss, covered with bright tawny orange hairs. This species is quite distinct from the large-leaved species No. 6782 [No. 72506], or from Nos. 6753 and 6792 [Nos. 72505 and 72507].

72566. ROSA sp.

No. 7501. A single bush found in the uppermost rhododendron forest. The pendent solitary glabrous fruits are bright reddish orange.

72567. VACCINIUM sp. Vacciniaceae.

No. 6845 (?).

72568. VACCINIUM sp. Vacciniaceae.

No. 6849 (?).

72569. VACCINIUM sp. Vacciniaceae.

No. 7602 (?).

72570. VERONICA sp. Scrophulariaceae.

No. 7008. A plant 3 to 4 inches high, growing on exposed earth banks. The nodding flowers are blue.

72571 to 72582.

From Leningrad, Russia. Seeds presented by A. Kol, chief, bureau of introduction, Institute of Applied Botany. Received February 9, 1927.

72571. AMELANCHIER sp. Malaceae.

No. 35341. Sovietsk, Viatka Government. A hardy Russian shrub with abundant small juicy fruits.

72572. BERBERIS sp. Berberidaceae. Barberry.

No. 35343. Sovietsk, Viatka Government. A hardy form grown for its berries.

72573. HIPPOPHAE RHAMNOIDES L. Elaeagnaceae. Sea buckthorn.

No. 35251. A deciduous spiny shrub, with small yellow flowers and acid orange berries which are used in Russia to make beverages and jellies.

For previous introduction see No. 36743.

72574 to 72578. PRUNUS spp. Amygdalaceae.

72574. PRUNUS BESSEYI Bailey. Bessey cherry.

No. 35350. Tulun Experiment Station, Irkutsk Government. A locally grown hardy strain with relatively sweet-flavored fruits.

For previous introduction see No. 49483.

72575 and 72576. PRUNUS SALICINA Lindl. Japanese plum.

Sovietsk, Viatka Government. Cultivated locally since 1916.

72575. No. 35344. Prolific yellow plum.

72576. No. 35345. Prolific red plum.

72577. PRUNUS SPINOSA L. Sloe.

No. 35359. Transcaucasia. A low-spreading thorny tree with small, deep-blue, edible fruits. A selection from wild trees.

For previous introduction see No. 43310.

72578. PRUNUS sp. Plum.

No. 35347. Voronezh Government. A large juicy sweet-flavored plum. The tree thrives without special care and bears annually.

72579 to 72581. RIBES spp. Grossulariaceae.

72579. RIBES AUREUM Pursh. Golden currant.

No. 35342. Sovietsk, Viatka Government. A strong grower and medium yielder. The fruits, about 240 to the pound, are of large size.

72571 to 72582—Continued.

72580. *RIBES DIACANTHA* Pall.

No. 35355. Trans-Baikal. A wild shrub by Siberian gooseberry, about 5 feet high, with scarlet fruits.

For previous introduction see No. 64794.

72581. *RIBES DIKUSCHA* Fisch.

No. 35349. Tulun Experiment Station, Irkutsk Government. A native Russian plant closely related to the common black currant; the fruits are used to make beverages.

For previous introduction see No. 42318.

72582. *RUBUS* sp. Rosaceae. Dewberry.

No. 35346. Sovietsk, Viatka Government. A plant cultivated locally under the name "Chinese dewberry." It is an annual bearer and productive, but the young shoots are often frosted in northern Russia.

72583 to 72589.

From Kharkof, Ukraine, Russia. Seeds presented by the All-Ukrainian Seed-Producing Association, through J. W. Pincus, Amtorg Trading Corporation, New York, N. Y. Received February, 1927.

72583. *ANETHUM GRAVEOLENS* L. Apiaceae. Dill.

A Russian garden variety.

For previous introduction see No. 64340.

72584. *CITRULLUS VULGARIS* Schrad. Cucurbitaceae. Watermelon.

Piatigorsk (favorite). A variety grown in Russia.

72585 to 72587. *CUCUMIS SATIVUS* L. Cucurbitaceae. Cucumber.

Russian varieties.

72585. *Viaznikovski*.72586. *Nejinski*.72587. *Zelenka* (green).72588. *CUCURBITA PEPO* L. Cucurbitaceae. Pumpkin.

A Greek variety grown in Russia.

72589. *TRIFOLIUM PRATENSE* L. Fabaceae. Red clover.

Russian-grown seeds.

72590 to 72592.

From Buitenzorg, Java. Seeds presented by Dr. W. M. Docters van Leeuwen, director, botanic garden. Received February 1, 1927.

72590. *CARYOTA RUMPHIANA* Mart. Phoenixaceae. Palm.

An East Indian palm about the size of the coconut palm, with a smooth trunk and graceful bipinnate leaves composed of segments with truncate jagged tips. From the central pith of the bark is prepared a sago which is eaten in the East Indies in times of scarcity.

For previous introduction see No. 51710.

72591. *CASSIA LESCHENAUZIANA* DC.

A low diffuse perennial with slender branches and finely divided leaves.

72592. *CASSIA PATELLARIA* DC.

A low tropical herbaceous perennial with yellow flowers. Native to the East Indies.

For previous introduction see No. 46243.

72593. *CASSIA PODOCARPA* Guill. and Perr. Caesalpinaceae.

From Sierra Leone, West Africa. Seeds obtained by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received March 12, 1927.

No. 1134. Near Freetown. January 24, 1927. A small shrubby tropical tree, 15 feet in height, bearing yellow flowers, produced in racemes.

72594 to 72609.

From Buitenzorg, Java. Seeds presented by Dr. W. M. Docters van Leeuwen, director, botanic garden. Received February 1, 1927.

72594. *CROTALARIA VALETonii* Backer. Fabaceae.

An East Indian plant described by C. A. Backer (Bulletin du Jardin Botanique, Buitenzorg, vol. 2, p. 324) as an erect densely branched herb, 1 to 4 feet high, with simple, hairy leaves and yellow flowers in terminal, 5-flowered to 12-flowered racemes.

For previous introduction see No. 65299.

72595. *CURCULIGO CAPITULATA* (Lour.) Kuntze (*C. recurvata* Ait.). Amaryllidaceae.

A slender bulbous plant about 2 feet high, with gracefully arching leaves and drooping yellow flowers; prefers shady places. Native to tropical Asia.

For previous introduction see No. 67691.

72596. *FICUS RIGIDA* Miquel. Moraceae.

An epiphytic woody plant, with narrow leathery leaves about 6 inches long. Native to the East Indies.

72597. *GNETUM INDICUM* (Lour.) Merr. (*G. funiculare* Blume.). Gnetaceae.

A native woody vine with brick-red fruits in bunches like grapes, each containing a nut which, when roasted, tastes like a chestnut. The nuts should not be eaten raw. (Note by P. J. Wester under No. 49779.)

72598. *LIVISTONA ALTISSIMA* Zoll. Phoenixaceae. Palm.

A graceful East Indian palm, up to 80 feet high, with fan-shaped leaves. The hardwood is valued by the natives for construction work.

For previous introduction see No. 46861.

72599. *LIVISTONA ROTUNDIFOLIA* (Lam.) Mart. Phoenixaceae. Palm.

An erect pinnate-leaved palm, native to tropical Asia, about the same size as the coconut palm. The hard, durable wood is used for general construction.

72600. *MARTINEZIA EROSA* Linden. Phoenixaceae. Palm.

A small ornamental feather-leaved palm from tropical America which is covered throughout with long, needlelike spines. A related species (*Martinezia caryotaefolia*) is grown to some extent in lower Florida.

For previous introduction see No. 61313.

72601. *ONCOSPERMA FILAMENTOSUM* Blume. Phoenixaceae. Palm.

The *nibung* palm of Java. A cluster palm of great beauty which rises to a height of 50 feet and waves its pinnate leaves in the slightest breeze. Like its relative, *Oncosperma fasciculatum*, it is a spiny palm and therefore not suited to small garden uses but to parks. The great clusters of this palm are wonderfully effective. (Note by Messrs. Fairchild and Dorsett under No. 66251)

72594 to 72609—Continued.

72602 to 72608. *PANDANUS* spp. Pandanaceae.72602. *PANDANUS AFFINIS* Kurz.

A tropical evergreen tree of possible value as an ornamental. Native to Ceylon.

72603. *PANDANUS FURCATUS* Roxb.

One of the most ornamental of the screw pines, which attains a height of about 5 meters, with dark green, linear spiny leaves 3 or more meters long, gracefully arching and somewhat spirally arranged. The whitish gray inflorescence emits a very agreeable odor. Native to the East Indies.

For previous introduction see No. 51728.

72604. *PANDANUS LABYRINTHICUS* Kurz.

An erect-spreading tropical shrub 15 feet high, with slender warty trunks. The linear leathery leaves are 4 to 6 feet long.

For previous introduction see No. 51729.

72605. *PANDANUS PARVUS* Ridley.

A low slender screw pine, about 3 feet high, with linear-oblong, thin leaves and very small spines. Native to the East Indies.

72606. *PANDANUS POLYCEPHALUS* Lam.

An East Indian screw pine with leaves 3 feet long. The natives of Java eat the young leaves and flower buds as a vegetable.

For previous introduction see No. 51730.

72607. *PANDANUS TECTORIUS* Parkins.

A tropical Asiatic "screw pine," 15 feet high, with light-green leaves 3 to 5 feet long. The staminate flowers yield a perfume.

For previous introduction see No. 57730.

72608. *PANDANUS VANDERMEESCHII* Balf. f.

A screw pine from the island of Mauritius, up to 20 feet high with lateral branches 8 feet long. The leaves are stiff, suberect, and 2 feet long.

For previous introduction see No. 51732.

72609. *VERSCHAFFELTIA SPLENDIDA* Wendl. Palm.

A tall spiny palm up to 80 feet in height with terminal, bifid leaves 5 to 8 feet long. Native to the Seychelles Islands.

For previous introduction see No. 39342.

72610 to 72613. *LILIUM* spp. Liliaceae. Lily.

From London, England. Seeds purchased from Watkins & Simpson. Received February 12, 1927.

72610. *LILIUM GIGANTEUM* Wall. Giant lily.

A Himalayan lily with stems 6 to 9 feet high and large fragrant white flowers, 12 to a raceme.

For previous introduction see No. 66469.

72611. *LILIUM MONADELPHUM* Bieb. Great Caucasian lily.

Variety *szovitzianum*. A stout-stemmed lily, 3 to 6 feet high, with 30 to 40 horizontal leaves about 3 inches long and 1 to 30 rich golden-yellow flowers.

72612. *LILIUM PHILIPPINENSE* Baker.

Benguet lily

Variety *formosanum*. A rather tender white-flowered lily, native to tropical Asia, with stems 1 to 2 feet high and 30 to 40 horizontal leaves about 4 inches long.

72610 to 72613—Continued.

72613. *LILIUM* sp.

A lily, about 6 feet high, which is the result of crosses made by the late Mrs. Backhouse between various forms of *Lilium martagon* and *L. hansonii*. The star-shaped perianth is somewhat reflexed and appears in such colors as rosy pink with marbled interior, straw yellow with crimson spots, orange-yellow spotted purple, and pinkish buff with dark spots. It is one of the very finest hybrids yet raised. (Watkins & Simpson Catalogue.)

72614. *PRUNUS* sp. Amygdalaceae. Plum.

From near Haitzu, Chihli Province, China. Scions collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received January, 1927.

For previous introduction and description see No. 72140.

72615. *FICUS CARICA* L. Moraceae. Fig.

From Beirut, Syria. Plants obtained from A. E. Day, Beirut, through W. T. Swingle, Bureau of Plant Industry. Received February 13, 1927.

Teen kazzi. A Syrian variety.

72616. *JUNIPERUS CEDRUS* Webb. Pinaceae.

From Orotava, Teneriffe, Canary Islands. Seeds collected by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received February 9, 1927.

No. 932. December 23, 1926. A subtropical tree about 12 feet high, with crowded bluish green leaves one-fourth to one-half inch long. The branches have a beautiful drooping habit, making it an attractive tree for large gardens and parks. Native to the Canary Islands.

For previous introduction see No. 57080.

72617 to 72620. *CHAYOTA EDULIS* Jacq. (*Sechium edule* Swartz). Cucurbitaceae. Chayote.

From the city of Guatemala, Guatemala. Fruits presented by Wilson Popenoe, superintendent of agricultural experiments, United Fruit Co., Tela, Honduras. Received February 16, 1927.

Locally grown seeds.

72617. Large green fruits.

72618. Light green fruits.

72619. The smooth white fruits are small and tinged with green.

72620. Small prickly white fruits.

72621. *STURTIA GOSSYPIOIDES* R. Br. Malvaceae.

From Sydney, New South Wales. Seeds presented by G. P. Darnell-Smith, director, botanic gardens. Received February 15, 1927.

A large Australian shrub, with broadly oval stiff leaves up to 2 inches long and large purple flowers. It is closely related to cotton (*Gossypium* spp.).

72622. *CITRUS* sp. Rutaceae.

From Vancouver, British Columbia, Canada. Seeds presented by F. R. Stewart & Co., through L. Mayer & Co., Portland, Ore. Received February 24, 1927.

A marmalade orange originally from Japan.

72623. VIOLA MIRABILIS L. Violaceae.
Violet.

From Seattle, Wash. Plants presented by G. E. Kastengren, Sanborn May Co. Received February 24, 1927.

A hardy violet, native to northern Europe, which becomes about 3 inches high, producing pale-blue flowers in midsummer.

72624. CITRUS GRANDIS (L.) Osbeck
(C. decumana Murr.). Rutaceae.
Grapefruit.

From China. Bud wood collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received February 23, 1927.

No. 980. From a tree growing in the China Inland Mission compound, Kanchow, Kiangsi Province. December 15, 1926.

Youtsz. A southern Chinese variety producing seedless fruits of good size and surpassing flavor.

72625. CHAYOTA EDULIS Jacq. (Sechium
edule Swartz). Cucurbitaceae.
Chayote.

From Cordoba, Vera Cruz, Mexico. Fruits presented by C. M. Holmes. Received February 21, 1927.

Locally grown seeds.

72626 to 72628. CAJANUS INDICUS
Spreng. Fabaceae. Pigeon pea.

From Santiago de las Vegas, Cuba. Seeds presented by Dr. Gonzalo M. Fortun, Director, Estación Experimental Agronómica. Received March 15, 1927.

Locally grown seeds.

72626. No. 1.

72628. No. 3.

72627. No. 2.

72629 and 72630. CAJANUS INDICUS
Spreng. Fabaceae. Pigeon pea.

From Samaru, Zaria, Northern Provinces, Nigeria. Seeds presented by the superintendent, Nigerian Department of Agriculture. Received February 11, 1927.

Locally grown seeds.

72629. No. 1.

72630. No. 2.

72631. CAJANUS INDICUS Spreng. Fa-
baceae. Pigeon pea.

From Gambia, British West Africa. Seeds presented by Archibald J. Brooks, Director, Department of Agriculture. Received February 11, 1927.

Locally grown seeds.

72632 to 72634.

From Brignoles, France. Seeds presented by René Salgues, Director, Brignoles Botanic Station. Received February 9, 1927.

72632. ERODIUM CICONIUM (Juss.) Willd. Ger-
aniaceae. Heronbill.

An annual hairy plant, belonging to the Geranium family, with stout ascending branches, oval leaves, and purple flowers. Native to southern Europe and Asia Minor.

For previous introduction see No. 63984.

72633. PISTACIA CHINENSIS Bunge. Anacardi-
aceae. Chinese pistache.

A fairly rapid-growing tree native to central China. The wood is durable and much used for furniture and agricultural implements. The young shoots are edible, and the seeds furnish an illuminating oil.

For previous introduction see No. 47362.

72632 to 72634—Continued.**72634. RHUS CORIARIA L. Anacardiaceae.**

A shrub up to 20 feet high, native to southern Europe, with greenish flowers and small crimson fruits. The leaves yield a commercial tannin.

For previous introduction see No. 58462.

72635. STIZOLOBIUM ATERRIMUM Piper
and Tracy. Fabaceae.
Mauritius bean.

From Sydney, New South Wales. Seeds obtained from Arthur Yates & Co., through A. J. Pieters, Bureau of Plant Industry. Received February 15, 1927.

A tropical leguminous annual used as a cover plant in sugar-cane districts.

72636. CAJANUS INDICUS Spreng. Fa-
baceae. Pigeon pea.

From Cienfuegos, Cuba. Seeds presented by Robert M. Grey, Harvard Botanic Station. Received February 16, 1927.

An especially productive type which is better than the native variety commonly cultivated here. (Grey.)

72637 to 72651.

From St. Jean le Blanc, Orleans, Loiret, France. Plants obtained from Edmond Versin. Received February 23, 1927.

72637 to 72641. CORYLUS spp. Betulaceae.**72637. CORYLUS CHINENSIS Franch.**

Hazel.
Chinese hazel.

The Chinese hazel is closely allied to the tree hazel (*Corylus colurna*), differing in leaf and stem characters. It becomes a tall tree with heart-shaped leaves about 7 inches long. The nuts are borne in clusters of four to six. Native to western China.

For previous introduction see No. 63680.

72638. CORYLUS DAVIANA Hort.

A hardy shrub with nuts which may be edible.

72639 and 72640. CORYLUS MAXIMA Mill.

For previous introduction see No. 49196.

72639. A large shrub or small tree with rounded leaves and large oblong nuts. Native to southern Europe.

72640. Variety *atropurpurea*. A variety with deep purplish foliage.

72641. CORYLUS SIEBOLDIANA MANDSHURICA
(Maxim.) C. Schneid.

A Manchurian shrub, up to 15 feet high, with oblong or elliptic leaves and clusters of small edible nuts.

For previous introduction see No. 65520.

72642. LABURNUM ANAGYROIDES Medic. Fa-
baceae. Golden chain.

Variety *involutum*. A variety of the commonly grown yellow-flowered shrub.

72643. LONICERA KOROLEVICH Stapf. Caprifol-
iaceae. Blue-leaf honeysuckle.

A hardy ornamental shrub, 12 feet in height, of graceful habit, with a profusion of pink flowers, succeeded by red fruits. Native of Turkestan.

72644. MICROGLOSSA ALBESCENS (DC.) Benth.
Asteraceae.

An erect, slender shrub with narrow, sharp-pointed leaves and heads of light-lilac flowers. Native to the temperate Himalayas.

For previous introduction see No. 47733.

72637 to 72651—Continued.

72645. *PAULOWNIA SPECIOSA* Hort. Scrophulariaceae.

An ornamental purple-flowered tree.

72646 to 72651. *RUBUS* spp. Rosaceae.

Raspberry.

72646. *RUBUS* sp.

Heytor.

72647. *RUBUS* sp.

Merveille de 4 Saisons.

72648. *RUBUS* sp.

Norwick Wonder.

72649. *RUBUS* sp.

Superlative perpetuelle.

72650. *RUBUS* sp.

Surprise d'automne.

72651. *RUBUS* sp.

Yellow superlative.

72652. CHAYOTA EDULIS Jacq. (*Sechium edule* Swartz). Cucurbitaceae.

Chayote.

From Santiago de las Vegas, Cuba. Fruits presented by Dr. Gonzalo M. Fortun, Director, Estación Experimental Agronómica. Received February 16, 1927.

Locally grown seeds.

72653 to 72661. DIOSPYROS KAKI L. f. Diospyraceae. Kaki.

From Yokohama, Japan. Plants obtained from the Yokohama Nursery Co. Received February 24, 1927.

A collection of selected oriental persimmon varieties, collected near Seoul, Chosen, in the vicinity of Peking, China, and near Pingting, Shansi, China.

72653. No. 1.

72658. No. 6.

72654. No. 2.

72659. No. 8.

72655. No. 3.

72660. No. 9.

72656. No. 4.

72661. No. 10.

72657. No. 5.

72662 and 72663. DIOSPYROS KAKI L. f. Diospyraceae. Kaki.

From Yokohama, Japan. Plants obtained from the Yokohama Nursery Co., through W. T. Swingle, Bureau of Plant Industry. Received February 25, 1927.

72662. *Fuyu* (Densuke's stock).

72663. *Fuyu* (Aoso stock).

72664 and 72665. CASTANEA spp. Fagaceae.

From Yokohama, Japan. Seeds obtained from the Yokohama Nursery Co., through G. F. Gravatt, Bureau of Plant Industry. Received February 16, 1927.

72664. *CASTANEA CRENATA* Sieb. and Zucc.

A Japanese shrub or small tree, up to 10 meters high, with crenate-serrate oblong-elliptic leaves 8 to 16 centimeters long and involucre containing usually two or three nuts about 3 centimeters across.

72665. *CASTANEA KORINENSIS* Hort.

A hardy chestnut native to Chosen.

72666. DIOSPYROS KAKI L. f. Diospyraceae. Kaki.

From Nanking, China. Seeds purchased from Prof. J. H. Reisner, College of Agriculture and Forestry, University of Nanking. Received February 24, 1927.

Chinese-grown seeds.

72667 to 72671.

From Vancouver, British Columbia, Canada. Seeds presented by Prof. John Davidson, department of botany, University of British Columbia. Received February 21, 1927.

72667. *BERBERIS AQUIFOLIUM* Pursh. Berberidaceae. **Oregon hollygrape.**

A spiny evergreen shrub about 4 feet high; the dark-green leaves become purplish in autumn. The bright-yellow flowers appear in the spring and are succeeded by racemes of bluish black fruits. Native to northwestern North America.

For previous introduction see No. 62701.

72668. *BERBERIS NERVOSA* Pursh. Berberidaceae. **Longleaf hollygrape.**

A dwarf shrubby barberry, by some authorities referred to Mahonia; it is native to western North America. The leafstalks are up to 4 inches long, and the pale-green spiny toothed narrow leaflets are 1 to 3 inches in length. The oblong berries are blue.

For previous introduction see No. 65233.

72669. *IRIS MISSOURIENSIS* Nutt. Iridaceae. **Rocky Mountain iris.**

A native American iris distributed in wet soil from South Dakota to Arizona. It is up to 3 feet high, with pale-green leaves. The limbs of the flower are bright lilac, with the outer segments yellow near the claw.

72670. *LIGUSTRUM* sp. Oleaceae. **Privet.**

An ornamental shrub with handsome foliage and small white flowers.

72671. *RHODODENDRON CALIFORNICUM* Hook. Ericaceae. **Coast rhododendron.**

An evergreen shrub, native to the Pacific coast of North America. The numerous rosy purple flowers, about 5 centimeters across, are spotted red-brown.

72672. CAJANUS INDICUS Spreng. Fabaceae. Pigeon pea.

From Peradeniya, Ceylon. Seeds presented by F. A. Stockdale, Director of Agriculture. Received February 21, 1927.

The usual type grown in Ceylon.

72673 and 72674. CAJANUS INDICUS Spreng. Fabaceae. Pigeon pea.

From St. Kitts-Nevis, British West Indies. Seeds presented by R. E. Kelsick, agricultural superintendent. Received February 23, 1927.

Locally grown varieties.

72673. No. 1.

72674. No. 2.

72675 and 72676. CAJANUS INDICUS Spreng. Fabaceae. Pigeon pea.

From Mayaguez, Porto Rico. Seeds presented by T. B. McClelland, horticulturist, Porto Rico Agricultural Experiment Station. Received February 23, 1927.

72675. No. 1. A local strain of the smallest seeded type.

72676. No. 2. Reported to be "todo el año," or everbearing.

72677. CAJANUS INDICUS Spreng. Fabaceae. Pigeon pea.

From Freetown, Sierra Leone, Africa. Seeds presented by M. T. Dawe, Commissioner of Lands and Forests. Received February 26, 1927.

Locally grown seeds.

72678. STIZOLOBIUM ATERRIMUM Piper and Tracy. Fabaceae.

Mauritius bean.

From Barreiros, Pernambuco, Brazil. Seeds presented by Dr. A. Menezes Sobrinho, Director, Barreiros Experiment Station. Received February 26, 1927.

A tropical leguminous annual used as a cover plant in sugar-cane districts.

72679 to 72689. SOJA MAX (L.) Piper (Glycine hispida Maxim.). Fabaceae. Soy bean.

From Ranchi, Bihar and Orissa, India. Seeds presented by the deputy director of agriculture. Received February 26, 1927.

Locally grown varieties.

72679. *Assam* × *Bermelli*.

72680. *Bermelli*.

72681. No. 1. *Biloxi* × *Bermelli* No. 2.

72682. No. 2. *Biloxi* × *Bermelli* No. 9.

72683. *Black Early* × *Bermelli* No. 5. Type 1.

72684. *Black Early* × *Bermelli* No. 4.

72685. *Black Early* × *Bermelli* No. 5.

72686. *Black Early* × *Bermelli* No. 9. Type 2.

72687. *Black Mottled Java*.

72688. *Burma* No. 1.

72689. *Mixed Kanke Giant*.

72690. CAJANUS INDICUS Spreng. Fabaceae. Pigeon pea.

From Indore, India. Seeds presented by A. Horard, director, Institute of Plant Industry. Received February 26, 1927.

A small-seeded variety which is grown in Malwa, India.

72691. TRIFOLIUM SQUARROSUM L. Fabaceae. Clover.

From San Remo, Italy. Seeds presented by Dr. Mario Calvino. Received February 26, 1927.

An upright or ascending, robust annual, with branches up to 30 inches in length; native to the Mediterranean countries. The pink or white flower heads are oval when young, becoming more elongated later.

For previous introduction see No. 67170.

72692 and 72693. NICOTIANA spp. Solanaceae.

From Tabor, Czechoslovakia. Seeds presented by Dr. Adolf Kutin, director, botanic garden. Received February 26, 1927.

72692. *NICOTIANA CHINENSIS* Fisch.

An annual relative of tobacco (*Nicotiana tabacum*), which grows to a height of 6 feet, with pink flowers. Native to China.

For previous introduction see No. 42335.

72693. *NICOTIANA RUSTICA* L. **Aztec tobacco.**

Locally grown seeds.

72694. EREMOCITRUS GLAUCA (Lindl.) Swingle (Atalantia glauca Benth.). Rutaceae.

Australian desert kumquat.

From Dundas, New South Wales. Seeds presented by Herbert J. Rumsey. Received February 25, 1927.

A shrub or small tree about 14 feet high, native to the deserts of northeastern Australia. The small thick leathery leaves are gray-green, and the fruits are about half an inch in diameter. The acid juice of the fruit forms the basis of an agreeable beverage, and the peel has the sweetish flavor of the kumquat. It is the hardiest of all the evergreen citrus fruits and is of promise to plant breeders.

For previous introduction see No. 69875.

72695 to 72709.

From the Canary Islands, West Africa, and Spain. Seeds collected by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received February and March, 1927.

72695. *ANNONA CHERIMOLA* Mill. **Annonaceae. Cherimoya.**

Botanic Gardens, Orotava, Teneriffe, Canary Islands. December 23, 1926. A large, fine-fruited variety.

72696. *CNESTIS FERRUGINEA* DC. **Connaraceae.**

No. 997. Near Konakry, French Guinea, West Africa. January 16, 1927. A very ornamental shrub, 8 to 12 feet high, with handsome glossy green leaves and soft plushlike scarlet fruits. These fruits appear during the Christmas season in West Africa, where they are used for decorative purposes.

72697. *CUCUMIS MELO* L. **Cucurbitaceae. Melon.**

From Gibraltar, Spain. A sweet winter melon obtained in the market.

72698 to 72701. *ELAEIS GUINEENSIS* Jacq. **Phoenicaceae. African oil palm.**

72698. No. 1106. From Konakry, French Guinea, West Africa. January 15, 1927. Seeds from a selected variety which is supposed to be rich in oil and particularly valuable.

72699. No. 1109. From Sierra Leone, West Africa. January 22, 1927. "Nigerian thin-shelled" variety which is a selection from the ordinary "Nigerian" made by the agricultural experiment station, Jala.

72700. No. 1110. From Sierra Leone, West Africa. January 22, 1927. A medium-shelled strain of the "Nigerian thin-shelled" variety made by the agricultural experiment station, Jala.

72701. No. 1111. From Sierra Leone, West Africa. A thick-shelled strain of the "Nigerian thin-shelled" African oil palm selected at the agricultural experiment station, Jala.

72702 to 72705. *SORGHUM VULGARE* Pers. **Poaceae. Sorghum.**

72702. No. 967. Bank of the Gambia River, Gambia, West Africa. January 10, 1927. There are seven months of drought and about 40 inches of rainfall in this region. The soil is a stiff clay containing some laterite.

72703. No. 968. Georgetown, McCarthy Island, Gambia, West Africa. January 10, 1927. *Kinto wollen*, the cultivated sorghum of the Gambia region.

72695 to 72709—Continued.

72704. No. 969. Georgetown, McCarthy Island, Gambia, West Africa. January 10, 1927. A sorghum with very dark seeds which is known as *Bassey ba kinto*. It is grown on clay soils and is very drought resistant.

72705. No. 970. Georgetown, McCarthy Island, Gambia, West Africa. January 10, 1927. A white-seeded sorghum known as *Bassey kayo*.

72706. *PANICUM* sp. Poaceae. **Grass.**

No. 954. Near Sankuli Kunda, Gambia, West Africa. January 9, 1927. A tall species growing on dried rice fields, forming a perfect stand. The clay soil in these fields has cracked open, showing its character.

72707. *RAPHIA* sp. Phoenicaceae. **Palm.**

No. 1108. Collected near the waterworks at Abuko, near Cape St. May, Gambia, West Africa. January 10, 1927. A stunning West African wine palm which grows on the banks of the Gambia River, forming immense clumps.

72708. *SESAMUM RADIATUM* Schum. Pedaliaceae.

No. 1105. Between Konakry and Fore Cariat, French Guinea, West Africa. January 16, 1927. An erect-growing, oil-producing species.

72709. *SPONDIAS MOMBIN* L. Anacardiaceae. **Yellow mombin.**

No. 966. Georgetown, McCarthy Island, Gambia, West Africa. January 10, 1927. A variety known as the "mombin plum," which is subjected to seven months' drought in this region.

For previous introduction see No. 54533.

72710 to 72718.

From Buitenzorg, Java. Seeds presented by Dr. W. M. Docters van Leeuwen, director, botanic garden. Received February 11, 1927.

72710. *ALBIZZIA LUCIDA* (Roxb.) Benth. Mimosaceae.

A handsome spreading leguminous tree with attractive feathery leaves; native to the East Indies.

For previous introduction see No. 69144.

72711. *ARTOCARPUS ELASTICA* Reinw. Moraceae.

A tall East Indian tree up to 40 meters in height. The young trees furnish a fiber, and the latex is a remarkable birdlime. (Note by David Fairchild under No. 67673.)

72712. *ARTOCARPUS RIGIDA* Blume. Moraceae.

A medium-sized tropical Asiatic tree, with small oval leaves and ovoid edible yellow fruits about 5 inches in diameter.

72713. *CURCULIGO LATIFOLIA* Ait. Amaryllidaceae.

An ornamental tropical stemless plant with large palmlike leaves and yellow flowers. Native to Java.

72714. *DAMMARA ALBA* Rumph. (*Agathis loranthifolia* Salisb.). Pinaceae.

White dammar pine.

A large tropical coniferous tree, native to the Malay Peninsula, which yields the dammar gum of commerce.

72715. *ELAeis GUINEENSIS* Jacq. Phoenicaceae. **African oil palm.**

Java-grown seeds of the African oil palm.

For previous introduction see No. 54040.

72710 to 72718—Continued.

72716. *FICUS PARIETALIS* Blume. Moraceae.

A handsome tropical tree with shining green leaves and golden-yellow fruits. Native to Java.

For previous introduction see No. 67702.

72717. *PITHECOLOBIUM JUNGHUENIANUM* Benth. Mimosaceae.

A tropical ornamental leguminous tree, up to 20 meters high. Native to the mountainous regions of Java.

72718. *VIGNA LUTEA* (Swartz) A. Gray (*V. retusa* Walp.). Fabaceae.

A tropical climbing vine or perennial creeper, native to the Philippines, where it has been found useful as a cover crop. It has also made good green forage for cattle.

For previous introduction see No. 60253.

72719. *MEDICAGO SATIVA* L. Fabaceae. **Alfalfa.**

From Russia. Seeds obtained through J. W. Pincus, Amtorg Trading Corporation, New York, N. Y. Received March 5, 1927.

A Turkestan variety.

72720 to 72724. *CAJANUS INDICUS* Spreng. Fabaceae. **Pigeon pea.**

From Salisbury, Southern Rhodesia, Africa. Seeds presented by H. G. Mundy, chief agriculturist, Department of Agriculture. Received March 5, 1927.

Locally grown seeds.

72720. *Early Maturing Dwarf.*

72721. No. 1. 72723. No. 3.

72722. No. 2. 72724. No. 4.

72725 to 72729. *PRUNUS SERRULATA* Lindl. Amygdalaceae.

Oriental cherry.

From Narberth, Pa. Plants presented by A. E. Wohlert, Garden Nurseries. Received March 16, 1927. Notes from 1927 Catalogue of the Garden Nurseries.

72725. *Jeanne Wohlert.* A decidedly dwarf variety, less than 6 feet high, with semidouble, fragrant, light-pink flowers.

72726. *Paul Wohlert.* A rather dwarf variety, with deep-pink semidouble flowers which appear very early, just after those of *Prunus subhirtella pendula*.

72727. *Rosea.* A spreading tree, with globular double flowers, deep pink becoming rose colored with age, in pendulous clusters of three to five.

72728. *Rosea Holland.* Very similar to *Rosea* [No. 72727] except that the tree assumes a vaselike habit with age.

72729. *Ruth Wohlert.* A variety with double light-pink flowers.

72730. *ZINZIBER OFFICINALE* Roscoe. Zinziberaceae. **Ginger.**

From Bathurst, Gambia, West Africa. Roots collected by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received February 11, 1927.

No. 957. Obtained in the market at Bathurst. January 4, 1927. This variety was probably grown in the Gambia region or somewhere on the west coast of Africa.

72731 to 72780.

From Manchuria. Seeds obtained by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received February 25, 1927.

72731 to 72750. *HORDEUM VULGARE PALLIDUM* Seringe. Poaceae. Six-rowed barley.

Numbers 72731 to 72733 were obtained through D. McLorn, Postal Commissioner, Harbin.

72731. No. 8987. 72733. No. 8998.

72732. No. 8991.

Numbers 72734 to 72750 were obtained from the localities named, through the Manchurian Research Society, Harbin.

72734. No. 9002. From Inkow.

72735. No. 9005. From Pangshangsiang.

72736. No. 9009. From Hangtsidiang.

72737. No. 9020. From Lalingchiang.

72738. No. 9024. Ouchiangsiang.

72739. No. 9025. Inkowsiang.

72740. No. 9028. Region of (Lagernaya) Camp Valley, Bukhedou.

72741. No. 9029. From Goflavohpoo, near Bodouneah.

72742. No. 9030. From Bahmiantung.

72743. No. 9031. From Sangdiatsi, near Sangsing.

72744. No. 9032. From Nahhuang, near Sangsing.

72745. No. 9033. From Neengoutah.

72746. No. 9034. From Tiabingho, Bingtsiang, in the region of Singdiang.

72747. No. 9036. From Bahmiantung.

72748. No. 9037. From Singmingsiang.

72749. No. 9038. From Neengoutah.

72750. No. 9040. From Shaelingchang, near Bodouneah.

72751 to 72755. *ORYZA SATIVA* L. Poaceae. Rice.

Obtained from the localities named, through the Manchurian Research Society, Harbin.

72751. No. 9011. From Neengoutah.

72752. No. 9018. From Shingiangsiang.

72753. No. 9022. From Hingkingsiang.

72754. No. 9023. From Tahlingsiang.

72755. No. 9035. From Neengoutah.

72756. *SECALE CEREALE* L. Poaceae. Rye.

No. 9043. Obtained from the region of (Lagernaya) Camp Valley, Bukhedou, through the Manchurian Research Society, Harbin. This variety is planted in the spring and is the main grain cultivated in northern Russia.

72757. *SOJA MAX* (L.) Piper (*Glycine hispida* Maxim.). Fabaceae. Soy bean.

No. 8992. Obtained through D. McLorn, Postal Commissioner, Harbin.

72758 to 72780. *TRITICUM AESTIVUM* L. (*T. vulgare* Vill.). Poaceae. Common wheat.

Numbers 72758 to 72760 were obtained from the localities named, through D. McLorn, Postal Commissioner, Harbin.

72758. No. 8989. From Neugtaohotzii.

72731 to 72780—Continued.

72759. No. 8993. From Yunglochen.

72760. No. 8996. From Tuichingshan.

Numbers 72761 to 72780 were obtained from the following localities through the Manchurian Research Society, Harbin.

72761. No. 8999. From Bingtsiang, in the region of Singdiang.

72762. No. 9000. From Dahsilakhe, near Bodouneah.

72763. No. 9001. From Neengoutah.

72764. No. 9003. From Teebaihao. Bingtsiang, in the region of Singdiang.

72765. No. 9004. From Sheeiangsiang.

72766. No. 9007. From Dahgoutsaitsah, near Bodouneah.

72767. No. 9008. From Nahhuang, near Sangsing.

72768. No. 9010. From Miaotsiavohpoo, near Bodouneah.

72769. No. 9012. From Singmingdiang.

72770. No. 9013. From Neengoutah.

72771. No. 9014. From the region of Etapnaia Valley, Bukhedou.

72772. No. 9016. From Pahmiantung.

72773. No. 9017. From Sadiatsi, near Sangsing.

72774. No. 9019. From Liayangsiang.

72775. No. 9021. From Bahmiantung.

72776. No. 9026. From Dahvah, near Bodouneah.

72777. No. 9027. From Hangtsidiang.

72778. No. 9039. From Lahlingsang.

72779. No. 9041. From Siaofangshier, near Bodouneah.

72780. No. 9042. From Ouchiangsiang.

72781 to 72818.

From Kew, England. Seeds presented by Dr. A. W. Hill, Director, Royal Botanic Gardens. Received February 16, 1927.

72781. *ACANTHOPANAX SESSILIFLORUM* (Rupr. and Maxim.) Seem. Araliaceae.

A vigorous deciduous shrub which forms a large spreading bush 10 feet high, with three-lobed or five-lobed, irregularly toothed leaves. The flowers, brownish purple with yellow protruding stamens, are packed in a spherical, almost stalkless cluster about an inch in diameter, and appear in July. The inky black berries are in round clusters about an inch thick. This is one of the hardest shrubs introduced from northern China, where it is native.

For previous introduction see No. 65908.

72782. *ALNUS HIRSUTA* Turcz. Betulaceae. Alder.

A rather handsome, medium-sized tree native to Japan and Manchuria, with rounded, elliptic, slightly lobed leaves, hairy beneath.

For previous introduction see No. 65912.

72783. *ARTEMISIA LACTIFLORA* Wall. Asteraceae.

An attractive herbaceous perennial, 2 feet high, with fragrant foliage and white flowers. Native to the Himalayas.

72781 to 72818—Continued.

72784. *ASTER YUNNANENSIS* Franch. Asteraceae.

A herbaceous perennial aster from south-eastern China, having unusually large brilliant lilac-blue flowers with a yellow disk.

For previous introduction see No. 67000.

72785. *BUDDLEIA FALLOWIANA* Balf. f., and W. W. Smith. Loganiaceae.

A shrubby plant with white woolly foliage and white flowers.

For previous introduction see No. 66280.

72786. *BUDDLEIA STENOSTACHYA* Rehd. and Wils. Loganiaceae. Butterfly bush.

A western Chinese shrub with narrowly oblong leaves 2 to 6 inches long and slender terminal panicles of fragrant lavender flowers which have orange eyes.

For previous introduction see No. 43829.

72787. *CARMICHAELIA ARBOREA* (Forst. f.) Druce (*C. australis* R. Br.). Fabaceae.

An ornamental evergreen shrub, 2 feet high, with light-blue flowers.

72788. *CASSINIA FULVIDA* Hook. f. Asteraceae.

An ornamental heathlike shrub which is covered with a yellowish down and produces white flowers. It is native to New Zealand.

72789. *CASSINIA VAUVILLIERSII* (Homb. and Jacq.) Hook. f. Asteraceae.

An erect compact shrub, 6 to 10 feet high, with small narrow leathery leaves half an inch long and dense terminal corymbs of white flowers. Native to New Zealand.

- 72790 to 72792. *CISTUS* spp. Cistaceae. Rockrose.

72790. *CISTUS CORBARIENSIS* Pourr.

A white-flowered shrub 2 feet high, native to Spain.

72791. *CISTUS FLORENTINUS* Lam.

A dwarf shrub with very narrow leaves and white flowers, which is a hybrid between *Cistus monspeliensis* and *C. salicifolius*.

For previous introduction see No. 67636.

72792. *CISTUS VILLOSUS* L.

An erect hairy shrub, 3 to 4 feet high, with wrinkled gray-green leaves and one to three reddish purple flowers about 2 inches wide. Native to the Mediterranean region.

For previous introduction see No. 67350.

72793. *CLEMATIS CHRYSOCOMA SERICEA* (Franch.) C. Schneid. Ranunculaceae.

An ornamental Chinese vine about 20 feet high, with silky hairy rounded leaves and solitary or paired pinkish flowers 3 to 4 inches across.

For previous introduction see No. 63394.

- 72794 to 72796. *COTONEASTER* spp. Malaceae.

72794. *COTONEASTER HARROVIANA* Wilson.

An evergreen shrub with a loose spreading habit, about 6 feet in height, having shining dark-green bristle-tipped leaves, dense corymbs of white flowers, and red fruits.

For previous introduction see No. 58146.

72795. *COTONEASTER LINDLEYI* Steud.

A large shrub or small tree, with semi-deciduous dark-green leaves, corymbs of white flowers, and bluish black fruits. Native to the northwestern Himalayas.

For previous introduction see No. 58149.

72781 to 72818—Continued.

72796. *COTONEASTER MELANOCARPA LAXIFLORA* (Jacq.) C. Schneid.

A spreading shrub, about 12 feet high, with oval dark-green leaves which are grayish white beneath, gracefully pendulous clusters of pinkish white flowers, and black globose fruits. This Siberian species is one of the most attractive of the black-fruited cotoneasters.

For previous introduction see No. 58150.

72797. *DAVIDIA INVOLUCRATA VILMORINIANA* (Dode) Hemsl. Cornaceae. Dove-tree.

A handsome hardy Chinese tree of pyramidal habit, differing from the typical form in leaf characters and perhaps less winter-hardy. The white floral bracts make a striking contrast with the bright-green foliage.

For previous introduction see No. 62030.

72798. *DEUTZIA LONGIFOLIA VEITCHII* (Veitch) Rehder. Hydrangeaceae. Longleaf deutzia.

This deutzia, from Yunnan, China, which bears its large flowers in dense many-flowered corymbs, is one of the handsomest of the genus, but has proved hardy only under protection at the Arnold Arboretum, Jamaica Plains, Mass.

For previous introduction see No. 66560.

72799. *DEUTZIA WILSONI* Duthie. Hydrangeaceae.

A very handsome Chinese shrub with reddish brown bark, soon peeling, and scabrous oblanceolate leaves 3 to 5 inches long. The white flowers, nearly 1 inch across, are in open corymbs, and the petal margins are wavy and hooded.

For previous introduction see No. 66289.

- 72800 to 72804. *ERODIUM* spp. Geraniaceae. Heronbill.

72800. *ERODIUM AMANUM* Boiss. and Kotschy.

A somewhat caespitose herbaceous perennial, native to Syria.

72801. *ERODIUM GLANDULOSUM* (Cav.) Willd. (*E. macradenum* L'Herit.).

A stemless herbaceous perennial, native to the Pyrenees Mountains, with long stout roots, hairy leaves 2 to 6 inches long, and light-purple flowers three-fourths of an inch across.

For previous introduction see No. 66563.

72802. *ERODIUM MANESCAVIA* Coss. Pyrenees heronbill.

A herbaceous perennial plant, belonging to the Geranium family, about a foot and a half high, with narrow leaves 6 inches or more in length and rosy purple flowers about 2 inches across. It grows wild in the Pyrenees Mountains.

For previous introduction see No. 66564.

72803. *ERODIUM PETRAEUM* (Gouan) Willd.

A herbaceous perennial, native to Asia Minor, with a vertical rhizome, numerous crowded basal leaves, and violet or pink flowers.

For previous introduction see No. 66565.

72804. *ERODIUM SUPRADENUM* Hort.

A herbaceous plant of possible use as forage.

- 72805 to 72807. *HEDYSARUM* spp. Fabaceae.

72805. *HEDYSARUM CORONARIUM* L.

A perennial or biennial European plant, 2 to 4 feet high, with odd-pinnate foliage and axillary racemes of deep-red, fragrant flowers.

For previous introduction see No. 64930.

72781 to 72818—Continued.

72806. *HEDYSARUM ESCULENTUM* Ledeb.

A hardy herbaceous yellow-flowered perennial, native to Siberia.

For previous introduction see No. 42191.

72807. *HEDYSARUM FLAVESCENS* Regel and Schmalh.

A hardy bushy leguminous plant with yellow flowers. Native to Turkestan.

For previous introduction see No. 42192.

72808. *HUMEA ELEGANS* J. E. Smith. Asteraceae. **Fountain humea.**

A somewhat tender red-flowered biennial, about 6 feet high, native to New South Wales.

72809. *LONICERA CHAETOCARPA* Rehder. Caprifoliaceae. **Honeysuckle.**

A honeysuckle collected in Kansu, western China, by E. H. Wilson, which is described (Curtis's Botanical Magazine, pl. 8804) as a shrub of compact habit and about 5 feet in height. The oblong leaves are bright green and more or less hairy, and the flowers, an inch or more in length, open in early June and are a pleasing primrose yellow.

For previous introduction see No. 66297.

72810. *MALUS KANSUENSIS* (Batal.) C. Schneid. Malaceae.

A hardy ornamental wild apple, up to 8 meters high, with white flowers and red or yellow fruits. Native to northwestern China.

72811. *ONOBRYCHIS TOURNEFORTII* (Willd.) Desv. Fabaceae.

A hardy herbaceous perennial native to Asia Minor.

72812. *PERNETTYA MUCRONATA* (L. f.) Gaud. Ericaceae.

According to W. J. Bean (Trees and Shrubs Hardy in the British Isles, vol. 2, p. 127), this is one of the finest ornamental shrubs, native to South America, about the Straits of Magellan. It is one of the hardest from that continent, and is rarely injured by frost in the neighborhood of London. The shrub is evergreen, 2 to 5 feet high, and spreads freely by suckers, forming ultimately a dense low thicket. The nodding white flowers, one-fourth of an inch long, are produced singly in the axils of the leaves at the ends of the shoots. The round berries, up to half an inch in diameter, vary in color from white to pink, lilac, crimson, purple, or almost black and remain on the branches throughout the winter and following spring. At Kew the berries are untouched by the birds.

For previous introduction see No. 62286.

72813. *PHOTINIA BEAUVERDIANA* C. Schneid. Malaceae.

A somewhat tender evergreen shrub with white flowers. Native to western China.

72814. *PYRACANTHA CRENULATA RODGERSIANA* A. B. Jacks. Malaceae.

A handsome evergreen spiny shrub with white flowers and orange-red fruits. Native to western China.

72815. *RODGERSIA PINNATA* Franch. Saxifragaceae.

A hardy herbaceous perennial, 2 to 4 feet high, with flowers varying in color from pink to deep red.

For previous introduction see No. 48655.

72781 to 72818—Continued.

72816. *ROSA DAVIDI* Crepin. Rosaceae.**David rose.**

A pink-flowered, orange-fruited rose, up to 18 feet high, native to western Szechwan, China, at altitudes of 4,000 to 9,000 feet. It is the nearest Chinese relative of *Rosa macrophylla* of the western Himalayas.

For previous introduction see No. 61986.

72817. *STRANVAESIA DAVIDIANA UNULATA* (Decaisne) Rehd. and Wils. Malaceae.

A low spreading evergreen shrub, or occasionally a small tree, native to western China. The narrow-oval, leathery leaves, 1 to 3 inches long, are glossy green, and the white flowers, about half an inch in diameter, appear in terminal clusters. Its greatest charm as an ornamental is the abundant crop of bright-red fruits.

For previous introduction see No. 66312.

72818. *TRIGONELLA POLYCERATA* L. Fabaceae.

A prostrate or ascending annual, 1 or 2 feet high, with obovate leaflets and small umbellike clusters of yellow flowers. Native to southern Europe and northern Africa.

For previous introduction see No. 58717.

72819 to 72827.

From Edinburgh, Scotland. Seeds presented by William Wright Smith, Regius Keeper, Royal Botanic Garden. Received February 12, 1927.

72819 to 72821. *ALNUS* spp. Betulaceae. **Alder.**72819. *ALNUS INCANA PENDULA* Callier.**Speckled alder.**

A pendulous variety of the speckled alder. The typical form is native to the eastern United States, where it is a small tree with dark-green leaves which are rusty beneath.

72820. *ALNUS INCANA GLAUCA* (Michx.) Ait.

A variety with the leaves blue-green beneath.

72821. *ALNUS HIRSUTA* Turcz.

A hardy Japanese tree, up to 60 feet in height, with large handsome foliage.

72822. *BUDDLEIA STENOSTACHYA* Rehd. and Wils. Loganiaceae.

For previous introduction and description see No. 72786.

72823. *CISTUS VILLOUS CORSICUS* (Lois.) Grosser. Cistaceae.

An erect ornamental hairy shrub, about 4 feet high, with small rounded-oval leaves and purplish pink flowers. Native to the island of Corsica.

72824. *COTONEASTER HARROVIANA* Wilson. Malaceae.

For previous introduction and description see No. 72794.

72825. *CRATAEGUS ORIENTALIS* Pall. Malaceae. **Hawthorn.**

A shrub or small tree, with dense corymbs of flowers and dark-red fruits. It is native to dry, stony places in Asia Minor and southeastern Europe and is said to withstand much heat and drought.

For previous introduction see No. 61331.

72826. *PERNETTYA MUCRONATA* (L. f.) Gaud. Ericaceae.

For previous introduction and description see No. 72812.

72827. *STRANVAESIA DAVIDIANA UNULATA* (Decaisne) Rehd. and Wils. Malaceae.

For previous introduction and description see No. 72817.

72828 to 72865.

From Tabor, Czechoslovakia. Seeds presented by Dr. Adolf Kutin, director, botanic garden. Received February 26, 1927.

72828 to 72832. *AMARANTHUS* spp. *Amaranthaceae*.

These amaranths are of possible value as green vegetables.

72828 and 72829. *AMARANTHUS CAUDATUS* L. *Amaranth.*

A subtropical herbaceous plant.

For previous introduction see No. 56611.

72828. Variety *albiflorus*. A white-flowered form.

72829. Variety *ruber*. A red-flowered form.

72830. *AMARANTHUS DUSSII* Sprenger.

An annual herbaceous plant native to Europe.

72831. *AMARANTHUS RETROFLEXUS* L.

An erect annual with dull-green leaves. Native to tropical America.

72832. *AMARANTHUS SYLVESTRIS* Desf.

A herbaceous annual, native to Asia Minor.

72833. *BETA TRIGYNA* Waldst. and Kit. *Chenopodiaceae*.

A hardy herbaceous white-flowered perennial, about 3 feet in height, native to Hungary.

For previous introduction see No. 58887.

72834 to 72836. *BETA VULGARIS* L. *Chenopodiaceae*. Beet.

Varieties of the common beet from southern Europe.

72834. Variety *altissima*.

72835. Variety *maritima*.

72836. Variety *rubra*.

72837. *CYCLANTHERA EXPLODENS* Naud. *Cucurbitaceae*.

A tender tropical climber, native to Colombia, with cucumberlike fruits which are perhaps edible.

72838. *CYCLANTHERA PEDATA* (L.) Schrad. *Cucurbitaceae*.

A tropical vegetable from northern South America, with cucumberlike fruits which are stuffed with meat and baked.

For previous introduction see No. 51557.

72839. *LALLEMANTIA IBERICA* (Bieb.) Fisch. and Mey. *Menthaceae*.

A blue-flowered, herbaceous perennial native to semiarid regions in Asia Minor and Syria, whose seeds yield an oil said to be a high-grade drying oil.

For previous introduction see No. 65465.

72840. *LILUM BULBIFERUM* L. *Liliaceae*. Lily.

A southern European lily, 2 to 4 feet high, with bright-red flowers spotted with black.

72841. *ORNITHOGALUM TENUIFOLIUM* Guss. *Liliaceae*.

A hardy white-flowered bulbous plant about a foot high, native to southern Europe. It is closely related to the star of Bethlehem (*Ornithogalum umbellatum*).

72842. *PHASEOLUS COCCINEUS* L. *Fabaceae*. Scarlet Runner bean.

Locally grown seeds.

72828 to 72865—Continued.

72843 to 72852. *PHASEOLUS VULGARIS* L. *Fabaceae*. Common bean.

Locally grown seeds.

72843. *Cerasiferus*.

72844. *Ellipticus* variety *carneus*.

72845. Variety *communis*.

72846. Variety *compressus*.

72847. Variety *gonospermus*.

72848. Variety *nanus*.

72849. Variety *nigerrimus*.

72850. Variety *oblongus*.

72851. Variety *tuberosus*.

72852. *Ricciardianus*.

72853 to 72860. *PISUM SATIVUM* L. *Fabaceae*. Pea.

Locally grown seeds.

72853. *Avense*.

72854. Variety *concentator*.

72855. Variety *hiberinum*.

72856. *Jomardi*.

72857. Variety *miclauxii*.

72858. *Quadratum*.

72859. Variety *thebaicum*.

72860. *Sativum*.

72861 to 72865. *POLEMONIUM* spp. *Polemoniaceae*.

72861. *POLEMONIUM CAERULEUM* L. Greek valerian.

A blue-flowered herbaceous perennial, 1 to 3 feet high, native to Europe.

For previous introduction see No. 66938.

72862. *POLEMONIUM FOLIOSISSIMUM* A. Gray.

A blue-flowered herbaceous perennial, native to New Mexico.

72863. *POLEMONIUM MEXICANUM* Cerv.

A herbaceous perennial up to 12 inches high, with blue flowers; native to New Mexico.

For previous introduction see No. 66939.

72864. *POLEMONIUM RICHARDSONII* R. Grah.

A hardy herbaceous perennial, 1 foot high, with blue flowers. Native to Europe.

72865. *POLEMONIUM SIBIRICUM* D. Don.

A hardy white-flowered herbaceous perennial, 2 feet high.

72866 to 72880.

From Les Barres, Nogent sur Vernisson, Loiret, France. Seeds presented by L. Pardé, Directeur, Arboretum des Barres et Fruticetum Vilmoriniana. Received March 4, 1927.

72866 to 72868. *BERBERIS* spp. *Berberidaceae*. Barberry.

72866. *BERBERIS POIRETI* C. Schneid.

A hardy shrub, up to 3 meters high, with small oval-oblong bright-green leaves, bright-yellow flowers, and ovoid red berries. Native to northern China.

For previous introduction see No. 61906.

72866 to 72880—Continued.

72867. *BERBERIS SOULIEANA* C. Schneid.

An evergreen shrub, 3 to 6 feet high, with leathery, lanceolate, spiny-serrate leaves 2 to 4 inches long and brownish yellow flowers in clusters of 2 to 15. The black ellipsoid berries are about five-eighths of an inch long. Native to China.

For previous introduction see No. 58141.

72868. *BERBERIS VERRUCULOSA* Hemsl. and Wils.

This attractive Chinese barberry is found as an evergreen shrub in western Szechwan, where it becomes 3 or 4 feet high. The yellow flowers and ovoid purplish blue fruits are borne along the small, very spiny leaves.

For previous introduction see No. 58126.

72869. *CLEMATIS GLOBULOSA* Hort. Ranunculaceae.

A hybrid of *Clematis douglasii scottii* and *C. texensis* with deep-purple pitcher-shaped flowers. Both of the parents of this European hybrid are native to the western United States.

For previous introduction see No. 63351.

72870. *CLERODENDRUM TRICOTOMUM FARGESII* (Dode) Rehder. Verbenaceae.

A rapid-growing Chinese shrub, with dark-green or purplish strongly veined, oval leaves and cymes of fragrant whitish flowers which are borne during the summer. The globular, peacock-blue fruits, about the size of peas, are set on the purple or crimson persistent calyx.

For previous introduction see No. 67638.

72871. *COTONEASTER LINDLEYI* Steud. Malaceae.

A large shrub or small tree, with semideciduous, dark-green leaves, corymbs of white flowers, and bluish black fruits. Native to the north-western Himalayas.

For previous introduction see No. 58149.

72872. *HAMAMELIS JAPONICA* Sieb. and Zucc. Hamamelidaceae. Japanese witch-hazel.

Variety *Zuccariniana*. A large hardy shrub, up to 30 feet high, with canary-yellow flowers. Native to Japan.

72873. *HAMAMELIS MOLLIS* Oliver. Hamamelidaceae. Chinese witch-hazel.

A large bush or small tree, sometimes 30 feet high, native to western China. The short-stemmed roundish toothed leaves are about 5 inches long, and the golden-yellow flowers are borne in nearly sessile heads.

For previous introduction see No. 49132.

72874 to 72877. *LIGUSTRUM* spp. Oleaceae. Privet.72874. *LIGUSTRUM ACUTISSIMUM* Koehne.

A much-branched shrub, 10 feet or less in height, with spreading and curving branches and very narrow sharp-pointed leaves about 2 inches long. The white flowers are borne in dense nodding panicles about an inch long. This privet is native to Japan and China.

For previous introduction see No. 65770.

72875. *LIGUSTRUM CILIATUM* Sieb.

A hardy Japanese shrub, up to 6 feet high, with black fruits.

72876. *LIGUSTRUM WALKERI* Decaisne.

An evergreen shrub with oval or lanceolate leaves and large panicles of white flowers. Native to southern India.

For previous introduction see No. 67041.

72866 to 72880—Continued.

72877. *LIGUSTRUM* sp.

A hardy shrub with white flowers and black fruits.

72878. *PYRACANTHA CRENULATA RODGERSIANA* A. B. Jacks. Malaceae.

Variety *flava*. An evergreen spiny shrub, perhaps tender, with orange fruits. Native to the Himalayas.

72879. *ROSA FOELIDA* Herrmann. Rosaceae.

A hardy shrub, up to 10 feet high, with slender stems and bright-yellow flowers. Native to western Asia.

72880. *STYRAX* sp. Styracaceae.

A handsome white-flowered shrub.

72881. *CAJANUS INDICUS* Spreng. Fabaceae. Pigeon pea.

From Central Baragua, Baragua, Camaguey, Cuba. Seeds presented by D. L. Van Dine, local director, Tropical Plant Research Foundation. Received March 8, 1927.

A variety growing at the Harvard Botanical Gardens, Soledad, Cienfuegos, which was introduced from the Dominican Republic by R. M. Grey, superintendent of the Harvard Gardens. (*Van Dine*.)

72882. *LONICERA PROSTRATA* Rehder. Caprifoliaceae. Honeysuckle.

From Stockholm, Sweden. Seeds presented by Dr. Robert E. Fries, director, botanic garden. Received March 30, 1927.

An ornamental prostrate shrub which forms dense mats and bears reddish flowers. Native to western China.

72883. *ELAEODENDRON QUADRANGULATUM* (Schrad.) Reiss. Celastraceae. False olive.

From Washington, D. C. Plants obtained from the National Botanic Garden. Received October 13, 1922. Numbered March, 1927.

An attractive tropical evergreen shrub or tree with glossy green leaves and small inconspicuous flowers. Native to Brazil.

72884. *ELAEODENDRON QUADRANGULATUM* (Schrad.) Reiss. Celastraceae. False olive.

From Palm Beach, Fla. Cuttings presented by J. B. Donnelly. Received October 2, 1922. Numbered March, 1927.

For previous introduction and description see No. 72883.

72885. *CASTANEA CRENATA* Sieb. and Zucc. Fagaceae. Japanese chestnut.

From Yokohama, Japan. Seeds purchased from the Yokohama Nursery Co. Received February 28, 1927.

A large shrub or small Japanese tree, up to 30 feet high, with edible nuts an inch or less in diameter.

72886. *CANARIUM ALBUM* (Lour.) DC. Balsameaceae.

From China. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received March 8, 1927.

No. 1005. Lohkongtung. November 13, 1926. *Chong laam paak laam*. A tropical tree which bears edible olivelike fruits; these are usually preserved in sugar or processed with salt.

72887 and 72888. FICUS spp. Moraceae. Fig.

From Solan Brewery, Punjab, India. Plants presented by H. E. J. Peake, Khaltoo Fruit Orchards. Received May 6, 1925. Numbered March, 1927.

Wild figs from India, of possible use as stocks.

72887. FICUS sp.

A form with entire leaves.

72888. FICUS CARICA L.

A form with deeply lobed leaves.

72889 to 72895. PRUNUS SERRULATA Lindl. Amygdalaceae.

Oriental cherry.

Flowering cherries, growing at the Plant Introduction Garden, Chico, Calif., originally received from Highland Park, Rochester, N. Y. Numbered March, 1927.

72889. Asagi. Row 27, trees 12, 13, 14, old test orchard. Tree 15 to 20 feet high, spreading; young leaves brownish; buds pinkish; flowers semidouble, up to 1½ inches across, in drooping clusters of two or three, light yellowish green becoming light pink just before falling. Not as showy as some varieties, but an interesting addition to a general collection because of its greenish flowers.

72890. Fudanzakura. Rows 130 and 131, tree 4, old test orchard. Tree about 15 feet high, upright, vigorous; young leaves reddish green; buds pink; flowers single, pale pink or white, up to 1½ inches across, in clusters of two or three, and borne very freely.

72891. Hosokawa. Tree up to 25 feet high, spreading; young leaves with only a slight reddish tinge; flowers mostly single, white, fragrant, up to 1¼ inches in diameter, in twos or threes.

72892. Shiratamazakura. Row 27, trees 4 and 5, old test orchard. Tree rather small, erect, and rather open; young leaves reddish; buds pinkish; flowers single, white with a pink tinge, about 1½ inches across, in twos and threes. An attractive single variety.

72893 to 72895. Shogetsu. Tree of medium height with a spreading, rather flat crown; buds deep pink, truncate; flowers double, with nearly white centers, tinged with pink on the edges, up to 2¼ inches across, in clusters of two to four. An excellent double light-pink variety.

72893. Tree 4 in rows 136, 137, and 138, old test orchard.

72894. Tree 3 in rows 148 and 149, old test orchard.

72895. Tree 5 in rows 139, 142, and 148, old test orchard.

72896. FRAGARIA sp. Rosaceae. Strawberry.

From Paris, France. Plants purchased from Vilmorin-Andrieux & Co. Received March 4, 1927.

Tardive de Léopold. Fruit broad, lobed, bright red, very large; flesh firm, scarlet. A very late variety particularly adapted for culture on a large scale.

72897 to 72899. FRAGARIA spp. Rosaceae. Strawberry.

From Berlin, Germany. Plants presented by L. Späth. Received December 28, 1925. Numbered March, 1927.

72897. FRAGARIA sp.

Aprikose. A medium early variety; fruits very large, handsome carmine red; flesh pink, with apricot flavor.

72898. FRAGARIA sp.

Deutsch Ebern. A very productive early variety. Fruits of medium size, beautifully colored, with a mild delicate flavor. They ship well because of the firm flesh.

72899. FRAGARIA sp.

Garteninspektor A. Koch. An early variety with very large fruits which are especially good for preserving.

72900 and 72901.

From China. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received March 8, 1927.

72900. CANARIUM PIMELA Koen. Balsameaceae.

No. 1013. Lohkongtung. November 13, 1926. *Yeung tai tau oo laam.* A tropical tree which produces edible oblong, olive-like fruits about 2 inches long. The Chinese pickle these fruits and use them as a relish.

For previous introduction see No. 65834.

72901. RAPHANUS SATIVUS L. Brassicaceae. Radish.

No. 1014. Linchow, Kwangtung Province. This plant is grown as a winter crop throughout the Linchow district, and is considered by the Chinese to have a beneficial effect upon the soil.

72902. COMBRETUM sp. Combretaceae.

From Sierra Leone, West Africa. Seeds collected by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received March 12, 1927.

No. 1135. Collected on the bank of the River Taia, near Mano. January 21, 1927. A vigorous climbing tropical African shrub with pendent clusters of unusually large 4-winged pods.

72903 and 72904. CAJANUS INDICUS Spreng. Fabaceae. Pigeon pea.

From Grenada, British West Indies. Seeds presented by W. O'Brien Donovan, officer in charge, Agricultural Department. Received March 14, 1927.

Locally grown seeds.

72903. Colored pigeon pea.

72904. White pigeon pea.

72905 to 72907. CORYLUS AVELLANA L. Betulaceae. Filbert.

From Saonara, Padova, Italy. Plants purchased from Fratelli Sgaravatti. Received March 21, 1927.

Italian-grown varieties.

72905. *A frutto grosso (macrocarpa).*

72906. *A pellicola bianca (fructus albo).*

72907. *A pellicola rossa (fructus rubro).*

72908. BENINCASA HISPIDA (Thunb.)
Cogn. Cucurbitaceae. Wax gourd.

From Luchowfu, Anhwei, China. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received January 14, 1927.

No. 783. October 11, 1926. *Tung kwa*. A variety planted here in April and ready to use in June.

72909. RUBUS sp. Rosaceae.

From China. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received February 24, 1927.

No. 960. En route from Kian to Taaihop, Kiangsi. A rather coarse, subtropical bramble with roundish, three-lobed, rugose leaves, gray beneath, and black edible berries of good flavor, produced in large pendulous clusters.

72910 and 72911. RUBUS spp. Rosa-ceae.

From Bogota, Colombia. Seeds purchased from Harvey Berman. Received March 10, 1927.

72910. RUBUS GLAUCUS Benth.

Andes raspberry.

A South American raspberry, native to the mountainous regions of Ecuador and neighboring countries, which is a half-climbing shrub, up to 10 feet in height. The oblong-oval fruits, an inch long, are light or dark red.

For previous introduction see No. 62690.

72911. RUBUS sp.

A South American bramble from the mountains of Colombia, said to bear berries 2 inches long.

72912 to 72920.

From Calcutta, India. Seeds presented by Percy Lancaster, secretary, Agricultural and Horticultural Society of India. Received March 12, 1927.

72912. PHASEOLUS CALCARATUS Roxb. Fa-baceae. Rice bean.

Mashiyam.

72913 and 72914. PHASEOLUS VULGARIS L. Fa-baceae. Common bean.

72913. A black French variety.

72914. A white French variety.

72915 to 72920. SOJA MAX (L.) Piper (Glycine hispida Maxim.). Fabaceae. Soy bean.

72915. *Barmali Bhatmay*.

72916. *Kaloo Bhatmas*. A black variety.

72917. Brown variety.

72918. Green variety.

72919. Small, brown variety.

72920. White variety.

72921. MEDICAGO SATIVA GAETULA Urban. Fabaceae.

From Algiers, Algeria, Africa. Seeds presented by Dr. L. Trabut, Government botanist. Received March 12, 1927.

A small-leaved herbaceous perennial with white flowers. Native to North Africa.

72922 to 72945. CAJANUS INDICUS Spreng. Fabaceae. Pigeon pea.

From Nagpur, Central Provinces, India. Seeds presented by D. Youngman, Government economic botanist. Received March 12, 1927. Locally developed Indian varieties.

72922. No. 27. 72934. No. 94.

72923. No. 33. 72935. No. 98.

72924. No. 34. 72936. No. 106.

72925. No. 35. 72937. No. 107.

72926. No. 38. 72938. No. 108.

72927. No. 45. 72939. No. 109.

72928. No. 66. 72940. No. 113.

72929. No. 78. 72941. No. 143.

72930. No. 80. 72942. No. 145.

72931. No. 81. 72943. No. 145-b.

72932. No. 82. 72944. No. 146-b.

72933. No. 90. 72945. No. 147.

72946 and 72947.

From West Africa. Seeds collected by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received March 12, 1927.

72946. TETRAPLEURA TETRAPTERA (Schum.) Taub. (T. thonningii Benth.). Mimosaceae.

No. 1133. En route from Konakry to Fore Carial. January 16, 1927. A large tropical West African forest tree suitable as a shade tree, producing 4-angled winged pods about a foot long, which contain sugar, a little saponin, but no alkaloid; these pods are ground and made into soup and also used for washing purposes.

For previous introduction see No. 62918.

72947. BAISSEA MULTIFLORA A. DC. Apocynaceae.

No. 1130. En route from Georgetown to Kuntaur, Gambia. January 9, 1927. An ornamental pink and white flowered climber growing over the top of a tall forest tree in a dry area.

72948 and 72949. CAJANUS INDICUS Spreng. Fabaceae. Pigeon pea.

From Nassau, Bahamas, British West Indies. Seeds presented by Dr. Charles S. Dolley, President, Bahamas Plantations Co. Received March 15, 1927.

Locally grown seeds.

72948. No. 1. 72949. No. 2.

72950. CARYOTA CUMMINGII Lodd. Phoenicaceae. Palm.

From Manila, Philippine Islands. Seeds presented by S. Youngberg, Director, Bureau of Agriculture. Received March 15, 1927.

An ornamental Philippine palm about 6 meters high and of erect habit, with few, spreading bipinnate leaves. The small fruits are globose.

72951. HIBISCUS CANNABINUS L. Malvaceae. Ambari hemp.

From Pusa, Bihar and Orissa, India. Seeds presented by Dr. F. J. F. Shaw, Imperial economic botanist, through C. R. Ball, Bureau of Plant Industry. Received March 16, 1927.

Seeds of type 3 grown at Pusa.

For previous introduction see No. 60958.

72952. CAJANUS INDICUS Spreng. Fabaceae. Pigeon pea.

From Reduit, Mauritius. Seeds presented by H. A. Tempany, Director of Agriculture. Received March 18, 1927.

A local variety known as *Embrevade dhol*.

72953 to 72958. CAJANUS INDICUS Spreng. Fabaceae. Pigeon pea.

From Bangalore, India. Seeds presented by H. C. Javaraya, superintendent, Mysore Government Gardens. Received March 18, 1927.

Locally developed varieties.

72953. *Bela*. 72956. *Kadur*.

72954. *Hassan*. 72957. *Kampu*.

72955. *Islampur*. 72958. *Tumkur*.

72959 and 72960. DIOSPYROS KAKI L. f. Diospyraceae. Kaki.

From Yokohama, Japan. Plants purchased from the Yokohama Nursery Co. Received March 24, 1927. Notes from the Yokohama Nursery 1926-27 catalogue.

72959. *Delicious*. Fruits large and sweet.

72960. *Twentieth Century*. A new variety with large flat fruits, sweet and juicy.

72961 to 72966.

From Orleans, France. Plants obtained from Léon Chénault. Received March 24, 1927.

72961. *MERATIA PRAECOX* (L.) Rehd. and Wils. (*Chimonanthus fragrans* Lindl.). Calycanthaceae. Wintersweet.

Variety *luteus grandiflorus*. An ornamental shrub, with bright-green oblong leaves 3 to 5 inches long and large very fragrant yellow flowers. Native to China and Japan.

72962. *FOKIENIA HODGINSII* (Dunn) Henry and Thomas. Pinaceae.

A coniferous tree, up to 40 feet in height, native to southeastern China, and probably adapted for cultivation only in the southern United States.

72963. *MELIOSMA WALLICHII* Planch. Sabiaceae.

A small subtropical tree, with stiff pinnate leaves up to 3 decimeters long and large panicles of small whitish flowers. Native to the Himalayas.

72964. *PSEUDOTSUGA WILSONIANA* Hayata. Pinaceae.

A tall handsome evergreen Chinese tree with shining red-brown bark and rather stout linear leaves up to 4.5 centimeters.

72965. *PSEUDOTSUGA JAPONICA* (Shiras.) Beiss. Pinaceae.

A hardy evergreen Japanese tree 30 meters or less in height, with dull reddish-brown bark and bright shining-green linear leaves about 2 centimeters long.

72966. *STYRAX DASYANTHUM* Perkins. Styracaceae. Snowbell.

An ornamental Chinese shrub or small tree, up to 8 meters high, with oblong-elliptic leaves about 7 centimeters long and showy white flowers in slender racemes.

For previous introduction see No. 61994.

72967 and 72968. CHAYOTA EDULIS Jacq. (Sesuvium edule Swartz). Cucurbitaceae. Chayote.

From Cordoba, Vera Cruz, Mexico. Fruits presented by C. M. Holmes. Received March 26, 1927.

Locally grown varieties.

72967. Small fruits.

72968. White fruits.

72969. CAJANUS INDICUS Spreng. Fabaceae. Pigeon pea.

From Grenada, British West Indies. Seeds presented by W. O'Brien Donovan, officer in charge, Agricultural Department. Received March 24, 1927.

A local dwarf variety with colored seeds.

72970 to 72977.

From Nancy, France. Seeds presented by Dr. Edmond Gain, director, botanic garden. Received March 16, 1927.

72970 to 72974. *ERODIUM* spp. Geraniaceae. Heronbill.

72970. *ERODIUM ARABICUM* Decaisne.

A tender herbaceous plant, native to Arabia.

72971. *ERODIUM CICONIUM* (Jusl.) Willd.

For previous introduction and description see No. 72632.

72972. *ERODIUM MANESCAVI* Coss.

For previous introduction and description see No. 72802.

72973. *ERODIUM SALZMANNI* Bois. and Reut.

A herbaceous perennial, native to southern Spain.

72974. *ERODIUM SEBACEUM* Delile.

A herbaceous perennial about 15 inches high, native to southeastern Europe.

72975 to 72977. *ONOBRYCHIS* spp. Fabaceae.

72975. *ONOBRYCHIS CRISTA-GALLI* (L.) Lam.

An annual or biennial ascending plant, 8 to 20 inches high, with pinkish purple flowers. Native to dry places in the Mediterranean region.

For previous introduction see No. 66529.

72976. *ONOBRYCHIS VAGINALIS* Meyer.

A herbaceous perennial with yellow flowers, native to the Caucasus.

72977. *ONOBRYCHIS VULGARIS* Hill (*O. viciaefolia* Scop.).

A herbaceous perennial, 1 to 2 feet high, with pink flowers. Native to Europe.

72978 to 72981.

From Haiti. Seeds obtained through O. F. Cook, Bureau of Plant Industry. Received March, 1927.

72978. *MANIHOT GLAZIOVII* Muell. Arg. Euphorbiaceae. Ceara rubber.

Locally grown seeds.

For previous introduction see No. 64037.

72979. *THEOBROMA CACAO* L. Sterculiaceae. Cacao.

Locally grown seeds.

72978 to 72981—Continued.

72980. HEVEA BRASILIENSIS (H. B. K.) Muell. Arg. Euphorbiaceae. **Para rubber tree.**
Locally grown seeds.

For previous introduction see No. 67528.

72981. MANIHOT DICHOTOMA Ule. Euphorbiaceae.

Locally grown seeds of a Brazilian rubber-producing tree closely related to the Ceara rubber tree (*Manihot glaziovii*).

For previous introduction see No. 39338.

72982. TRITICUM AESTIVUM L. (*T. vulgare* Vill.). Poaceae.

Common wheat.

From Pusa, Bihar and Orissa, India. Seeds presented by Dr. F. J. F. Shaw, Imperial economic botanist, through C. R. Ball, Bureau of Plant Industry. Received March 16, 1927.

Pusa 52. A locally developed variety.

72983. CERATOSTIGMA WILLMOTTIANUM Stapf. Plumbaginaceae.

From Philadelphia, Pa. Plants presented by Mrs. J. Norman Henry. Received March 29, 1927.

A half-woody perennial, 1 to 3 feet high, with angled purplish stems, bristly leaves, and cobalt-blue flowers an inch wide, borne successively in a large head. Native to western China.

72984. BELOU MARMELOS (L.) Lyons (*Aegle marmelos* Correa). Rutaceae. **Bel.**

From Kandy, Ceylon. Fruits presented by Dr. Andreas Nell. Received March 25, 1927.

A small spiny tropical Asiatic tree which bears edible fruits; these are globular, about 3 inches in diameter, with hard shells. The glutinous edible pulp is aromatic and is supposed to have a special tonic effect.

72985. CHAYOTA EDULIS Jacq. (*Sechium edule* Swartz). Cucurbitaceae.

Chayote.

From Cordoba, Vera Cruz, Mexico. Fruits presented by C. M. Holmes. Received March 26, 1927.

Locally grown fruits.

72986. SICANA ODORIFERA (Vell.) Naud. Cucurbitaceae. **Casabanana.**

From Gaston, Oreg. Seeds presented by S. H. Carnahan. Received March 24, 1927.

A subtropical ornamental cucurbitaceous vine producing large fruits, a foot or more long, which are edible but insipid.

For previous introduction see No. 43440.

72987. CAJANUS INDICUS Spreng. Fabaceae. **Pigeon pea.**

From Akkra, Gold Coast, Africa. Seeds presented by G. H. Knowles, Director of Agriculture. Received March 25, 1927.

Locally grown seeds.

72988. DACTYLIS GLOMERATA L. Poaceae. **Orchard grass.**

From Wellington, New Zealand. Seeds presented by A. H. Cockayne, director of the field division, Department of Agriculture. Received March 25, 1927.

Akaroa, a selected strain from New Zealand.

72989. RUBUS MACROCARPUS Benth. Rosaceae. **Colombian blackberry.**

From Bogota, Colombia. Seeds purchased from Harvey Berman. Received March 22, 1927.

A rather coarse-growing blackberry, with stout canes about 10 feet long, large rough leaves, and deep maroon-red juicy berries up to 2 inches in length. Native to moist regions in the Andes, at altitudes of 8,500 to 9,500 feet.

For previous introduction see No. 61065.

72990 and 72991. EUCALYPTUS spp. Myrtaceae.

From Garbeen, near Cairns, northern Queensland, Australia. Seeds presented by J. A. Hamilton. Received March 24, 1927.

72990. EUCALYPTUS CORYMBOSA J. E. Smith.

A tall tree with creamy white flowers from the warmer and damper parts of Australia. It should make a good honey plant.

72991. EUCALYPTUS POPULIFOLIA Desf.

A timber tree of compact habit, native to Australia, said to be the best honey plant in that country. The wood of this tree is very durable.

72992 to 73012.

From West Africa. Seeds collected by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received March, 1927.

72992. AMOMUM MELEGUETA Roscoe. Ziniberaceae.

No. 1182. Obtained in a native market at Moliko, Cameroon. February 12, 1927. A gingerlike bushy perennial, 5 feet high, with small golden seeds which are used as spice.

72993. COMBRETUM GRANDIFLORUM Don. Combretaceae.

No. 1101. Bathurst, Gambia, January 11, 1927. An ornamental climbing shrub producing long flowering branches of brilliant red flowers in closely packed spikes. It is native to Upper Guinea and the Congo region and is adapted to hot muggy summers and very dry winters.

72994. ADENOCARPUS MANNII Hook. f. Fabaceae.

No. 1202. February 17, 1927. A tropical ornamental shrub 7 feet high with yellow flowers half an inch across, found in black volcanic soil above the timber line on the Cameroon Mountain.

72995. CLITORIA LAURIFOLIA Poir. (*C. cajani-folia* Benth.). Fabaceae.

No. 1165. Botanic Garden, Victoria, Cameroon. February 10, 1927. An erect herbaceous tropical leguminous plant said to have white flowers. It may prove valuable as a cover crop.

For previous introduction see No. 62904.

72996. (Undetermined.)

No. 1141. January 28, 1927. A tropical euphorbiaceous shrub growing on sandy land near the seashore, en route from Monrovia to Mount Barclay, Liberia. It has long pendent branches loaded with seed pods; the copious flow of latex is very sticky and may contain rubber.

72997. (Undetermined.)

No. 1203. A tropical leguminous shrub about 3 feet high, found in black loamy soil just above the timber line on the Cameroon Mountain, near Buea Cameroon.

72992 to 73012—Continued.

72998. *ALBIZZIA BROWNEI* Walp. Mimosaceae.

No. 1126. Jala Jungle, Sierra Leone. January 20, 1927. An ornamental tropical tree, 30 feet high, with feathery foliage.

72999. *ALCHORNEA CORDIFOLIA* (Schum.) Muell. Arg. (*A. cordata* Benth.). Euphorbiaceae.
Christmas bush.

No. 1131. Jala Jungle, Sierra Leone. January 20, 1927. The "Christmas bush," so-called because of the long pendent spikes of brilliant red berries produced at Christmas time. It is a tropical ornamental shrub native to West Africa.

73000. *CASSIA BRASILIENSIS* Hort. Caesalpiniaceae.

No. 1205. Botanic Garden, Victoria, Cameroon. A small tropical tree with deep-green foliage and yellow flowers.

73001. *CHAETOCLOA* sp. Poaceae. Grass.

No. 1208. Near Ekoua, Cameroon. February 18, 1927. An ornamental broad-leaved grass.

73002 and 73003. *CHRYSOPHYLLUM CAINITO* L. Sapotaceae. Caimito.

For previous introduction see No. 67532.

73002. No. 1161. Botanic Garden, Victoria, Cameroon. February 9, 1927. A white-fleshed variety of the star apple whose fruits attain a large size, $3\frac{1}{2}$ inches in diameter.

73003. No. 1201. Buea, Cameroon. February 13, 1927. A purple-fleshed variety of the star apple. These seeds are from a fruit $\frac{1}{2}$ inches in diameter.

73004. *CRACCA VOGELII* (Hook. f.) Kuntze (*Tephrosia vogelii* Hook. f.). Fabaceae.

No. 1184. Victoria, Cameroon. February 17, 1927. *Moom* or *Kassa*. A leguminous shrub with velvety leaves and pods which is used as fish poison. A dam is made in a stream, and the macerated branches of this bush are thrown into the water. Men then wade into the stream, stirring up the water, and after a few minutes the dead fish rise to the surface. The skin on the men is affected somewhat by the poison. The macerated leaves are also used to cure skin diseases of dogs and goats.

For previous introduction see No. 66250.

73005. *CROTALARIA RETUSA* L. Fabaceae.

No. 1160. Between Victoria and Bota, Cameroon. February 9, 1927. A tropical leguminous plant possibly resistant to salt spray.

73006. *CYCLANTHERA EXPLODENS* Naud. Cucurbitaceae.

No. 1204. Buea, Cameroon. February 12, 1927. A tropical American cucurbitaceous vine whose fleshy pods break open suddenly to scatter the seeds.

73007. *DRYOPHLOEUS* sp. Phoeniceae. Palm.

No. 1169. Botanic Garden, Victoria, Cameroon. February 10, 1927. A rather dwarf clump palm producing beautiful clusters of scarlet fruits which are half an inch long and have a sweetish taste.

73008 and 73009. *ELAEIS GUINEENSIS* Jacq. Phoeniceae. African oil palm.

73008. No. 1196. Victoria, Cameroon. February 17, 1927. A variety distinguished by having a large, thick-shelled seed with a thin but oily pericarp.

72992 to 73012—Continued.

73009. Nos. 1193 and 1197. February, 1927. Mixed seeds obtained near Victoria, Cameroon. The Cameroon name is *lisombe*.

73010. *ELAEOPHORBA DRUPIFERA* (Thonn.) Stapf. Euphorbiaceae.

No. 1155. Santa Isabel, Fernando Po Island, West Africa. A tropical fleshy-leaved tree 30 feet high which is drought resistant. It contains a large amount of latex and may be a source of rubber.

73011. *ERYTHRINA GLAUCA* Willd. Fabaceae. Coral tree.

No. 1168. Botanic Garden, Victoria, Cameroon. February 16, 1927. A stately tree from tropical America with large leaves and showy orange flowers.

73012. *FICUS* sp. Moraceae. Fig.

No. 1172. Cameroon Mountain. February 10, 1927. A large tropical tree with light-green leaves and an abundance of fruits in long clusters.

73013. *MAGNOLIA DELAVAYI* Franch. Magnoliaceae.

From Orleans, France. Plants presented by Léon Chénault. Received March 24, 1927.

An evergreen ornamental tree, up to 10 meters high, with dull-green oblong leaves growing to a length of 30 centimeters and white flowers 20 centimeters in diameter. Native to southwestern China.

73014 to 73027.

From West Africa. Seeds collected by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received March, 1927.

73014 to 73016. *MEIBOMIA* spp. Fabaceae.

73014. *MEIBOMIA* sp.

No. 1166. Botanic garden, Victoria, Cameroon. February 10, 1927. An attractive blue-flowered species 3 feet high.

73015. *MEIBOMIA* sp.

No. 1175. Between Buea and Moyuca, Cameroon. February 12, 1927. A tall leafy plant which may prove useful as a cover plant.

73016. *MEIBOMIA* sp.

No. 1198. Between Buea and Signal Point, Cameroon. February 12, 1927. A species which looks promising as a cover plant.

73017. *MORINDA CITRIFOLIA* L. Rubiaceae. Indian mulberry.

No. 1177. Botanic garden, Victoria, Cameroon. February 10, 1927. An ornamental tropical shrub with large white juicy fruits.

For previous introduction see No. 36880.

73018. *OCIMUM VIRIDIFLORUM* Roth. Menthaeae.

No. 1167. A tropical herbaceous bushy perennial with an aromatic odor, producing small greenish flowers.

73019. *PENNISSETUM* sp. Poaceae. Grass.

No. 1209. February 17, 1927. A tall silvery bunch grass growing abundantly on the Cameroon Mountains near the timber line, at an altitude of about 9,000 feet.

73014 to 73027—Continued.**73020. RUBUS** sp. Rosaceae. **Raspberry.**

No. 1187. Buea, Cameroon. February 12, 1927. A moisture-loving species growing in the shade at an altitude of 3,000 feet.

73021. SPOROBOLUS sp. Poaceae. **Grass.**

No. 1207. February 18, 1927. A bunch grass 2 feet high growing in black loamy volcanic soil on the Cameroon Mountains at an altitude of 9,000 feet.

73022. VIGNA sp. Fabaceae.

No. 1159. Between Victoria and Bota, Cameroon. February 9, 1927. A leguminous herb from tropical Africa.

73023. VIGNA sp. Fabaceae.

No. 1190. February 20, 1927. A beautiful deep-blue flowered climber growing at Ekoua, Cameroon Mountains.

73024. (Undetermined.)

No. 1158. From the jungle near the Taia River, Mano, Sierra Leone. January 22, 1927. A tall large-leaved gingerlike plant which is excellent as a border for pools.

73025. (Undetermined.)

No. 1185. A tropical vine with white and lavender flowers, found hanging from the rocks on the road between Victoria and Bota, Cameroon. February 9, 1927.

73026. (Undetermined.)

No. 1191. Probably collected in Cameroon. A striking climber which has flowers with corollas that are white outside and purple inside or orange variegated with purple. The fruits are eaten raw, and the stems are used as tying material. This climber is called *gumatetei* by the natives.

73027. (Undetermined.)

A tropical West African climber found near the United Brotherhood Mission at Tiama, near Jala, Sierra Leone. It is a possible source of rubber.

73028 to 73030. PRUNUS MUME Sieb. and Zucc. Amygdalaceae.**Japanese apricot.**

From China. Bud wood obtained by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received February 23, 1927.

The fruits of this group, *tsing mui*, are so sour that they are rarely eaten fresh. The most common method of treatment is to place them in large wooden vats having a capacity of nearly 400 cubic feet, with salt at the rate of 1.3 pounds of salt to 10 pounds of fruit. By means of mats and stones the fruits are weighted down and kept submerged for about 10 days. They are then spread out on bamboo trays and dried in the sun. When thoroughly dried, they may be kept indefinitely. They are used to make a great variety of confections, most of which have licorice and saccharine as their chief flavoring principles.

73028. No. 984. Lingnan University orchard. January 5, 1927. *Wong mui*. In the markets the name *wong mui* (yellow mui) is applied to those that have turned yellow in ripening.

For previous introduction see No. 64574.

73029. No. 987. Lingnan University orchard. January 5, 1927. *Ngho shue mui*.

For previous introduction see No. 64570.

73028 to 73030—Continued.

73030. No. 988. *Hang mui chi*. Lingnan University orchard. January 5, 1927.

For previous introduction see No. 64582.

73031. LEUCADENDRON ARGENTEUM R. Br. Proteaceae.

From Cape Town, South Africa. Seeds presented by R. H. Compton, director, national garden. Received March 29, 1927.

A handsome evergreen South African tree found native only in the vicinity of Cape Town, where it is known as the witteboom or silver-leaf pine. The narrow white-silky leaves, up to 7 inches long, are commonly used as curios and for bookmarks.

For previous introduction see No. 57796.

73032. CAJANUS INDICUS Spreng. Fabaceae. **Pigeon pea.**

From Saigon, Cochinchina. Seeds presented by I. Robin, chief of agricultural service. Received March 31, 1927.

Locally grown variety with yellow and purple flowers; seeds edible.

73033. CALLITRIS ROBUSTA (A. Cunn.) R. Br. Pinaceae.

From Carbeen, near Cairns, northern Queensland, Australia. Seeds presented by J. A. Hamilton. Received March 24, 1927.

A tall coniferous timber tree, up to 70 feet, native to Australia, where it grows on poor stony soil. The timber is durable and handsomely grained and is used for making furniture.

73034 to 73045.

From Hangchow, Chekiang Province, China. Seeds collected by F. A. McClure, agricultural explorer, Bureau of Plant Industry. Received March 31, 1927.

73034 to 73037. BRASSICA spp. Brassicaceae.**73034. BRASSICA** sp.

No. 1019. *Ai keuk pak tsoi*. The seeds are planted here in the autumn.

73035. BRASSICA sp.

No. 1020. *Suet lei kai*. Seeds planted during the spring and autumn.

73036. BRASSICA sp.

No. 1021. *Tap tai tsoi*. Seeds planted in the autumn.

73037. BRASSICA sp.

No. 1022. *Kai tsoi*. Seeds planted in the autumn.

73038. CITRULLUS VULGARIS Schrad. Cucurbitaceae. **Watermelon.**

No. 1027. *Ma ling kwa*.

73039 to 73045. CUCUMIS MELO L. Cucurbitaceae. **Melon.**

73039. No. 1023. *Tsing pei luk yuk*.

73040. No. 1024. *Wong kam kwa*.

73041. No. 1025. *Suet kwa*.

73042. No. 1026. *Tso i kwa*.

73043. No. 1028. *Lei kwa*.

73044. No. 1029. *Hop i kwa*.

73045. No. 1030. *Shau kwa*.

73046. TRITICUM AESTIVUM L. (T. vulgare Vill.). Poaceae.

Common wheat.

From Uruguay. Seeds presented by H. V. de Pena, first secretary, Legation of Uruguay, Washington, D. C. Received February 8, 1927.

Artigas. A Uruguayan variety.

73047. FICUS sp. Moraceae. Fig.

From West Africa. Seeds collected by David Fairchild, agricultural explorer, Bureau of Plant Industry, with the Allison V. Armour expedition. Received March 25, 1927.

No. 1180. En route from Buea to Moyuco, Cameroon. February 12, 1927. A tropical tree with small edible brown fruits about an inch in diameter produced in hanging clusters 6 feet long.

73048 and 73049. QUERCUS spp. Fa-gaceae. Oak.

From Manchuria. Seeds collected by P. H. Dorsett, agricultural explorer, Bureau of Plant Industry. Received January 10, 1927.

73048. QUERCUS sp.

No. 8866. November 20, 1926. From trees on the mountain side near the Fa Hua Ssu Temple, Haitzu, Chihli Province.

73049. QUERCUS sp.

No. 8867. November 20, 1926. A tall-growing chestnut-leaved oak found near the Fa Hua Ssu Temple, Haitzu, Chihli Province. The bark looks different from that of the other oaks, and this variety appears to be very interesting.

For previous introduction see No. 72163.

ORGANIZATION OF THE UNITED STATES DEPARTMENT OF AGRICULTURE

September 9, 1929

<i>Secretary of Agriculture</i> -----	ARTHUR M. HYDE.
<i>Assistant Secretary</i> -----	R. W. DUNLAP.
<i>Director of Scientific Work</i> -----	A. F. WOODS.
<i>Director of Regulatory Work</i> -----	WALTER G. CAMPBELL.
<i>Director of Extension Work</i> -----	C. W. WARBURTON.
<i>Director of Personnel and Business Administration.</i>	W. W. STOCKBERGER.
<i>Director of Information</i> -----	M. S. EISENHOWER.
<i>Solicitor</i> -----	R. W. WILLIAMS.
<i>Weather Bureau</i> -----	CHARLES F. MARVIN, <i>Chief</i> .
<i>Bureau of Animal Industry</i> -----	JOHN R. MOHLER, <i>Chief</i> .
<i>Bureau of Dairy Industry</i> -----	O. E. REED, <i>Chief</i> .
<i>Bureau of Plant Industry</i> -----	WILLIAM A. TAYLOR, <i>Chief</i> .
<i>Forest Service</i> -----	R. Y. STUART, <i>Chief</i> .
<i>Bureau of Chemistry and Soils</i> -----	H. G. KNIGHT, <i>Chief</i> .
<i>Bureau of Entomology</i> -----	C. L. MARLATT, <i>Chief</i> .
<i>Bureau of Biological Survey</i> -----	PAUL G. REDINGTON, <i>Chief</i> .
<i>Bureau of Public Roads</i> -----	THOMAS H. MACDONALD, <i>Chief</i> .
<i>Bureau of Agricultural Economics</i> -----	NILS A. OLSEN, <i>Chief</i> .
<i>Bureau of Home Economics</i> -----	LOUISE STANLEY, <i>Chief</i> .
<i>Plant Quarantine and Control Administration.</i>	C. L. MARLATT, <i>Chief</i> .
<i>Grain Futures Administration</i> -----	J. W. T. DUVEL, <i>Chief</i> .
<i>Food, Drug, and Insecticide Administration</i> -----	WALTER G. CAMPBELL, <i>Director of Regulatory Work, in Charge</i> .
<i>Office of Experiment Stations</i> -----	E. W. ALLEN, <i>Chief</i> .
<i>Office of Cooperative Extension Work</i> -----	C. B. SMITH, <i>Chief</i> .
<i>Library</i> -----	CLARIBEL R. BARNETT, <i>Librarian</i> .

This inventory is a contribution from

<i>Bureau of Plant Industry</i> -----	WILLIAM A. TAYLOR, <i>Chief</i> .
<i>Office of Foreign Plant Introduction</i> -----	KNOWLES A. RYERSON, <i>Principal Horticulturist, in Charge</i> .
